1:1 call with an external call	Caller	Caller's OneDrive for Business account	Caller is owner and has full rights. Callee has no access. Caller must share it to the Callee.
1:1 call with an external call	Callee	Callee's OneDrive for Business account	Callee is owner and has full rights. Caller has no access. Callee must share it to the Caller.
Group call	Any member of the call	Group member who clicked on Record's OneDrive for Business account	Member who clicked on Record has full rights. Other group members from the same tenant have Read rights. Other group members from different tenant have no rights to it.

MEETING TYPE	WHO CLICKED ON RECORD?	WHERE DOES THE RECORDING LAND?	WHO HAS ACCESS? R/W, R, OR SHARING
Adhoc/Scheduled meeting	Organizer	Organizer's OneDrive for Business account	Organizer has full rights to the recording. All other members of the meeting have read access.
Adhoc/Scheduled meeting	Other meeting member	Meeting member who clicked on Record	Member who clicked on Record has full rights to the recording. Organizer has edit rights and can share. All other meeting members have read access.
Adhoc/Scheduled meeting with external users	Organizer	Organizer's OneDrive for Business account	Organizer has full rights to the recording. All other members of the meeting from the same tenant as the organizer have read access. All other external members have no access, and the Organizer must share it to them.
Adhoc/Scheduled meeting with external users	Other meeting member	Member who clicked on Record	Member who clicked on Record has full rights to the recording. Organizer has edit rights and can share. All other members of the meeting from the same tenant as the organizer have read access. All other external members have no access, and the Organizer must share it to them.
Channel meeting	Channel Member	Teams SharePoint location for that channel. Note: Channel meeting recording upload to SharePoint is not supported for IP-based restrictions. We recommend using Azure conditional access .	Member who clicked on Record has edit rights to the recording. Every other member's permissions are based on the Channel SharePoint permissions.

Frequently asked questions

Where will the meeting recording be stored?

- For non-Channel meetings, the recording is stored in a folder named **Recordings** that's at the top level

of the OneDrive for Business that belongs to the person who started the meeting recording. Example:

recorder's OneDrive for Business/Recordings

- For Channel meetings, the recording is stored in the Teams site documentation library in a folder named **Recordings**. Example:

Teams name - Channel name/Documents/Recordings

When Stream files (such as recordings) are stored in SharePoint/OneDrive, how is it decided where they go? Does the admin have the ability to change where it goes?

By default, all recording files will go to the OneDrive account of the user who selected **Record**. For channel meetings, the recording will always go to the SharePoint site of the channel. The admin can't change where the recording is stored.

How do I handle recordings from former employees?

Since videos are just like any other file in OneDrive for Business and SharePoint, handling ownership and retention after an employee leaves will follow the normal [OneDrive for Business and SharePoint process](#).

Who has the permissions to view the meeting recording?

- For non-Channel meetings, all meeting invitees, except for external users, will automatically get a personally shared link. External users will need to be explicitly added to the shared list by the meeting organizer or the person who started the meeting recording.
- For Channel meetings, permissions are inherited from the owners and members list in the channel.

NOTE

You'll not get an email when the recording finishes saving, but the recording will appear in the meeting chat once it's finished. This will happen much quicker than it did in Stream previously.

How can I manage captions?

Closed captions for Teams meeting recordings will be available during playback only if the user had transcription turned on at the time of recording. Admins must [turn on recording transcription](#) to ensure their users have the option to record meetings with transcription.

Captions help create inclusive content for viewers of all abilities. As an owner, you can hide captions on the meeting recording, although the meeting transcript will still be available on Teams unless you delete it there.

Closed captions are supported for Teams meeting recordings for 60 days from when the meeting is recorded.

Closed captions aren't fully supported if the Teams Meeting Recording is moved or copied from its original location on OneDrive for Business or SharePoint.

NOTE

There will be English-only closed captions (meeting transcription is not yet available in GCC).

How will my storage quota be impacted?

Teams meeting recording files live in OneDrive for Business and SharePoint and are included in your quota for those services. See [SharePoint quota](#) and [OneDrive for Business quota](#).

You get more storage with [OneDrive for Business](#) compared with Stream and more fungible storage with SharePoint.

How can I play a Teams meeting recording?

Your video will play on the video player of OneDrive for Business or SharePoint depending on where you access the file.

If you plan on deprecating adding to Stream, will existing videos stay as is and for how long?

Stream as a platform won't be deprecated in the near future. The videos that currently live in Stream will stay there until we start migrating. Upon migration, those videos will be migrated to OneDrive for Business or SharePoint as well. Check [Stream classic migration](#) for more information.

How do I apply a retention label to Microsoft Teams meeting recordings?

See [How to auto-apply a retention label](#).

How do I assign policies to my users in Microsoft Teams and which policies take precedence?

See [Which policy takes precedence?](#).

Where does the recording go if the user doesn't have OneDrive for Business or SharePoint, or the storage quota is full?

The recording will land in our temporary storage location where it will be held for 21 days. During that time, the organizer must download the recording. If not downloaded within 21 days, the recording is deleted.

Contact center integrations for Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article provides an overview of how contact center solutions can be integrated with Microsoft Teams and the solution providers participating in the Microsoft Teams Connected contact center certification program.

What is contact center integration for Microsoft Teams?

Microsoft Teams supports customer interaction work streams by acting as the hub for internal and external customer connection across its modes of communication including chat, video meetings, and calling. For some organizations, Microsoft Teams' [cloud voice capabilities](#), including [auto attendant](#) and [call queues](#), meet their needs.

For organizations that want solutions with business tools and workflows to drive the customer journey, contact center integration for Microsoft Teams allows Contact Center as a Service (CCaaS) solution providers to integrate their solutions into Teams.

Connected contact center for Microsoft Teams certification program

The Connected contact center for Microsoft Teams certification program verifies that each participating provider's solution provides the quality, compatibility, and reliability they expect from Microsoft solutions.

If you're an organization looking for an integrated contact center solution, see [Certified Microsoft Teams solutions for contact centers](#) for a list of certified solution providers, and see [Connected Contact Center solutions](#) for a list of providers in the process of certification.

If you're a vendor seeking to join the certification program, email Teamscategorypartner@microsoft.com.

Integration models for solution providers

As a contact center solution provider, there are three models to choose from to integrate your connected contact center solution into Teams:

- If you want to use certified SBCs and Direct Routing to connect a contact center solution to Teams, see the [Connect model](#).
 - If you want to use Azure bots and the Microsoft Graph Communication APIs to enable solution providers to create Teams apps, see the [Extend model](#).
 - If you want to use an SDK that enables solution providers to imbed native Teams experiences in their App, see the [Power model](#). Power solutions will be possible when the SDK is available, towards the end of 2021.
- [The Connect model](#)
 - [The Extend model](#)
 - [The Power model](#)

The Connect model uses Microsoft certified SBCs and Direct Routing to connect contact center solutions to Teams phone system infrastructure, enabling enhanced routing, configuration, and system insights.

Agents can set up automated virtual assistants and skill-based routing queues to gather information and connect customers with subject matter experts.

Feature highlights:

While these features aren't a comprehensive list of feature capabilities for this model of integration, the focus areas include:

- Office 365 authN for agents to connect to their Microsoft tenant from their integrated CCaaS client
- See when agents are available with Teams
- Transfers and group call support with Teams
- Teams Graph APIs and Cloud Communication APIs for integration with Teams
- Multi-tenant SIP trunking to support several customers on solution provider's SBC.
- Solution providers to use [Microsoft certified session border controller \(SBC\)](#)

Connected contact center solutions

The following providers offer contact center solutions that are integrated into Teams using one of the Connect, Extend, or Power integration models.

Use the Teams Meeting add-in in Outlook

12/7/2021 • 8 minutes to read • [Edit Online](#)

The Teams Meeting add-in lets users schedule a Teams meeting from Outlook. The add-in is available for Outlook on Windows, Mac, web, and mobile.

Teams Meeting add-in in Outlook for Windows

The Teams Meeting add-in is automatically installed for users who have Microsoft Teams and either Office 2013, Office 2016, or Office 2019 installed on their Windows PC. Users will see the Teams Meeting add-in on the Outlook Calendar ribbon.

NOTE

- There is **no direct URL** that links to the Teams add-in.
- There are additional considerations if your organization runs both Teams and Skype for Business. Under some circumstances, the Teams add-in is not available in Outlook. See [Upgrade from Skype for Business to Teams](#) for details.
- User permissions to execute the Regsvr32.exe file is a minimum requirement for the Teams Meeting add-in to be installed on the computer.
- If users do not see the Teams Meeting add-in, instruct them to close Outlook and Teams, then restart the Teams client first, then sign in to Teams, and then restart the Outlook client, in that specific order.
- If you are using an Office Outlook installation from the Microsoft Store, the Teams Meeting add-in isn't supported. Users who require this add-in are advised to install Click-to-Run version of Office, as outlined in [Office on Windows 10 in S mode](#) article.

Teams Meeting add-in in Outlook for Mac

The Teams Meeting button in Outlook for Mac will appear in the Outlook for Mac ribbon if Outlook is running production build 16.24.414.0 and later and is activated with a Microsoft 365 or Office 365 client subscription.

The meeting coordinates (the Teams join link and dial-in numbers) will be added to the meeting invite after the user clicks **Send**.

Teams Meeting add-in in Outlook Web App

The Teams Meetings button in Outlook Web App will appear as part of new event creation if the user is on an early version of the new Outlook on the web. See the [Outlook Blog](#) to learn about how users can try the early version of the new Outlook on the web.

Teams Meeting add-in and FindTime for Outlook

FindTime is an add-in for Outlook that helps users reach consensus on a meeting time across companies. Once

the meeting invitees have provided their preferred times, FindTime sends out the meeting invite on the user's behalf. If the **Online meeting** option is selected in FindTime, FindTime will schedule a Skype for Business or Microsoft Teams meeting. (FindTime will use whichever has been set by your organization as the default online meeting channel.)

NOTE

If you saved a Skype for Business setting in your [Findtime dashboard](#), FindTime will use that instead of Microsoft Teams. If you want to use Microsoft Teams, delete the Skype for Business setting in your dashboard.

For more information, see [Schedule meetings with FindTime](#).

Authentication requirements

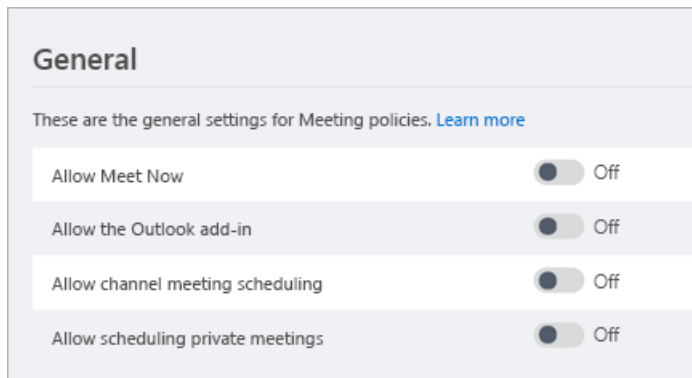

The Teams Meeting add-in requires users to sign in to Teams using Modern Authentication. If users do not use this method to sign in, they'll still be able to use the Teams client, but will be unable to schedule [Teams online meetings](#) using the Outlook add-in. You can fix this by doing one of the following:

- If Modern Authentication is not configured for your organization, you should configure Modern Authentication.
- If Modern Authentication is configured, but they canceled out on the dialog box, you should instruct users to sign in again using multi-factor authentication.

To learn more about how to configure authentication, see [Identity models and authentication in Microsoft Teams](#).

Enable private meetings

Allow scheduling for private meetings must be enabled in the Microsoft Teams admin center for the add-in to get deployed. In the admin center, go to **Meetings > Meeting Policies**, and in the **General** section, toggle **Allow scheduling private meetings** to On.)

General	
These are the general settings for Meeting policies. Learn more	
Allow Meet Now	<input type="checkbox"/> Off
Allow the Outlook add-in	<input type="checkbox"/> Off
Allow channel meeting scheduling	<input type="checkbox"/> Off
Allow scheduling private meetings	<input type="checkbox"/> Off

The Teams client installs the correct add-in by determining if users need the 32-bit or 64-bit version.

NOTE

Users might need to restart Outlook after an installation or upgrade of Teams to get the latest add-in.

Teams upgrade policy and the Teams Meeting add-in for Outlook

Customers can [choose their upgrade journey from Skype for Business to Teams](#). Tenant admins can use the Teams co-existence mode to define this journey for their users. Tenant admins have the option to enable users to use Teams alongside Skype for Business (Islands mode).

When users who are in Islands mode schedule a meeting in Outlook, they typically expect to be able to choose whether to schedule a Skype for Business or a Teams meeting. In Outlook on the web, Outlook Windows, and Outlook Mac, users see both Skype for Business and Teams add-ins when in Islands mode by default. You can configure a Teams meeting policy setting to control whether users in Islands mode can only use the Teams Meeting add-in or both the Teams Meeting and Skype for Business Meeting add-ins.

Due to certain limitations in the initial release, Outlook mobile can only support creating Skype for Business or Teams meetings. See the following table for details.

COEXISTENCE MODE IN THE TEAMS ADMIN CENTER	DEFAULT MEETINGS PROVIDER IN OUTLOOK MOBILE
Islands	Skype for Business
Skype for Business only	Skype for Business
Skype for Business with Teams collaboration	Skype for Business
Skype for Business with Teams collaboration and meetings	Teams
Teams only	Teams

Set whether users in Islands mode can only use the Teams Meeting add-in or both the Teams Meeting and Skype for Business Meeting add-ins

As an admin, you can configure a Teams meeting policy setting to control which Outlook meeting add-in is used for *users who are in Islands mode*. You can specify whether users can only use the Teams Meeting add-in or both the Teams Meeting and Skype for Business Meeting add-ins to schedule meetings in Outlook.

You can only apply this policy to users who are in Islands mode and have the **AllowOutlookAddIn** parameter set to **True** in their Teams meeting policy. For steps on how to set this policy, see [Meeting policy settings - General](#).

Other considerations

The Teams Meeting add-in is still building functionality, so be aware of the following:

- The Teams Meeting add-in requires an Exchange mailbox for the primary user scheduling the meeting. Ensure that you have at least one Exchange mailbox configured in your Outlook profile and use it to schedule Teams meetings with the add-in. For Exchange requirements, see [How Exchange and Teams interact](#).
- The add-in is for scheduled meetings with specific participants, not for meetings in a channel. Channel meetings must be scheduled from within Teams.
- The add-in will not work if an Authentication Proxy is in the network path of the user's PC and Teams Services.
- Users can't schedule live events from within Outlook. Go to Teams to schedule live events. For more information, see [What are Microsoft Teams live events?](#).

Learn more about [meetings and calling in Microsoft Teams](#).

Troubleshooting

Use the following steps to troubleshoot issues with the Teams Meeting add-in.

NOTE

This scenario can also be managed using the [command-line version of Microsoft Support and Recovery Assistant](#) with SaRAcmd.exe -S TeamsAddinScenario -AcceptEula -CloseOutlook.

Teams Meeting add-in in Outlook for Windows does not show

If you cannot get the Teams Meeting add-in for Outlook to install, try these troubleshooting steps.

[Download](#) and run the [Microsoft Support Recovery Assistant](#) to perform automated troubleshooting steps and fixes.

Alternatively, perform the following steps manually:

- Windows 7 users must install the [Update for Universal C Runtime in Windows](#) for the Teams Meeting add-in to work.
- Check that the user has a Teams Upgrade policy which enables scheduling meetings in Teams. See [Upgrade from Skype for Business to Teams](#) for more details.
- Check that the user has a Teams Meeting policy that permits the Outlook Add-in. See [Meeting policy settings - General](#) for more details.
- Ensure the user has the Teams desktop client installed. The meeting add-in will not be installed when only using the Teams web client.
- Ensure the user has Outlook 2013 or later installed.
- Make sure the user has permission to execute regsvr32.exe.
- Ensure that all available updates for Outlook desktop client have been applied.
- Follow these steps:
 - Restart the Teams desktop client.
 - Sign out and then sign back in to the Teams desktop client.
 - Restart the Outlook desktop client. (Make sure Outlook isn't running in admin mode.)

If you still don't see the add-in, make sure that it isn't disabled in Outlook.

- In Outlook, choose **File** and then **Options**.
- Select the **Add-ins** tab of **Outlook Options** dialog box.
- Confirm that **Microsoft Teams Meeting Add-in for Microsoft Office** is listed in the **Active Application Add-ins** list
- If the Teams Meeting Add-in is listed in the **Disabled Application Add-ins** list, select **COM Add-ins** in **Manage** and then select **Go...**
- Set the checkbox next to **Microsoft Teams Meeting Add-in for Microsoft Office**.
- Choose **OK** on all dialog boxes and restart Outlook.

For general guidance about how to manage add-ins, see [View, manage, and install add-ins in Office programs](#).

If the add-in still does not show, use the following steps to verify the registry settings.

NOTE

Incorrectly editing the registry may severely damage your system. Before making changes to the registry, you should back up any valued data on the computer.

- Launch RegEdit.exe
- Navigate to HKEY_CURRENT_USER\Software\Microsoft\Office\Outlook\Addins
- Verify TeamsAddin.FastConnect exists.

- Within TeamsAddin.FastConnect, verify LoadBehavior exists and is set to 3.
 - If LoadBehavior has a value other than 3, change it to 3 and restart Outlook.

Delegate scheduling does not work

If your administrator has configured Microsoft Exchange to [control access to Exchange Web Server \(EWS\)](#), a delegate won't be able to schedule a Teams meeting on behalf of the boss. The solution for this configuration is under development and will be released in the future. As a workaround, your administrator can add the following string to the EWS Allow List: "*SchedulingService*".

Configure the Skype Meetings App to work with Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

After a user is upgraded to Microsoft Teams, admins can use the Microsoft Teams admin center to specify the preferred app that users will use to join Skype for Business meetings.

To specify the Skype for Meetings App as the preferred app:

1. Sign in to the Microsoft Teams admin center.
2. In the left pane, under **Org-wide settings**, select **Teams upgrade**.
3. On the Teams upgrade page, under **App preferences**, select **Skype Meetings App** from the **Preferred app for users to join Skype for Business meetings** drop-down list.

Known limitations

Users who use the Skype Meetings App with Teams are subject to the following limitations:

- Users have no option to change their video device.
- After a user is upgraded to Teams, if the user is in a meeting using the Skype Meetings App and then receives a call on Teams, the meeting in Skype Meetings App is not placed on hold. Instead, the user is connected to both calls.

More information

- [What is Skype Meetings App \(Skype for Business Web App\)](#)
- [Skype Meetings App minimum network requirements](#)

Set up the Call me feature for your users

12/7/2021 • 2 minutes to read • [Edit Online](#)

In Microsoft Teams, the **Call me** feature gives users a way to join the audio portion of a meeting by phone. This is handy in scenarios when using a computer for audio might not be possible. Users get the audio portion of the meeting through their cell phone or land line and the content portion of the meeting—such as when another meeting participant shares their screen or plays a video—through their computer.

IMPORTANT

During periods of high meeting volume (which we've been experiencing in conjunction with the COVID-19 outbreak), we recommend that users join meetings by clicking the **Join Teams Meeting** button rather than dialing in by using the PSTN conference numbers or by using **Call me at**. This helps ensure quality audio during times when high meeting volume is causing congestion on the PSTN network.

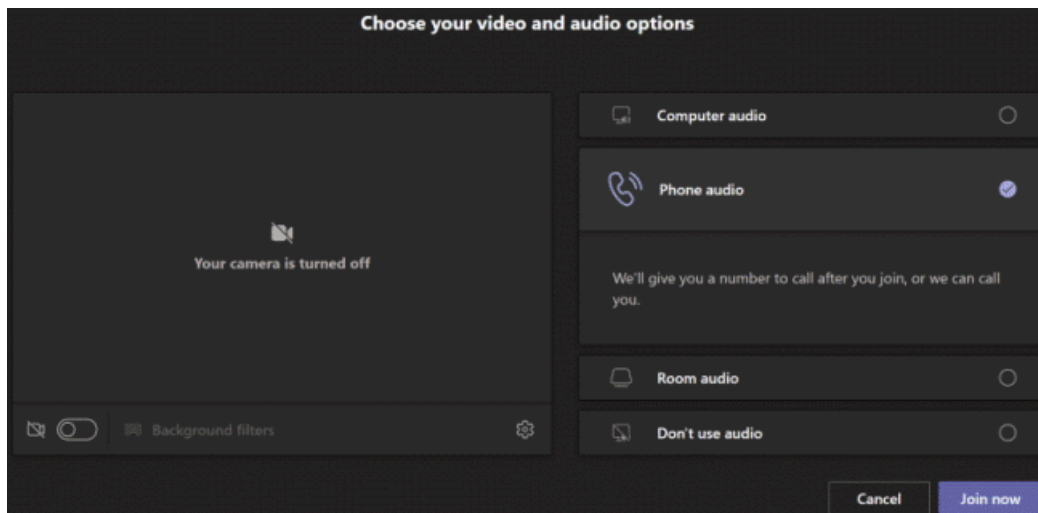

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

The user experience

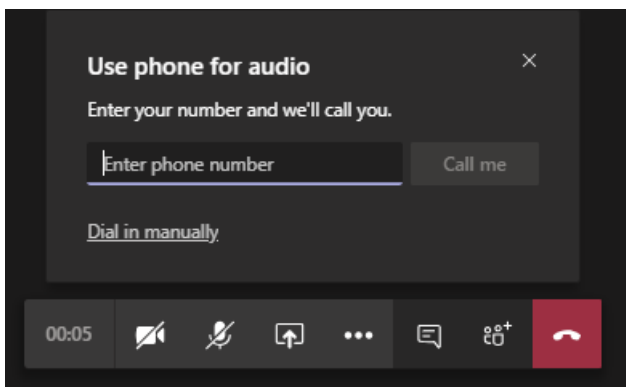

Join a meeting by using phone for audio

Click **Join** to join a meeting, then **Phone audio** on the **Choose your video and audio options** screen, and click **Join now**. From here, users can have the meeting call and join them or dial in manually to the meeting.

Let the Teams meeting call

On the **Use phone for audio** screen, the user enters their phone number, and then clicks **Call me**. The meeting calls the user and joins them to the meeting.

Dial in manually

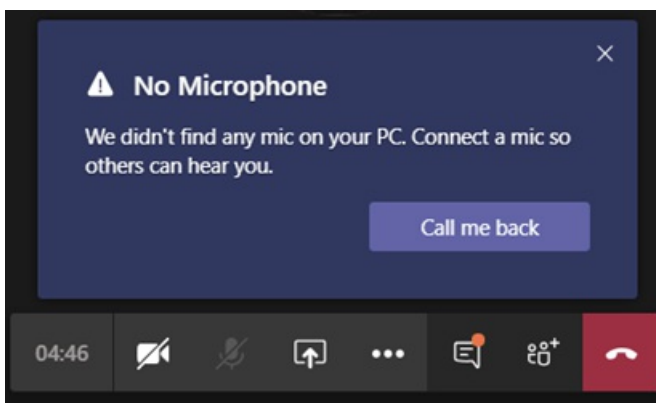

Another way to join is to dial in directly to the meeting. On the **Use phone for audio** screen, click **Dial in manually** to get a list of phone numbers to use to dial in to the meeting.

Get a call back when something goes wrong with audio during a meeting

If a user experiences audio issues when using their computer during a meeting, the user can easily switch to using their phone for audio. Teams detects when an audio or device issue occurs and redirects the user to use their phone by displaying a **Call me back** option.

Here's an example of the message and the **Call me back** option that's displayed when Teams doesn't detect a microphone.

The user clicks **Call me back**, which brings up the **Use phone for audio** screen. From here, they can enter their phone number and have the Teams meeting call and join them to the meeting or dial in manually to the meeting.

Set up the Call me feature

To enable the Call me feature for users in your organization, the following must be configured:

- Audio Conferencing is enabled for users in your organization who schedule meetings (meeting organizers). To learn more, see [Set up Audio Conferencing for Teams](#) and [Manage the Audio Conferencing settings for a user in Teams](#).
- Meeting organizer can dial-out from meetings. To learn more, see [Manage the Audio Conferencing settings for a user in Teams](#).

If the meeting organizer doesn't have dial-out from meetings enabled, the **Phone audio** option on the **Choose your video and audio options** screen isn't available to anyone, and other users can't receive a call to join them to the meeting. For users with dial-out enabled, once they have joined the meeting, they can join others dialing their number from the **Show participants** icon.

Microsoft Teams meeting attendance report

12/7/2021 • 2 minutes to read • [Edit Online](#)

Meeting organizers can view and download a meeting attendance report. Find this report in the **Participants** pane of the meeting, by clicking the download arrow as shown below. You can download the report as a .CSV file (text format).

For education tenants, this report is useful to track student attendance in online classes. For example, the teacher can download the attendance report at the start of class as a simple way to do a "roll call." To learn more, read [Download attendance reports in Teams](#).

As an admin, you control whether meeting organizers can download meeting attendance reports by setting a Teams meeting policy. By default, the ability to download the report is turned off. For steps on how to turn on this feature, see [Meeting policy settings - Allow engagement report](#).

If meeting organizers need access to more meeting attendance data than they get from the report available within the meeting, you can assign the *Report reader* role so they can access the Teams admin reports themselves. To learn about this, read [Who can access the Teams activity reports](#).

Manage the Whiteboard in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Whiteboard is a free-form, digital canvas where people, content, and ideas come together. Whiteboard integration in Microsoft Teams meetings is powered by the Whiteboard web app, which lets Teams meeting participants draw, sketch, and write together on a shared digital canvas.

Users can share a whiteboard to make it available to all participants in a Teams meeting. That same whiteboard is simultaneously available in all the Whiteboard applications on Windows 10, iOS, and the web app.

To turn the Whiteboard app on or off, see [Enable Microsoft Whiteboard for your organization](#). Keep in mind that this setting will enable or disable Whiteboard for your entire organization, and not just for Teams.

Whiteboard on Surface Hub

Before trying to use Microsoft Whiteboard, make sure that the Whiteboard app is installed on your Surface Hub device. If Whiteboard isn't installed, on the Surface Hub device, go to the Microsoft Store app, and get [Microsoft Whiteboard](#). For more information, see [Enable Microsoft Whiteboard on Surface Hub](#).

More information

For more information, see:

- [Use Whiteboard in Microsoft Teams](#)
- [Enable Microsoft Whiteboard for your organization](#)
- [Enable Microsoft Whiteboard on Surface Hub](#)

Set up Microsoft Teams meeting add-on for Google Workspace

12/7/2021 • 2 minutes to read • [Edit Online](#)

Using the Microsoft Teams meeting add-on lets Google calendar users schedule and join a Microsoft Teams meeting directly from Google Workspace. Users will get access to Teams meetings features including video and audio conferencing, screen sharing, meeting chat, digital whiteboards, and more. Stay connected and organized to get more done together across work, school, and life.

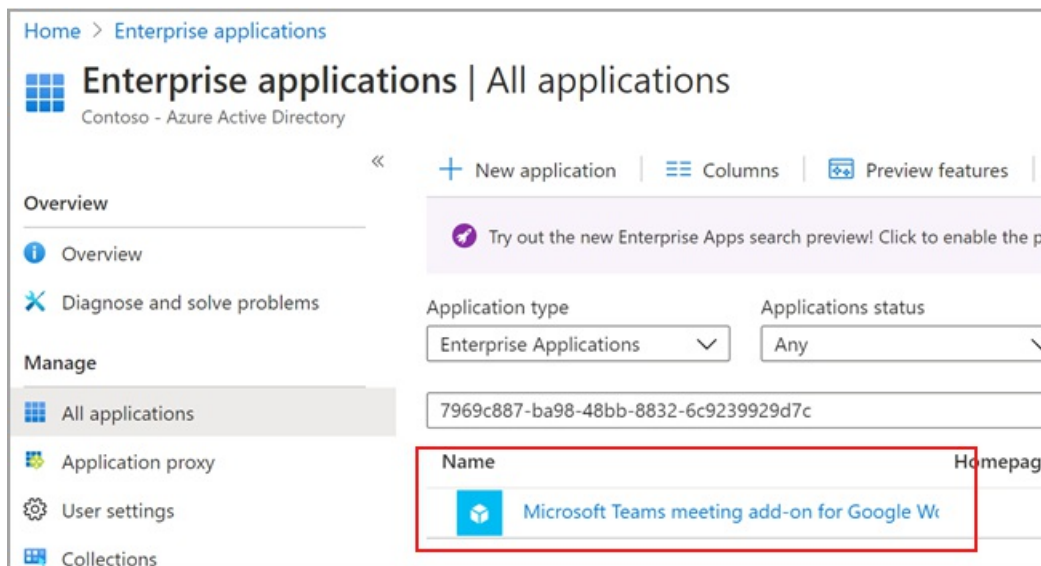

The Microsoft Teams meeting add-on for Google Workspace must be enabled by a Teams admin before tenant users can access the app.

Enable or disable Microsoft Teams meeting add-on for Google Workspace in the Azure portal

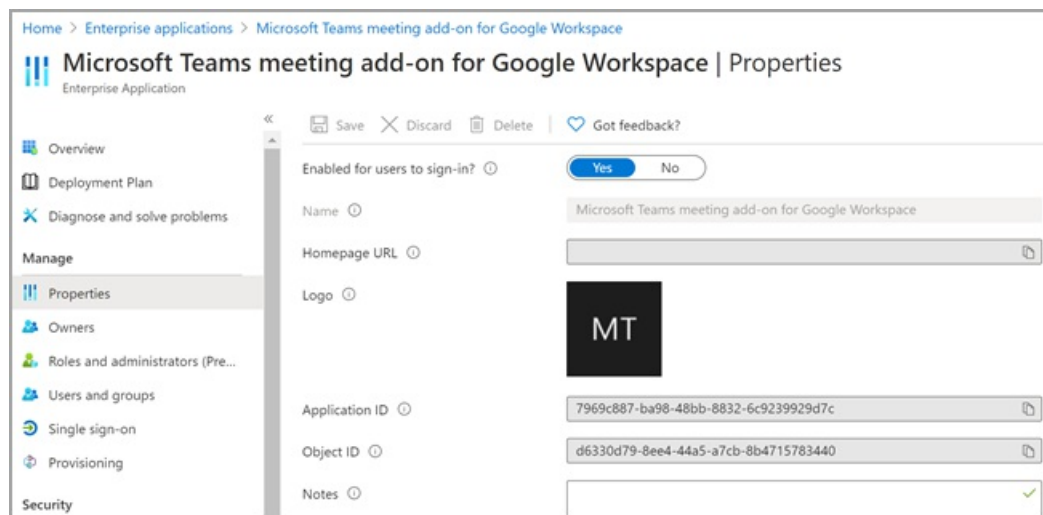

As a tenant administrator, you can enable or disable a Microsoft Teams meeting add-on for Google Workspace from your organization's admin account using the Azure portal.

The add-on is enabled by default.

1. Sign in to the Azure portal.
2. Select **Enterprise applications** > **All applications**.
3. Search for **Microsoft Teams meeting add-on for Google Workspace**.

4. Select **Yes**.

5. (Optional) To disable the add-on, select **No** instead of **Yes** in Step 4.

Disable Microsoft Teams meeting add-on for Google Workspace using PowerShell

```
Connect-AzureAD
```

```
$displayName = 'Microsoft Teams meeting add-on for Google Workspace'
$appId = '7969c887-ba98-48bb-8832-6c9239929d7c'

# Check if a service principal already exists for the app
$servicePrincipal = Get-AzureADServicePrincipal -Filter "appId eq '$appId'"
if ($servicePrincipal) {
    # Service principal exists already, disable it
    Set-AzureADServicePrincipal -ObjectId $servicePrincipal.ObjectId -AccountEnabled $false
    Write-Host "Disabled existing Service Principal \n"
} else {
    # Service principal does not yet exist, create it and disable it at the same time
    New-AzureADServicePrincipal -AppId $appId -DisplayName $displayName
    $servicePrincipal = New-AzureADServicePrincipal -AppId $appId -DisplayName $displayName -AccountEnabled
    $false
    Write-Host "Created and disabled the Service Principal \n"
}
```

For more information, see [Create an Azure service principal with Azure PowerShell](#).

Delete the Microsoft Teams meeting add-on for Google Workspace

See the Google documentation [Delete a Google Workspace Marketplace app](#) for instructions.

Cloud Video Interop for Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

Cloud Video Interop (CVI) is a Microsoft Qualified third-party solution that enables third-party meeting rooms (telepresence) and personal video devices (VTCs) to join Microsoft Teams meetings.

With Microsoft Teams, you get rich online content collaboration in meetings that include audio, video, and content sharing. This can be enjoyed through the desktop and web client, as well as through many partner devices that integrate natively with Microsoft Teams. However, many customers have already invested in video teleconferencing and personal video communication devices, which can be expensive to upgrade. Cloud Video Interop provides an easy solution, allowing you to keep using your existing solutions until you are ready to upgrade.

With Cloud Video Interop, Microsoft Teams delivers a native meeting experience for all participants – in meeting rooms or inside of Teams clients.

Is Cloud Video Interop for me?

Cloud Video Interop provides an intermediate service while you transition to a full native Microsoft Teams Solution, using Teams endpoints. The service provided should be part of your migration path.

Cloud Video Interop is intended for customers who meet the following criteria:

- Have a large deployment of meeting room devices and personal video devices deployment (50+ devices) that are not qualified for direct integration with Microsoft Teams
- Are supported by one of our Cloud Video Interop partners
- Want to retain the value of their investment in their current meeting room devices and personal video devices during the migration to a native Microsoft Teams solution

While Cloud Video Interop provides a great intermediate solution, we encourage our customers to look into our native Teams Meeting solutions, such as Teams Room Systems, for the long term.

Office 365 US Government and third-party services

Office 365 provides the ability to integrate third-party applications into SharePoint Online sites, Skype for Business, Teams, Office applications included in Microsoft 365 Apps for enterprise (such as Word, Excel, PowerPoint, and Outlook), and Outlook Web App. In addition, Office 365 supports integration with third-party service providers. These third-party applications and services might involve storing, transmitting, and processing your organization's customer data on third-party systems that are outside of the Office 365 infrastructure and therefore are not covered by the Office 365 compliance and data protection commitments. **It is recommended that you review the privacy and compliance statements provided by the third parties when assessing the appropriate use of these services for your organization.**

Partners Certified for Microsoft Teams

The following partners have video interop solutions for Microsoft Teams. Your company may choose to work with any combination of these partners within your enterprise.

PARTNER	PARTNER SOLUTION
	Poly RealConnect Service

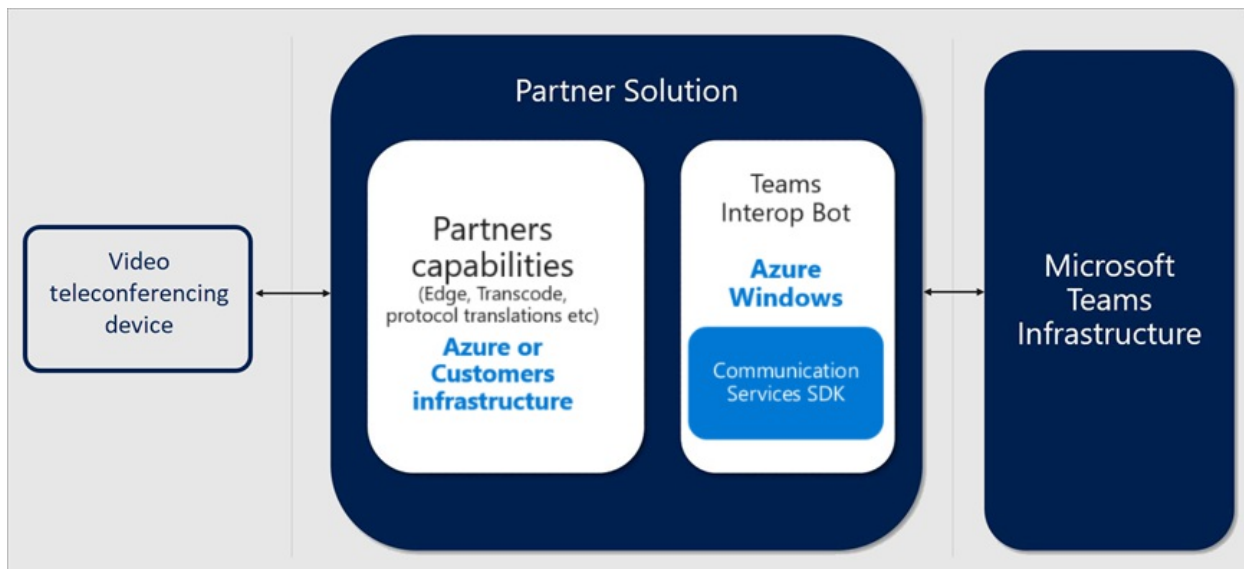

PARTNER	PARTNER SOLUTION
]pexip[Pexip Infinity for Microsoft Teams
BlueJeans	BlueJeans Gateway for Microsoft Teams
	Cisco Webex Video Integration for Microsoft Teams

Cloud Video Interop overview

Cloud Video Interop is a third-party service that is offered by our partners to provide interoperability between existing video conferencing and personal video device solutions on premises, and Microsoft Teams.

The solutions offered by our partners consist of components that can be deployed either fully cloud based or partially/fully on premises.

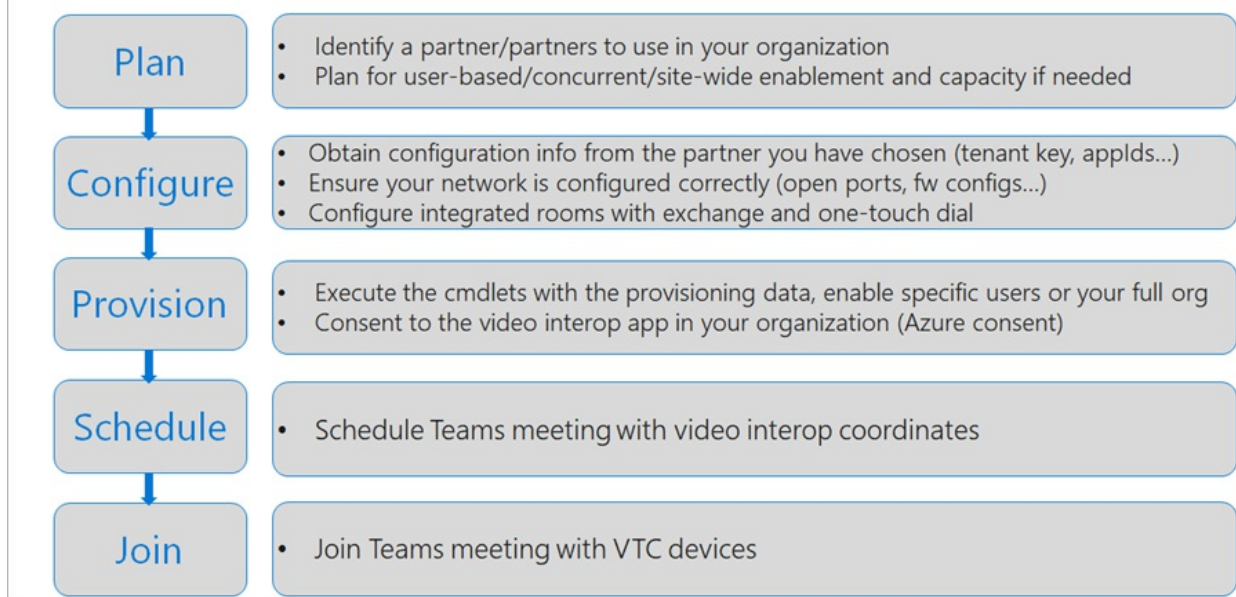

The following diagram shows the high-level architecture of our partner solutions.

Deploy Cloud Video Interop

When deploying a Cloud Video Interop solution, it's important to understand that you are deploying a partner solution. The general steps you should take to deploy Cloud Video Interop are listed in the following diagram.

Deploying CVI in your Organization

Plan

During the plan phase, you should identify the devices that you will not replace with a native Teams device, and find a Cloud Video Interop partner that can support these devices.

It's also important to understand that you will need a license for each user who will schedule meetings in which you want a Cloud Video Interop-enabled device to join. Note that exact licensing requirements can be obtained from the Cloud Video Interop partner. Ensure that this is clear before you start your deployment.

Configure

The partner that you have chosen for your CVI deployment will provide you with a full deployment document that consists of all the steps needed to deploy successfully within your organization. This will include firewall ports and IP ranges, configuration changes for your devices, and other settings that need to change.

Provision

During the provision phase, you will assign licenses to the appropriate users according to the partner configuration guide. You will also need to go through the Azure Consent process to provide the partner access to your Teams environment. See [Permissions and consent in the Microsoft identity platform endpoint](#) for more information about the Azure consent process.

Schedule

After a user is enabled for Cloud Video Interop, any meeting scheduled using either the Teams Meeting Add-in for Outlook or the Teams Client will have the appropriate additional information automatically added into the Teams meeting so that Cloud Video Interop-compatible devices can join these meetings.

Join

Depending on the partner solution, there are several ways to join a Cloud Video Interop-enabled meeting. Exact meeting join scenarios will be provided by your Cloud Video Interop partner. We've listed some examples below:

- IVR (Interactive Voice Response)
 - You can dial in to the partner's IVR using the tenantkey@domain.
 - When you are in the partner IVR, you will be prompted to enter the VTC conferenceld, which will then connect you to the Teams meeting.
- Direct dial
 - You can directly dial in to the Teams meeting without interacting with the partner's IVR by using the direct dial feature, using the full string of tenantkey.VTC Conferenceld@domain.

- One-touch dial
 - If you have an integrated Teams room, you can use the one-touch dial capabilities offered by your partner (without needing to type any dial string).

Manage Cloud Video Interop

After Cloud Video Interop is deployed, you can manage the devices using the solutions provided by our partners. Each partner will provide you with an administrative interface that will include both license and device management.

Reporting is also available directly from the partner administrative interface. For more information on reporting capabilities, contact the partner of your choice.

Troubleshooting Cloud Video Interop

Cloud Video Interop is a partner-provided service. If you are experiencing issues, the first step is to connect a device that has the Teams Client installed and connect it to the same segment as the Cloud Video Interop device that is causing problems.

If Teams functions correctly on this segment, and you have also followed all the networking and configuration guidelines the partner has provided, you will need to contact the partner for further troubleshooting.

PowerShell for Cloud Video Interop

The following PowerShell cmdlets are available for you to (partially) automate the Cloud Video Interop deployment.

- **Get-CsTeamsVideoInteropServicePolicy:** Microsoft provides pre-constructed policies for each of our supported partners that allow you to designate which partner(s) to use for Cloud Video Interop. This cmdlet allows you to identify the pre-constructed policies that you can use in your organization. You can assign this policy to one or more of your users by leveraging the `Grant-CsTeamsVideoInteropServicePolicy` cmdlet.
- **Grant-CsTeamsVideoInteropServicePolicy:** This cmdlet allows you to assign a pre-constructed policy for use in your organization or assign the policy to specific users.
- **New-CsVideoInteropServiceProvider:** Use this cmdlet to specify information about a supported CVI partner that your organization would like to use.
- **Set-CsVideoInteropServiceProvider:** Use this cmdlet to update information about a supported CVI partner that your organization uses.
- **Get-CsVideoInteropServiceProvider:** Use this cmdlet to get all of the providers that have been configured for use within the organization.
- **Remove-CsVideoInteropServiceProvider:** Use this cmdlet to remove all provider information about a provider that your organization no longer uses.

Teams view-only meeting experience

12/7/2021 • 5 minutes to read • [Edit Online](#)

NOTE

View-only broadcasts is available in Microsoft 365 E3/E5 and Microsoft 365 A3/A5. This feature will be enabled March 1, 2021 as default OFF. The feature in Microsoft 365 Government Community Cloud (GCC) will begin to roll out at the end of March 2021. Government Community Cloud High (GCCH) and Department of Defense (DoD) will roll out at a later date. You must change the default policy after that date if you want to have the feature be default ON. Use PowerShell to enable the policy `Set-CsTeamsMeetingPolicy -Identity Global -StreamingAttendeeMode Enabled`.

NOTE

If your meeting hits capacity, Teams will seamlessly scale to accommodate a 10,000-person view-only broadcast experience. Plus, during this time of increased remote work, take advantage of even larger 20,000-person broadcasts through the end of this year. Webinars currently don't support a view-only broadcast experience.

Microsoft Teams allows up to 10,000 attendees to join a Teams meeting. After the capacity of the main meeting has been reached (which is when 1000 users enter a meeting), additional attendees will join with a view-only experience.

Attendees who join the meeting first, up to the capacity of the main meeting, will get the full Teams meeting experience. They can share audio and video, see shared videos, and participate in meeting chat.

Attendees who join after the main meeting capacity has been reached will have a view-only experience.

Attendees will be able to join the view-only experience through desktop, web, and Teams mobile (Android and iOS).

NOTE

The current limit capacity of the "main meeting", or in other words, the number of fully interactive users, is 1000 and includes GCC and webinars.

Teams view-only experience controls

You enable the view-only experience using the `Set-CsTeamsMeetingPolicy` cmdlet from the [SkypeForBusiness PowerShell module](#) or at least version 2.0.0 of the [MicrosoftTeams module](#).

To use the recommended `MicrosoftTeams` module:

```
Install-Module -Name "MicrosoftTeams" -MinimumVersion 2.0.0
Connect-MicrosoftTeams
```

To enable the view-only experience, you can use the following PowerShell snippet:

```
Set-CsTeamsMeetingPolicy -Identity Global -StreamingAttendeeMode Enabled
```

To disable the view-only experience, you can also use PowerShell.

Set-CsTeamsMeetingPolicy -Identity Global -StreamingAttendeeMode Disabled

In the future, you'll be able to enable or disable the view-only experience in the Teams admin center.

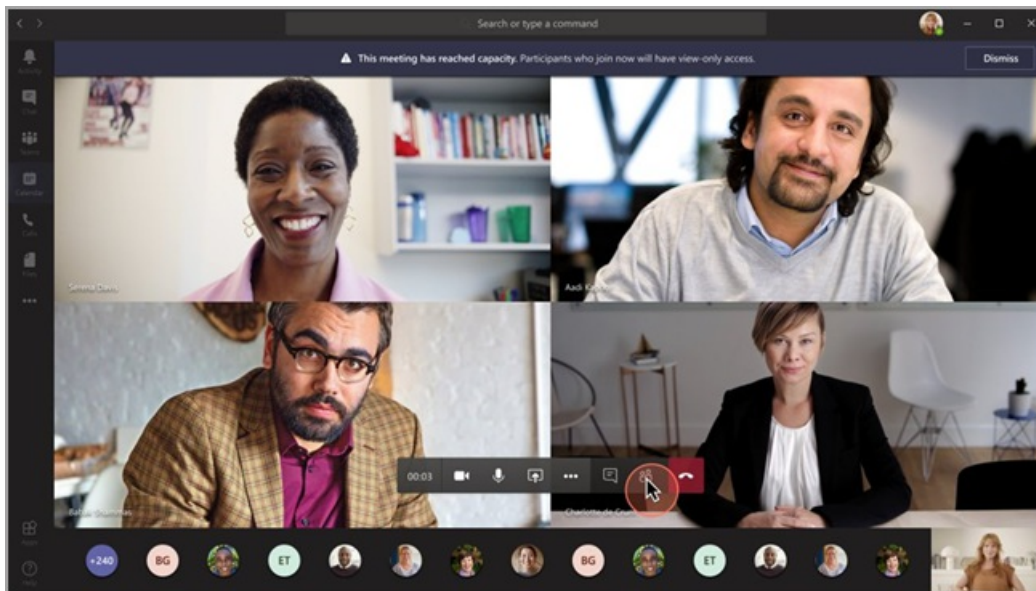

Impact to users

A user's experience will vary depending on several factors.

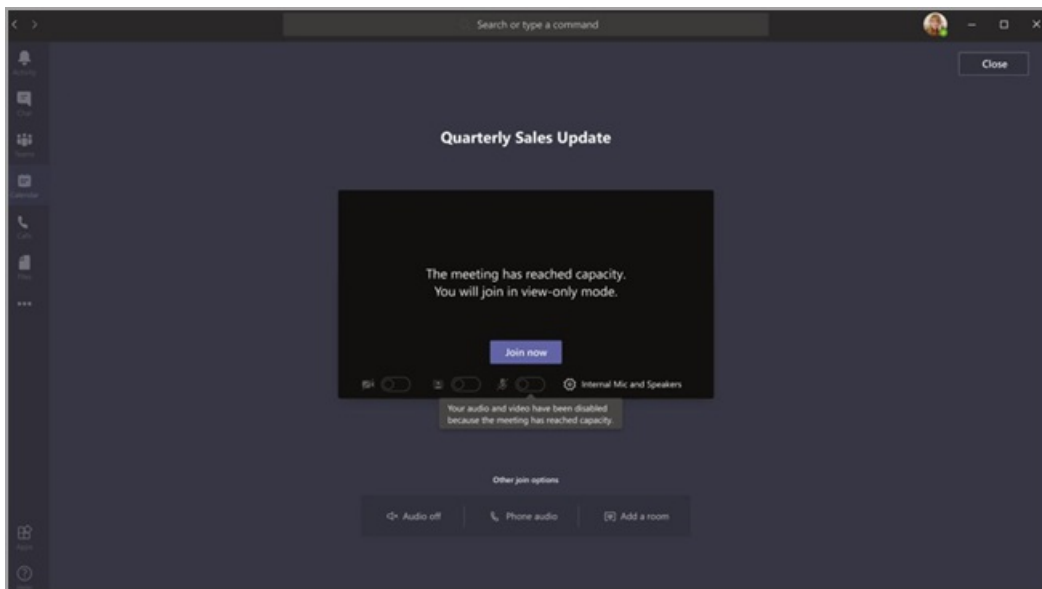

When the capacity of the main meeting has been reached, an attendee will be unable to join the meeting if any of the following are true:

- An administrator has disabled the Teams view-only experience for either the organizer or for the entire tenant.
- The view-only attendee can't bypass the lobby. As an example, if an organizer of a meeting chooses to have only **People in my organization** bypass the lobby, and an attendee who is outside of the organization attempts to join as a view-only attendee, they won't be able to join.

When the capacity of the main meeting has been reached, the meeting organizer and presenters will see a banner informing them that new attendees will join as view-only attendees.

When the capacity of the main meeting has been reached, meeting attendees will be informed on the pre-join screen that they're joining in view-only mode.

If there's space, a user will always join the main meeting. If the main meeting reaches capacity, and one or more attendees leave the main meeting, the main meeting has available capacity. Attendees who join (or rejoin) the meeting will join the main meeting until it reaches capacity again. Attendees who are in the view-only experience won't automatically be promoted to the main meeting and can't be manually promoted to the main meeting.

If presenter and attendee roles have been set, and a presenter attempts to join a meeting after the main meeting has reached capacity, they'll join as a view-only attendee and have the same limitations as other view-only attendees. Support to ensure all presenters join the main meeting will roll out at a later date. The organizer will always be guaranteed space in the main meeting.

Impact to meeting presenters and organizers

Limitations for meeting presenters and organizers include:

- You'll have no information about the view-only attendee. We don't support E-discovery for view-only attendees.
- Users in the main meeting can't see the view-only attendees.
- You can't remove a view-only attendee from the meeting.

NOTE

Attendee count will only reflect the people in the main meeting and not the people in the view-only room. Therefore, presenters can't get an exact count of who is in the view-only experience.

Experience for view-only attendees

The Teams view-only experience allows attendees to:

- Listen to the participants in the main Teams meeting.
- See the video feed for the active speaker (if the active speaker is sharing video).
- See content being shared using the share desktop or screen functionality.

The view-only attendee won't be able to experience the following options in meetings:

- Join the meeting if the attendee doesn't have permission to bypass the lobby based on set lobby policies or options.
- Join the view-only room using Audio Conferencing.

- Join the view-only room using Microsoft Teams Rooms system or using Cloud Video Interop (CVI) services.
- Share their audio or video.
- See or participate in the meeting chat.
- See the video feed of meeting participants unless the participant is the active speaker.
- See PowerPoint files that are shared using the PowerPoint Live functionality or individual application shares (other than desktop or screen sharing).
- Raise their hand in the meeting.
- Send or see reactions.
- Interact with any 3P App integrating into the Teams Meeting, including Polls.

View-only feature limitations

- View-only attendees will only be able to see Live Captions on Desktop and Web. Only English Captions are supported at this time.
- View-only attendees cannot register for Webinars.
- View-only attendees will be supported by streaming technology.
- View-only attendees won't be included in the attendance report.
- View-only attendees will have a single video experience. They can see either the active speaker or the content being shared, but not both.
- We don't currently support **Gallery**, **Large gallery**, or **Together mode** layouts for view-only attendees.
- View-only attendees are only supported by the following lobby policies: 'People in my organization,' 'People in my organization and guests,' 'People in my organization, trusted organizations, and guests,' and 'Everyone.' If you use a lobby policy that does not support View-only attendees, View-only attendees will be rejected from the meeting.
- View-only attendees won't have the same latency as a regular attendee. ¹

¹ View-only attendees will be at a 30-second video and audio delay in the meeting.

Stream Teams meetings

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article will help you set up streaming for Teams meetings.

What is streaming and how does it work?

Streaming allows your organization to expand your reach and gives meeting attendees more meeting options. When you enable streaming, organizers can stream meetings and webinars to external endpoints by providing a Real-Time Messaging Protocol (RTMP) URL and key to the built-in Custom Streaming app in Teams.

NOTE

You can't stream live events.

Set up streaming with PowerShell

You can set up your organization for streaming with PowerShell. Currently, this policy is not available in the Teams admin center. The per-user policy is used to specify **who** can enable live streaming. It's turned off by default.

You can use the following attribute within the Windows PowerShell **Set-CsTeamsMeetingPolicy** cmdlet to set up streaming. For more information on the cmdlet, see [Set-CsTeamsMeetingPolicy](#).

- LiveStreamingMode

Set **LiveStreamingMode** to **Enabled** to turn on streaming capabilities for one or more users.

IMPORTANT

You have to turn on meeting registration before your organizers can stream webinars. For more information, see [Set up webinars](#).

Assign the policy

For more information on how to assign policies with PowerShell, see [Assign policies in Teams](#).

Related topics

- [Assign policies in Teams](#)
- [Set-CsTeamsMeetingPolicy](#)
- [Quick start - Meetings, webinars, and live events](#)

Set up for webinars in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article will help you set up your organization to host webinars.

What are webinars?

Webinars are structured meetings where presenters and participants have clear roles, often used for training purposes or sales and marketing lead generation scenarios.

After setting up webinars in your organization, your users can schedule webinars and open registration to attendees. Unlike traditional meetings that include many discussions and task assignment, webinars are meant for interactive presentations and provide tools for attendee analysis.

IMPORTANT

To let users set up webinars, Microsoft Lists must be configured in SharePoint by enabling the creation of personal lists. To learn more, see [Control settings for Microsoft Lists](#).

Allow users to schedule webinars in the Teams admin center

You can use the Teams admin center to set up webinars for your organization. You'll find the policies to set up webinars in the Teams admin center under **Meetings > Meeting policies**.

Meeting registration

If you turn this on, users can schedule webinars. By default, this is turned on. If you want to turn off meeting registration, set this policy to **Off**.

IMPORTANT

Private meeting scheduling must be on for meeting registration to work. By default, this policy is turned on in the Teams admin center. For students in education tenants, this policy is turned off by default. For more information on how to enable private meeting scheduling for students, see [Teams for Education policies and policy packages](#).

Who can register

If you select **Everyone**, all users, including anonymous users, can register for and attend webinars. If you select **Everyone in the organization**, only users in your organization can register for webinars. If meeting registration is turned off, this option will not be available and no one can register for webinars.

NOTE

The default value for **Who can register** is **Everyone in the organization** in education tenants. For more information, see [Teams for Education Policy Wizard](#).

Engagement report

If you turn this on, organizers can see reports of who registered and attended the webinars they set up. This policy is off by default. For more information, see [Meeting policies in Teams - Engagement report](#). For information on the end-user experience, see [View and download meeting attendance reports](#).

Allow users to schedule webinars using PowerShell

You can use the following attributes within the Windows PowerShell **Set-CsTeamsMeetingPolicy** cmdlet to set up for webinars in Teams.

- MeetingRegistration
- WhoCanRegister
- PrivateMeetingScheduling

Read [Set-CsTeamsMeetingPolicy](#) for more information on the cmdlet.

NOTE

Before you can run these cmdlets you must be connected to Microsoft Teams PowerShell. For more information, see [Manage Teams with Microsoft Teams PowerShell](#).

Allow users to schedule webinars

You can restrict registration to users only in your organization or open it up to everyone both inside and outside your tenant. By default, **WhoCanRegister** is enabled and set to **Everyone** for the **Global (Org-wide default)** policy. If you want to turn off meeting registration, set **MeetingRegistration** to **False**.

IMPORTANT

PrivateMeetingScheduling must be set to **True** for **MeetingRegistration** to work.

1. Turn on meeting registration

```
Set-CsTeamsMeetingPolicy -MeetingRegistration $True
```

2. Turn on private meeting scheduling

```
Set-CsTeamsMeetingPolicy -PrivateMeetingScheduling $True
```

3. Configure who can register for webinars

Allow *only* users in your organization to register for webinars

```
Set-CsTeamsMeetingPolicy -WhoCanRegister EveryoneInCompany
```

To allow anyone, including anonymous users, to register for webinars, run:

```
Set-CsTeamsMeetingPolicy -WhoCanRegister Everyone
```

Caution

If anonymous join is turned off in meeting settings, anonymous users can't join webinars. To learn more and enable this setting, see [Meeting settings in Teams](#).

Collect meeting attendance

If you want organizers to analyze who registered and attended webinars, you'll need to turn on the **EngagementReport** policy. To do this, run the following command in PowerShell.

Configure webinar settings

After enabling your environment for webinars, no further admin management is required. The policy controls which options show up for webinar organizers.

What are Microsoft Teams live events

12/7/2021 • 5 minutes to read • [Edit Online](#)

Overview

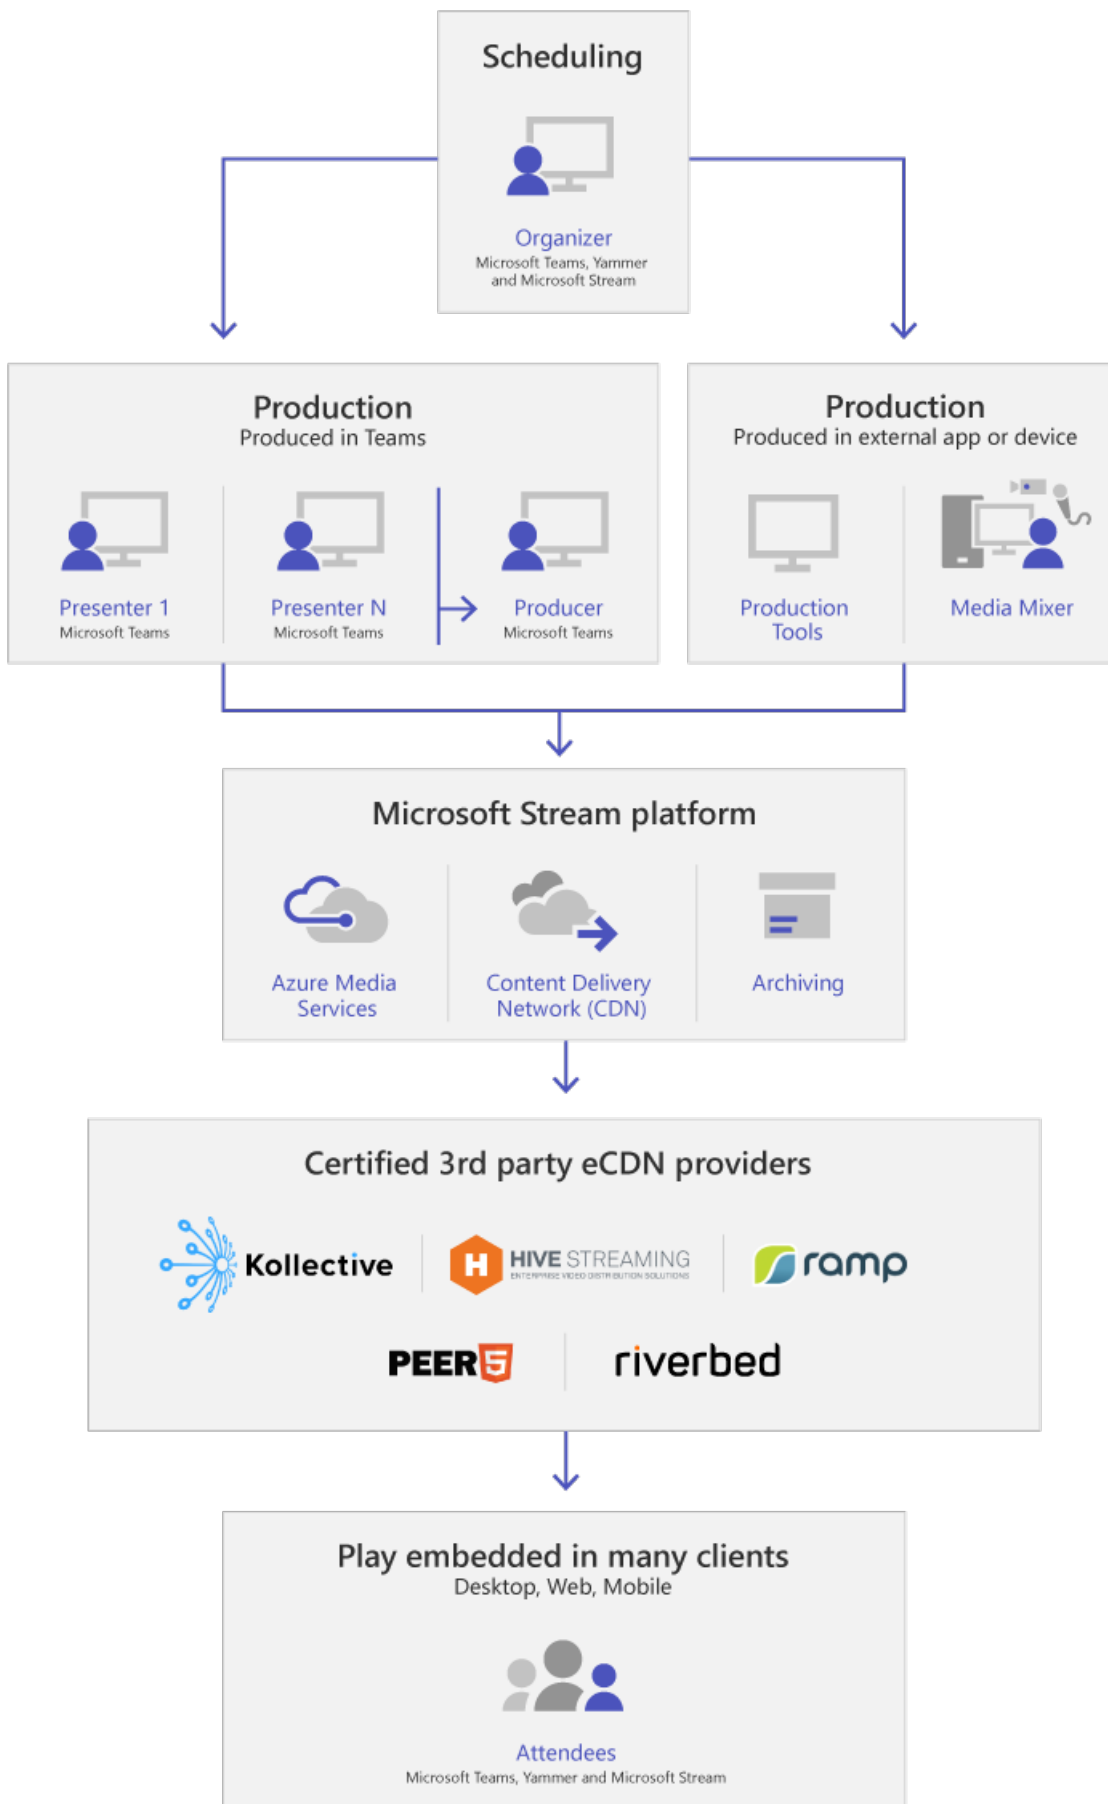

With Teams live events, users in your organization can broadcast video and meeting content to large online audiences.

Microsoft 365 live events bring live video streaming to a new level. Live events encourage connection throughout the entire engagement lifecycle with attendees before, during, and after live events. You can create a live event wherever your audience, team, or community resides, using Microsoft Stream, Teams, or Yammer.

Teams delivers chat-based collaboration, calling, meetings, and live events, so you can expand the audience of your meetings. Teams live events is an extension of Teams meetings, enabling users to broadcast video and meeting content to a large online audience. Live events are meant for one-to-many communications where the host of the event is leading the interactions and audience participation is primarily to view the content shared by host. The attendees can watch the live or recorded event in Yammer, Teams, or Stream and can interact with the presenters using moderated Q & A or a Yammer conversation.

Teams live events are considered the next version of Skype Meeting Broadcast and will eventually replace the capabilities provided in Skype Meeting Broadcast. At this point, Microsoft will continue to support Skype Meeting Broadcast for users who are using Skype for Business in their organizations, with no disruption in service for new or future events. However, we encourage you to try out Teams live events to use all the new and exciting features including screen sharing and support for external hardware/software encoders.

So, let's get started. First, take a look at the following diagram that shows high level components involved in Microsoft 365 live events and how they're connected.

Note: Events produced in Teams will not automatically archive to Microsoft Stream in the initial release.

NOTE

We would like to emphasize that Teams Live Events, given the nature of broadcast technology, often exceed normal (internal) meeting populations.

As is the case with other larger reaching media broadcasting services, we rely on Content Delivery Networks to deliver the content for your live event to recipients. This content is protected by encryption methods and subject to authorization by access tokens that are only issued to recipients based on your live event meeting configuration.

Extra care should be given to ensuring that either the meeting content is appropriate for such a large audience, or that the audience is appropriately reduced for sensitive content.

As is common in the industry, compromises to other elements of your security such as personnel or infrastructure, could impact the security of your live events. Organizations should consider including Live Events and other broadcast service in their security planning and exercises.

Event group roles

Live events in Teams empower multiple roles (organizer, producer, presenter, and attendee) to successfully broadcast and participate in an event. To learn more, see [Event group roles](#).

Key components

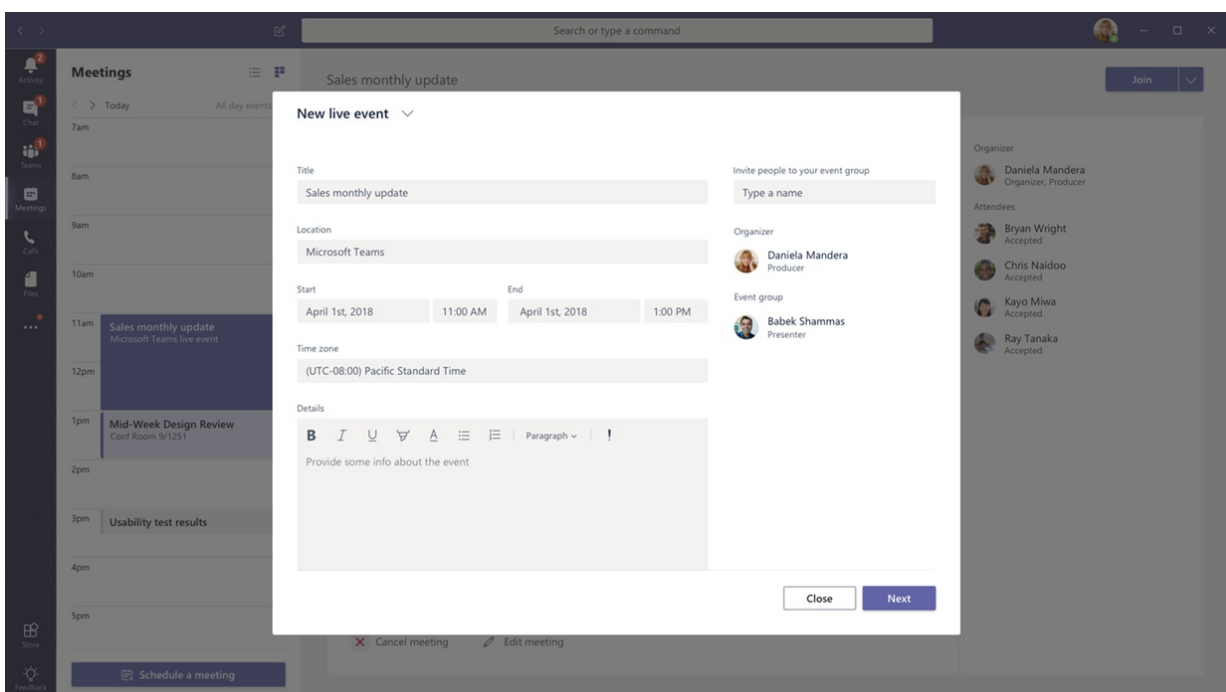

You can see from the picture above that there are five key components that are used with live events in Teams.

NOTE

For an overview of how to set up live events and the attendee experience, check out these short [videos](#).

Scheduling

Teams provides the ability for the organizers to create an event with the appropriate attendee permissions, designate event team members, select a production method, and invite attendees. If the live event was created from within a Yammer group, the live event attendees will be able to use Yammer conversation for interacting with people in the event.

IMPORTANT

Teams won't let users schedule meetings or live events when they're offline or running with limited bandwidth.

Production

The video input is the foundation of the live event and it can vary from a single webcam to a multi-camera professional video production. The live events in Microsoft 365 support a spectrum of production scenarios, include an event produced in Teams using a webcam or an event produced in an external app or device. You can choose these options depending on their project requirements and budget. There are two ways to produce events:

- **Teams:** This production method allows users to produce their live events in Teams using their webcam or using A/V input from Teams room systems. This option is the best and quickest option if you want to use the audio and video devices connected to the PC or are inviting remote presenters to participate in the event. This option allows users to easily use their webcams and share their screen as input in the event.
- **External app or device:** External encoders allow users to produce their live events directly from an external hardware or software-based encoder with [Stream](#). This option is best if you already have studio quality equipment (for example, media mixers) which support streaming to a Real-time Messaging Protocol (RTMP) service. This type of production is typically used in large-scale events such as executive town halls – where a single stream from a media mixer is broadcasted to the audience.

NOTE

The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch you'll be able to opt-in to this experience, in November you'll have to opt-out if you want to continue using Stream, and some time in early 2021 we'll require all customers to use OneDrive for Business and SharePoint for new meeting recordings.

Streaming platform

The live event streaming platform is made up of the following pieces:

- **Azure Media Services:** [Azure Media Services](#) gives you broadcast-quality video streaming services to reach larger audiences on today's most popular mobile devices. Media Services enhances accessibility, distribution, and scalability, and makes it easy and cost-effective to stream content to your local or worldwide

audiences—all while protecting your content.

- **Azure Content Delivery Network (CDN):** Once your stream goes live, it's delivered through the [Azure Content Delivery Network \(CDN\)](#). Azure Media Services provides integrated CDN for streaming endpoints. This allows the streams to be viewed worldwide with no buffering.

Enterprise Content Delivery Network (eCDN)

The goal of eCDN is to take the video content from the internet and distribute the content throughout your enterprise without impacting network performance. You can use one of the following certified eCDN partners to optimize your network for live events held within your organization:

- [Hive](#)
- [Kolletive](#)
- [Ramp](#)
- [Riverbed](#)
- [Peer5](#) (coming soon)

Attendee experience

The attendee experience is the most important aspect of live events and it's critical that the attendees can participate in the live event without having any issues. The attendee experience uses Stream Player (for events produced in Teams) and Azure Media Player (for events produced in an external app or device) and works across desktop, browser, and mobile (iOS, Android). Microsoft 365 and Office 365 provide Yammer and Teams as two collaboration hubs, and the live attendee experience is integrated into these collaboration tools.

Live event usage report

Tenant admins can view real-time usage analytics for live events in Microsoft Teams admin center. The [live event usage report](#) shows the activity overview of the live events held in the organization. Admins can view event usage information, including event status, start time, views, and production type.

Next steps

Go to [Plan for Teams live events](#).

Plan for live events in Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

When you're planning Teams live events to hold large meetings in your organization, there are several factors that you need to consider before starting the setup.

NOTE

For details about Teams live events on different platforms, see [Teams features by platform](#). See [prepare your organization](#) to learn about bandwidth requirements for Teams live events.

Who can attend, create, and schedule live events

Anyone can attend a live event without a license. Read [Admin quick start - Meetings and live events](#).

The following prerequisites are required for the user to schedule a Teams live event.

Here are the licenses that must be assigned to organize, produce or present a Teams live event:

- **To organize:** A Microsoft or Office 365 Enterprise E1, E3, or E5 license, [or] a Microsoft or Office 365 Education A3 or A5 license.
- **To produce or present:** A Microsoft or Office 365 Enterprise E1, E3 or E5 license, [or] a Microsoft or Office 365 Education A1, A3 or A5 license. The exception to this requirement is guest users can present without a license if the other criteria for [guest users](#) is met.
- A Microsoft Teams license - this license is included in the licenses listed in the first and second bullets.
- A Microsoft Stream license - is required if you are planning to share the content to an external app or device; see [Microsoft Stream licensing](#).

Users won't need a Microsoft Stream license assigned if you want users to only record and download the recordings. This will mean that the recordings aren't stored in Microsoft Stream but are instead stored in Azure Media Services (AMS) with a 180-day limit before it's deleted. It's not something at this point that an admin can control or manage to include the ability to delete it.

NOTE

The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch you'll be able to opt-in to this experience, in November you'll have to opt-out if you want to continue using Stream, and some time in early 2021 we'll require all customers to OneDrive for Business and SharePoint for meeting recordings.

NOTE

At this time there aren't any Microsoft 365 Small Business plans that can be used to create and hold Teams live events.

It's important to know that a Microsoft 365 or Office 365 license is required to participate in a live event as an authenticated user, but this requirement depends on the production method used:

- **For events produced in Teams** The user must be assigned a Teams license.

- **For events produced with an external app or device** The user must be assigned a Stream license.

NOTE

Teams live events is now available for US Government Cloud Community (GCC) organizations.

For more information about licensing, see [Microsoft Teams add-on licensing](#).

The user must have:

- Private meeting scheduling in Teams enabled (*The TeamsMeetingPolicy -AllowPrivateMeetingScheduling parameter = True*).
- Video sharing enabled in Teams meetings (*The TeamsMeetingPolicy -AllowIPVideo parameter = True*).
- Screen sharing enabled in Teams meetings (*The TeamsMeetingPolicy -ScreenSharingMode parameter = EntireScreen*).
- Live event scheduling in Teams enabled (*The TeamsMeetingBroadcastPolicy -AllowBroadcastScheduling parameter = True*).
- Permissions to create live events in Stream (for external app or device production).
- Coexistence mode configured to be able to schedule Teams meetings (*Islands, Meeting First, or Teams Only*).

IMPORTANT

Non-authenticated anonymous users can't be invited as producers or presenters in Teams live events.

Guest to present

For a guest to present in a live event, do the following tasks:

1. [Add the user as a guest to a team](#).
2. Have the user accept the guest invitation and join the team.
3. [Schedule the live event and add the guest to your event group](#).

As a best practice, we recommend that you create a channel for producers and presenters of the live event so they can chat and share information before the event. Guests who don't have Microsoft 365 credentials won't see the Calendar in Teams. To make it easy for them to join the event, producers can post the event link to the channel. Presenters can then open Teams, go to the channel, and then select the link to join the event.

Who can watch live events

ATTENDEE VISIBILITY	TEAMS PRODUCTION	EXTERNAL APP OR DEVICE PRODUCTION
Public (anonymous users)	Yes	No
Guest users	Yes ¹	No
Everyone in external access (federation) company	Yes ¹	No
Everyone in company	Yes	Yes
Specific groups / people	Yes	Yes

¹ Can only be invited through People & Group

Teams live events and Skype Meeting Broadcast

The following table highlights core capabilities and features offered in live events and how they differ from Skype Meeting Broadcast.

IMPORTANT

Microsoft 365 live event limit increases

To continue supporting our customers' needs, we will extend temporary limit increases for live events through June 30, 2022, including:

- Event support for up to 20,000 attendees
- 50 events can be hosted simultaneously across a tenant
- Event duration of 16 hours per broadcast

Additionally, live events with up to 100,000 attendees can be planned through the Microsoft 365 live events assistance program. The team will assess each request and work with you to determine options that may be available. [Learn more.](#)

CAPABILITY	SKYPE MEETING BROADCAST	EVENTS PRODUCED IN TEAMS	EVENTS PRODUCED IN EXTERNAL APP OR DEVICE

¹ The limits that are set might be changed. Check [Limits and specifications for Teams](#).

² You can have up to 100 presenters and producers in a live event, but only the last 10 who spoke show up in the list.

Regional availability

You can use Teams live events in multiple regions across the world. The following information shows availability for event team members and attendees.

IMPORTANT

The region for the event is automatically selected depending on the organizer and the Microsoft 365 tenant location.

Available in these regional data centers

- North America
- Central America
- South America
- Asia Pacific
- Europe/Africa

Data location for these countries/regions (supported)

- Australia
- Brazil
- Canada
- France
- Germany
- India
- Japan
- Norway
- Singapore
- South Africa
- South Korea
- Switzerland
- UAE
- United Kingdom

These countries/regions and clouds aren't supported

- Government Community Cloud (GCC)-H
- Department of Defense (DOD)

Exclusions and considerations

- **Data location:** Teams data locations, outside of the ones listed above, aren't currently supported.
- **China:** Event team members and attendees will not be able to use Teams live events because Azure CDN is not accessible in China. A workaround is to use a company VPN connection, which gets the client connected to CDN via the customer's corporate network.

Next steps

Go to [Set up for Teams live events](#).

Set up for live events in Microsoft Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

When you're setting up for live events, there are several steps that you must take.

Step 1: Set up your network for live events in Teams

Live events produced in Teams require you to [prepare your organization's network for Teams](#).

Step 2: Get and assign licenses

Ensure you have correct license assignments for [who can create and schedule live events](#) and [who can watch live events](#).

Step 3: Set up live events policies

Live events policies are used to control who in your organization can hold live events and the features that are available in the events they create. You can use the default policy or create one or more custom live events policies. After you create a custom policy, assign it to a user or groups of users in your organization.

NOTE

Users in your organization will get the global (Org-wide default) policy unless you create and assign a custom policy. By default in the global policy, live event scheduling is enabled for Teams users, live captions and subtitles (transcription) is turned off, everyone in the organization can join live events, and the recording setting is set to always record.

Create or edit a live events policy

1. In the left navigation of the Microsoft Teams admin center, go to **Meetings > Live events policies > Manage Policies** tab.
2. Do one of the following options:
 - If you want to edit the existing default policy, choose **Global (Org-wide default)**.
 - If you want to create a new custom policy, choose **+ Add**.
 - If you want to edit a custom policy, select the policy, and then choose **Edit**.

Here are the settings you can change to fit the needs of your organization.

Live events policies \ Add

Add a name for your live event policy

Add a friendly description so you know why it was created

Allow scheduling ☒ On

Allow transcription for attendees ☐ Off

Who can join scheduled live events

Everyone in the organization

Who can record an event

Always record

Save

Cancel

SETTING	DESCRIPTION
Title	This is the title of the policy that appears on the live events policies page. It can't be longer than 64 characters or have any special characters.
Description	Use this to add a friendly description for the policy.
Live events scheduling	Turning this on lets users in your organization create and schedule live events in Teams. It's important to know that if you want users to schedule a live event produced with an external app or device, there are additional steps you must do. To learn more, see Enable users to schedule events that were produced with an external app or device .
Transcription for attendees	This setting can only be applied to events produced in Teams. Turning this on enables live event attendees to see live captions and subtitles during the event.
Who can join scheduled live events	<p>Choose one of the following.</p> <p>Everyone Users can create live events that everyone, including people outside your organization, can attend. This setting enables the Public permission type in Teams when a user schedules a live event.</p> <p>Everyone in the organization Users can create live events that people in your organization, including guest users added to your organization, can attend. Users can't create live events that are attended by anonymous users. This setting enables the Org-wide permission type in Teams when a user schedules a live event.</p> <p>Specific users or groups Users can create live events that only specific users or groups in your organization can attend. Users can't create live events that are attended by everyone in your organization or by anonymous users. This setting enables the People and groups permission type in Teams when a user schedules a live event.</p>

SETTING	DESCRIPTION
Recording setting	<p>This setting can only be applied to events produced in Teams. Choose one of the following.</p> <p>Always record Live events created by users are always recorded. After the event is over, event team members can download the recording and attendees can watch the event.</p> <p>Never record Live events created by users are never recorded.</p> <p>Organizer can record or not Users can decide whether to record the live event. If it's recorded, after the event is over, event team members can download the recording and attendees can watch the event.</p>

You can also do this by using Windows PowerShell. For more information, see [Use PowerShell to set live events policies in Teams](#).

Assign a live events policy to users

If you created a custom live events policy, assign it to users for the policy to be active.

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type). To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Enable users to schedule events that were produced with an external app or device

For users to schedule events produced with an external app or device, you must also do the following steps:

1. Enable Microsoft Stream for users in your organization. Stream is available as part of eligible Microsoft 365 or Office 365 subscriptions or as a standalone service. Stream isn't included in Business Essentials or Business Premium plans. See [Stream licensing overview](#) for more details.

NOTE

The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch you'll be able to opt-in to this experience, in November you'll have to opt-out if you want to continue using Stream, and some time in early 2021 we'll require all customers to use OneDrive for Business and SharePoint for new meeting recordings. Learn more about how you can [assign licenses to users](#) so that users can access Stream. Ensure Stream isn't blocked for the users as defined in [this article](#).

2. Ensure users have live event creation permission in Stream. By default, administrators can create events with an external app or device. Stream administrator can [enable additional users for live event creation](#) in Stream.
3. Ensure live event organizers have consented to the company policy set by Stream admin. If a Stream administrator has [set up a company guidelines policy](#) and requires employees to accept this policy before saving content, then users must do so before creating a live event (with an external app or device) in Teams. Before you roll out the live events feature in the organization, make sure users who will be creating these live events have consented to the policy.

Step 4: Set up a video distribution solution for live events in Teams

Playback of live event videos uses adaptive bitrate streaming (ABR) but it's a unicast stream, meaning every viewer is getting their own video stream from the internet. For live events or videos sent out to large portions of your organization, there could be a significant amount of internet bandwidth consumed by viewers. For organizations that want to reduce this internet traffic for live events, live events solutions are integrated with

Microsoft's trusted video delivery partners offering software defined networks (SDNs) or enterprise content delivery networks (eCDNs). These SDN/eCDN platforms enable organizations to optimize network bandwidth without sacrificing end user viewing experiences. Our partners can help enable a more scalable and efficient video distribution across your enterprise network.

Purchase and set up your solution outside of Teams Get expert help with scaling video delivery by leveraging Microsoft's trusted video delivery partners. Before you can enable a video delivery provider to be used with Teams, you must purchase and set up the SDN/eCDN solution outside and separate from Teams.

The following SDN/eCDN solutions are pre-integrated and can be set up to be used with Stream.

- **Hive Streaming** provides a simple and powerful solution for live and on-demand enterprise video distribution. Hive is a software-based solution that requires no additional hardware or bandwidth and provides a secure way to enable thousands of simultaneous video viewers without impact to your network. For customers looking to understand the impact video is having on their network prior to purchasing an SDN/eCDN solution, Hive Streaming also provides a browser-based analytics solution for Microsoft customers. [Learn more.](#)
- **Kollective** is a cloud-based, smart peering distribution platform that leverages your existing network infrastructure to deliver content, in many forms, (live streaming video, on-demand video, software updates, security patches, etc.) faster, more reliably and with less bandwidth. Our secure platform is trusted by the world's largest financial institutions and with no additional hardware, setup and maintenance are easy. [Learn more.](#)
- **Ramp OmniCache** provides next-generation network distribution and ensures seamless delivery of video content across global WANs, helping event producers optimize network bandwidth and support successful live event broadcasts and on-demand streaming. The support for Ramp OmniCache for live events produced in Teams is coming soon. [Learn more.](#)
- **Riverbed**, the industry standard in network optimization, is extending its acceleration solutions to Microsoft Teams and Stream. Now Microsoft 365 customers can confidently accelerate 365 traffic including Teams and Stream along with a wealth of other leading enterprise SaaS services to increase workforce productivity from anywhere. Teams and Stream acceleration can be enabled through an effortless setup that comes with all the assurance of Riverbed's world-class support and ongoing investment.

NOTE

Your chosen SDN or eCDN solution is subject to the selected **3rd party provider's terms of service and privacy policy**, which will govern your use of the provider's solution. Your use of the provider's solution will not be subject to the Microsoft volume licensing terms or Online Services Terms. If you do not agree to the **3rd party provider's terms**, then don't enable the solution in Teams.

After you set up the SDN or eCDN solution, you're ready to configure the provider for live events in Teams.

Next steps

Go to [Configure live events settings in Teams](#).

- [Configure live events settings in Teams](#)

Use PowerShell to set live events policies in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

You can use the following Windows PowerShell cmdlets to set and assign policy settings for live events in Teams:

- [Get-CsTeamsMeetingBroadcastPolicy](#)
- [Set-CsTeamsMeetingBroadcastPolicy](#)
- [New-CsTeamsMeetingBroadcastPolicy](#)
- [Grant-CsTeamsMeetingBroadcastPolicy](#)
- [New-CsGroupPolicyAssignment](#)

Here are some examples.

NOTE

Before you can run these cmdlets you must be connected to Skype for Business Online PowerShell. For more information, see [Manage Skype for Business Online with Microsoft 365 or Office 365 PowerShell](#).

Allow users to schedule live events

NOTE

These examples are for events produced in Teams. For events produced with an external app or device, there are additional steps you must do. For more information, see [Enable users to schedule events that were produced with an external app or device](#).

Allow a user to schedule live events

If the user is assigned the global policy, run and verify that *AllowBroadcastScheduling* parameter is set to *True*:

```
Get-CsTeamsMeetingBroadcastPolicy -identity Global
```

Then assign the user to the global policy, run:

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity {user} -PolicyName $null -Verbose
```

User scenarios

You want all users in your organization to be able to schedule live events

If users are assigned the global policy, run and verify that *AllowBroadcastScheduling* is set to *True*:

```
Get-CsTeamsMeetingBroadcastPolicy -identity Global
```

If users are assigned a policy other than the global policy, run and verify that *-AllowBroadcastScheduling* is set to *True*:

```
Get-CsTeamsMeetingBroadcastPolicy -identity {policy name}
```

You want live events scheduling to be disabled across your organization

Disable live events scheduling, run:

```
Set-CsTeamsMeetingBroadcastPolicy -identity Global -AllowBroadcastScheduling $false
```

Assign all users in your organization to the global policy, run:

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity {user} -PolicyName $null -Verbose
```

You want a large number of users to be able to schedule live events and prevent a set of users from scheduling them

Run and verify that *AllowBroadcastScheduling* is set to *True*.

```
Get-CsTeamsMeetingBroadcastPolicy -Identity Global
```

Then assign a user or users to the global policy, run:

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity {user} -PolicyName $null -Verbose
```

Create a new policy that doesn't allow scheduling live events, run:

```
New-CsTeamsMeetingBroadcastPolicy -Identity DisabledBroadcastSchedulingPolicy
```

Disable live events scheduling, run:

```
Set-CsTeamsMeetingBroadcastPolicy -Identity DisabledBroadcastSchedulingPolicy -AllowBroadcastScheduling $false
```

Then assign users to this policy, run:

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity {user} -PolicyName DisabledBroadcastSchedulingPolicy -Verbose
```

You want to disable live event scheduling for a large number of the users and allow a set of users to schedule them

Disable live events scheduling, run:

```
Set-CsTeamsMeetingBroadcastPolicy -identity Global -AllowBroadcastScheduling $false
```

Then assign those users to the global policy, run:

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity {user} -PolicyName $null -Verbose
```

Create a policy to allow live events scheduling, run:

```
New-CsTeamsMeetingBroadcastPolicy -identity EnableBroadcastSchedulingpolicy
```

Enable live events scheduling, run:

```
Set-CsTeamsMeetingBroadcastPolicy -identity EnableBroadcastSchedulingpolicy -AllowBroadcastScheduling $true
```

Then assign users to this policy, run:

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity {user} -PolicyName EnableBroadcastSchedulingpolicy -Verbose
```

Set who can join live events

Set the global policy to allow users to create events that everyone, including anonymous users, can attend, run:

```
Set-CsTeamsMeetingBroadcastPolicy -Identity Global -BroadcastAttendeeVisibility Everyone
```

Set the recording option for live events

NOTE

This setting applies only to events produced in Teams.

Set the global policy to disable recording for live events:

```
Set-CsTeamsMeetingBroadcastPolicy -Identity Global -BroadcastRecordingMode AlwaysDisabled
```

Set live captions and subtitles in live events

NOTE

This setting applies only to events produced in Teams.

Set the global policy to turn on live captions and subtitles (transcription) for event attendees:

```
Set-CsTeamsMeetingBroadcastPolicy -Identity Global -AllowBroadcastTranscription $true
```

Configure live event settings in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Use Teams live events settings to configure settings for live events that are held in your organization. You can set up a support URL and configure a third-party video distribution provider. These settings apply to all live events that are created in your organization.

You can easily manage these settings in the Microsoft Teams admin center. In the left navigation, go to **Meetings > Live events settings**.

Live events settings

Teams live events settings lets you control org-wide settings for all live events that are scheduled. You can choose to include a support URL when live events are held and set up a third-party video distribution provider for all live events organized and scheduled by people in your organization. [Learn more](#)

Support URL

Customize the support URL if a user needs to contact support during a live event

Third-party video distribution providers

Use a third-party distribution provider

☒ On

SDN provider name

SDN configuration

1.1

Set up event support URL

This URL is shown to live event attendees. Add the support URL for your organization to give attendees a way to contact support during a live event.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Live event settings**.
2. Under **Support URL**, enter your organization's support URL.

Support URL

Customize the support URL if a user needs to contact support during a live event

Using Windows PowerShell

Run the following:

```
Set-CsTeamsMeetingBroadcastConfiguration -SupportURL "{your URL}"
```

For more information, see [Set-CsTeamsMeetingBroadcastConfiguration](#).

Configure a third-party video distribution provider

If you purchased and set up a software defined network (SDN) solution or enterprise content delivery network (eCDN) solution through a Microsoft video delivery partner, configure the provider for live events in Teams.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Live event settings**.
2. Under **Third-party video distribution providers**, complete the following:

Third-party video distribution providers	
Use a third-party distribution provider	<input checked="" type="checkbox"/> On
SDN provider name	<input type="text" value="Ramp"/>
SDN configuration	<input type="text" value="12345"/>

- **Third-party distribution provider** Turn this ON to enable the third-party video distribution provider.
- **SDN provider name** Choose the provider you're using.
- **SDN Configuration** Enter SDN Configuration details.

Using Windows PowerShell

Get the license ID or API token and API template from your provider contact, and then run one of the following, depending on the provider you're using:

Hive

```
Set-CsTeamsMeetingBroadcastConfiguration -AllowSdnProviderForBroadcastMeeting $True -SdnProviderName hive -SdnLicenseId {license ID GUID provided by Hive} -SdnApiTemplateUrl "{API template URL provided by Hive}"
```

Kollective

```
Set-CsTeamsMeetingBroadcastConfiguration -AllowSdnProviderForBroadcastMeeting $True -SdnProviderName kollective -SdnApiTemplateUrl "{API template URL provided by Kollective}" -SdnApiToken {API token GUID provided by Kollective}
```

Riverbed

```
Set-CsTeamsMeetingBroadcastConfiguration -AllowSdnProviderForBroadcastMeeting $True -SdnProviderName riverbed -SdnApiTemplateUrl "{API template URL provided by Riverbed}" -SdnApiToken {API token GUID provided by Riverbed}
```

Ramp

```
Set-CsTeamsMeetingBroadcastConfiguration -AllowSdnProviderForBroadcastMeeting $True -SdnProviderName ramp -SdnRuntimeConfiguration "{Configuration provided by RAMP}"
```

Peer5

```
Set-CsTeamsMeetingBroadcastConfiguration -AllowSdnProviderForBroadcastMeeting $True -SdnProviderName peer5 -SdnLicenseId {peer5CustomerId}
```

For more information, see [Set-CsTeamsMeetingBroadcastConfiguration](#).

NOTE

If you plan to create live events using an external app or device, you'll also need to [configure your eCDN provider with Microsoft Stream](#).

NOTE

The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch you'll be able to opt-in to this experience, in November you'll have to opt-out if you want to continue using Stream, and some time in early 2021 we'll require all customers to use OneDrive for Business and SharePoint for new meeting recordings.

NOTE

Your chosen eCDN solution is subject to the selected 3rd party provider's terms of service and privacy policy, which will govern your use of the eCDN provider's solution. Your use of the eCDN provider's solution will not be subject to the Microsoft volume licensing terms or Online Services Terms. If you don't agree to the 3rd party provider's terms, then don't enable the eCDN solution in Microsoft Teams.

Live event recording policies in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

You have several options for recording a Microsoft Teams live event. The recording options are set using recording policies. This article describes the various settings.

The recording options are set using the PowerShell command [Set-CsTeamsMeetingBroadcastPolicy](#).

Scheduling and option behaviors

There are two organizer options while scheduling a live event recording:

- Recording available for producers and presenters
 - Recording file: Provides a recording file that producers and presenters can download after the event is over.
- Recording available for attendees
 - DVR: A digital video recorder (DVR) allows attendees to rewind and pause during the event
 - VOD: A video on demand (VOD) allows attendees to watch after the event is over

Broadcast recording policy setting

As part of the broadcast policy, there's a setting that you can toggle to turn recording on or off for a live event.

	RECORDING AVAILABLE FOR PRODUCERS AND PRESENTERS	RECORDING AVAILABLE FOR ATTENDEES
Always record	Disabled and selected	Enabled and selected
Organizer can record or not	Enabled and selected by default	Enabled and selected by default
Never record	Disabled and not selected	Disabled and not selected

Storage and persistence behavior

OPTION	STATE	DVR	VOD	RECORDING
Recording available for attendees	Selected	DVR is available and the Azure Media Services (AMS) asset is stored for 180 days	Attendee can access and watch the event	
	Not Selected	DVR is available and the AMS asset is stored for 180 days	Attendee won't get access into the event after it's over	

OPTION	STATE	DVR	VOD	RECORDING
	Disabled (Not selected)	DVR is available and the AMS asset is deleted after the event	Attendee won't get access into the event after it's over	
Recording available to producers and presenters	Selected			An MP4 is created and stored for 180 days
	Not Selected			No file is created

Learn how to deploy audio conferencing in Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

Audio Conferencing is the ability to join a Teams meeting from a regular phone and dial out from a meeting to a phone number. Be sure you've reviewed [Meetings rollout](#) as part of rolling out Audio Conferencing in your organization.

Audio Conferencing deployment decisions

This article helps you decide whether to change any of the default Audio Conferencing settings, based on your organization's profile and business requirements, then it walks you through each change. We've split the settings into two groups, starting with the core set of [changes you're more likely to make](#). The second group includes the [additional settings](#) you may want to configure, based on your organization's needs.

You only need to set up Audio Conferencing for people who plan to schedule or lead meetings. Meeting attendees who dial in don't need any licenses assigned to them or any other setup. Dialing in (calling in) to meetings is very useful for users who are on the road and can't attend a meeting using the Skype for Business or Teams app on their laptops or mobile devices.

Audio Conferencing prerequisites

Before you can roll out Audio Conferencing for Teams, consider the following:

ASK YOURSELF	ACTION
Is Audio Conferencing available for my country/region?	To find out if Audio Conferencing is available for your country/region, see Country and region availability for Audio Conferencing and Calling Plans .
Do my users have the proper licensing for Teams Audio Conferencing?	<p>Audio Conferencing licenses are available as part of a Microsoft 365 or Office 365 E5 subscription or as an add-on service for a Microsoft 365 Business Standard, E1, or E3 subscription.</p> <ul style="list-style-type: none">• To get and assign licenses, see Try or purchase Audio Conferencing in Microsoft 365 or Office 365 and Assign or remove licenses for Microsoft 365 Apps for business.• To learn more, read Microsoft Teams add-on licensing.• To see what cloud features are included in each plan, see the License options based on your plan articles.
Do I need to purchase Communications Credits for the users who are assigned Audio Conferencing licenses?	To learn more, read What are Communications Credits , then check out the Communications Credits section below.

Core deployment decisions

After you meet the Audio Conferencing prerequisites, complete the following tasks to configure Audio

Conferencing for your users.

Teams administrators

Teams provides a set of custom administrator roles that can be used to manage Teams for your organization. The roles provide various capabilities to administrators.

ASK YOURSELF	ACTION
Who will be assigned the Teams Communications Administrator role?	To learn more about Teams administrator roles see Use Microsoft Teams admin roles to manage Teams .
Who will be assigned the Teams Communications Support Engineer role?	To assign admin roles, see Assign administrator and non-administrator roles to users with Active Directory .
Who will be assigned the Teams Communications Support Specialist role?	

Conferencing bridges and phone numbers

Conferencing bridges let people dial into meetings using a phone. You can use the default settings for a conferencing bridge or change the phone numbers (toll and toll-free) and other settings, such as the PIN or the languages that are used.

See [Audio Conferencing](#) to learn more.

ASK YOURSELF	ACTION
Do I need to add new conferencing bridge numbers?	To add new numbers, see Getting service phone numbers .
Will I need to modify the bridge settings?	To modify the bridge settings, see Change the settings for an Audio Conferencing bridge .
Do I need to port numbers to use with audio conferencing?	To learn about porting phone numbers, read Transfer phone numbers to Teams .

Default and alternate languages

Teams Audio Conferencing lets you set up default and alternate languages for a conferencing bridge.

ASK YOURSELF	ACTION
Which languages should I choose for auto attendant greetings?	To choose languages, see Set auto attendant languages for Audio Conferencing .

Conferencing bridge settings

After setting up your conferencing bridge, including default and alternate languages, you should verify that the default settings such as entry/exit notifications and PIN length are the ones you want to use. If they're not, you can change them.

ASK YOURSELF	ACTION
Will attendees hear a notification when a user joins or exits a meeting?	To change these settings, see Change the settings for an Audio Conferencing bridge .
What is the required length of the PIN that a meeting organizer uses to start the meeting?	

Dial-in phone number settings for users who lead meetings

After you create your Audio Conferencing bridge, you need to set the toll and/or toll-free numbers that users who lead meetings will use.

ASK YOURSELF	ACTION
Which conference bridge numbers will I assign to each user who leads meetings?	To assign a dial-in phone number to a user, see Step 7: Assign dial-in phone numbers for users who lead meetings .

Communications Credits

To provide toll-free conference bridge phone numbers and to support conferencing dial-out to international phone numbers, you must set up Communications Credits for your organization. To learn more about Communications Credits, see [What are Communications Credits?](#).

ASK YOURSELF	ACTION
Are Communications Credits required for my Audio Conferencing implementation?	To find out if you need to set up Communications Credits, see Set up Communications Credits for your organization .
If they're required, how much should I purchase?	To determine the Communications Credits amount, see Recommended funding amounts .
Do I want to configure an auto-recharge amount?	To configure an auto-recharge amount, see Set up Communications Credits for your organization .

Additional deployment decisions

You may want to change these settings, based on your organization's needs and configuration.

Outbound calling restriction policies

As an administrator, you can use outbound call controls to restrict the type of audio conferencing and end user PSTN calls that can be made by users in your organization.

ASK YOURSELF	ACTION
Will I limit the type of outbound calls that are allowed?	To restrict outbound calls, see Outbound calling restriction policies for Audio Conferencing and user PSTN calls .

Dial plans

A dial plan, as part of Phone System in Microsoft 365 or Office 365, is a set of normalization rules that translate

dialed phone numbers into an alternate format (typically E.164 format) for call authorization and call routing.

For more information about dial plans, see [What are dial plans?](#)

ASK YOURSELF	ACTION
Does my organization need a customized dial plan?	To help determine if you need a custom dial plan, see Planning for tenant dial plans .
Which users require a customized dial plan, and which tenant dial plan should be assigned to each user?	To add users to a customized dial plan using PowerShell, see Create and manage dial plans .

Troubleshoot meeting and call quality

Teams gives you two ways to monitor and troubleshoot call quality problems: [Call Analytics and Call Quality Dashboard](#). Call Analytics shows detailed information about the devices, networks, and connectivity related to the specific calls and meetings for each user. Call Analytics is designed to help admins and helpdesk agents troubleshoot call quality problems with specific calls, whereas the Call Quality Dashboard is designed to help admins and network engineers optimize a network. Call Quality Dashboard shifts focus from specific users and instead looks at aggregate information for an entire Teams organization.

ASK YOURSELF	ACTION
Who will be responsible for monitoring and troubleshooting call quality issues?	See Use Call Analytics to troubleshoot poor call quality for information about permission levels required to troubleshoot call quality issues.

Next steps

- [Drive adoption](#) of audio conferencing in your organization.
- [Roll out cloud voice](#)
- Include featured apps - such as Planner - in your initial Teams rollout. Add other [apps](#), [bots](#), & [connectors](#) as you drive Teams adoption.

Audio Conferencing in Microsoft 365

12/7/2021 • 5 minutes to read • [Edit Online](#)

Audio Conferencing in Microsoft 365 and Office 365 enables users to call in to meetings from their phones. Audio Conferencing allows up to 1000 phone attendees.

What is Audio Conferencing?

Calling in (dialing in) to meetings is very useful for users who are on the road and can't attend a meeting using the Skype for Business or Microsoft Teams app on their laptops or mobile devices. But there are other scenarios in which using a phone to attend a Skype for Business or Microsoft Teams meeting can be a better option than using an app on a computer:

- Internet connectivity is limited.
- A meeting is audio only.
- The person tried to join a Skype for Business meeting and it failed.
- The call quality is better when dialing in.
- People can join a meeting "hands free" using Bluetooth devices.
- People find it's easier and more convenient for their situation.

You only need to set up Audio Conferencing for people who plan to schedule or lead meetings. Meeting attendees who dial in don't need any licenses assigned to them or other setup.

After attendees have joined meeting, they can also dial out and invite other callers into a Skype for Business or Microsoft Teams meeting. See [Dialing out from a Teams meeting so other people can join it](#) or [Dialing out from a Skype for Business meeting so other people can join it](#).

What does it cost?

For pricing info, see [Pricing for Audio Conferencing](#).

Where is it available?

With Audio Conferencing, your users can use toll and toll-free phone numbers to dial in to meetings. Toll (service) numbers are automatically assigned as shared audio conferencing numbers to organizations when they're enabled for Audio Conferencing. Dedicated toll and toll-free numbers can be assigned to your organization from additional cities.

Toll-free phone numbers (service numbers) are available, but only in some countries/regions. To see what is available in your country or region, see [Country and region availability for Audio Conferencing and Calling Plans](#).

After you have decided you want Audio Conferencing for your organization, you need to buy one **Audio Conferencing** license for each person in your organization who is going to schedule/host an audio meeting.

How do conferencing bridges work?

When you are setting up Audio Conferencing for Skype for Business or Microsoft Teams, you will get an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers. The phone number you set will be included on the meeting invites for Skype for Business and Microsoft Teams apps. You can [change the phone numbers on your conferencing bridge](#), and you can also [change other audio conferencing bridge](#)

[settings](#).

The audio conferencing bridge answers a call for people who are dialing in to a meeting using a phone. It answers the caller with voice prompts from an auto attendant, and then, depending on your settings, can play notifications and ask callers to record their name. **Microsoft bridge settings** allow you to change the settings for meeting notifications and the meeting join experience, and set the length of the PINs that are used by meeting organizers [in Microsoft Teams](#) or in [Skype for Business Online](#). Meeting organizers use PINs to start meetings if they can't join the meeting using the Skype for Business or Microsoft Teams app.

Dial-in phone numbers set on an audio conferencing bridge

There are two types of audio conferencing phone numbers that can be assigned to your conferencing bridge: **Shared** and **Dedicated**. Both types of numbers can be used by any caller to join audio meetings that are being held in your organization.

Dedicated phone numbers are those phone numbers that are only available to users within your organization. You can change the languages that are used when someone calls in to one of these numbers. You will need to get a service phone number for these.

Shared phone numbers are those phone numbers that can be shared with other Microsoft 365 or Office 365s. You can't change the languages that are used when someone calls in to one of these numbers.

While the default audio conferencing number that is assigned to an organizer is only included in the meeting invite, a caller can use any of the phone numbers that are assigned to your conferencing bridge to join a meeting. The list of phone numbers that can be used to join a meeting is available using the **Find a local number** link that is included on every meeting invite.

For more information, see [Phone numbers for Audio Conferencing in Microsoft Teams](#) or [Phone numbers for Audio Conferencing in Skype for Business Online](#).

Automatically assigned audio conferencing phone numbers

Shared audio conferencing phone numbers are automatically assigned to organizations when they're enabled for audio conferencing. When the phone numbers are assigned, a phone number is assigned as the default phone number of the conferencing bridge. The phone number assigned as the default number of the bridge will be one from the country/region of the organization.

NOTE

The country or region location of your organization can be found by signing in to the **Microsoft 365 admin center** and looking under **Organization Profile**.

Caution

Due to limited availability of toll phone numbers in Venezuela, Indonesia, and United Arab Emirates (UAE), organizations from these countries/regions won't have an Audio Conferencing toll number automatically assigned to them. Toll-free numbers from these locations are available depending on available inventory.

To see a list of those countries/regions that have phone numbers automatically assigned to organizations, see [Country and region availability for Audio Conferencing and Calling Plans](#).

How do you get dedicated phone numbers?

Dedicated audio conferencing phone numbers are service numbers that you can get and then assign to your organization. You can get dedicated toll and toll-free phone numbers for your conferencing bridges in one of three ways:

- **Use the Skype for Business admin center.** For some countries/regions, you can get numbers for your conference bridges using the Skype for Business admin center. See [Getting service phone numbers](#).
- **Port your existing numbers.** You can port or transfer existing numbers from your current service provider or phone carrier to Microsoft 365 or Office 365. See [Transfer phone numbers to Teams](#) or [Manage phone numbers for your organization](#) for more information to help you do this.
- **Use a request form for new numbers.** Sometimes (depending on your country/region) you won't be able to get your new phone numbers using the Skype for Business admin center, or you will need specific phone numbers or area codes. If so, you will need to download a form and send it back to us. See [Manage phone numbers for your organization](#) for more information.

How do you set it up?

After you have decided to set up Audio Conferencing for your users, see [Set up Audio Conferencing for Microsoft Teams](#) or [Set up Audio Conferencing for Skype for Business Online](#) for steps you can follow to do so.

On-network Conferencing for Audio Conferencing

12/7/2021 • 6 minutes to read • [Edit Online](#)

On-network Conferencing allows organizations to send inbound and outbound Audio Conferencing calls to Microsoft dial-in numbers through Direct Routing. This capability is not intended to extend the support of Audio Conferencing to third party dial-in numbers. On-network Conferencing is not supported if it is used to route inbound calls to the Audio Conferencing service through third party dial-in phone numbers or outbound calls to the PSTN from Microsoft Audio Conferencing Bridge.

This article describes the prerequisites and configuration steps required to enable On-network Conferencing for your organization.

IMPORTANT

On-network Conferencing must NOT be deployed with any telephony equipment in India.

Prerequisites

Before configuring On-network Conferencing, make sure your organization meets the following prerequisites:

- Ensure that all users in your organization who are enabled, or will be enabled, for Audio Conferencing are using Teams for all Meetings. The routing of inbound and outbound Audio Conferencing calls through On-network Conferencing is only supported for Teams meetings.
- Assign Audio Conferencing licenses to all users who will be using On-network Conferencing.
- Set up the Audio Conferencing service. For additional information, see [Set up Audio Conferencing for Microsoft Teams](#).
- Set up your Session Border Controller (SBC) for Direct Routing. For additional information, see [Plan Direct Routing](#) and [Configure Direct Routing](#).

If you are setting up Direct Routing only for the purposes of Audio Conferencing, then you need only complete "Step 1: Connect your SBC" for On-network Conferencing.

Enable the routing of dial-in calls to Microsoft Audio Conferencing through Direct Routing

To route dial-in calls made by your on-premises users to the Audio Conferencing service through Direct Routing, you need to configure appropriate routing rules for your SBCs and Private Branch Exchange (PBXs).

You need to configure the telephony equipment of your sites to route calls to any service number of the conference bridge of your organization through a Direct Routing trunk.

You can find the service numbers in Teams admin center under **Meetings** -> **Conferencing Bridges** or by using the Skype for Business Online PowerShell cmdlet `Get-CsOnlineDialInConferencingBridge`. For additional information, see a list of [Audio Conferencing numbers in Microsoft Teams](#).

NOTE

This feature is not available to users with the pay-per-minute Audio Conferencing license.

Enable the routing of Teams meeting dial-out calls through Direct Routing

Teams meeting dial-out calls are initiated from within a meeting in your organization to PSTN numbers, including call-me-at calls and calls to bring new participants to a meeting.

To enable Teams meeting dial-out routing through Direct Routing to on-network users, you need to create and assign an Audio Conferencing routing policy called "OnlineAudioConferencingRoutingPolicy".

The OnlineAudioConferencingRoutingPolicy policy is equivalent to the CsOnlineVoiceRoutingPolicy for 1:1 PSTN calls via Direct Routing. The OnlineAudioConferencingRoutingPolicy policy can be managed by using the following cmdlets:

- New-CsOnlineAudioConferencingRoutingPolicy
- Set-CsOnlineAudioConferencingRoutingPolicy
- Get-CsOnlineAudioConferencingRoutingPolicy
- Grant-CsOnlineAudioConferencingRoutingPolicy
- Remove-CsOnlineAudioConferencingRoutingPolicy

For more information about routing for Direct Routing, see [Configure voice routing for Direct Routing](#).

To enable the routing of meeting dial-out calls through Direct Routing, you need to:

- Configure Audio Conferencing routing policies
- Configure the routing on the telephony equipment of your organization
- (Optional) Configure a dial plan

Dial-out calls from Teams meetings are coming from the default service number on the conference bridge. For additional information on the default service number of your Audio Conferencing bridge, see [Change the phone numbers on your Audio Conferencing bridge](#).

Configure Audio Conferencing routing policies

The Audio Conferencing routing policy OnlineAudioConferencingRoutingPolicy determines which meeting dial-out calls are routed to Direct Routing trunks. If you are familiar with the CsOnlineVoiceRoutingPolicy policy, this policy works in a very similar way.

The following steps are needed to set up Audio Conferencing routing policies:

1. Create PSTN usages
2. Configure voice routes
3. Create Audio Conferencing voice routing policies
4. Assign a policy to your users

Create PSTN usages

PSTN usages are collections of voice routes. When a dial-out call is initiated from the meeting of a given organizer, voice routes will be used to determine the routing path of the call based on the PSTN usages that are associated to the user via the user's voice routing policy.

You can create a PSTN usage by using the "Set-CsOnlinePstnUsage" cmdlet. For Example:

```
Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="US and Canada"}
```

Configure voice routes

Voice routes determine the PSTN gateway that should be used to route a call based on the phone number that is dialed from a Teams meeting. Voice routes determine the PSTN gateway that should be used to route a given

call by matching the phone number dialed from a Teams meeting with a regex pattern. When creating a voice route, the route must be associated to one or more PSTN usages.

You can create a voice route and define the regex and gateways to be associated with the voice route by using the "New-CsOnlineVoiceRoute" cmdlet. For Example:

```
New-CsOnlineVoiceRoute -Identity "Redmond 1" -NumberPattern "^\\+1(425|206)(\\d{7})$" -OnlinePstnGatewayList sbc1.contoso.biz, sbc2.contoso.biz -Priority 1 -OnlinePstnUsages "US and Canada"
```

Create Audio Conferencing voice routing policies

Audio Conferencing voice routing policies determine the possible routes that can be used to route a call originating from the meetings of an organizer based on the target phone number of the meeting dial-out call. Audio Conferencing voice routing policies are associated to one or more PSTN usages, which in turn, determine the possible routes that will be attempted to be used for the meeting dial-out calls of the organizers associated to the policy.

You can create an Audio Conferencing voice routing policy by using the "New-CsOnlineAudioConferencingRoutingPolicy" cmdlet. For Example:

```
New-CsOnlineAudioConferencingRoutingPolicy "Policy 1" -OnlinePstnUsages "US and Canada"
```

After the policy is assigned to a user, and when a meeting dial-out call is initiated from one of the user's meetings, the voice routes in the PSTN usages that are associated to the organizer through the user's voice routing policy will be evaluated. If the meeting dial-out call destination matches a regex in one of the voice routes that are associated to the organizer, the meeting dial-out call will be routed to the PSTN gateway defined in the voice route. If the meeting dial-out call destination does not match any of the voice routes associated to the organizer, the meeting dial-out call will be routed by Microsoft.

Assign a policy to your users

After the Audio Conferencing routing policies are defined, you can now assign them to users. After policies are assigned to them, the meeting dial-out calls will be evaluated against it to determine their routing path. Audio Conferencing routing policies are always evaluated based on the organizer of the meeting, independently from the user in the meeting that initiates a meeting dial-out call.

You can assign an Audio Conferencing voice routing policy to a user by using the "Grant-CsOnlineAudioConferencingRoutingPolicy" cmdlet. For example:

```
Grant-CsOnlineAudioConferencingRoutingPolicy -Identity "<User Identity>" -PolicyName "Policy 1"
```

Configure routing on the telephony equipment of your organization

On the telephony equipment of your organization, you need to ensure that the meeting dial-out calls routed through Direct Routing are routed to the intended on-network destination.

(Optional) Configure a dial plan

A dial plan is a set of normalization rules that translate dialed phone numbers by an individual user into an alternate format (typically E.164) for purposes of call authorization and call routing.

By default, Teams users can dial-out to PSTN numbers in E.164 format, that is, + <country code> <number>. However, dial plans can be used to allow users to dial phone numbers in other formats, for instance 4-digit extensions.

If you would like to enable extension-based dialing through On-network conferencing, you can set up dial plans to match the extension dialing pattern to the phone number ranges of the phone number of your organization. To set up dial plans, see [Create and manage dial plans](#).

Related topics

Audio Conferencing common questions

12/7/2021 • 8 minutes to read • [Edit Online](#)

The following are some of the top questions we get from our customers who want to use Audio Conferencing.

What are the benefits of Audio Conferencing?

Calling in to meetings is beneficial when people are on the road, for example, and can't attend a meeting using the Skype for Business or Microsoft Teams app on their laptop or mobile devices. But there are other scenarios in which using a phone to attend a Skype for Business or Microsoft Teams meeting can be a better option than using an app on a computer:

- Internet connectivity is limited.
- A meeting is audio only.
- The person tried to join a Skype for Business meeting and it failed.
- The call quality is better if they dial in.
- People can join a meeting "hands free" using Bluetooth devices.
- People find it's easier and more convenient for their situation.

Who can attend an Audio Conferencing meeting? And who can I hear?

Anyone who has the dial-in number and conference ID can join a Skype for Business or Microsoft Teams meeting, unless the meeting organizer has locked the meeting.

Whether you're calling in using a phone or the Skype for Business or Microsoft Teams apps, you'll be able to hear everyone else on the call, and they can hear you. The meeting organizer has the ability to "mute" meeting attendees if they don't want to hear them.

Can I add a toll-free number for my Audio Conferencing users?

Yes, toll-free phone numbers (service numbers) are available but only in some countries/regions. For a list of the numbers that are available, see [Country and region availability for Audio Conferencing and Calling Plans](#).

How many local dial-in numbers are currently supported?

There are local dial-in numbers that are assigned to you when you purchase the licenses for Audio Conferencing. The dial-in numbers will be included in the meeting invite. These local numbers will be only available to your organization. The phone assigned to your organization and that number is shared by the users within that organization that are enabled for Audio Conferencing. So, Skype for Business or Microsoft Teams meetings scheduled by User A and another User B will both have the same dial-in number.

Local dial-in numbers, and also in some cases international dial-in numbers from the country where your organization is located, will be included on the meeting invite. If a meeting attendee uses a different number that is included in the invite, it will be a shared phone number.

How many international dial-in numbers does Audio Conferencing in

Microsoft 365 or Office 365 support?

For a current list of countries/regions, see [Phone numbers for Audio Conferencing in Microsoft Teams](#) or [Phone numbers for Audio Conferencing in Skype for Business Online](#).

Can I set up local numbers for Audio Conferencing from additional cities in the country?

If phone numbers for Audio Conferencing aren't available in your area or don't meet the needs of your organization, send us feedback at [SkypeFeedback forums](#).

What is the maximum length of the Audio Conferencing meetings?

The maximum length of time depends on who is in the meeting and the type of authentication they used to join the meeting.

MEETING ATTENDEES	MEETING END TIME
Users have joined using the Skype for Business or Microsoft Teams app or have dialed in to the meeting.	The meeting ends if there are no changes to the attendee list after 24 hours.
All of the users are dialed in to the meeting but someone has used a PIN to enter the meeting.	The meeting ends after 24 hours.
All of the users are dialed in to the meeting but there wasn't anyone who used a PIN to enter the meeting.	If anonymous users are allowed to start meetings, the meeting ends after four hours. If anonymous users aren't allowed to start meetings and all authenticated participants have left the meeting, the meeting ends 90 minutes after the last authenticated participant left.

How many total phone participants can I have in meetings?

See [Limits and Specifications](#) for total number of attendees allowed in meetings.

To find out about meeting limits, see [Skype for Business Online Limits](#).

Why did users start receiving emails with their Audio Conferencing information?

We added a new feature that allows you, the [admin](#), to send and update Audio Conferencing information and PIN in email. To learn more about it, including how to disable it, see [Enable or disable sending emails when Audio Conferencing settings change in Microsoft Teams](#) or [Enable or disable sending emails when Audio Conferencing settings change in Skype for Business Online](#).

Can Audio Conferencing be used by the users who are part of an on-premises deployment of Skype for Business Server?

With [Meetings First](#), Skype for Business Server users can benefit from Teams meetings and Teams Audio Conferencing.

Can a user get a personal conference ID?

Skype for Business and Microsoft Teams users will be randomly assigned conferencing IDs. Users can't reserve or set a static conference ID that only they can use.

Can I use Audio Conferencing with Skype Meeting Broadcast?

There isn't support currently for users enabled for Audio Conferencing to join a Skype Meeting Broadcast.

Can a user get operator assistance during a meeting?

No, a user can't get any operator assistance or support by pressing *0 during the meeting. If there are issues with Audio Conferencing, an administrator for an organization can contact [Microsoft support for Office 365](#).

How does a user access or change their conference ID?

Skype for Business or Microsoft Teams users can find the conference ID that is assigned to them by scheduling a meeting in Outlook and Outlook on the web. Also, users can find the conference ID in the email that will be sent to them after they are set up.

NOTE

Users won't be able to reset their conference ID. The conference ID can only be reset by you, the [admin](#), for the organization.

We are working on a solution that will let the user access and reset a conference ID without help from an organization's admin.

How do users access or change their PIN?

Skype for Business or Microsoft Teams users can find the PIN in an email that will be sent to them once they are set up.

NOTE

Teams users can change their pin. There is a link at the bottom of the meeting invite to reset their pin.

We are working on a solution that will let the user access and reset a PIN without help from an organization's administrator.

What in-meeting dial-pad commands are supported?

For meeting participants and organizers:

COMMAND NAME	COMMAND KEYS	DESCRIPTION
Command menu	*1	Press *1 to play the descriptions of dial-pad commands that are available.
Raise/lower hand	*5	Press *5 to raise or lower hand.
Mute/unmute	*6	Press *6 to mute or unmute themselves.

For meeting organizers only:

COMMAND NAME	COMMAND KEYS	DESCRIPTION
Admit all	*21	Press *21 to admit all participants waiting in the lobby.
Mute all	*22	Press *21 to mute all participants (except the organizer).
Toggle Enter/Exit Announcement	*23	Press *23 to enable or disable Enter/Exit Announcement.

Can attendees dial out to international phone numbers when they are in a Skype for Business or Microsoft Teams meeting?

Yes, attendees can dial out internationally and invite other callers into a Skype for Business or Microsoft Teams meeting. See [Dialing out from a Microsoft Teams meeting so other people can join it](#) or [Dialing out from a Skype for Business Online meeting so other people can join it](#).

How does a Skype for Business or Microsoft Teams user schedule a meeting with Audio Conferencing meeting details?

When a user is assigned an **Audio Conferencing** license and the user creates a new Skype for Business or Microsoft Teams meeting in Outlook or Outlook on the web, the dial-in phone numbers and conferencing IDs are added automatically to the meeting invite.

How does a user schedule and start a meeting when all attendees will be using a phone to dial in?

Scheduling a meeting that will be joined by all attendees using a phone to dial in is not different from scheduling a regular online meeting. However, there are two ways to start a meeting on which all of the participants use a phone to dial in:

- **Option #1:** By default, if the meeting organizer and all participants are joining a meeting using a phone, the meeting organizer needs to input her Audio Conferencing PIN to start it. Callers get asked if they want to authenticate as the organizer of a given meeting when they dial the phone number of an online meeting. All participants that join the meeting via dial-in before the organizer starts will be placed in the lobby and will listen to music on hold. For Skype for Business meetings, once the organizer starts it by inputting his or her Audio Conferencing PIN, all participants in the lobby will automatically join the meeting. For Microsoft Teams meetings, the participants will join the meeting according to the value of the automatically admit people setting in the organizer's meeting policy.
- **Option #2:** The "Allow unauthenticated callers to be the first people in a meeting" setting is disabled by default. If the setting is enabled for a given organizer, then all meetings scheduled by that organizer can be started before the organizer inputs the Audio Conferencing PIN. When this setting is enabled, the meeting will start as soon as the first participant joins it via a dial-in phone number, and the first participant won't be put in the lobby. For more information, see, [Manage Audio Conferencing settings for a user in Microsoft Teams](#) or [Manage Audio Conferencing settings for a user in Skype for Business Online](#).

[Set up Skype for Business Online](#)

[Phone numbers for Audio Conferencing in Microsoft Teams](#)

[Phone numbers for Audio Conferencing in Skype for Business Online](#)

Try or purchase Audio Conferencing in Microsoft 365 for Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Sometimes people in your organization will need to use a phone to call in to a meeting. Microsoft Teams includes the Audio Conferencing feature for just this situation! People can call in to Microsoft Teams meetings using a phone, instead of using the Microsoft Teams app on a mobile device or PC.

You only need to set up audio conferencing for people who plan to schedule or lead meetings. Meeting attendees who call in to the meeting don't need any licenses assigned to them and don't need other setup.

For pricing info, see [Pricing for Audio Conferencing](#).

Step 1: Buy and assign Audio Conferencing licenses

You must be a [global administrator or billing administrator](#) to perform these steps.

To buy and assign user Audio Conferencing licenses

1. Find out if **Audio Conferencing** is available in your country/region. [Countries and region availability for Audio Conferencing and Calling Plans](#).
2. Get your **Audio Conferencing** licenses. If you want to:
 - **Try it** before you buy it: you can sign up for an Office 365 Enterprise E5 free trial that includes Audio Conferencing. See [Office 365 Enterprise E5 Trial](#).
 - **Buy it**: see [Microsoft Teams add-on licensing](#).
3. [Assign licenses to users](#) in your organization who are going to schedule or lead meetings.
4. If you purchased audio conferencing add-on licenses and Communications Credits licenses, assign them too. For instructions, see [Assign Microsoft Teams add-on licenses](#).

To buy and assign pay-per-minute Audio Conferencing licenses

If you're a Volume and Licensing customer, you can get pay-per-minute Audio Conferencing licenses. For additional information on pay-per-minute Audio Conferencing licenses, see [Audio Conferencing pay-per-minute](#).

1. Find out if **Audio Conferencing** is available in your country/region. [Country and region availability for Audio Conferencing and Calling Plans](#).
2. Get your **Audio Conferencing** licenses. To acquire pay-per-minute licenses, please contact your account representative.
3. [Set up Communications Credits for your organization](#) for your organization. To set up Communications Credits, see [What are Communications Credits?](#)

IMPORTANT

If Communications Credits haven't been set up, Audio Conferencing won't work for any users with pay-per-minute licenses.

4. [Assign licenses to users](#) in your organization who are going to schedule or lead meetings.

NOTE

If you have Audio Conferencing pay-per-minute licenses, you must assign a Communications Credits license separately to each user as well.

Step 2: Set the audio conferencing provider for people who lead or schedule meetings

When you assign an **Audio Conferencing** license to people in your organization who don't have Skype for Business integrated with a 3rd party audio conferencing provider, they are all set up and ready to go! (You don't have to set their audio conferencing provider.)

If you have users enabled with a 3rd party audio conferencing provider, you must change the provider of those users to Microsoft. To change the provider for a user, see [Assign Microsoft as the audio conferencing provider](#).

Step 3: Other admin tasks

The following steps are **optional**, but a lot of admins like to do them:

1. [Customize meeting invitations](#). The dial-in numbers that are set for the user will be automatically added to the meeting invitations that are sent to attendees. However, you can add your own help and legal links, a text message, and small company graphic.
2. [Set the phone numbers included on invites](#). This is the phone number that will show up in the meeting that is scheduled by a user.
3. [Set auto attendant languages for Audio Conferencing](#) that the Audio Conferencing auto attendant uses to greet a caller when they dial in to an audio conferencing phone number. This step only applies if you're using Microsoft as your audio conferencing provider.
4. [Set the length of the PIN for Audio Conferencing meetings](#).

NOTE

This feature is not yet available to customers using Office 365 operated by 21Vianet in China. To learn more, see [Learn about Office 365 operated by 21Vianet](#).

[Phone numbers for Audio Conferencing](#)

[Set options for online meetings and conference calls](#)

Plan for Operator Connect Conferencing

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Audio Conferencing provides the ability to dial into a conference and dial out from a conference using Public Switched Telephone Network (PSTN) phone numbers. Participants join Microsoft Teams meetings using an audio-only conferencing bridge.

With Operator Connect Conferencing capabilities, organizations can use phone numbers from a third-party operator to join Microsoft Teams meetings. If your current operator is part of the Microsoft Operator Connect program, you can add phone numbers from your operator to your Audio Conferencing bridge and use them to join meetings.

Without Operator Connect Conferencing capabilities, organizations can only use phone numbers provided by Microsoft for their audio conferencing bridge.

NOTE

A telephone number provider that is part of the Microsoft Operator Connect program is referenced in this article as an "operator."

To see if your operator participates in the Microsoft Operator Connect program, see the [Microsoft 365 Operator Connect directory](#).

This article describes Operator Connect Conferencing:

- [Benefits](#)
- [Licensing requirements and billing](#)
- [Additional information on Microsoft Audio Conferencing](#)

For information about configuring Operator Connect Conferencing, see [Configure Operator Connect Conferencing](#).

If some of your organization's users need to make external calls to PSTN phone numbers, you still need a calling plan. To learn about using a third-party operator for external PSTN connectivity, see [Plan for Operator Connect](#).

Benefits

Operator Connect Conferencing provides the following benefits:

- **Flexible allocation of phone numbers between your operator and Microsoft.** Use phone numbers from both Microsoft and your operator (with a Microsoft Audio Conferencing Standard subscription only), or only use phone numbers from your operator (with an Operator Connect Conferencing license only).
- **Operator-managed infrastructure.** Your operator manages the Session Border Controllers (SBCs) and the interconnectivity with Microsoft, saving you from extra hardware purchases and management.
- **Faster, easier deployment.** Quickly connect to your operator and assign phone numbers to your Audio Conferencing bridge from the Teams admin center.
- **Enhanced support and reliability.** Operators provide technical support and shared service level agreements to improve service support, and direct peering powered by Azure creates a one-to-one network connection for enhanced reliability.

Operator Connect Conferencing might be the right solution for your organization if:

- You want to **keep your contracts** with your existing telephone number provider
- You want to **expand the global coverage** of your existing Microsoft Audio Conferencing bridge
- You want to **source phone numbers for Audio Conferencing** from a new telephone number provider
- **Microsoft Audio Conferencing isn't available in your geographic location**
- You want to **leverage an operator for Audio Conferencing services with a pay-per-minute model**, such as use toll-free numbers and make outbound calls from Teams meetings to phone numbers in countries not included in your subscription

Licensing requirements and billing

Users who need Operator Connect Conferencing numbers to join the meetings they organize must have either a Microsoft Audio Conferencing Standard subscription or a Microsoft Operator Connect Conferencing license assigned to them.

Audio Conferencing Standard subscription

A Microsoft Audio Conferencing Standard subscription can be purchased as an add-on to a Microsoft Teams license and is also included in Microsoft 365 E5 and Office 365 E5 subscriptions.

The Audio Conferencing Standard subscription allows subscribers to use phone numbers from Microsoft and expand their audio conferencing bridges with numbers from an operator. Subscribers can also decide which outbound calls from Teams meetings to route via Microsoft and which calls to route via an operator.

For more information, see [Configure Operator Connect Conferencing](#).

Operator Connect Conferencing license

A Microsoft Operator Connect Conferencing license can be acquired as an add-on to a Microsoft Teams license.

The Operator Connect Conferencing license allows subscribers to use phone numbers from an operator, but it doesn't include phone numbers from Microsoft. All outbound calls from Teams meetings must be routed via an operator.

For more information, see [Configure Operator Connect Conferencing](#).

NOTE

Meeting participants don't require an Audio Conferencing Standard Subscription license or an Operator Connect Conferencing license to join a meeting organized by a user with Operator Connect Conferencing capabilities.

With Operator Connect Conferencing, Microsoft bills your organization according to the type of Audio Conferencing license used by your organization, Microsoft Audio Conferencing or Operator Connect Conferencing, and the use of any phone numbers provided by Microsoft.

Your operator bills your organization for the use of Operator Connect Conferencing numbers they provide.

Additional information on Microsoft Audio Conferencing

Microsoft Audio Conferencing allows participants to join Microsoft Teams meetings by dialing in with a PSTN phone number or by dialing out to a PSTN phone number. For more information on Microsoft Audio Conferencing capabilities available to your organization, see [Audio Conferencing in Microsoft 365](#).

Configure Operator Connect Conferencing

12/7/2021 • 7 minutes to read • [Edit Online](#)

This article details how to configure Operator Connect Conferencing for your organization and users.

Before configuring Operator Connect Conferencing, read [Plan for Operator Connect Conferencing](#) for information about benefits and licensing requirements.

The topics covered in this article include:

- [Set up an operator](#)
- [Acquire numbers for your Audio Conferencing bridge](#)
- [Change the default phone numbers that are included in the meeting invites of users](#)
- [Sending outbound calls from Microsoft Teams meetings through an operator](#)
- [Manage your operators](#)
- [Release numbers from your Audio Conferencing bridge](#)
- [Additional information on managing Microsoft Audio Conferencing](#)

Set up an operator

You can set up, edit, and remove operators in the Teams admin center. In the left navigation pane, go to **Voice > Operators**.

To set up an operator:

1. **Choose an operator.** In the **All operators** tab, filter available operators by region or service to find the right operator for your voice needs. Then, select the operator you want to use. For Operator Connect Conferencing, verify that your operator has **Conferencing** listed as an available product.
2. **Select countries.** Under **Operator settings**, select the countries you want to enable with your selected operator.
3. **Provide contact information** Your contact information, including your full name and email address, will be shared with your operator. You can change this information later. Additionally, you'll need to provide company size, with the option to provide your phone number. Operators use this information to contact you with more details about Operator Connect Conferencing.
4. Accept the data transfer notice.
5. **Add your operator.** Select **Add as my operator** to save.

Acquire numbers for your Audio Conferencing bridge

Your organization's Audio Conferencing bridge includes phone numbers available to all users in your organization to join Microsoft Teams meetings with PSTN phone numbers. You can see the phone numbers associated with your organization's Audio Conferencing bridge in the Teams Admin Center under **Meetings > Conference Bridges**.

To acquire phone numbers for your Audio Conferencing bridge, follow these steps:

1. **Audio Conferencing Standard subscription or Operator Connect Conferencing license.** Users that need Operator Connect Conferencing numbers to join the meetings that they organize need to have an Audio Conferencing Standard subscription license or an Operator Connect Conferencing license

assigned to them. For more information, see [Plan for Operator Connect Conferencing](#).

2. **Acquire numbers.** Go to your operator's website to order and acquire phone numbers. For a list of operator websites, go to the [Microsoft 365 Operator Connect directory](#). You'll need to provide your tenant ID. If you don't know your tenant ID, see [Find your Microsoft 365 tenant ID](#). Once your operator completes the order, they'll upload numbers to your tenant. You can view the numbers and the provider in the Teams admin center by going to **Voice > Phone numbers**.
3. **Assign numbers to your Audio Conferencing bridge.** You can assign numbers to your Audio Conferencing bridge from the Teams admin center under **Meetings > Conference Bridges > Add**. For more information, see [Change the phone numbers on your Audio Conferencing bridge](#).

NOTE

You can't assign Operator Connect Conferencing numbers as default numbers of a bridge. Once a phone number is assigned to your Audio Conferencing bridge, the number will be listed in the **Find a local number** page included in meeting invites of users in your organization with an Audio Conferencing license or an Operator Connect Conferencing license.

To route outbound calls through an operator, see the [Sending outbound calls from Teams meetings through an operator](#) section further down in this article.

Change the default phone numbers that are included in the meeting invites of users

This step is optional.

The default phone numbers of a user are the ones included in their meeting invites when they schedule a meeting. You can update the phone numbers included in the meeting invites of users in the Teams Admin Center under **Users > Manage users**. To update the phone numbers included in the meeting invites of users, select the user, and select **Edit** in the **Audio Conferencing** section.

After the changes have been applied, new meeting invites of organizers will include the new default phone numbers. However, existing meeting invites that were scheduled before the change will keep the original default numbers.

Sending outbound calls from Microsoft Teams meetings through an operator

If you have a Microsoft Audio Conferencing Standard subscription or an Operator Connect Conferencing license, you can configure the Audio Conferencing service to route all or a set of outbound calls from Teams meetings through your operator by setting up an Audio Conferencing Routing policy.

NOTE

With an Operator Connect Conferencing license, outbound calls can only go through your operator. If you have Operator Connect Conferencing licenses, you need to configure the service as described below to enable outbound calls from Teams meetings to telephone numbers.

You can apply Audio Conferencing Routing policies at the user level, meaning that your operator routes only the outbound calls from Teams meetings organized by users with the associated policy. You can also apply these policies at the global level, meaning that your operator routes outbound calls from Teams meetings organized by all users in your organization.

Using PowerShell, create your organization's new Audio Conferencing Routing policy. To specify an operator as the primary route for outbound calls from Teams meetings, follow the steps below using the PowerShell commands indicated:

1. [Step 1: Add a new string to the Online PSTN Usage policy](#)
2. [Step 2: Create a new Online Voice Route policy](#)
3. [Step 3: Create a new Online Audio Conferencing Routing policy](#)
4. [Step 4: Assign the new policy to users](#)

Step 1: Add a new string to the Online PSTN Usage policy

Read [Set-CsOnlinePstnUsage](#) for more information on using this cmdlet.

```
Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="International"}
```

Step 2: Create a new Online Voice Route policy

Read [Set-CsOnlineVoiceRoute](#) for more information on using this cmdlet.

```
New-CsOnlineVoiceRoute -Identity "International" -NumberPattern "\d+" -OnlinePstnUsages "International" -  
BridgeSourcePhoneNumber <an Operator Connect Conferencing number assigned to your Audio Conferencing bridge>
```

Step 3: Create a new Online Audio Conferencing Routing policy

```
New-CsOnlineAudioConferencingRoutingPolicy "International Policy" -OnlinePstnUsages "International"
```

Step 4: Assign the new policy to users

```
Grant-CsOnlineAudioConferencingRoutingPolicy -Identity <identity of the organizer of the meeting> -  
PolicyName "International Policy"
```

NOTE

To set an Audio Conferencing Routing policy as global and apply it to all users in your organization, you can use the

`-Global` parameter instead of the `-Identity` parameter. For example,

```
Grant-CsOnlineAudioConferencingRoutingPolicy -Global -PolicyName "International Policy"
```

When you create an Audio Conferencing Routing policy and apply it to a user, the operator that provides the phone number specified in the `BridgeSourcePhoneNumber` parameter routes Teams outbound calls to PSTN phone numbers. Additionally, the `BridgeSourcePhoneNumber` parameter specifies the phone number to use as the calling line identification phone number of outbound calls to PSTN phone numbers.

The pattern specified in the `NumberPattern` is of regex form, and it specifies which calls to route through your operator. The `"\d+"` pattern in the example above matches all outbound calls from Teams meetings. You can also set the `NumberPattern` parameter as `"^+1(425|206)(\d{7})$"`, which matches dialed numbers with the following formats: +1 425 XXX XX XX or +1 206 XXX XX XX, or `"^+1(\d{10})$"`, which matches dialed numbers with the following format: +1 425 XXX XX XX.

Once you assign an Audio Conferencing Routing policy to a user, all calls from their meetings to a phone number that matches the regex specified in their Audio Conferencing Routing policy routes through your operator, including **Call me at** calls and calls initiated through the **Invite someone or dial a number** meeting option.

Manage your operators

From the **My operator** tab, you can view your operators, their status, and make the following changes to your selections:

- Manage operator services by country
- Suspend an operator
- Remove an operator

NOTE

Before removing an operator from your organization or from a country, you must remove all phone numbers assigned to the users and your Audio Conferencing bridge, then contact the operator to release the numbers.

Release numbers from your Audio Conferencing bridge

To release phone numbers from your Audio Conferencing bridge from the Teams admin center, see **Steps when you are unassigning a service phone number for a conferencing bridge** in [Change the phone numbers on your Audio Conferencing bridge](#).

Additional information on managing Microsoft Audio Conferencing

For additional information on how to manage Microsoft Audio Conferencing for your organization, see the following articles:

- Managing the Microsoft Audio Conferencing service settings for your organization: [Manage the Audio Conferencing settings for your organization in Microsoft Teams](#)
- Managing the Microsoft Audio Conferencing service setting of the users in your organization: [Manage the Audio Conferencing settings for a user in Microsoft Teams](#)
- Changing the auto attendant languages of your Audio Conferencing phone numbers: [Set auto attendant languages for Audio Conferencing in Microsoft Teams](#)

Office 365 Audio Conferencing Extended Dial-out Minutes to US and Canada

12/7/2021 • 2 minutes to read • [Edit Online](#)

For customers who are adopting our Audio Conferencing service and have a high business need for dialing out to US and Canada, Microsoft now provides an add-on offer that allows virtually unlimited with fair use policy US and Canada dial-out minutes for any audio conferencing user. Meeting organizers with this add-on SKU can make virtually unlimited with fair use policy dial-out calls to US and Canada without deducting their tenant's Zone A country dial-out usage pool or Communications Credits.¹

OFFER NAME	UNLIMITED DIAL-OUT MINUTES TO US CANADA
What are the unlimited dial-out countries included in the offer?	US and Canada.
Who needs to have the license assigned?	The meeting organizer needs to have the license assigned. The user initializing the call doesn't need to have the license.
Are there any prerequisites?	Audio Conferencing needs to be enabled. It can be either subscription or per-minute service.
Who can purchase this offer?	Any country or region where Audio Conferencing can be purchased. Read more .
Are the minutes pooled?	No. A meeting organizer will have virtually unlimited with fair use policy dial-out minutes to US/Canada per month.
Will this new add-on SKU replace the 60 minutes included with Audio Conferencing?	No. The existing Audio Conferencing 60 minutes per user per month, pooled at the tenant level, will continue to apply to all Zone A dial-out conferencing countries.
What is the channel availability?	It is available on EA/EAS, EES, CSP, and Web Direct.
What is the segment availability?	It is available for Commercial (including WW Commercial Public Sectors), Education, Nonprofit, and US GCC
What if a user with Extended Dial-out Minutes to USA/CAN is located in the US and travels to another country outside of an Audio-Conferencing sell-to market? Will their dial-out service work?	Yes. If a user based in the US (meaning their Office 365 license is assigned in the US) traveled to Zimbabwe (a market currently not in a sell-to location for Audio Conferencing), all dial-out minutes made to the US or Canada would continue to apply to their Extended Dial-out Minutes to USA/CAN add-on regardless of where the call takes place.

¹ Microsoft reserves the right to limit or terminate use of the capability in the event of abnormal usage or suspicion of use for fraudulent purposes.

Audio Conferencing complimentary dial-out period

12/7/2021 • 3 minutes to read • [Edit Online](#)

Skype for Business PSTN Services

Customers may use Microsoft 365 or Office 365 Calling Plan and Office 365 Audio Conferencing as permitted in the Skype for Business Online PSTN Services Use Terms and Customer's volume licensing agreement. The PSTN Services Use Terms may be found at [Licensing Terms and Documentation](#).

End of complimentary dial out period

The complimentary dial-out capability ended on December 1, 2019. For more information, see [Audio Conferencing subscription dial out and call me at benefit](#).

This change did not take place for countries where the Audio Conferencing subscription is available, but we do not currently enable setting up Communications Credits. These specific countries are Russia, South Korea, and Taiwan.

Complimentary dial out period details

For customers who are adopting our Microsoft 365 or Office 365 Audio Conferencing service, Microsoft is providing an additional complimentary benefit related to dial out from meetings that are organized by users who are assigned a Microsoft 365 or Office 365 Audio Conferencing subscription license through November 2019. During this complimentary period, Microsoft allows meeting organizers or authorized attendees, as defined in meeting policy settings, to make dial-out calls from within the meeting to non-premium phone numbers in the 44 [Zone A countries and regions](#). This benefit is applicable to Audio Conferencing monthly subscription licenses and does not extend to Audio Conferencing pay-per-minute licenses.

In addition, there is a 900-minute limit during the complimentary dial out period as such:

Users with a license usage location (the location is the user country location that is defined in the licensing area of the Microsoft 365 admin center) in *any_* country can dial out from a conference to any of the 44 [Zone A countries and regions](#). Each user receives 900 minutes per user per month to *any* of the [Zone A countries and regions](#), which are pooled at the tenant level. For example, a customer has purchased 115 Audio Conferencing subscription licenses and has 10 users in the US, 100 users in the UK, and 5 users in India, all with Audio Conferencing subscription licenses assigned to their users.

- All 115 users share a pool of $(115 \text{ users} \times 900 \text{ min}) = 103,500$ conferencing dial-out out minutes per calendar month, which can be used to place outbound calls to any of the [Zone A countries and regions](#).
- All calls exceeding the 103,500 minutes per calendar month are billed per minute using Communications Credits at our published rates to that destination. (Note: Tenant must set up Communications Credits and assign the Communications Credits license to the meeting organizer).
- All outbound calls to destinations not in the [Zone A countries and regions](#) list are billed per minute using Communications Credits at our published rates to that destination (provided tenant has set up Communications Credits and assigned the Communications Credits license to the meeting organizer).

NOTE

You can monitor the usage against dial-out minute pool in the Skype for Business Admin Center. In the Microsoft Teams & Skype Admin Center, go to **Legacy portal > Reports > PSTN Minute Pools**. This complimentary minute pool will be labeled in the report as "Outbound Calls to Zone A countries and regions."

Email notifications will be sent to all tenant administrators of a given customer when the utilization of the tenant's dial-out minutes pool has reached 80% and 100%.

For dial-out calls that are billed per minute (calls exceeding the tenant dial-out minute pool or calls to destinations not in the [Zone A countries and regions](#) list), the calls and their associated rates are based primarily on the destination of the call and not the country or region of the organizer or the participant initiating the dial-out call. For example, a call to a phone number in France will be billed with the same rate if it is initiated by a meeting participant in the United States or one in France.

For more information about Communication Credits, see [Communications Credits](#).

Audio Conferencing subscription "Dial-Out"/"Call Me At" minutes benefit

12/7/2021 • 4 minutes to read • [Edit Online](#)

Microsoft Teams and Skype for Business PSTN Audio Conferencing

Each Audio Conferencing subscription provides 60 minutes per user per month that can be used to dial out to non-premium numbers in ANY of the Zone A countries as described in this document. Your tenant dial-out minute pool size is based on *purchased* licenses. This benefit is applicable to Audio Conferencing *monthly subscription* licenses and does not extend to Audio Conferencing pay-per-minute licenses.

NOTE

As of October 22, 2020, the dial-out minute pool size of our tenant is based on the number of *purchased* Audio Conferencing subscription licenses. Before, the dial-out minute pool size was based on the number of licenses that were *assigned* to users.

NOTE

The end of the [complimentary dial-out period](#) did not take place on November 30, 2019, for countries where the Audio Conferencing subscription is available, but we do not currently provide the ability to set up Communications Credits. These specific countries are Russia, South Korea, and Taiwan.

Audio Conferencing "Dial Out From a Meeting" & "Call Me At" details

For customers adopting our Audio Conferencing service, Microsoft provides the ability to dial out from meetings organized by users assigned an Audio Conferencing subscription license. Dial-out calls to countries not included in the [Zone A countries and regions](#) list are charged per minute using Communications Credits. For dial-out calls that are billed per minute (calls exceeding the tenant dial-out minute pool or calls to destinations not in the [Zone A countries and regions](#) list), the calls and their associated rates are based on the destination of the call and not the organizer's country of residence or the meeting participant initiating the dial-out call. For example, an audio conference dial-out call to a phone number in France, which is a Zone A country, will be billed at the same per-minute rate if it were initiated by a meeting participant in the United States, France, or Zimbabwe.

MEETING ORGANIZER LICENSE USAGE LOCATION	DESTINATION DIALED	CAN I USE MY DIAL-OUT MINUTE POOL MINUTES?	DO I NEED COMMUNICATIONS CREDITS?
United States	United States	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
United States	United Kingdom	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
United States	Zimbabwe	No	Yes on <i>ALL</i> calls

MEETING ORGANIZER LICENSE USAGE LOCATION	DESTINATION DIALED	CAN I USE MY DIAL-OUT MINUTE POOL MINUTES?	DO I NEED COMMUNICATIONS CREDITS?
United Kingdom	United Kingdom	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
United Kingdom	United States	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
United Kingdom	Zimbabwe	No	Yes on <i>ALL</i> calls
Zimbabwe	Zimbabwe	No	Yes on <i>ALL</i> calls
Zimbabwe	United States	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
Zimbabwe	United Kingdom	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
Cook Islands	Cook Islands	No	Yes on <i>ALL</i> calls
Cook Islands	United States	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool
Cook Islands	United Kingdom	Yes (Zone A country)	Yes <i>after</i> consuming the tenant minute pool

How are minute pools calculated?

Consider the following example. A customer has purchased 115 Audio Conferencing subscription licenses and has 10 users in the United States, 100 users in the United Kingdom, and 5 users in Zimbabwe, all with Audio Conferencing subscription licenses assigned. All 115 users share a pool of (115 users x 60 min = 6,900 conferencing dial-out out minutes per calendar month) to place outbound calls to non-premium numbers in any of the [Zone A countries and regions](#), *regardless* of where the meeting organizer is licensed or physically located. For example, a Zimbabwe meeting organizer will be able to dial out to any of the [Zone A countries and regions](#) up to the minute pool limit.

- All dial-out calls exceeding 6,900 minutes per calendar month are billed per minute using Communications Credits at our published rates to that destination.

NOTE

The customer must set up [Communications Credits](#) and assign the Communications Credits license to the meeting organizer.

- All dial-out calls to destinations not in the [Zone A countries and regions](#) list are billed per minute using Communications Credits at our published rates to that destination (provided the customer has set up Communications Credits and assigned the Communications Credits license to the meeting organizer).

How can I monitor minute my pool usage?

- You can monitor the usage against your dial-out minute pool in the Microsoft Teams admin center. In the

left navigation, go to **Analytics & reports** > **Usage reports**, and then select **PSTN minute pools**. The Zone A dial-out minute pool will be labeled in the report as "Outbound Calls to Zone A Countries."

- Email notifications will be sent to the following admins when the utilization of your organization's dial-out minutes pool has reached 80 percent and 100 percent:
 - Billing Administrator
 - Skype for Business Administrator
 - Global Administrator
 - User Administrator
 - Helpdesk Administrator
 - Service Support Administrator
 - Azure AD Joined Device Local Administrator
 - Application Administrator
 - License Administrator
 - Cloud Device Administrator
 - Authentication Administrator
 - Privileged Authentication Administrator
 - Teams Communications Administrator
 - Teams Communications Support Engineer
 - Teams Communications Support Specialist
 - Teams Administrator

For additional information on Communication Credits, see [Communications Credits](#).

Set up Audio Conferencing for Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Sometimes people in your organization will need to use a phone to call in to a meeting. Microsoft Teams includes the audio conferencing feature for just this situation! People can call in to Teams meetings using a phone, instead of using the Teams app on a mobile device or PC.

You only need to set up Audio Conferencing for people who plan to schedule or lead meetings. Meeting attendees who dial in don't need any licenses assigned to them or other setup.

For frequently asked questions about Audio Conferencing, see [Audio Conferencing common questions](#).

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Step 1: Find out if Audio Conferencing is available in your country/region

Go to [Country and region availability for Audio Conferencing and Calling Plans](#) and select your country or region to get availability information about Audio Conferencing, as well as information about Phone System, Calling Plans, toll and toll-free numbers, and Communications Credits.

Step 2: Get and assign licenses

1. For Audio Conferencing, you need a license for each user who will set up dial-in meetings. To learn which licenses you need to buy for Audio Conferencing and how much they will cost, see [Microsoft Teams add-on licensing](#).

NOTE

Audio Conferencing is included in Office 365 Enterprise E5 licenses and as an add-on.

2. After you buy the Audio Conferencing licenses, you will need to assign them to those people in your organization who are going to schedule or lead meetings. See [Assign licenses to users in Microsoft 365 or Office 365 for business](#) you purchased to the people in your organization who are going to schedule or lead meetings.
3. We also recommend that you assign Communications Credits licenses (they don't cost anything) to the same people you assigned licenses to in the previous step. To learn how to set up Communications Credits, see [Set up Communications Credits for your organization](#).

NOTE

You can also set up [pay-per-minute Audio Conferencing](#).

Step 3: Get service numbers for your conferencing bridges

For Audio Conferencing, you can't use phone numbers for users; you will need to get service numbers. You can get either toll or toll-free service numbers for your conferencing bridges. There are three ways to get toll and toll-free service numbers:

- **Use the Microsoft Teams admin center.** For some countries/regions, you can get service numbers for your conferencing bridges using the Microsoft Teams admin center. See [Getting service phone numbers](#).
- **Port your existing service numbers.** To port or transfer existing numbers from your current service provider or phone carrier to Microsoft 365 or Office 365. You can see [Transfer phone numbers to Teams](#) or [Manage phone numbers for your organization](#) for more information to help you do this.
- **Use a request form for new numbers.** Sometimes (depending on your country/region) you won't be able to get your new service numbers using the Microsoft Teams admin center, or you will need specific phone numbers or area codes. If so, you will need to download a form and send it back to us. See [Manage phone numbers for your organization](#) for more information.

Step 4: Assign a service number to the conferencing bridge

Once you get your toll and/or toll-free phone numbers for your conferencing bridge, you need to assign the numbers so they can be used on meeting invitations.

Follow these steps to assign a new phone number to your audio conferencing bridge.

Using the Microsoft Teams admin center:

1. From the Home, go to **Voice > Phone numbers**.
2. Select the phone number, and click **Assign**.

For more details, see [Change the phone numbers on your Audio Conferencing bridge](#).

Step 5: Set the default and alternate languages for a conferencing bridge

Next, you want to [Set auto attendant languages for Audio Conferencing in Microsoft Teams](#) that the conferencing auto attendant uses to greet callers when they dial in to a phone number for Audio Conferencing.

Using the Microsoft Teams admin center:

1. From the Home, go to **Meetings > Conference bridges**.
2. Select the conferencing bridge phone number, click **Edit**, and then choose the default language.

Step 6: Set your conferencing bridge settings

After setting up your conferencing bridge, verify that the default settings such as entry/exit notifications and PIN length are the ones you want to use; if they're not, you can change them.

Using the Microsoft Teams admin center:

1. From the Home, go to **Meetings > Conference bridges**.
2. Select **Bridge settings**. This will open the **Bridge settings** pane.

For more details, see [Change the settings for an Audio Conferencing bridge](#).

Step 7: Assign dial-in phone numbers for users who lead meetings

After you have created an Audio Conferencing bridge, you need to set the toll and toll-free numbers for your

users.

You will need to do this for all of the people in your organization who lead or schedule meetings.

Using the Microsoft Teams admin center:

1. From the Home, click **Users**, select the user from the list, and select **Edit**.
2. Select **Edit** next to **Audio Conferencing**, and then in the **Audio Conferencing** pane, choose a number in the **Toll number** and **Toll-free** number lists.

If you need more details, see [Assign Microsoft as the audio conferencing provider](#).

Step 8: Set up meeting invitations (optional)

The dial-in numbers that are set for the user will be automatically added to the meeting invitations that are sent to meeting attendees. However, you can add your own help and legal links, a text message, and small company graphic if you want. See [Customize meeting invitations](#).

[Phone numbers for Audio Conferencing in Microsoft Teams](#)

[Set options for online meetings and conference calls](#)

Set up Audio Conferencing for small and medium businesses

12/7/2021 • 4 minutes to read • [Edit Online](#)

With Audio Conferencing, people can call in to Teams meetings using a phone instead of using the Teams app on their mobile device or from their computer.

If you're a small or medium-sized business with up to 300 users and you currently don't have any Audio Conferencing licenses, you can get Audio Conferencing free for one year. This free offer is available starting October 1, 2020.

The Audio Conferencing add-on license can be applied to users who have Microsoft 365 Business Basic, Business Standard, Business Premium, Enterprise E1, or Enterprise E3 licenses. To learn more, see [Teams add-on licenses](#)

NOTE

If you have Enterprise E5 or Microsoft 365 Business Voice, you won't be able to use the free Audio Conferencing offer because these licenses already include Audio Conferencing.

In this article, we'll walk you through how to set up Audio Conferencing. You only need to set up Audio Conferencing for people who plan to schedule or lead meetings. Meeting attendees who call in to meetings don't need licenses or other setup. To learn more, see [Audio Conferencing](#).

Set up Audio Conferencing

When you set up Audio Conferencing, a phone number is automatically assigned to your conferencing bridge so that it can be used in meeting invitations. The phone number that's assigned as the default number of your conferencing bridge will be one from the country or region of your organization. This phone number is a toll number, in which long-distance charges may apply.

NOTE

You can also use a toll-free number, which requires a few additional steps. To learn more about phone numbers for your conferencing bridge, see [Audio Conferencing phone numbers](#) later in this article.

Step 1: Get Audio Conferencing licenses

Get one Audio Conferencing license for each person who will lead meetings. Use the Microsoft 365 admin center to do this.

1. In the Microsoft 365 admin center, go to **Billing > Purchase services**, and then at the bottom of the page, select **Add-ons**.
2. Select **Microsoft 365 Audio Conferencing Adoption Promo > Details**, and then select **Get now**.
3. Enter the number of licenses you need for your meeting organizers, and then complete your order.

The screenshot shows the 'Admin' page for the 'Microsoft 365 Audio Conferencing Adoption Promo'. At the top, there are links for 'Find a solution provider', 'View my subscriptions', and a 'Cart (0)' icon. The main heading is 'Microsoft 365 Audio Conferencing Adoption Promo' with a price of '\$0.00 user/month'. Below this, it states: 'Enables users to dial-in a number to join meetings, or dial-out to bring participants into the meeting. There are base pre-requisites required to purchase this offering. (Plan b0abc)'. It also lists 'Office 2016 desktop & mobile apps' as 'Not included' and 'Office 365 services' as included, with a blue 'S' icon. Under 'How do you want to pay?', there are two buttons: 'Pay monthly' and 'Pay for a full year'. The 'Annual commitment: (\$0.00 user/month)' is shown. Below this, 'How many users do you want?' is set to '1' with '+' and '-' buttons. A checkbox 'Automatically assign to all of your users with no licenses' is checked. At the bottom, there are 'Check out now' and 'Add to cart' buttons, and a link 'Need help with your order?'.

NOTE

Clear or select the **Automatically assign to all of your users with no licenses**, depending on whether you want to automatically assign an Audio Conferencing license to all users who don't have this license.

Step 2: Assign an Audio Conferencing license to users who lead meetings

Assign a license to each person who will lead meetings. Use the Microsoft 365 admin center to do this.

Assign a license to one user

1. In the Microsoft 365 admin center, go to **Users > Active users**.
2. Select the row of the user you want to assign the license to, and then in the pane, select **Licenses and Apps**.
3. Select the **Microsoft 365 Audio Conferencing** check box, and then select **Save changes**.

Assign a license to multiple users

1. In the Microsoft 365 admin center, go to **Users > Active users**.
2. Select the circles next to the users you want to assign the license to, and then select **Manage product licenses**.
3. In the **Manage product licenses** pane, select **Assign more**.
4. Select the **Microsoft 365 Audio Conferencing** check box, and then select **Save changes**.

Schedule Teams meetings in Outlook

Your meeting organizers can now schedule meetings in Outlook. In Outlook, go to **Calendar**, and then select the **New Teams meeting** button. The meeting dial-in numbers and the conference ID are automatically added to the meeting invitation that's sent to meeting attendees. To learn more, see [Schedule a Teams meeting in Outlook](#).

NOTE

If you want, you can customize meeting invitations to add your company logo, links to your support website and legal disclaimer, and a text-only footer. To learn more, see [Customize meeting invitations](#).

Audio Conferencing phone numbers

There are two types of numbers that you can use for your conferencing bridge. You can use either **shared numbers** (as in the [Set up Audio Conferencing](#) section earlier in this article) or **dedicated numbers**. Here's more information about each.

Shared numbers

A shared number is a number that's shared across all organizations. Shared numbers are toll numbers and are automatically assigned when you set up Audio Conferencing.

To see the default number that's assigned to your conferencing bridge, in the left navigation of the Microsoft Teams admin center, go to **Meetings > Conference bridges**, and then find the number for the location that's nearest to you.

Dedicated numbers

A dedicated number is a number that's available only to your users. A dedicated number can be a toll number or a toll-free number. To use a dedicated number, you'll have to first get the number, assign it to your conferencing bridge, and then assign the number to each person who will lead meetings.

There are a couple ways to get a dedicated number. You can get a number from Microsoft or transfer (port) an existing number from your current service provider to Microsoft. To learn more about how to do this, see [Getting service numbers](#).

Keep in mind that if you use a toll-free number, you have to first assign a Communications Credits license to each person who will lead meetings. To learn more, see [Set up Communications Credits for your organization](#).

After you have your number, assign it to your conference bridge. Use the Microsoft Teams admin center to do this.

1. In the left navigation of the Microsoft Teams admin center, go to **Meetings > Conference bridges**.
2. Select **Add**, and then select **Toll number** or **Toll-free number**.
3. In the **Add phone number** pane, select the number, and then select **Apply**.

Then, assign the number to each person who will lead meetings. Use the Microsoft Teams admin center to do this.

1. In the left navigation of the Microsoft Teams admin center, select **Users**, click the display name of the user, and select **Edit**.
2. Select **Edit** next to **Audio Conferencing**, and then in the **Audio Conferencing** pane, select a number in the **Toll number** or **free** number lists, and then select **Apply**.

Related topics

Change the phone numbers on your Audio Conferencing bridge

12/7/2021 • 7 minutes to read • [Edit Online](#)

When you buy **Audio Conferencing** licenses, Microsoft is hosting your audio conferencing bridge for your organization. The audio conferencing bridge gives out dial-in phone numbers from different locations so that meeting organizers and participants can use them to join Skype for Business or Microsoft Teams meetings using a phone.

In addition to the phone numbers already assigned to your conferencing bridge, you can [get additional service numbers](#) (toll and toll-free numbers used for audio conferencing) from other locations, and then assign them to the conferencing bridge so you can expand coverage for your users.

NOTE

To be able to assign/unassign a phone number for a conferencing bridge, the phone number must be a '*service*' number. You can see the type of number it is by navigating to **Voice > Phone numbers** in the Microsoft Teams admin center and looking in the **Number Type** column. Microsoft 365 or Office 365 Communications Credits must be set up first in order for users to dial into the bridge on a toll-free number.

Steps when you are assigning a new service phone number to your conference bridge

Step 1 - Assign the new phone number to your audio conferencing bridge

Using the Microsoft Teams admin center

1. On the left navigation pane, go to **Voice > Phone numbers**.
2. Select the phone number from the list, and click **Edit**.
3. On the **Edit** page, under **Assigned to**, expand the dropdown and then select **Conference bridge > Apply**.

Step 2 - Change the default phone number of your conference bridge (optional)

The default phone number of your conference bridge defines the caller ID that will be used when an outbound call is placed by a participant or the organizer from within a meeting.

Only a service toll number can be set as the default number for your conferencing bridge; **service toll-free numbers can't be set as the default number of your conferencing bridge**. If you are assigning a service toll number and you would like to set it as the new default number for your audio conferencing bridge, perform these steps:

Using the Microsoft Teams admin center

1. On the left navigation pane, go to **Meetings > Conference bridges**.
2. Highlight the service toll number that you want to configure as the default.
3. Select **Set as default**.

Step 3 - Change the default phone numbers that are included in the meeting invites of users (optional)

The default phone numbers of a user are the ones that are included on their meeting invites when they schedule a meeting. For more information, including how the default phone numbers are assigned for new users, see [Set the phone numbers included on invites in Microsoft Teams](#) or [Set the phone numbers included on invites in Skype for Business Online](#).

Using the Microsoft Teams admin center

1. On the left navigation pane, go to **Users** and click the Display name of the desired user on the list.
2. Next to **Audio conferencing**, click on **Edit**.
3. Under **Toll number** or **Toll-free number**, select the number from the dropdown and click **Apply**.

After the changes have been applied, the new default phone numbers will be included on the meeting invites of organizers the next time they schedule a new meeting.

Step 4 - Update existing meeting invites of users using the Meeting Migration Service (optional)

For the next two steps, you will need to start Windows PowerShell.

If you updated the default phone numbers that are included in the meeting invites for some or all of your users, you can optionally update meeting invites that were already sent to users in your organization before their default phone numbers were changed using the Meeting Migration Service. For additional information, see [Setting up the Meeting Migration Service \(MMS\)](#).

- Run the Meeting Migration Service (MMS) for the users who had their default phone numbers changed in Step 2. To do this, run the following command:

```
Start-CsExMeetingMigration user@contoso.com
```

- You can also view the meeting migration status. All meetings would be rescheduled once there are no operations in *Pending* or *In-Progress* state.

```
Get-CsMeetingMigrationStatus -SummaryOnly
```

Steps when you are unassigning a service phone number for a conferencing bridge

When you unassign a phone number from a conferencing bridge, users won't be able to join any meetings using that phone number anymore. Because the phone number is changing, it's important to update all users who could have a phone number as their default number (if any) and to update their existing meeting invites before the phone number is unassigned from the audio conferencing bridge.

If the phone number is removed without updating the users and their meetings, their existing meeting invites could contain a phone number that won't work for joining their meetings.

For the first three steps, you will need to start Windows PowerShell. To see how to do this, click [Want to know how to manage with Windows PowerShell?](#)

Step 1 - Update users who have the phone number to be unassigned as one of their default numbers

Replace the default toll or toll-free number for all users who have the number to be unassigned as a default number and start the process of rescheduling their meetings. To do this, run the following command:

```
Set-CsOnlineDialInConferencingUserDefaultNumber -FromNumber <Number to be removed> -ToNumber <Number to be set as new default> -NumberType <"Toll" or "Toll-Free"> -RescheduleMeetings
```

IMPORTANT

You can also change the default toll or toll-free number of users in the Microsoft Teams admin center. However, this won't automatically reschedule their meetings.

For additional information, see [Set the phone numbers included on invites in Microsoft Teams](#) or [Set the phone numbers included on invites in Skype for Business Online](#).

NOTE

Depending on the size of your organization, this could take some time to complete.

Step 2 - View meeting migration status using Windows PowerShell

All meetings will be rescheduled once there are no operations in *Pending* or *In-Progress* state.

```
Get-CsMeetingMigrationStatus -SummaryOnly
```

For more information about the Meeting Migration Service, see [Setting up the Meeting Migration Service \(MMS\)](#).

Step 3 - Unassign the old phone number from the audio conferencing bridge

Use the `Unregister-CsOnlineDialInConferencingServiceNumber` cmdlet to unregister a Toll or Toll free number from a conference bridge

```
Unregister-CsOnlineDialInConferencingServiceNumber -identity "toll number to be removed" -bridgeId  
"Conference Bridge ID"  
Unregister-CsOnlineDialInConferencingServiceNumber -identity "toll free number to be removed" -bridgeId  
"Conference Bridge ID"
```

Note: To find the Conference Bridge ID, run the following PowerShell: `Get-CsOnlineDialInConferencingBridge`.

IMPORTANT

After a phone number is unassigned from an audio conferencing bridge, the phone number will no longer be available for users to join new or existing meetings.

Save time and automate

To save time by automating this process, you can use the [Set-CsOnlineDialInConferencingUser](#) or the `Set-CsOnlineDialInConferencingUserDefaultNumber` cmdlets.

- Use the [Set-CsOnlineDialInConferencingUser](#) cmdlet to change the default toll or toll-free number for specific users.
 - To change the default toll-free number for a user, run:

```
Set-CsOnlineDialInConferencingUser -Identity amos.marble@Contoso.com -TollFreeServiceNumber  
80045551234
```

- Use the `Set-CsOnlineDialInConferencingUserDefaultNumber` cmdlet to change the default toll or toll-free number of users based on their original default number or their location.

NOTE

To find the BridgeID, use the **Get-CsOnlineDialInConferencingBridge**.

- To set the default toll-free number for all users without one to 8005551234, run:

```
Set-CsOnlineDialInConferencingUserDefaultNumber -FromNumber $null -ToNumber 8005551234 -NumberType TollFree -BridgeId <Bridge Id>
```

- To change the default toll-free number of all users that have 8005551234 as their default toll-free number to 8005551239 and automatically reschedule their meetings, run:

```
Set-CsOnlineDialInConferencingUserDefaultNumber -FromNumber 8005551234 -ToNumber 8005551239 -NumberType TollFree -BridgeId <Bridge Id> -RescheduleMeetings
```

- To set the default toll-free number of all users located in the U.S. to 8005551234 and automatically reschedule their meetings, run:

```
Set-CsOnlineDialInConferencingUserDefaultNumber -Country US -ToNumber 8005551234 -NumberType TollFree -BridgeId <Bridge Id> -RescheduleMeetings
```

NOTE

The location that is used above needs to match the contact information of user(s) that is set in the Microsoft 365 admin center.

Troubleshooting

Unassign button isn't available

You want to Unassign a number but the button isn't available, and if while hovering over it, you are redirected to contact Support with the following message *"Default or shared numbers can't be unassigned from the bridge. To unassign dedicated toll numbers, please contact support."*

To obtain more information about the bridge(s), run the following Powershell :

```
Get-CsOnlineDialInConferencingBridge -Name "Conference Bridge"
```

The result, aside other information like Identity, Name and Region, should also contain the DefaultServiceNumber.

Example, to unassign, the DefaultServiceNumber "8005551234"

```
Unregister-CsOnlineDialInConferencingServiceNumber -BridgeName "Conference Bridge" - RemoveDefaultServiceNumber 8005551234
```

About Windows PowerShell

With Windows PowerShell you can manage users and what they are or are not allowed to do. Windows PowerShell can help you manage Microsoft 365 or Office 365 and Skype for Business Online using a single point of administration that can simplify your daily work, especially when you've got multiple tasks to do. To get

started with Windows PowerShell, see these topics:

- [An introduction to Windows PowerShell and Skype for Business Online](#)
- [Why you need to use Office 365 PowerShell](#)

Windows PowerShell has many advantages in speed, simplicity, and productivity over only using the Microsoft 365 admin center such as when you are making setting changes for many users at one time. Learn about these advantages in the following topics:

- [Best ways to manage Microsoft 365 or Office 365 with Windows PowerShell](#)
- [Using Windows PowerShell to manage Skype for Business Online](#)
- [Using Windows PowerShell to do common Skype for Business Online management tasks](#)

[Change the settings for an Audio Conferencing bridge](#)

Change the settings for an Audio Conferencing bridge

12/7/2021 • 3 minutes to read • [Edit Online](#)

When you are setting up Audio Conferencing in Microsoft 365 or Office 365, you will receive phone numbers for your users from what is called an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers. These phone numbers are used when callers dial in to a meeting. The phone number is included at the bottom of the Skype for Business or Microsoft Teams meeting invite.

The conferencing bridge answers a call and prompts the caller with voice prompts using a meeting auto attendant, and then, depending on your settings, it can play notifications, ask callers to record their name, and control the PIN settings. PINs are given to meeting organizers to allow them to start a meeting when they are aren't using a Skype for Business or Microsoft Teams app.

IMPORTANT

A PIN is only required for the meeting organizer when a Skype for Business or Microsoft Teams app user hasn't already started the meeting. If everyone is dialing in to the meeting, the PIN is required for the meeting organizer to start the meeting.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference bridges**.
2. At the top of the **Conference bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, select:
 - **Meeting entry and exit notifications** If you turn this off, users who have already joined the meeting won't be notified when someone enters or leaves the meeting.

When you turn on **Meeting entry and exit notifications**, you can select these options:
 - **Names or phone numbers** When users dial in to a meeting, their phone number will be played when they join it.
 - **Tones** When users dial in to a meeting, an audio tone will be played when they join it.
 - **Ask callers to record their name before joining the meeting** If you turn this off, callers won't be asked to record their name before they join a meeting.
4. To set the PIN length for meetings, select the number of digits you want for the PIN in the **PIN length** list.
5. To specify whether to send email to your users, enable or disable **Automatically send emails to users if their audio conferencing configuration changes**. See [Emails automatically sent to users when their Audio Conferencing settings change in Microsoft Teams](#) or [Emails sent to users when their settings](#)

[change in Skype for Business Online](#) for more information.

6. Click **Save**.

Want to know how to manage with Windows PowerShell?

- To save time or automate this process, you can use the [Set-CsDialInConferencingBridge](#) cmdlet.
- Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 or Office 365 using a single point of administration that can simplify your daily work when you have multiple tasks to do. To get started with Windows PowerShell, see these topics:

[Set up Audio Conferencing for Skype for Business Online](#)

See a list of Audio Conferencing numbers in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you set up Audio Conferencing for Microsoft Teams users, you can view the phone numbers that are available to them for audio conferencing. This list will have all of the audio conferencing phone numbers that are available to your organization.

Looking for prices? Review the **Audio Conferencing rates** section in [Audio Conferencing](#).

If there is only one phone number available in your organization, it will be used as the default number for all of your users. When multiple phone numbers are available, you can select the default phone number for each user. This default number will be included in Microsoft Teams meeting invitations.

You can see [Set the phone numbers included on invites](#) to change the dial-in phone number for a single user.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

To view your audio conferencing phone numbers

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings** > **Conference bridges**.
 2. View the phone numbers that are available for audio conferencing.
- You can also view the location and primary language that will be used by the audio conferencing auto attendant.

Want to know more about Windows PowerShell?

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. Set auto attendant languages for Audio Conferencing in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

The Audio Conferencing auto attendant for Microsoft Teams can greet audio callers in a number of different languages when they join a meeting.

Choose one primary language and up to four secondary languages. The primary language that you set will be used first and the secondary languages will be used by the auto-attendant in order that you select.

NOTE

You can only change the languages of audio conferencing numbers that are of the Dedicated category. The languages of Shared audio conferencing number can't be changed.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Set the conferencing auto attendant languages

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings** > **Conference Bridges**.
2. Select a **Dedicated** audio conferencing phone number from the list, and at the top of the page, click **Edit**.
It is only possible to change the languages of Dedicated audio conferencing numbers. The **Edit** option is only shown when a Dedicated audio conferencing number is selected.
3. In the pane on the right, choose the default language you want and any alternate languages.

NOTE

The default and alternate languages that are supported are listed. The order in which you select them in the lists will be the order of the languages presented to callers.

4. Click **Save**.

Want else should I know?

- To see the list of supported languages for Audio Conferencing, see [Audio Conferencing supported languages](#).
- Languages can be set for dedicated but not for shared phone numbers.
- To see a list of countries/regions in which Audio Conferencing in Microsoft 365 or Office 365 using Microsoft as the provider is available, see [Phone numbers for Audio Conferencing](#).

Want to use Windows PowerShell?

Set up meeting dial-out confirmation for your users in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Meeting dial outs and Call me calls are very useful ways to invite participants to join a meeting and for existing participants to join a meeting using a traditional or mobile phone. However, when the called person is unable to answer the call and the call is answered by a voicemail system, the voicemail system is connected to the meeting and participants will be able to listen to it until it's removed from the meeting.

To prevent voicemail systems from connecting to meetings when a meeting dial out is sent to a phone number and the called person is unable to answer the call, you can set up Teams to request a confirmation from the called person for them to join the meeting. If the called person can't answer the call and the call is answered by a voicemail system, the voicemail system won't be connected to the meeting because it won't provide a confirmation to join it.

When this capability is enabled, people that receive a dial out or Call me call must confirm that they want to join the meeting by pressing 1 on their traditional or mobile phone.

To enable this capability for all meetings in your organization, set the `EnableDialOutJoinConfirmation` parameter of the [Set-CsOnlineDialInConferencingTenantSettings](#) cmdlet to `true`. To do this, run the following command:

```
Set-CsOnlineDialInConferencingTenantSettings -EnableDialOutJoinConfirmation $true
```

Manage the Audio Conferencing settings for your organization in Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

It might be easier for you to see all of the audio conferencing settings for Microsoft Teams in one place.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Assign an Audio Conferencing license

NOTE

You can't assign licenses using Teams. You must use the Microsoft 365 admin center. See [Assign Microsoft Teams add-on licenses](#).

To assign a license for a user

1. Sign in to Microsoft 365 with your work or school account.
2. In the left navigation of the **Microsoft 365 admin center**, go to **Users > Active users**, and then select the user or users from the list of available users.

NOTE

If you are assigning licenses to up to 20 users at the same time, you can use the **Select a view** drop-down then choose one of the options or create your own view. Then click **Edit**, **Next** twice then select the license and click **Submit**.

3. In the Action pane under **Product licenses**, click **Edit**.
4. On the **Product Licenses** page, turn on **Audio Conferencing** and then click **Save**. For more on licensing, see [Microsoft Teams add-on licensing](#).

NOTE

After you assign the license, Microsoft might not appear initially in the list as an audio conferencing provider. If this happens, either log out of the admin center or press CTRL+F5 to refresh the browser window.

Enable or disable emails sent to audio conferencing users

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enable or disable **Automatically send emails to users if their dial-in**

settings change.

4. Click **Save**.

Using Windows PowerShell

See the [Microsoft Teams PowerShell reference](#) for more information.

Reset the meeting conference ID

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Under **Audio Conferencing**, click **Reset conference ID**.
3. In the **Reset conference ID?** window, click **Reset**. A conference ID will be automatically created and an email sent to the user with the new conference ID if sending email to your users is enabled. It's enabled by default.

See [Reset a conference ID for a user](#).

Reset a conference organizer's PIN

Each meeting that a user schedules will get assigned a unique conference ID. Although a conference ID will be automatically created and assigned to a user, there may be times when a user doesn't want to use this one and you want to set it to a certain number, or your users can't remember or have lost their conference ID.

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Under **Audio Conferencing**, click **Reset PIN**, and then click **Reset**.

Users will receive an email with their PIN when they're enabled for audio conferencing or when the PIN is reset. But if you have disabled automatically sending emails, a PIN reset email won't be sent and you will have to manually send the PIN to the user. The PIN will only be shown once after it has been reset. After it's displayed just after being reset, the PIN won't be shown anymore on the user properties; instead, ***** will be shown.

See [Reset the Audio Conferencing PIN](#).

Send an email with Audio Conferencing information to a user

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Under **Audio Conferencing**, click **Send conference info in email**.

NOTE

When you do this, the audio conferencing PIN isn't sent to the user.

See [Send an email to a user with their Audio Conferencing information](#).

Set the phone numbers included on invites

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Next to **Audio Conferencing**, click **Edit**.
3. In the **Audio Conferencing** pane, you can set the **Toll number** and, if allowed, the **Toll-free number**.
4. Click **Save**.

See [Set the phone numbers included on invites](#).

Choose audio conferencing bridge settings

Set the meeting experience when callers join a meeting

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enable or disable **Meeting entry and exit notifications**.

This is enabled by default. If you disable this option, users who have already joined the meeting by default won't be notified when someone enters or leaves the meeting.

4. Under **Entry/exit announcement type**, choose either **Tones** or **Names or phone numbers**.

If you choose **Names or phone numbers**, you can also choose to enable or disable **Ask callers to record their name before joining the meeting**.

NOTE

By default, external participants can't see the phone numbers of dialed-in participants. If you want to maintain the privacy of these phone numbers, select **Tones** for **Entry/exit announcement type** (this prevents the numbers from being read out by Teams).

5. Click **Save**.

See [Change the settings for an Audio Conferencing bridge](#).

Set the PIN length for meetings

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enter the number of digits you want for the PIN in the **PIN length** list, and then click **Save**.

The PIN must be between 4 and 12 digits. The default is 5.

See [Change the settings for an Audio Conferencing bridge](#).

Enable or disable email from being sent to audio users

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enable or disable **Automatically send emails to users if their audio conferencing settings change**.

4. Click **Save**.

You can also send email to the user with the audio conferencing settings, by going to the user's audio conferencing properties and clicking **Send conference info in email**.

If you do this, an email will be sent that only includes conference ID and conference phone number, but the PIN won't be included.

See [Send an email to a user with their Audio Conferencing information](#).

See and set the primary (default) and secondary (alternate) languages on an audio conferencing bridge

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. Select a phone number from the list and click **Edit**.
3. Choose the languages you want under **Default language** and **Alternate languages (optional)**.
4. Click **Save**.

See [Set auto attendant languages for Audio Conferencing](#).

See audio conferencing dial-in numbers

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. Select a phone number from the list and click **Edit**. Here you can:
 - View the phone numbers that are to be used for Audio Conferencing.
 - View the location, and the primary language, that will be used by the Audio Conferencing auto attendant.

See [See a list of Audio Conferencing numbers](#).

Want to know more about Windows PowerShell?

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. [Manage the Audio Conferencing settings for a user](#)

Audio Conferencing pay-per-minute

12/7/2021 • 2 minutes to read • [Edit Online](#)

In addition to the standard Audio Conferencing per-user license, Volume and Licensing organizations can also choose a pay-per-minute offer to enable Audio Conferencing capabilities for their organizations.

You can find out if your [country/region is supported](#) for Audio Conferencing.

NOTE

Because this offer is only available to Volume and Licensing customers, you will need to work with your account representative to acquire these licenses.

Need some details?

Whereas the Audio Conferencing per-user license offer includes dial-in usage and some dial-out usage, Audio Conferencing pay-per-minute **allows you to pay for all of your Audio Conferencing usage on a per-minute basis without paying for a per-user monthly license.** With this, all dial-in and dial-out calls will be charged on a per-minute basis, including:

- Inbound calls to toll Audio Conferencing numbers of your organization.
- Inbound calls to toll-free Audio Conferencing numbers of your organization.
- Outbound calls placed to external phone numbers from within a meeting of your organization.

NOTE

You can find the dial-in and dial-out rates associated to these types of calls by reviewing the **Audio Conferencing rates** section in [Audio Conferencing](#).

Pay-per-minute requires your organization to have [Communications Credits](#) set up. If you want more details, see [Set up Communications Credits for your organization](#) and/or [Microsoft Teams add-on licensing](#).

To enable Audio Conferencing pay-per-minute for users in your organization, see [Try or purchase Audio Conferencing in Microsoft Office 365 or Office 365](#).

Why is it best for you?

- Pay per-minute will only be charged on a per-minute basis for each inbound or outbound call placed by each attendee during a scheduled meeting (rates vary for toll or toll-free call and by destination) instead of using Skype for Business or Teams application in a mobile device or PC.
- Capability to manage cost since admins can control to restrict the types of dial-outs (international and domestic) that can be done from the meetings of an organizer. See [Outbound calling restriction policies for Audio Conferencing and user PSTN calls](#)
- If you have Audio Conferencing pay-per-minute licenses, you don't have to assign Communications Credits licenses separately to each user specifically for Audio Conferencing usage (you might still need to assign them for other services).
- Control and monitor pay-per minute charges by using Communications Credits.

- More flexibility in pricing for customers who don't need all users on a subscription basis.
- Enable Audio Conferencing pay-per-minute along with a monthly subscription of E5 or a standalone Audio Conferencing subscription, both services will continue to work the same way. Changes will have no effect on the operations of Audio Conferencing or Communications Credits.

Want to find out more about pricing?

Looking for prices? See the following:

- [Pricing for Audio Conferencing](#)
- [Pricing for Phone System](#)
- [Pricing for Calling Plans](#)

Manage the Audio Conferencing settings for a user in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

As a Microsoft 365 or Office 365 admin, you can edit the Audio Conferencing settings—such as the provider, default toll or toll-free number, conference ID, or PIN—for an individual user in your organization. If you want to edit settings for your organization, see [Manage the Audio Conferencing settings for your organization](#).

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Click **Edit**.
3. Under **Audio Conferencing**, modify any of the following:

SETTING	DESCRIPTION
Audio conferencing	To turn audio conferencing on or off for the user, click Edit next to Audio Conferencing , and then in the Audio Conferencing pane, toggle Audio conferencing On or Off.
Send conference info in email	Click this link only if you want to immediately send an email to the user with his or her conference ID and phone number. (This email does not include the PIN.) See Send an email to a user with their Audio Conferencing information .
Conference ID	Click Reset conference ID if you need to reset the conference ID for the user. For more information, see Reset a conference ID for a user .
PIN	Click Reset PIN if you need to reset the PIN for the user. For more information, see Reset the Audio Conferencing PIN .
Default conferencing toll phone number (required)	These will be numbers that are set on the audio conferencing bridge. Format the numbers as you want them to appear in Skype for Business and Microsoft Teams meeting requests. To change the default toll number, click Edit next to Audio Conferencing and in the Audio Conferencing pane, select a number under Toll number .
Invites from this user can include toll-free number	To change this setting, click Edit next to Audio Conferencing and in the Audio Conferencing pane, toggle Include toll-free numbers in meeting requests from this user On or Off.
Unauthenticated users can be the first person in the meeting	To change this setting, toggle Unauthenticated users can be the first person in the meeting On or Off.
Dial-out permissions	To change this setting, click Edit next to Audio Conferencing and in the Audio Conferencing pane, choose an option under Dial-out from meetings .

Enable users to record their name when they join a meeting in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you are setting up Audio Conferencing in Microsoft 365 or Office 365, you will receive phone numbers and what is called an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers that can be a dedicated or shared phone number.

The conferencing bridge answers a call for a user who is dialing in to a meeting using a phone. The conferencing bridge answers the caller with voice prompts from an auto attendant, and then, depending on their settings, can play notifications, ask callers to record their name, and set up the PIN security for meeting organizers. PINs are given to meeting organizers to allow them to start a meeting. However, you can set it up so a PIN isn't required to start a meeting.

Set whether callers should record their name

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings** > **Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. Enable or disable **Meeting entry and exit notifications**.
4. If enabling notifications, choose **Names or phone numbers** under **Entry/exit announcement type**, and then turn on **Ask callers to record their name before joining a meeting**.
5. Click **Save**.

Reset a conference ID for a user in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

A dynamic conference ID is included at the bottom of meeting invitations along with the dial-in phone numbers that can be used by callers to call in to a meeting. When the user dials the phone number, the auto attendant for the meeting will ask the caller to enter this conference ID so they can attend the meeting.

NOTE

Conference IDs are generated automatically, will be between 7-9 digits, and are set when you enable Audio Conferencing for a user. **Static conference IDs aren't supported.**

Resetting the conference ID for a user

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Click **Edit**.
3. Under **Audio Conferencing** click **Reset conference ID**.
4. In the **Reset conference ID** window, click **Reset**. A conference ID will be automatically created and an email sent to the user with the new conference ID. By default, emails are sent to users, but this can be turned off.

NOTE

After you reset the conference ID, an email with the new conference ID will be sent to the user. This email will be sent to the primary email address, in many cases, their Microsoft 365 or Office 365 mailbox. The email contains the new conference ID, default dial-in phone number(s) and instructions for updating existing meetings.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

What else should I know?

- You can send all of the conferencing information to the user in an email that includes the conference ID and dial-in phone numbers by clicking **Send conference info in email** for the user in the **Audio Conferencing** section. It doesn't send the PIN.
- A 7- 9 digit conference ID is created by the Teams service. You can't change its length.
- After it has been reset, you can see the new conference ID listed under **Conference ID**.
- After a new conference ID is created, the old conference ID can't be used by callers. You should notify users to reschedule their existing meeting invites to make sure the new conference ID is added to the invitations.

[Reset the Audio Conferencing PIN](#)

Reset the Audio Conferencing PIN in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

A PIN is a code made up of numbers that is created for each Microsoft Teams user who is enabled for audio conferencing. Audio conferencing PINs are used by meeting organizers to identify that they are the meeting organizer and allow them to start a meeting over the phone. If they use the Microsoft Teams app to start the meeting, a PIN isn't required. If users forget their PIN and they can't find it in the email that was sent to them when they were enabled for audio conferencing, an administrator can reset their PIN, or they can reset their own PIN.

Meetings can be started when an authenticated user joins using the Microsoft Teams app or when the organizer joins with their PIN over the phone. When a meeting requires a PIN to start, users who join over the phone will be placed in the lobby and will listen to music on hold until the organizer admits them. If the organizer of a meeting doesn't require a PIN to start the meeting over the phone, then callers won't be asked to provide a PIN when they join the meeting.

Reset a user's PIN

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Click **Edit**.
3. Under **Audio Conferencing**, click **Reset PIN**.
4. Click **Reset**.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Have a user reset their own PIN

1. Have the user go to <https://dialin.teams.microsoft.com/usp>.
2. Click **Reset PIN**.

NOTE

For GCCH go to: <https://dialin.cpc.gov.teams.microsoft.us/usp>. For DoD go to: <https://dialin.cpc.dod.teams.microsoft.us/usp>.

What else should you know about PINs?

- For security purposes, the PIN is only shown to an administrator one time, when the PIN is reset. After the PIN is reset by an administrator, the PIN will be listed as *****.
- Automatically sending emails to users is enabled by default, and users will receive an email with their PIN when they're enabled for audio conferencing or when the PIN is reset. But if you have disabled

automatically sending emails, a PIN reset email won't be sent to a user and you will have to manually send the PIN information to the user.

- When a meeting starts, the organizer needs to admit all PSTN users in the lobby to join the meeting. For example, if two PSTN participants try to join a meeting before it has started, they will be put in the lobby and will listen to music on hold, and when the meeting organizer joins using their PIN via phone, the meeting will start and the organizer can use the in-meeting command (press *21) to admit all PSTN users in the lobby.
- The default setting is to not allow a meeting to be started by anonymous callers.
- When you enable a user for audio conferencing, by default they are sent emails that include conferencing information and their PIN. The user must have a Microsoft 365 or Office 365 mailbox, because when a PIN is reset, a new PIN will be sent to the user in email to their primary SMTP address (alias) that is set for the user.
- When you set up audio conferencing, you set the digits that are required for the PINs in your organization. PINs can be from 4 to 12 digits - the default is 5. If you change the PIN length setting, the setting is only applied on newly generated PINs and isn't applied to the PIN setting for existing users that are enabled for audio conferencing. See [Set the length of the PIN for Audio Conferencing meetings](#).
- The email by default will be set to the Microsoft 365 or Office 365 primary SMTP address of the user. You can send an email to a non-Microsoft 365 or non-Office 365 address such as a Hotmail or MSN email address. You can override the default email address by using Windows PowerShell. This is useful if the users don't have an Exchange mailbox in Microsoft 365 or Office 365.

Emails sent to users when their settings change in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Emails will be automatically sent to users who are [enabled for Audio Conferencing](#) using Microsoft as the audio conferencing provider.

By default, there are four types of email that will be sent to your users who are enabled for Audio Conferencing. However, if you want to limit the number of emails sent to users, you can turn it off. Audio Conferencing in Microsoft 365 or Office 365 will send email to your users' email when:

- **An Audio Conferencing license is assigned to them or when you are changing the audio conferencing provider to Microsoft.**

This email includes the conference ID, the default conference phone number for the meetings, the audio conferencing PIN for the user, and the instructions and link to use the Skype for Business Online Meeting Update Tool that is used to update existing meetings for the user. See [Assign Microsoft Teams add-on licenses](#) or [Assign Microsoft as the audio conferencing provider](#).

NOTE

If your organization has been enabled for dynamic conference IDs, all of a user's meetings that they schedule will have unique conference IDs. You can set up [Audio Conferencing dynamic IDs in your organization](#).

Here is an example of this email:

You now have Office 365 Audio Conferencing

Office 365 Audio Conferencing has been turned on for your account. With Audio Conferencing, you and your meeting participants can join by phone.

Name:

Account:

Your Audio Conferencing Information

Here are the credentials that you and your meeting participants can use to join by phone. This information will be added to any Skype for Business or Microsoft Teams meetings you create. To join a meeting by phone, dial the conference phone number and enter the conference ID.

Conference phone number:

1(800) 555-1234

Note: You can get additional phone numbers by clicking the "Find a local number" link in your meeting invites.

Your Audio Conferencing PIN

As the meeting organizer, you'll need to enter your PIN to start your meeting when you're the first person to join and you join by phone. As with any PIN, keep it confidential. You can reset your PIN via the reset PIN link that is included in your meeting invites or by contacting your Office 365 admin.

Audio Conferencing PIN:

This is an automatically generated service communication. For more information, please contact your administrator.

To find out more about licensing, see [Microsoft Teams add-on licensing](#).

- **The conference ID or default conference phone number of a user changes.**

This email contains the conference ID, default conference phone number, and the instructions and link to use the Skype for Business Online Meeting Update Tool that is used to update existing meetings for the user. But this email doesn't include the user's audio conferencing PIN. See [Reset a conference ID for a user](#).

Here is an example of this email:

- **The audio conferencing PIN of a user is reset.**

This email contains the organizer's audio conferencing PIN, the existing conference ID, and default conference phone number for the user. See [Reset the Audio Conferencing PIN](#).

Here is an example of this email:

Your Office 365 Audio Conferencing PIN has changed

Effective immediately, you've got a new Office 365 Audio Conferencing PIN.

Name:

Account:

New Audio Conferencing PIN

Audio Conferencing PIN:

As the meeting organizer, you'll need to enter your PIN to start your meeting when you're the first person to join and you join by phone. As with any PIN, keep it confidential. You can reset your PIN via the reset PIN link that is included in your meeting invites or by contacting your Office 365 admin.

No change to Audio Conferencing phone number or ID

Keep using the same Audio Conferencing phone number and ID - these credentials haven't changed. As always, this information will be added to any Skype for Business or Microsoft Teams meetings you create. To join a meeting by phone, dial the conference phone number and enter the conference ID. Here are your existing Audio Conferencing credentials:

Conference phone number:

1(800) 555-1234

Note: You can get additional phone numbers by clicking the "Find a local number" link in your meeting invites.

This is an automatically generated service communication. For more information, please contact your administrator.

- A user's license is removed or when audio conferencing provider changes from Microsoft to other provider or None.

This happens when the **Audio Conferencing** license is removed from a user or when setting the audio conferencing provider to **None**.

See [Assign or remove licenses for Microsoft 365 for business](#).

Here is an example of this email:

Office 365 Audio Conferencing has been turned off

Office 365 Audio Conferencing has been turned off for your account. This means your meeting participants can no longer join by phone. Please contact your Office 365 admin if you have questions.

Name:

Account:

This is an automatically generated service communication. For more information, please contact your administrator.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Make changes to the email messages that are sent to them

You can make changes to the email that is automatically sent to users. By default, the sender of the emails will be from Microsoft 365 or Office 365, but you can change the display name using Windows PowerShell. See the

[Microsoft Teams PowerShell reference](#) for more information.

What if you don't want email to be sent to them?

When you disable sending emails to users, email won't be sent even when a user gets assigned a license. In this case, the conference ID, default conferencing phone number, and, more importantly, their audio conferencing PIN won't be sent to the user. When this happens, you must tell the user by sending them a separate email or by calling them.

By default, emails will be sent to your users, but if you want to prevent them from receiving email for audio conferencing, you can use Microsoft Teams or Windows PowerShell.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enable or disable **Automatically send emails to users if their dial-in settings change**.
4. Click **Save**.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Using Windows PowerShell

You can also use the Microsoft Teams PowerShell module and run:

```
Set-CsOnlineDialInConferencingTenantSettings -AutomaticallySendEmailsToUsers $true|$false
```

You can use the [Set-CsOnlineDialInConferencingTenantSettings](#) to manage other settings for your organization, including email.

See the [Microsoft Teams PowerShell reference](#) for more information.

Want to know more about Windows PowerShell?

By default, the sender of the emails will be from Microsoft 365 or Office 365, but you can change the email address and display name using Windows PowerShell.

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 or Office 365 using a single point of administration that can simplify your daily work when you have multiple tasks to do. To get started with Windows PowerShell, see these topics:

Enable or disable sending emails when Audio Conferencing settings change

Send an email to a user with their Audio Conferencing information

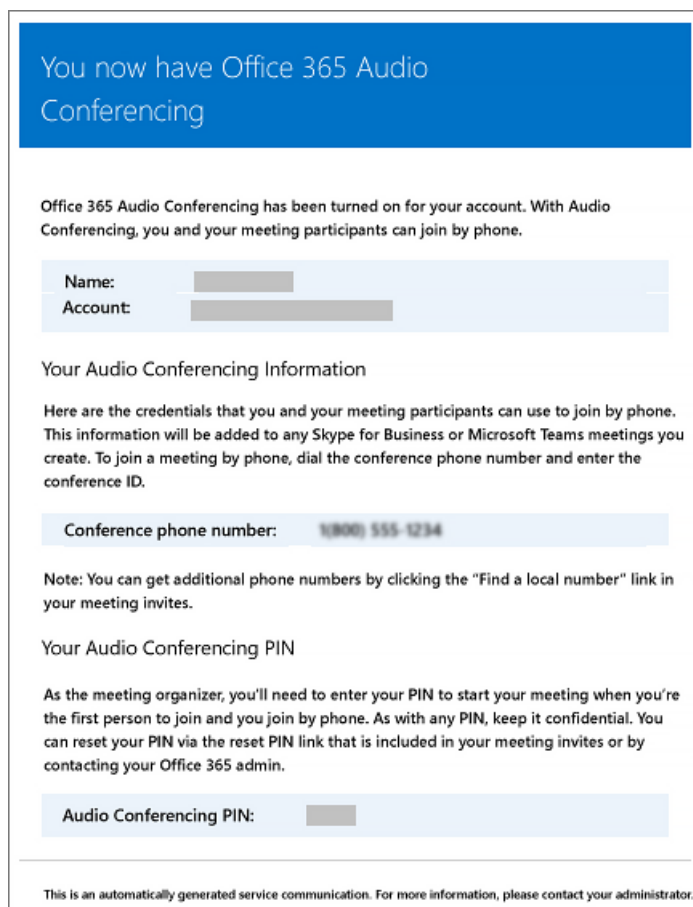

Enable or disable sending emails when Audio Conferencing settings change in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Users are automatically notified by email when they are enabled for Audio Conferencing. There may be times, however, when you want to reduce the number of emails that are sent to Microsoft Teams users. In such cases, you can disable sending email.

If you disable sending emails, Audio Conferencing emails won't be sent to your users, including emails for when users are enabled or disabled for audio conferencing, when their PIN is reset, and when the conference ID and the default conferencing phone number changes.

Here is an example of the email that is sent to users when they are enabled for Audio Conferencing:

When are emails being sent to your users?

- There are several emails that are sent to users in your organization after they are enabled for audio conferencing:
 - When an **Audio Conferencing** license is assigned to them.
 - When you manually reset the user's audio conferencing PIN.
 - When you manually reset the user's conference ID.
 - When the **Audio Conferencing** license is removed from them.
 - When the audio conferencing provider of a user is changed from Microsoft to another provider or

None.

- When the audio conferencing provider of a user is changed to Microsoft.

Enable or disable email from being sent to users

You can use Microsoft Teams or Windows PowerShell to enable or disable email sent to users.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings** > **Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enable or disable **Automatically send emails to users if their dial-in settings change**.
4. Click **Save**.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Using Windows PowerShell

You can also use the Microsoft Teams PowerShell module and run:

```
Set-CsOnlineDialInConferencingTenantSettings -AutomaticallySendEmailsToUsers $true|$false
```

You can use the [Set-CsOnlineDialInConferencingTenantSettings](#) to manage other settings for your organization, including email.

See the [Microsoft Teams PowerShell reference](#) for more information.

Disabling toll-free numbers for specific Teams users

12/7/2021 • 2 minutes to read • [Edit Online](#)

If your organization has toll-free numbers in its Microsoft Audio Conferencing Bridge, you can allow or prevent their usage in the meetings of specific organizers.

By default, all users in your organization are enabled for using toll-free numbers, meaning that those numbers, if available, can be used by participants to join their meetings. If this is not the desired behavior for some users in your organization, you can restrict specific users from using those numbers in their meetings via a toll-free number enablement control.

When toll-free numbers are disabled for a given organizer:

- A toll-free number will no longer be included in his or her meeting invites.
- Toll-free numbers will no longer be listed on the "Find a local number" page that is referenced in his or her meeting invites.
- Participants won't be able to join the meeting of the given organizer if they dial any toll-free number of the organization.
- All meetings of the organizer will be automatically rescheduled, and the toll-free number will be removed from them.

IMPORTANT

This will resend all of the email invites of the organizer to all the participants of those meetings.

- Participants can continue joining meetings of the organizer using toll numbers.

Disabling toll-free numbers for specific users

From the **Microsoft Teams admin center**:

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. Next to **Audio Conferencing**, click **Edit**.
3. Set **Include toll-free numbers in meeting requests from this user** to **Off**.
4. Click **Save**.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Using PowerShell

See the [Microsoft Teams PowerShell reference](#) for more information.

Outbound calling restriction policies for Audio Conferencing and user PSTN calls

12/7/2021 • 3 minutes to read • [Edit Online](#)

As an administrator, you can use outbound call controls to restrict the type of audio conferencing and end-user Public Switched Telephone Network (PSTN) calls that can be made by users in your organization.

Outbound call controls can be applied on a per-user basis or on a tenant basis and provide the following two controls to independently restrict each type of outbound calls. By default, both controls are set to allow international and domestic outbound calls.

CONTROL	DESCRIPTION	CONTROL OPTIONS
Audio Conferencing PSTN calls	Restricts the type of outbound calls that are allowed from within meetings organized by a user.	Any destination (default) In the same country or region as the organizer Zone A countries or regions only Don't allow
End-user PSTN calls	Restricts the type of calls that can be made by a user.	International and Domestic (default) Domestic None

To find out which countries and regions are considered Zone A, see [Country and region zones for Audio Conferencing](#).

NOTE

A call is considered domestic if the number dialed is in the same country where Microsoft 365 or Office 365 has been set up for the organizer of the meeting (in the case of audio conferencing), or the end user (in the case of end user PSTN calls).

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Restrict audio conferencing outbound calls

Using the Microsoft Teams admin center

1. In the left navigation, select **Users**, and then select the display name of the user from the list of available users.
2. Next to **Audio Conferencing**, select **Edit**.
3. Under **Dial-out from meetings**, select the dial-out restriction option you want.
4. Select **Save**.

Using PowerShell

Outbound call restrictions are controlled by a single policy called OnlineDialOutPolicy, which has a restriction attribute for each. The policy cannot be customized, rather there are pre-defined policy instances for each combination of the settings.

You can use the Get-CSOnlineDialOutPolicy cmdlet to view the outbound calling policies and use the following command for the setup.

Set the policy on a per-user level with the following cmdlet. (The Grant cmdlet doesn't contain the word "Online" as the Get cmdlet does.)

```
Grant-CsDialoutPolicy -Identity <username> -PolicyName <policy name>
```

Set the policy on the tenant level with the following cmdlet.

```
Grant-CsDialoutPolicy -PolicyName <policy name> -Global
```

All users of the tenant who don't have any dialout policy assigned will get this policy. Other users remain with their current policy.

The following table provides an overview of each policy.

POWERSHELL CMDLET	DESCRIPTION
Identity='tag:DialoutCPCandPSTNInternational'	User in the conference can dial out to international and domestic numbers, and this user can also make outbound calls to international and domestic numbers.
Identity='tag:DialoutCPCDomesticPSTNInternational'	User in the conference can only dial out to domestic numbers, and this user can make outbound calls to international and domestic numbers.
Identity='tag:DialoutCPCDisabledPSTNInternational'	User in the conference can't dial out. This user can make outbound calls to international and domestic numbers.
Identity='tag:DialoutCPCInternationalPSTNDomestic'	User in the conference can dial out to international and domestic numbers, and this user can only make outbound calls to domestic PSTN number.
Identity='tag:DialoutCPCInternationalPSTNDisabled'	User in the conference can dial out to international and domestic numbers, and this user cannot make any outbound calls to PSTN number besides emergency numbers.
Identity='tag:DialoutCPCandPSTNDomestic'	User in the conference can only dial out to domestic numbers, and this user can only make outbound call to domestic PSTN numbers.
Identity='tag:DialoutCPCDomesticPSTNDisabled'	User in the conference can only dial out to domestic numbers, and this user cannot make any outbound calls to PSTN number besides emergency numbers.
Identity='tag:DialoutCPCDisabledPSTNDomestic'	User in the conference can't dial out, and this user can only make outbound call to domestic PSTN numbers.

POWERSHELL CMDLET	DESCRIPTION
Identity='tag:DialoutCPCandPSTNDisabled'	User in the conference can't dial out, and this user can't make any outbound calls to PSTN number besides emergency numbers.
Identity='tag:DialoutCPCZoneAPSTNInternational'	User in the conference can only dial out to Zone A countries and regions , and this user can make outbound calls to international and domestic numbers.
Identity='tag:DialoutCPCZoneAPSTNDomestic'	User in the conference can only dial out to Zone A countries and regions , and this user can only make outbound calls to domestic PSTN number.
Identity='tag:DialoutCPCZoneAPSTNDisabled'	User in the conference can only dial out to Zone A countries and regions , and this user can't make any outbound calls to PSTN number besides emergency numbers.

View and reset a conference ID assigned to a user in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

A conferencing ID is automatically assigned to a Microsoft Teams user when they are set up for Audio Conferencing in Microsoft 365 or Office 365 and use Microsoft as the audio conferencing provider. The conference ID assigned is sent in the meeting invite when the meeting is scheduled. Each meeting that a user schedules will get assigned a unique conference ID.

Although a conference ID will be automatically created and assigned to a user, there may be times when a user doesn't want to use this one and you want to set it to a certain number, or when your users can't remember or have lost their conference ID. You can use Microsoft Teams admin center or Windows PowerShell to view, change, and reset their conference ID.

An email will be sent to the user with the conference ID and the default audio conferencing phone numbers, or if you reset the conference ID a different email will be sent that will include the conference ID but not a PIN. See [Reset a conference ID for a user in Microsoft Teams](#) for more information about how to reset a conference organizer's PIN.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

View and reset conference IDs

To view the conference ID

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. At the top of the page, click **Edit**.
3. Under **Audio Conferencing**, look under **Conference ID**.

TIP

You can send all of the conferencing information to the user in an email that includes the conference ID and audio phone numbers by clicking the **Send conference info in email** link.

Using Windows PowerShell

See the [Microsoft Teams PowerShell reference](#) for more information.

To reset the conference ID

You can reset a conference ID for a user if, for example, they forget it.

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. At the top of the page, click **Edit**.

3. Under **Audio Conferencing**, click **Reset conference ID**.
4. In the **Reset conference ID** window, click **Reset**. A conference ID will be automatically created and an email sent to the user with the new conference ID.

Using Windows PowerShell

See the [Microsoft Teams PowerShell reference](#) for more information.

What else should you know?

IMPORTANT

After a new conference ID is created or one is reset, the old conference ID can't be used by callers. You should notify users to reschedule their existing meeting invites to make sure the new conference ID is added to the invitations.

- The conference ID must meet the length in digits set on the audio conferencing bridge. You can't use alphabetic or special characters in conference IDs; only numbers can be used.

Want to know more about Windows PowerShell?

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. Send an email to a user with their Audio Conferencing information in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Sometimes Microsoft Teams users may need you to send them their Audio Conferencing information. You can do this by clicking **Send conference info via email** under the properties for a user. When you send this email, it will contain all of the audio conferencing information, including:

- The conference phone or dial-in phone number for the user.
- The user's conference ID.

Here is an example of the email that is sent:

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Send an email with audio conferencing information to a user

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**, and then select the user from the list of available users.
2. At the top of the page, click **Edit**.
3. Under **Audio Conferencing**, click **Send conference info in email**.

What else should you know about this email?

- There are several emails that are sent to users in your organization after they are enabled for audio conferencing:
 - When an **Audio Conferencing** license is assigned to them.
 - When you manually reset the user's audio conferencing PIN.
 - When you manually reset the user's conference ID.
 - When an **Audio Conferencing** license is removed from them.
 - When the audio conferencing provider for a user is changed from Microsoft to another provider or **None**.
 - When the audio conferencing provider for a user is changed to Microsoft.

Dialing out from a Microsoft Teams meeting so other people can join it

12/7/2021 • 2 minutes to read • [Edit Online](#)

As the meeting organizer, you can dial out using the Teams app to let other people join the same meeting using their phones.

When you dial out to someone, we recommend that you do so using their full phone numbers (including the country/region code - E.164 format).

Please note that:

- You can dial out only if you join a meeting using Teams.
- The meeting organizer, has been enabled for audio conferencing, OR, in the case no audio conferencing license is assigned, is allowed to make calls to the public switched telephone network via online calling plans or direct routing.
- The meeting organizer is [Granted an online dial out policy that enables dial out from conferencing enabled](#)

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Here's how to get dial out to work:

Step 1: In the meeting, use the **Add people**  option to dial out to a phone number. **Step 2:** Enter the full phone number, including the country/region code in the **Invite someone or dial a number** box.

Supported countries and regions

Dial-out is only available to some countries/regions. For complete list, see [Country and region availability for Audio Conferencing and Calling Plans](#).

Allow users to dial in

If you are looking for instructions on how to let your users dial in to a Teams meeting, please see [Phone numbers for Audio Conferencing in Microsoft Teams](#).

Turn on or off entry and exit announcements for meetings in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you are setting up Audio Conferencing in Microsoft 365 or Office 365, you will get an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers that people will use to call in to a Microsoft Teams meeting.

The conferencing bridge answers a call for a user who is dialing in to a meeting using a phone. The conferencing bridge answers the caller with voice prompts from a conferencing auto attendant, and then, depending on your settings, can play notifications, ask callers to record their name, and set up the PIN security. A PIN is given to a Microsoft Teams meeting organizer, and it allows them to start a meeting if they can't start the meeting using the Microsoft Teams app. You can, however, set it so that a PIN isn't required to start a meeting.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Setting meeting join options

Using the Microsoft Teams admin center

You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. Log in to the admin center.
2. In the left navigation, go to **Meetings > Conference Bridges**.
3. At the top of the **Conference Bridges** page, click **Bridge Settings**.
4. In the **Bridge settings** pane, enable or disable **Meeting entry and exit notifications**. This is selected by default. If you clear it, users who have already joined the meeting won't be notified when someone enters or leaves the meeting.
5. Under **Entry/exit announcement type**, select **Names or phone numbers** or **Tones**.

NOTE

By default, external participants can't see the phone numbers of dialed-in participants. If you want to maintain the privacy of these phone numbers, select **Tones** for **Entry/exit announcement type** (this prevents the numbers from being read out by Teams).

6. If you chose **Names or phone numbers**, enable or disable **Ask callers to record their name before joining the meeting**.
7. Click **Save**.

Want to know more about Windows PowerShell

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With

Windows PowerShell, you can manage Microsoft 365 or Office 365 using a single point of administration that can simplify your daily work when you have multiple tasks to do. To get started with Windows PowerShell, see these topics:

- [Why you need to use Microsoft 365 or Office 365 PowerShell](#)
- [Best ways to manage Microsoft 365 or Office 365 with Windows PowerShell](#)

For more information about Windows PowerShell, see the [Microsoft Teams PowerShell reference](#) for more information.

Set the PIN length for Audio Conferencing meetings in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you are setting up audio conferencing for Microsoft Teams, you will get an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers. The phone number you set will be included on the meeting invites for the Microsoft Teams app.

The audio conferencing bridge answers a call for people who are dialing in to a meeting using a phone. It answers the caller with voice prompts from an auto attendant and then, depending on your settings, can play notifications and ask callers to record their name. **Microsoft bridge settings** allow you to change the settings for meeting notifications and the meeting join experience, and set the length of the PINs that are used by meeting organizers. Meeting organizers use PINs to start meetings if they can't join the meeting using the Microsoft Teams app.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Setting the PIN length

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge Settings**.
3. In the **Bridge settings** pane, under **PIN length**, select the number of digits you want for the PIN.
4. Click **Save**.

NOTE

A PIN is different from a conference ID. Conference IDs are used by callers when they join the meeting. They are used to identify the meeting. The PIN is used to authenticate a caller as the meeting organizer.

Want to know more about PIN settings?

- PINs can be from 4 to 12 digits; the default is 5. Numbers are only used when creating PINs. Letters and special characters aren't used.
- A PIN is only required for the meeting organizer when a Microsoft Teams user hasn't already started the meeting. If everyone is dialing in to the meeting, then the PIN is required for the meeting organizer to start the meeting.
- PIN security settings are applied to all of the phone numbers that are associated with a Microsoft bridge. They will be applied to all meetings that use the phone numbers associated with a given bridge.

Want to know more about Windows PowerShell?

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 or Office 365 by using a single point of administration that can simplify your daily work when you have multiple tasks to do. Related topics

[Try or purchase Audio Conferencing in Microsoft 365 or Office 365](#)

Set the phone numbers included on invites in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Audio Conferencing in Microsoft 365 and Office 365 enables users in your organization to create Microsoft Teams meetings, and then allow users to dial in to those meetings using a phone.

A conferencing bridge gives you a set of dial-in phone numbers for your organization. All of them can be used to join the meetings that a meeting organizer has created, but you can select which ones will be included on their meeting invites.

NOTE

There can be a maximum of one toll and one toll-free phone number on the meeting invite for a meeting organizer, but there is also a link located at the bottom of each meeting invite that opens the full list of all dial-in phone numbers that can be used to join a meeting.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Initial assignment of phone numbers that are included in the meeting invites for new users

The phone numbers that get included in the meeting invites of users enabled for Audio Conferencing are defined by the default conferencing toll phone number and the default conferencing toll-free phone number user's settings. Each setting specifies which toll and toll-free number will be included in the meeting invite of a given user. As noted above, each meeting invite contains one toll number, one optional toll-free number and a link that opens the full list of all dial-in phone numbers that can be used to join a given meeting.

For a new user, the default conferencing toll numbers is assigned based on the Usage Location that is set in the Microsoft 365 administration center of the user when the user is enabled for the Audio Conferencing service. If there is a toll number in the conference bridge that matches the country of the user, that number will be automatically assigned as the default toll number of the user. If there isn't one, the number that is defined as the default toll number of the conference bridge will be assigned as the default toll number of the user.

Once the user is enabled for the Audio Conferencing service, the default toll and toll-free phone numbers of the user can be changed by the tenant administrator from their initial values at any moment.

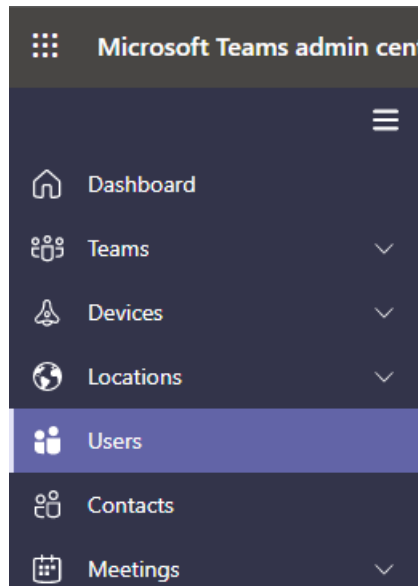

Set or change the default audio conferencing phone number for a meeting organizer or user

Using the Microsoft Teams admin center

You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

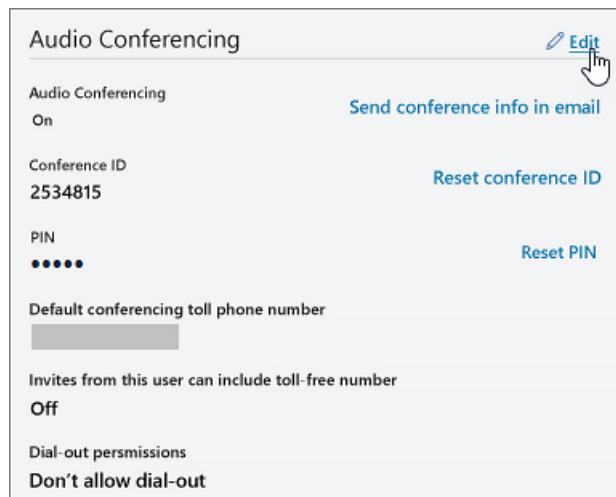

1. Log in to the Microsoft Teams admin center.

2. In the left navigation, click **Users**.

3. Click the user name from the list of available users.

4. Next to **Audio Conferencing**, click **Edit**.

5. Use the **Toll number** or **Toll-free number** fields to enter the numbers for the user.

IMPORTANT

When you change a user's audio conferencing settings, recurring and future Microsoft Teams meetings must be updated and sent to attendees.

Want to use Windows PowerShell

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 or Office 365 by using a single point of administration that can simplify your daily work when you have multiple tasks to do. To get started with Windows PowerShell, see these topics:

- [Why you need to use Office 365 PowerShell](#)
- [Best ways to manage Microsoft 365 or Office 365 with Windows PowerShell](#)

To set or change the default audio conferencing phone number for a meeting organizer or user using [Microsoft](#)

[Teams PowerShell](#), set the `ServiceNumber` or `TollFreeServiceNumber` parameters of the [Set-CsOnlineDialInConferencingUser](#) cmdlet to one of the available numbers.

[Change the phone numbers on your Audio Conferencing bridge](#)

Start an Audio Conference over the phone without a PIN in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

It might be frustrating for users who dial in to a meeting to be held in the meeting's lobby listening to music because the Microsoft Teams meeting organizer hasn't started the meeting.

If a meeting organizer calls in to the meeting, by default, a PIN is required to start a meeting. You can set it up so that anyone can dial in to a meeting and not be prompted for a PIN to start the meeting. You can use the admin center to enable or disable this setting for a single user.

A PIN isn't required for the meeting organizer if someone has started the meeting from the Microsoft Teams app. A PIN is only required when a meeting organizer joins their meeting over a phone. The PIN for meetings is sent to the audio user when they are assigned the **Audio Conferencing** license and are enabled for Audio Conferencing. See [Send an email to a user with their Audio Conferencing information](#) and [Emails that are automatically sent to users when their Audio Conferencing settings change](#).

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Enable or disable anonymous callers from joining a meeting

Using the Microsoft Teams admin center

1. In the left navigation, click **Users**.
2. Select a user in the list, and then click **Edit** at the top of the page.
3. Next to **Audio Conferencing**, click **Edit**.
4. In the **Audio Conferencing** pane, enable or disable **Dial-in callers can be the first person in a meeting**.
5. Click **Apply**.

Using Windows PowerShell

See the [Microsoft Teams PowerShell reference](#) for more information.

What else should you know?

- If you want to reset the PIN, see [Reset the Audio Conferencing PIN](#).
- If anonymous access, or not requiring a PIN to start a meeting, is disabled:
 - If the meeting hasn't started (there's no one in the meeting yet): A caller will be prompted if he's the organizer; if he says yes, he'll be prompted for his PIN, and after he inputs the PIN, the meeting will start and the user will join the meeting.
 - If the meeting already started (someone else is already in the meeting): A caller won't be prompted if he's the organizer and he'll never be prompted for the PIN; the meeting is already started, and the caller will join it.

- If anonymous access, or not requiring a PIN to start a meeting, is enabled:
 - If the meeting hasn't started (there's no one in the meeting yet): A caller won't be prompted if she's the organizer, and she'll never be prompted for the PIN. Because the setting of the organizer is set to off, the meeting will start and the anonymous callers will join the meeting.
 - If the meeting already started (someone else is already in the meeting): A caller won't be prompted if she's the organizer, and she'll never be prompted for the PIN; the meeting is already started, and the caller will join it.

Mask phone numbers in Microsoft Teams meetings

12/7/2021 • 2 minutes to read • [Edit Online](#)

For added privacy, the phone numbers of participants who dial in to a Teams meeting using audio conferencing are fully displayed to the internal participants. The numbers are masked from the participants outside of your organization. This setting is the default for all organizations. The masked number is displayed as shown in the following image:

For specific industry use cases, admins have the ability to choose how the audio conferencing participants' phone numbers appear in meetings that are organized in their tenant. The admins can choose from three options:

- Phone numbers are masked only from external participants. The participants who belong to the meeting organizer's tenant still see the full phone number.
- Phone numbers are masked from everyone in the meeting except the organizer.
- Phone numbers are unmasked, which makes them visible to everyone in the meeting.

This setting is applied to all the surfaces in the meeting where phone numbers are exposed.

Use Microsoft PowerShell to set phone-number masking

To change the Public Switched Telephone Network (PSTN) masking setting, set the `MaskPstnNumbersType` parameter of the [Set-CsOnlineDialInConferencingTenantSettings](#) cmdlet to one of the available options.

To mask phone numbers only from external participants, run the following command:

```
Set-CsOnlineDialInConferencingTenantSettings -MaskPstnNumbersType "MaskedForExternalUsers"
```

To mask phone numbers from all participants in the meeting (except the organizer), run the following command:

```
Set-CsOnlineDialInConferencingTenantSettings -MaskPstnNumbersType "MaskedForAllUsers"
```

To disable phone number masking, run the following command:

```
Set-CsOnlineDialInConferencingTenantSettings -MaskPstnNumbersType "NoMasking"
```

Country and region availability for Audio Conferencing and Calling Plans

12/7/2021 • 7 minutes to read • [Edit Online](#)

You can select a country or region to see what cloud voice features are available to your organization.

Select your country or region to see what's available for your organization

If you're looking for a spreadsheet with all countries and regions, download and save the [Cloud voice feature country/region availability spreadsheet](#).

After you've verified if one of the Skype for Business or Microsoft Teams services are available, you can see [Skype for Business and Microsoft Teams add-on licensing](#) to help you buy licenses and assign them to your users.

NOTE

If you need to get more telephone numbers for your users, see [Getting phone numbers for your users](#) or, for phone number request forms, [Manage phone numbers for your organization](#).

Want to learn more about these services

Audio Conferencing

Sometimes people in your organization will need to use a phone to call in to a meeting. Skype for Business and Microsoft Teams includes the Audio Conferencing feature for just this situation! People can call in to meetings using a phone instead of using the Skype for Business and Microsoft Teams apps on a mobile device or PC. When you've decided that you want Audio Conferencing for your organization, buy one **Audio Conferencing** license for each person in your organization who is going to schedule/host an audio meeting.

With Audio Conferencing, there are toll and toll free phone numbers that can be used by your users to dial in to meetings. Toll numbers from the following countries or regions are automatically assigned as shared audio conferencing numbers to organizations when they're enabled for Audio Conferencing. Dedicated toll and toll free numbers can be assigned to your organization from additional cities.

IMPORTANT

There isn't a resource that contains a listing of all of the dial-in numbers for Audio Conferencing. To find out if there are dial-in phone numbers available in your area or country/region, go to **Skype for Business admin center > Voice > Phone Numbers**, click **Add**, and then click **New Service Numbers**. Use the lists for **Country/Region**, **State/Region**, and **City** to filter your search. If you are looking for toll free service numbers, select **toll free** from the **State/Region** list.

To see more about Audio Conferencing, see [Audio Conferencing common questions](#)

[Pricing for Audio Conferencing](#)

Using the Call Me feature or when adding other people to a meeting so they can join it

In Audio Conferencing, the "Call Me" feature is used to let other people join a dial-in meeting. Use the drop-

down list in this article to search for the country/region and see if this feature is available.

Caution

Dialing out to toll free or free phone numbers may not be possible, because some toll free numbers only function from within a certain country or area within a country. For example, if you dial out from the United States to a toll free number in Brazil, the call may not be successful because the call didn't originate from within Brazil or from a specific region within Brazil. The ability to dial out to toll free numbers varies widely depending on the restrictions of the toll free number dialed. Unfortunately, we can't control this behavior, and as a result, your experience may vary depending on the toll free number dialed and the restrictions of the toll free number.

Dialing out from a meeting to another country/region in the world that isn't listed below is available using [Communication Credits](#). For those users, you'll need to [Set up Communications Credits for your organization](#).

Phone System

With Phone System, you create auto attendants and call queues (with a toll or toll free number) to answer incoming calls for your organization. When you add a Calling Plan for users, they can use Skype for Business to take care of basic call-control tasks, such as placing and receiving calls, transferring calls, and muting and unmuting calls. **Phone System** users click a name in their address book, and Skype for Business will place a call to that person. To place and receive calls, **Phone System** users use their mobile devices, a headset with a laptop or PC, or one of many IP phones that work with Skype for Business.

The availability of toll phone numbers from some of these locations might vary at any given time depending on inventory levels. In addition to getting phone numbers for individual users, it's also possible to search and acquire toll or toll free phone numbers for services such as Audio Conferencing (for conference bridges), auto attendants and call queues. These are called service numbers. See [Getting service phone numbers](#) to get phone numbers. But for your users, after you assign a Calling Plan to them, you can assign a user phone number so they can make and receive phone calls. To find those phone numbers, go to [Getting phone numbers for your users](#). You can also see [Assign, change, or remove a phone number for a user](#).

Pricing for Phone System

NOTE

The availability of toll phone numbers from some of these locations might vary at any given time depending on inventory levels.

Use the drop-down list at the top of the page to search for a country or region and what services are available.

Calling Plans

Along with Phone System, a Calling Plans let users make and receive phone calls. You first get a user (subscriber) phone number (not a service number) to assign to the user, and then assign a Calling Plan. There are two types of Calling Plans available: **Domestic** and **Domestic and International**. See [Phone System and Calling Plans](#) for more details.

You can also see [Phone System and Calling Plans licensing](#) for licensing information.

NOTE

The country/region is based on the location of the user's license in the **Microsoft 365 admin center > Active Users** and **not** the billing address listed under the **Organization Profile** in the **Microsoft 365 admin center**.

Toll and toll free phone numbers for services

In addition to getting phone numbers for individual users, it's also possible to search and acquire toll or toll free phone numbers for services such as Audio Conferencing (for conference bridges), auto attendants, and call queues. These are called service numbers.

The following is a list of capitals and major cities from where you can get toll service numbers to use with Audio Conferencing and Calling Plans. You get toll service numbers from these locations using the **Skype for Business admin center**.

If you want to get a toll or toll free service number, you can see [Getting service phone numbers](#). If you already have a toll or toll free service number that you want to transfer from a different provider, see [Manage phone numbers for your organization](#).

Use the drop-down list at the top of the page to search for a country or region and what services are available.

Communications Credits

We recommend that you set up Communications Credits for your Audio Conferencing and Calling Plans users that need the ability to dial out to **any destination**. Many countries/regions are included, but some destinations might not be included in your Calling Plan or Audio Conferencing subscriptions.

If you don't set up Communications Credits and assign a license to users, and you run out of minutes for your organization (depending on your Calling Plan or Audio Conferencing plan or your country/region), they won't be able to make calls or dial out from meetings. You can find out more information including recommended funding amounts by reading [What are Communications Credits?](#)

Phone numbers for Audio Conferencing in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you are setting up **Audio Conferencing** for Microsoft Teams, dial-in phone numbers are automatically assigned to your organization. To see the phone numbers that are assigned to your audio conferencing bridge, in the Microsoft Teams admin center, go to **Meetings > Conference bridges**. For more information, go to [See a list of Audio Conferencing numbers](#).

Audio Conferencing coverage and pricing

For a complete list of all the countries/regions and cities where Audio Conferencing is available, see [Country and region availability for Audio Conferencing and Calling Plans](#). For pricing information, see [Pricing for Audio Conferencing](#).

Dial-in phone numbers in a meeting invite

When a Microsoft Teams user schedules a meeting in Outlook or Outlook Web App, the default audio conferencing number that is set for the user is included in the meeting invite. If you want to select a different default number for one or more users, you can change that by going to **Users**, selecting the user, and editing the user's Audio Conferencing settings. See [Set the phone numbers included on invites](#).

Dial-in phone numbers set on an audio conferencing bridge

There are two types of audio conferencing phone numbers that can be assigned to your conferencing bridge: **Shared** and **Dedicated**. Both types of these numbers can be used by any caller to join audio meetings that are being held in your organization.

- **Dedicated phone numbers** are those phone numbers that are only available to users within your organization. You can change the languages that are used when someone calls in to one of these numbers.
- **Shared phone numbers** are those phone numbers that can be shared with other Microsoft 365 or Office 365. You can't change the languages that are used when someone calls in to one of these numbers.

While the default audio conferencing number that is assigned to an organizer is only included in the meeting invite, a caller can use any of the phone numbers that are assigned to your conferencing bridge to join a meeting. The list of phone numbers that can be used to join a meeting is available using the **Find a local number** link that is included on every meeting invite.

Automatically assigned audio conferencing phone numbers

Shared audio conferencing phone numbers are automatically assigned to organizations when they're enabled for audio conferencing. When the phone numbers are assigned, a phone number is assigned as the default phone number of the conferencing bridge. The phone number assigned as the default number of the bridge will be one from the country/region of the organization.

To see a list of those countries/regions that have phone numbers automatically assigned to organizations, see [Country and region availability for Audio Conferencing and Calling Plans](#).

NOTE

The country or region location of your organization can be found by signing in to the **Microsoft 365 admin center** and looking under **Organization Profile**.

Caution

Due to limited availability of toll phone numbers in Venezuela, Indonesia, and United Arab Emirates (UAE), organizations from these countries/regions won't have an Audio Conferencing toll number automatically assigned to them. Toll-free numbers from these locations are available depending on available inventory.

What else should you know?

- To see the list of supported languages for audio conferencing, see [Audio Conferencing supported languages](#).
- You can set up to four languages for each audio conferencing phone number - one primary and three secondary. And you can also set languages on a dedicated audio conferencing phone number.
- To set the dial-in phone number for a user, see [Set the phone numbers included on invites](#).

Audio Conferencing in Microsoft 365

12/7/2021 • 5 minutes to read • [Edit Online](#)

Audio Conferencing in Microsoft 365 and Office 365 enables users to call in to meetings from their phones. Audio Conferencing allows up to 1000 phone attendees.

What is Audio Conferencing?

Calling in (dialing in) to meetings is very useful for users who are on the road and can't attend a meeting using the Skype for Business or Microsoft Teams app on their laptops or mobile devices. But there are other scenarios in which using a phone to attend a Skype for Business or Microsoft Teams meeting can be a better option than using an app on a computer:

- Internet connectivity is limited.
- A meeting is audio only.
- The person tried to join a Skype for Business meeting and it failed.
- The call quality is better when dialing in.
- People can join a meeting "hands free" using Bluetooth devices.
- People find it's easier and more convenient for their situation.

You only need to set up Audio Conferencing for people who plan to schedule or lead meetings. Meeting attendees who dial in don't need any licenses assigned to them or other setup.

After attendees have joined meeting, they can also dial out and invite other callers into a Skype for Business or Microsoft Teams meeting. See [Dialing out from a Teams meeting so other people can join it](#) or [Dialing out from a Skype for Business meeting so other people can join it](#).

What does it cost?

For pricing info, see [Pricing for Audio Conferencing](#).

Where is it available?

With Audio Conferencing, your users can use toll and toll-free phone numbers to dial in to meetings. Toll (service) numbers are automatically assigned as shared audio conferencing numbers to organizations when they're enabled for Audio Conferencing. Dedicated toll and toll-free numbers can be assigned to your organization from additional cities.

Toll-free phone numbers (service numbers) are available, but only in some countries/regions. To see what is available in your country or region, see [Country and region availability for Audio Conferencing and Calling Plans](#).

After you have decided you want Audio Conferencing for your organization, you need to buy one **Audio Conferencing** license for each person in your organization who is going to schedule/host an audio meeting.

How do conferencing bridges work?

When you are setting up Audio Conferencing for Skype for Business or Microsoft Teams, you will get an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers. The phone number you set will be included on the meeting invites for Skype for Business and Microsoft Teams apps. You can [change the phone numbers on your conferencing bridge](#), and you can also [change other audio conferencing bridge](#)

[settings](#).

The audio conferencing bridge answers a call for people who are dialing in to a meeting using a phone. It answers the caller with voice prompts from an auto attendant, and then, depending on your settings, can play notifications and ask callers to record their name. **Microsoft bridge settings** allow you to change the settings for meeting notifications and the meeting join experience, and set the length of the PINs that are used by meeting organizers [in Microsoft Teams](#) or in [Skype for Business Online](#). Meeting organizers use PINs to start meetings if they can't join the meeting using the Skype for Business or Microsoft Teams app.

Dial-in phone numbers set on an audio conferencing bridge

There are two types of audio conferencing phone numbers that can be assigned to your conferencing bridge: **Shared** and **Dedicated**. Both types of numbers can be used by any caller to join audio meetings that are being held in your organization.

Dedicated phone numbers are those phone numbers that are only available to users within your organization. You can change the languages that are used when someone calls in to one of these numbers. You will need to get a service phone number for these.

Shared phone numbers are those phone numbers that can be shared with other Microsoft 365 or Office 365s. You can't change the languages that are used when someone calls in to one of these numbers.

While the default audio conferencing number that is assigned to an organizer is only included in the meeting invite, a caller can use any of the phone numbers that are assigned to your conferencing bridge to join a meeting. The list of phone numbers that can be used to join a meeting is available using the **Find a local number** link that is included on every meeting invite.

For more information, see [Phone numbers for Audio Conferencing in Microsoft Teams](#) or [Phone numbers for Audio Conferencing in Skype for Business Online](#).

Automatically assigned audio conferencing phone numbers

Shared audio conferencing phone numbers are automatically assigned to organizations when they're enabled for audio conferencing. When the phone numbers are assigned, a phone number is assigned as the default phone number of the conferencing bridge. The phone number assigned as the default number of the bridge will be one from the country/region of the organization.

NOTE

The country or region location of your organization can be found by signing in to the **Microsoft 365 admin center** and looking under **Organization Profile**.

Caution

Due to limited availability of toll phone numbers in Venezuela, Indonesia, and United Arab Emirates (UAE), organizations from these countries/regions won't have an Audio Conferencing toll number automatically assigned to them. Toll-free numbers from these locations are available depending on available inventory.

To see a list of those countries/regions that have phone numbers automatically assigned to organizations, see [Country and region availability for Audio Conferencing and Calling Plans](#).

How do you get dedicated phone numbers?

Dedicated audio conferencing phone numbers are service numbers that you can get and then assign to your organization. You can get dedicated toll and toll-free phone numbers for your conferencing bridges in one of three ways:

- **Use the Skype for Business admin center.** For some countries/regions, you can get numbers for your conference bridges using the Skype for Business admin center. See [Getting service phone numbers](#).
- **Port your existing numbers.** You can port or transfer existing numbers from your current service provider or phone carrier to Microsoft 365 or Office 365. See [Transfer phone numbers to Teams](#) or [Manage phone numbers for your organization](#) for more information to help you do this.
- **Use a request form for new numbers.** Sometimes (depending on your country/region) you won't be able to get your new phone numbers using the Skype for Business admin center, or you will need specific phone numbers or area codes. If so, you will need to download a form and send it back to us. See [Manage phone numbers for your organization](#) for more information.

How do you set it up?

After you have decided to set up Audio Conferencing for your users, see [Set up Audio Conferencing for Microsoft Teams](#) or [Set up Audio Conferencing for Skype for Business Online](#) for steps you can follow to do so.

Plan your Teams voice solution

12/7/2021 • 9 minutes to read • [Edit Online](#)

This article helps you decide which Microsoft voice solution is right for your organization. After you've decided, the article provides a roadmap to content that will enable you to implement your chosen solution.

You might want the simplest solution—Teams Phone with Calling Plan. This is Microsoft's all-in-the-cloud solution that provides Private Branch Exchange (PBX) functionality and calls to the Public Switched Telephone Network (PSTN), as shown in the following diagram. With this solution, Microsoft is your PSTN carrier.

Start with the simplest solution: Phone System with Calling Plan

If you answer yes to the following, then Teams Phone with Calling Plan is the right solution for you:

- Calling Plan is available in your region.
- You do not need to retain your current PSTN carrier.
- You want to use Microsoft-managed access to the PSTN.

However, your situation might be more complex. For example, you might have offices in locations where Calling Plan isn't available. Or you might need a combination solution that supports a complex, multi-national deployment, with different requirements for different geographic locations. Microsoft supports a combination of solutions:

- Teams Phone with Calling Plan
- Teams Phone with your own PSTN carrier with Operator Connect
- Teams Phone with your own PSTN carrier with Direct Routing
- A combination solution that uses Teams Phone with Calling Plan, Teams Phone with Operator Connect, and/or Teams Phone with Direct Routing

What do you need to read?

Required for all. Some of the sections in this article pertain to all organizations. For example, everyone should read about Teams Phone and understand the options for connecting to the Public Switched Telephone Network (PSTN).

REQUIRED FOR ALL	DESCRIPTION
Teams Phone	Microsoft's technology for enabling call control and Private Branch Exchange (PBX) capabilities in the Microsoft 365 cloud with Microsoft Teams.

REQUIRED FOR ALL	DESCRIPTION
Public Switched Telephone Network (PSTN) connectivity options	A choice between using Microsoft as your telephony carrier or connecting your own telephony carrier to Microsoft Teams by using Operator Connect or Direct Routing. Combined with Teams Phone, PSTN connectivity options enable your users to make phone calls all over the world.

Depending on your requirements. Some of the sections in this and related articles are pertinent depending on your existing deployment and requirements. For example, Location-Based Routing is only required for Direct Routing customers in geographic locations that do not allow toll bypass.

Consider which of these additional configurations you might need:

Consider whether you also need:

Phone numbers

Dial plans and call routing

Emergency calling

Location-based routing for direct routing

Network topology for cloud voice features

Migrate your existing voice solution

DEPENDING ON YOUR REQUIREMENTS	DESCRIPTION
Phone number management	How to get and manage phone numbers differs depending on your PSTN connectivity option. Read this section if you need to obtain phone numbers, transfer existing numbers, obtain service numbers, and so on.
Call routing and dial plans	How to configure and manage dial plans that translate dialed phone numbers into an alternate format (typically E.164 format) for call authorization and call routing. Read this section if you need to understand what dial plans are and whether you need to specify dial plans for your organization.
Emergency calling	How to manage and configure emergency calling differs depending on your PSTN connectivity option. Read this section if you need to understand how to manage emergency calling for your organization.
Location-Based Routing for Direct Routing	How to use Location-Based Routing (LBR) to restrict toll bypass for Microsoft Teams users based on their geographic location. Read this section if your organization is using Direct Routing at a location that does not allow toll bypass.
Network topology for cloud voice features	If your organization is deploying Location-Based Routing (LBR) for Direct Routing or dynamic emergency calling, you must configure network settings for use with these features in Microsoft Teams. Read this section if you are implementing LBR for Direct Routing, or if you are implementing dynamic emergency calling with Calling Plan or Direct Routing.
Migrate your existing voice solution	What you need to think about when migrating your voice solution to Teams. Read this section if you are migrating from an existing voice solution to Teams.

DEPENDENT ON YOUR REQUIREMENTS	DESCRIPTION
--------------------------------	-------------

IMPORTANT

This article focuses on voice solutions with Microsoft Teams. It's important to understand that Skype for Business Online will be retired on July 31, 2021. After that date, the Skype for Business Online service will no longer be accessible. In addition, PSTN connectivity between your on-premises environment—whether through Skype for Business Server or Cloud Connector Edition—and Skype for Business Online will no longer be supported. This article introduces Teams voice solutions and how you can connect your on-premises telephony network, if necessary, to Teams by using Operator Connect or Direct Routing.

Teams Phone

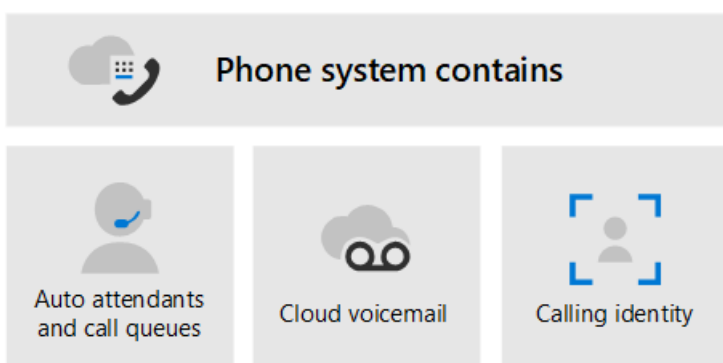

Teams Phone is Microsoft's technology for enabling call control and Private Branch Exchange (PBX) capabilities in the Microsoft 365 cloud with Microsoft Teams.

Teams Phone works with Teams clients and certified devices. Teams Phone allows you to replace your existing PBX system with a set of features directly delivered from Microsoft 365.

Calls between users in your organization are handled internally within Teams Phone, and never go to the Public Switched Telephone Network (PSTN). This applies to calls between users in your organization located in different geographical areas, removing long-distance costs on these internal calls.

This article introduces the following Teams Phone key features and functionality, and the deployment decisions you'll need to consider:

- [Auto attendants and call queues](#)
- [Cloud Voicemail](#)
- [Calling identity](#)

For information about all Teams Phone features, and how to set up Teams Phone, see the following articles:

- [Here's what you get with Teams Phone](#)
- [Set up Teams Phone in your organization](#)
Describes how to buy and assign Phone System licenses, manage phone numbers, and set up communication credits for toll-free numbers.

For information about managing supported devices, see [Manage your devices in Microsoft Teams](#) and [Teams Marketplace](#).

Auto attendants and Call queues

Auto attendants allow you to set up menu options to route calls based on caller input. Call queues are waiting areas for callers. Used together, auto attendants and call queues can easily route callers to the appropriate person or department in your organization.

For information about auto attendants and call queues, see the following articles:

- [Plan for Teams auto attendants and call queues](#)
- [Set up an auto attendant](#)
- [Create a call queue](#)
- [Contoso case study: Auto attendants and call queues](#)

Describes how a fictional multi-national corporation, Contoso, implemented auto attendants and call queues for their voice solution.

Cloud Voicemail

Cloud Voicemail, powered by Azure Voicemail services, supports voicemail deposits to Exchange mailboxes only. It doesn't support third-party email systems.

Cloud Voicemail includes voicemail transcription, which is enabled for all users in your organization by default. Your business needs might require that you disable voicemail transcription for specific users or everyone throughout the organization.

Cloud Voicemail is automatically set up and provisioned for Teams users.

For more information about Cloud Voicemail and its configuration, see the following articles:

- [Set up Cloud Voicemail](#)
- [Set voicemail policies in your organization](#)

Calling identity

By default, all outbound calls use the assigned phone number as calling identity (caller ID). The recipient of the call can quickly identify the caller and decide whether to accept or reject the call. For information about configuring caller ID or to change or block the caller ID, see [Set the caller ID for a user](#).

Public Switched Telephone Network connectivity options

Teams Phone provides complete PBX capabilities for your organization. However, to enable users to make calls outside your organization, you need to connect Teams Phone to the Public Switched Telephone Network (PSTN). To connect Teams Phone to the PSTN, you can choose one of the following options:

- [Teams Phone with Calling Plan](#). An all-in-the-cloud solution with Microsoft as your PSTN carrier.
- [Teams Phone with your own PSTN carrier by using Operator Connect](#). With Operator Connect, if your existing operator is a participant in the Microsoft Operator Connect program, they can manage the service for bringing PSTN calling to Teams. For information on the benefits and requirements of Operator Connect, see [Plan Operator Connect](#).
- [Teams Phone with your own PSTN carrier by using Direct Routing](#) to connect your on-premises environment to Teams.

You can also choose a combination of options, which enables you to design a solution for a complex environment, or manage a multi-step migration (more about migration later).

Most Teams Phone features are the same regardless of the PSTN connectivity option you choose. There are some differences in functionality, however, that affect how you configure certain Teams Phone features, such as call routing and emergency calling. For more information about PSTN connectivity options and these configuration considerations, see [PSTN connectivity options](#).

Migrate your existing voice solution to Teams

NOTE

For guidance on planning a Teams voice solution as part as your overall plan to upgrade to Teams from Skype for Business Server, see [PSTN considerations for upgrading to Teams from Skype for Business on-premises](#).

For an organization that is upgrading to Teams, the ultimate goal is to move all users to TeamsOnly mode. Using Teams Phone is only supported when the user is in TeamsOnly mode. If you need basic information about upgrading to Teams, start here:

- [Getting started with your Microsoft Teams upgrade](#)
- [About the upgrade framework](#)
- [Upgrade strategies for IT administrators](#)

When migrating your voice solution, there are four possible calling scenarios when moving to TeamsOnly mode:

- **A user in Skype for Business Online, with a Microsoft Calling Plan.** Upon upgrade, this user will continue to have a Microsoft Calling Plan.
- **A user in Skype for Business Online, with on-premises voice functionality through Skype for Business on-premises or Cloud Connector Edition.** The user's upgrade to Teams needs to be coordinated with migration of the user to Direct Routing to ensure the TeamsOnly user has PSTN functionality.
- **A user in Skype for Business on-premises with Enterprise Voice, who will be moving to online and keeping on-premises PSTN connectivity.** Migrating this user to Teams requires moving the user's on-premises Skype for Business account to the cloud, and coordinating that move with migration of the user to Direct Routing.
- **A user in Skype for Business on-premises with Enterprise Voice, who will be moving to online and using a Microsoft Calling plan.** Migrating this user to Teams requires moving the user's on-premises Skype for Business account to the cloud, and coordinating that move with either A) the port of that user's phone number to a Microsoft Calling Plan or B) assigning a new subscriber number from available regions.

For more information about how to implement your voice migration for each of these scenarios—including information about when you need to set up hybrid connectivity and how to migrate users with on-premises voice functionality to Direct Routing—see the following articles:

- [PSTN considerations when upgrading to Teams — for IT administrators](#)
- [Contoso voice migration case study](#)

The case study describes how a fictional multi-national corporation, Contoso, implemented a Teams voice solution for their organization. It contains the following articles:

- [Teams upgrade plan](#)
- [Teams Phone and PSTN connectivity options](#)
- [Location-Based Routing implementation](#)
- [Emergency calling](#)
- [Auto attendants and call queues](#)
- [Audio Conferencing](#)

What is Teams Phone

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams Phone is Microsoft's technology for enabling call control and Private Branch Exchange (PBX) capabilities in the Microsoft 365 cloud with Microsoft Teams.

Teams Phone works with Teams clients and certified devices. Teams Phone allows you to replace your existing PBX system with a set of features directly delivered from Microsoft 365.

Calls between users in your organization are handled internally within Teams Phone, and never go to the Public Switched Telephone Network (PSTN). This applies to calls between users in your organization located in different geographical areas, removing long-distance costs on these internal calls.

For making external calls, Teams Phone provides add-on options for connecting to the PSTN. For more information about voice solutions and PSTN connectivity options, see [Plan your Teams voice solution](#) and [Connect to the PSTN](#).

Teams Phone features

With Teams Phone, users can use Teams to place and receive calls, transfer calls, and mute or unmute calls. Teams Phone users can click a name in their address book, and place Teams calls to that person. To place and receive calls, Teams Phone users can use their mobile devices, a headset with a laptop or PC, or one of many IP phones that work with Teams.

Teams Phone administrators can manage calling options and settings from the same console used for messaging, collaboration, and so on.

For more information about Teams Phone features, see [Here's what you get with Teams Phone](#).

Connect to the Public Switched Telephone Network (PSTN)

For external calling, Teams Phone can be connected to the PSTN in one of several ways:

- Purchase a Microsoft Calling Plan (domestic or domestic and international). Microsoft Calling Plan is an all-in-the-cloud solution with Microsoft as your PSTN carrier. For more information, see [Teams Phone and Calling Plans](#).
- Use your existing telephony infrastructure for on-premises PSTN connectivity.

You can connect your on-premises telephony infrastructure to Teams Phone by using Operator Connect Calling or Direct Routing.

For more information about all PSTN Connectivity options, see [PSTN connectivity options](#).

Teams Phone with services

Teams Phone can be used for services and voicemail, such as:

- **Auto attendants** - Auto attendants can be used to create a menu system for your organization that lets external and internal callers move through the system to locate and place or transfer calls to company users or departments in your organization. See [What are Cloud auto attendants?](#).
- **Call queues** - Call queue greetings can be used when someone calls in to a phone number for your organization. These greetings include the ability to automatically put the calls on hold and the ability to

search for the next available call agent to handle the call while the people who call are listening to music on hold. You can create single or multiple call queues for your organization. See [Create a Cloud call queue](#).

- **Voicemail** - Cloud Voicemail is automatically set up and provisioned for all Teams users. See [Set up Cloud Voicemail](#).

For more information about features, see [Here's what you get with Teams Phone](#). If you're ready to get started, see [Set up Teams Phone in your organization](#).

Here's what you get with Teams Phone

12/7/2021 • 6 minutes to read • [Edit Online](#)

This article describes Teams Phone features. For more information about using Teams Phone as your Private Branch Exchange (PBX) replacement, and options for connecting to the Public Switched Telephone Network (PSTN), see [What is Teams Phone](#).

Clients are available for PC, Mac, and mobile, which provides features on devices from tablets and mobile phones to PCs and desktop IP phones. For more information, see [Get clients for Microsoft Teams](#).

NOTE

For details about Teams phone systems on different platforms, see [Teams features by platform](#).

To use Teams Phone features, your organization must have a Phone System license. For more information about licensing, see [Microsoft Teams add-on licensing](#).

Be aware that most features require you to assign the Phone System license and ensure that users are "voice enabled." To assign the license, use the [Set-CsUser cmdlet](#) and set the **enterprisevoiceenabled** parameter to \$true. A few features, such as cloud auto attendant, do not require a user to be voice enabled. Exceptions are called out in the table below.

Teams Phone features

Teams Phone provides the following features.

TEAMS PHONE FEATURE	DESCRIPTION
Cloud auto attendants	Lets you create a menu system that enables external and internal callers to locate and place or transfer calls to company users or departments in your organization. Note that users <i>do not</i> need to be voice enabled to receive calls from the auto attendant.
Cloud call queues	Lets you configure how call queues are managed for your organization: for example, set up greetings and music on hold, search for the next available call agent to handle the call, and so on. Note that users <i>do</i> need to be voice enabled to receive calls from a call queue.
Music on hold	Plays default music defined by the service when an external call from the Public Switched Telephone Network (PSTN) is placed on hold. This feature works for one-to-one PSTN-to-Teams calls in addition to calls made to a call queue. This feature provides on-hold notification parity with other platforms. This feature is configurable by the administrator but currently only via PowerShell . Hold music is also not supported in consultative transfer of a PSTN call. For more information, see Music on hold .

TEAMS PHONE FEATURE	DESCRIPTION
Call answer/initiate (by name and number)	Lets users answer inbound calls with a touch, and place outbound calls either by dialing the full phone number or by clicking a name in the client.
Call forwarding options and simultaneous ring	Lets users set up forwarding rules so calls can go with them anywhere, or calls can be forwarded to colleagues or to voicemail.
Group call pickup and forward to group	Lets users share incoming calls with colleagues so that the colleagues can answer calls that occur while the user is unavailable. Less disruptive to recipients than other forms of call sharing (such as call forwarding or simultaneous ringing) because users can configure how they want to be notified of an incoming shared call.
Transfer a call and consultative transfer	Lets users transfers calls to another person. Or, if they need to leave their office but want to continue the conversation, they can transfer the calls from their PC or IP phone to their cell phone. Note that users <i>do not</i> need to be voice enabled to receive transferred calls from another user.
Transfer to voicemail mid call*	Lets users transfer to voicemail during a call.
Call park and retrieve	Lets users place a call on hold in the Teams service in the cloud. When a call is parked, the service generates a unique code for call retrieval. The user who parked the call or someone else can then use that code and a supported app or device to retrieve the call.
Call phone number from search	Lets users place a call from the search box by using the /call command and specifying a name or a number.
Caller ID	Calls from inside the company display a detailed caller ID that pulls information from the corporate directory, showing picture ID and job title instead of just a phone number. For calls from external phone numbers, the caller ID as provided by the phone service provider is displayed. If the external phone numbers are secondary numbers in the corporate directory, then the information from the corporate directory will be displayed.
Device switching	Lets users play a call or meeting on another HID device that is connected to Teams; for example, switching from their PC speakers to a headset.
Presence-based call routing	Controls inbound communications with presence, enabling the user to block all incoming communication except from those specifically indicated.
Integrated dial pad	Lets users dial by name or by number anywhere in the search bar and in the dial pad, speeding up the process of making outbound calls.
Federated calling	Lets users securely connect, communicate, and collaborate with users in federated tenants.

TEAMS PHONE FEATURE	DESCRIPTION
Make and receive a video call	If the user's account is enabled for video calls, the user can make face-to-face video calls with their contacts. All they need is a camera, their computer's speakers and microphone. Users can also use a headset if their computer doesn't have a built-in audio device.
Cloud Voicemail	<p>When a user receives a voicemail, it is delivered to their Exchange mailbox as an email with the voicemail message as an attachment. Users can listen to their messages on their certified desktop phone, and on all Teams or Skype for Business applications. Support for voicemail transcription has been added as of March 2017 and is enabled by default for all organizations and users.</p> <p>Note that users <i>do not</i> need a Phone System license, <i>nor</i> do they need to be voice enabled to use Cloud Voicemail features.</p>
Cloud Voicemail user settings	<p>Lets users configure their client settings for voicemail greetings, call answering rules, and greeting language, including out-of-office greetings.</p> <p>Note that users <i>do not</i> need a Phone System license, <i>nor</i> do they need to be voice enabled to use Cloud Voicemail features.</p>
Secondary ringer	Users with multiple speaker devices connected to their PC can choose to set a secondary device to ring in addition to their default speaker. For example, a user with a headset connected to the PC and desk speakers can choose to have both headset and desk speakers ring when a call comes in so that they don't miss a call.
Distinctive ring alerts (Teams only)	Lets users choose separate ringtones for normal calls, forwarded calls, and delegated calls so they can distinguish the type of call.
Shared Line Appearance	Lets users share their phone line so that another user can make and receive calls on their behalf.
Busy on Busy (Teams only)	<p>A calling policy that lets you configure how incoming calls are handled when a user is:</p> <ul style="list-style-type: none"> • in a call • in a conference • has a call placed on hold. <p>The caller will receive one of the following responses:</p> <ul style="list-style-type: none"> • hear a busy signal when the callee is on the phone • will be routed accordingly to the user's unanswered settings. One option lets the caller leave a voicemail for the user who is already on a call. <p>The callee gets a missed call notification but isn't able to answer incoming calls. This feature is disabled by default, but can be turned on by the tenant admin.</p>
Call blocking	Lets users add (PSTN) phone numbers to a blocked list so that the next call from that number is blocked from ringing the user.

TEAMS PHONE FEATURE	DESCRIPTION
Common Area Phones	A common area phone is typically placed in an area like a lobby or conference room making it available to multiple people. Common area phones are set up as devices rather than users, and can automatically sign into a network.
Media bypass support (for Teams Direct Routing only)	For better performance, media is kept between the Session Border Controller (SBC) and the client instead of sending it through the Teams Phone.

Availability in GCC High and DoD clouds

The following capabilities are not yet available in GCC High and DoD Clouds.

- [Call settings for secondary ringer, voicemail, and enhanced delegation](#)
- [Transfer to voicemail mid call](#)
- Call phone number from search bar
- Music on hold
- Azure AD reverse number lookup

Set up Teams Phone in your organization

12/7/2021 • 7 minutes to read • [Edit Online](#)

The following is a step-by-step guide for setting up Teams Phone in Microsoft 365. Links to additional, detailed information are available at the end of each step.

Step 1: Make sure that Teams Phone is available in your country or region

1. First go to [Country and region availability for Audio Conferencing and Calling Plans](#), and select your country or region from the list at the top of the page.
2. Under **Phone System**, review the list of features and details.
3. If Phone System is available, go to step 2.

Step 2: Buy and assign Phone System and Calling Plan licenses

To assign a Phone System and Calling Plan license to a single user, the steps are the same as assigning a Microsoft 365 license. You can also assign licenses to multiple users in bulk. For more information, see [Assign Microsoft Teams add-on licenses](#).

If Calling Plans are not available for your country or region, there are other options for connecting to the Public Switched Telephone Network (PSTN). For more information, see [PSTN connectivity options](#).

Step 3: Get phone numbers for your users

Before you can set up users in your organization to make and receive phone calls, you must get phone numbers for them.

You have three ways of getting numbers for your users:

- Get new numbers using the Teams admin center.
- Get new numbers that aren't available in the Teams admin center.
- Port or transfer your existing numbers from your current service provider or phone carrier to Microsoft 365.

You must use the **Add numbers** page to see, search, acquire, and reserve those numbers. You can search by Country/Region, State, and City, and then enter the number of phone numbers you will need for your users.

Get new user phone numbers using the Teams admin center

1. Sign in to Microsoft 365 with your work or school account.
2. Go to the **Teams admin center**.
3. In the left navigation go to **Voice > Phone numbers**, click **Add**, and then follow the prompts.

Get new numbers that aren't available in the Teams admin center

Sometimes (depending on your country/region) you won't be able to get your new numbers using the Teams admin center. In this case, you'll need to download a form and send it back to us. To learn how to request new user numbers, see [Manage phone numbers for your organization](#).

Port or transfer phone numbers from your service provider or phone carrier

- If you need 999 or fewer phone numbers for your users, you can use the **New Local Number Port**

Order wizard in the Teams admin center. Follow the steps found in [Transfer phone numbers to Teams](#) to transfer your phone numbers.

- If you need to port more than 999 phone numbers, see [Manage phone numbers for your organization](#) to submit a port order service request or order.

For detailed information about getting new phone numbers or transferring existing numbers, see [Manage phone numbers for your organization](#).

Step 4: Get service phone numbers (audio conferencing, call queues, auto attendants)

In addition to getting phone numbers for your users from Microsoft 365 or Office 365, you can search and acquire toll or toll-free phone numbers for services such as audio conferencing (for conference bridges), auto attendants, and call queues. Service phone numbers have a higher concurrent calling capacity than user or subscriber phone numbers. For example, a service number can handle hundreds of calls simultaneously, whereas a user's phone number can only handle a few calls simultaneously.

Get new service numbers using the Teams admin center

1. Sign in with your work or school account.
2. Go to the **Teams admin center**.
3. In the left navigation pane go to **Voice > Phone numbers > Add new number**, and then click **New service numbers**.

IMPORTANT

For you to see the **Voice** option in the left navigation pane in the Teams admin center, you must first buy at least one **Enterprise E5 license**, one **Phone System** add-on license, or one **Audio Conferencing** add-on license.

Get new numbers that aren't available in the Teams admin center

Sometimes (depending on your country/region) you won't be able to get your new numbers using the Teams admin center. In this case, you will need to download a form and send it back to us. To learn how to request new numbers, see [Manage phone numbers for your organization](#).

Port or transfer existing service numbers

If you want to transfer service numbers from your current service provider or carrier, you need to manually submit a port order to Microsoft. You need to submit separate port orders for each type of service number (toll vs. toll-free) that you will be transferring using a Letter of Authorization (LOA). In the Letter of Authorization (LOA), you must select the correct type of service number. When contacting Microsoft support, specify that you are transferring a service number (*and not a user or subscriber number*), or the concurrent calling capacity may not be enough to handle call volumes. If you want to transfer phone numbers or do other things with your phone numbers, see [Manage phone numbers for your organization](#).

Step 5: If you want to set up Calling Plans

If you have been following the steps above, you have already bought and assigned Phone System and licenses and a Calling Plan (step 2) and acquired phone numbers for your users (step 3), so your calling plan is partially set up. To complete the procedures for setting up Calling Plan, see [Set up Calling Plans](#).

Step 6: If you want to set up Audio Conferencing

Sometimes people in your organization will need to use a phone to call in to a meeting. Microsoft Teams

includes the Audio Conferencing feature for just this situation. People can call in to Teams meetings using a phone, instead of using the Teams app on a mobile device or PC. For information about how to set up Audio Conferencing, see [Set up Audio Conferencing for Teams](#).

Step 7: If you want to set up a Cloud call queue

Cloud call queues include greetings that are used when someone calls in to a phone number for your organization, the ability to automatically put the calls on hold, and the ability to search for the next available call agent to handle the call while the people who call are listening to music on hold. You can create single or multiple call queues for your organization.

For more information about call queues, see [Create a Cloud call queue](#).

Step 8: If you want to set up a Cloud auto attendant

Auto attendants let people that call in to your organization and navigate a menu system to get them to the right department, call queue, person, or the operator. You can create an auto attendant for your organization by using the Teams admin center.

For information about setting up a Cloud auto attendant, see [Set up a Cloud auto attendant](#).

Step 9: Assign service phone numbers (audio conferencing, call queues, auto attendants)

Once you have your service numbers from **Step 4 above**, you need to assign them to each type of service that you want. For example, if you want a dedicated service phone number (toll or toll-free), you'll need to assign the number to the conferencing bridge.

- For Audio Conferencing, you can assign a dedicated number to a conferencing bridge by going to **Teams admin center** > **Meetings** > **Conference bridges** and follow the prompts. For more information, see [Change the toll or toll-free numbers on your Audio Conferencing bridge](#).
- For Auto Attendants, you can assign a dedicated number to an auto attendant by going to **Teams admin center** > **Voice** > **Auto attendants** and follow the prompts. For more information, see [Set up a Cloud auto attendant](#).
- For Call Queues, you can assign a dedicated number to a call queue by going to **Teams admin center** > **Voice** > **Call queues** and follow the prompts. For more information, see [Create a Cloud call queue](#).

For detailed information about getting new service numbers and porting existing service numbers, see [Getting service phone numbers](#).

Step 10: Set up Communications Credits for your organization

If you would like to use toll-free numbers with Microsoft Teams, You'll need to set up Communications Credits. Microsoft recommends that you set up Communications Credits for your Calling Plans (Domestic or International) and Audio Conferencing users who need the ability to dial out to any destination. Many countries/regions are included, but some destinations may not be included in your Calling Plan or Audio Conferencing subscriptions.

If you don't set up Communications Credits billing and assign a **Communications Credits** license to your users and you run out minutes for your organization (depending on your Calling Plan or Audio Conferencing plan in your country/region), those users won't be able to make calls or dial out from Audio Conferencing meetings. For more information, including recommended funding amounts, see [What are Communications Credits?](#) and [Set up Communications Credits for your organization](#).

Set up the Common Area Phone license for Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Common area phones do not support voicemail.

A common area phone is typically placed in an area like a lobby or another area that is available to many people to make a call; for example, a reception area, lobby, or conference phone. Common area phones are signed in with accounts tied to a Common Area Phone license. The TeamsIPPhone policy must also be appropriately set for the phone to have a common area user experience.

In the steps below, we'll help you set up an account for Phone System to deploy common area phones for your organization. For a more complete meeting room experience, including audio conferencing, consider purchasing the dedicated Meeting Room license with a meeting room device.

First, you need to purchase a Common Area Phone (CAP) license and make sure that you have a certified phone. To search for and learn more about certified phones, go to [Microsoft Teams devices](#).

Step 1 - Buy the licenses

1. In the Microsoft 365 admin center, go to **Billing** > **Purchase services** and then expand **Other plans**.

2. Select **Common Area Phone** > **Buy now**.
3. On the Checkout page, click **Buy now**.
4. Expand **Add-on subscriptions** and then click to buy a Calling Plan. Choose either the **Domestic Calling Plan** or **Domestic and International Calling Plan**.

NOTE

If you are using Microsoft Phone System Direct Routing, you do not need a Calling Plan license.

NOTE

You don't need to add a Phone System license. It's included with the Common Area Phone license.

For more information on licenses, see [Microsoft Teams add-on licensing](#).

The Common Area Phone license supports:

	COMMON AREA PHONE
Skype for Business	✓
Microsoft Teams	✓
Phone System	✓
Audio Conferencing	X ¹
Microsoft Intune	X
Worldwide Availability	X ²
Channel Availability	EA, EAS, CSP, GCC, EES, Web Direct

¹ Common Area Phones can join audio conferences via dial-in number provided by the meeting organizer

² Not available in sovereign clouds

Step 2 - Create a new user account for the phone and assign the licenses

1. In the Microsoft 365 admin center, go to **users > active users > add a user**.
2. Enter a user name like "Main" for the first name and "Reception" for the second name.
3. Enter a display name if it doesn't autogenerate one like "Main Reception."
4. Enter a user name like "MainReception" or "Mainlobby."
5. For common area phones, you might want to set a password manually or have the same password for all your common area phones. Also, you might think about clearing the **Make this user change their password when they first sign in** check box.
6. Assign the licenses to the user. On the same page, click to expand **Product licenses**. Turn on the Common Area Phone and pick either a **Domestic Calling Plan** or a **Domestic and International Calling Plan**.

NOTE

If you are using Microsoft Phone System Direct Routing, you do not need to assign a Calling Plan license.

For more information, see [Assign licenses to users](#).

Step 3 - Assign a phone number to the Common Area Phone user account

Use the Teams admin center to assign a number to the user.

1. In the Teams admin center, select **Voice > Phone numbers**.
2. Select a number from the list of phone numbers and click **Assign**.
3. On the **Assign** page, in the Voice user box, type the name of the user who will be using the phone, and then select the user in the **Select a voice user** drop-down list.
4. Next, you need to add an emergency address. Choose **Search by city**, **Search by description**, or **Search by location** from the drop-down list, and then enter the city, description, or location in the text box. Once you search, look under **Select emergency address** to pick the right one for you.
5. Click **Save** and your user should look like this:

NOTE

Users will only show up if they have a Phone System license applied. If you just did this, then sometimes it takes a bit for the user to show up in the list.

For more information, see [Getting phone numbers for your users](#).

You can also take your phone number that you have with another carrier and "port" or transfer it over to Microsoft 365 or Office 365. See [Transfer phone numbers to Teams](#).

Set up Cloud Voicemail

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is for the Microsoft 365 or Office 365 admin as described in [About admin roles](#) who wants to set up the Cloud Voicemail feature for everyone in the business. Cloud Voicemail requires Exchange mailboxes for users where it deposits voicemail messages. It doesn't support third-party email systems.

Cloud Voicemail for Teams users

For Teams users, Cloud Voicemail is automatically set up and provisioned. A Microsoft Teams Phone license is not required for Cloud Voicemail.

Help your users learn Teams voicemail features

We have the following information for your users on using and managing voicemail in Teams:

- [Check your voicemail in Teams](#)
- [Manage your call settings in Teams](#)

Setting up Cloud Voicemail to work with on-premises users

You can use Cloud Voicemail to provide voice mail functionality to your users who have mailboxes on your Exchange Servers, or for users who are using Skype for Business Server. This section provides information for these scenarios.

Set up Cloud Voicemail for Exchange Server Mailbox Users

The following information is about configuring Cloud Voicemail to work with Microsoft Teams Phone users who have their mailbox on Exchange Server.

1. Voicemail messages are delivered to users' Exchange mailbox via SMTP routed through Exchange Online Protection. To enable successful delivery of these messages, be sure that Exchange Connectors are configured correctly between your Exchange servers and Exchange Online Protection; [Use Connectors to Configure Mail Flow](#).
2. To enable Voicemail features such as customizing greetings and visual voicemail in Skype for Business clients, connectivity from Microsoft 365 or Office 365 to the Exchange server mailbox via Exchange Web Services is required. To enable this connectivity, you must configure the new Exchange OAuth authentication protocol described in [Configure OAuth authentication between Exchange and Exchange Online organizations](#), or run the Exchange Hybrid Wizard from Exchange 2013 CU5 or greater. Additionally, you must configure integration and OAuth between Skype for Business Online and Exchange server described in [Configure Integration and OAuth between Skype for Business Online and Exchange Server](#).

Set up Cloud Voicemail for Skype for Business Server Users

To configure Skype for Business server users for Cloud Voicemail, see [Plan Cloud Voicemail service for on-premises users](#).

Enabling protected voicemail in your organization

When someone leaves a voicemail message for a user in your organization, the voicemail is delivered to the user's mailbox as an email message attachment. Using mail flow rules to apply message encryption, you can

prevent those voicemail messages from being forwarded to other recipients. When you enable protected voicemail, users can listen to protected voicemail messages by calling into their voicemail mailbox or by opening the message in Outlook, Outlook on the web, or in Outlook for Android or iOS. Protected voicemail messages can't be opened in Skype for Business or Microsoft Teams.

For more information about message encryption, see [Define mail flow rules to encrypt email messages](#).

Setting voicemail policies in your organization

12/7/2021 • 3 minutes to read • [Edit Online](#)

WARNING

For Skype for Business customers, disabling voicemail through a Microsoft Teams calling policy might also disable the voicemail service for your Skype for Business users.

Voicemail organization defaults for all users

- Voicemail transcription is enabled.
- Voicemail transcription profanity masking is disabled.
- The maximum recording duration is set to five minutes.

You can control these defaults by using the [Set-CsOnlineVoicemailPolicy](#) and [Grant-CsOnlineVoicemailPolicy](#) cmdlets.

Voicemail messages received by users in your organization are transcribed in the region where your Microsoft 365 or Office 365 organization is hosted. The region where your tenant is hosted might not be the same region where the user receiving the voicemail message is located. To view the region where your tenant is hosted, go to the [Organization profile](#) page and then click **View details** next to **Data location**.

IMPORTANT

You can't create a new policy instance for transcription and transcription profanity masking using the **New-CsOnlineVoiceMailPolicy** cmdlet, and you can't remove an existing policy instance using the **Remove-CsOnlineVoiceMailPolicy** cmdlet.

You can manage the transcription settings for your users using voicemail policies. To see all available voicemail policy instances, you can use the [Get-CsOnlineVoicemailPolicy](#) cmdlet.

```
PS C:\> Get-CsOnlineVoicemailPolicy
```

```
Identity                : Global
EnableTranscription     : True
ShareData                : Defer
EnableTranscriptionProfanityMasking : False
EnableEditingCallAnswerRulesSetting : True
MaximumRecordingLength  : 00:05:00
EnableTranscriptionTranslation : True
```

```
Identity                : Tag:Default
EnableTranscription     : True
ShareData                : Defer
EnableTranscriptionProfanityMasking : False
EnableEditingCallAnswerRulesSetting : True
MaximumRecordingLength  : 00:05:00
EnableTranscriptionTranslation : True
```

```
Identity                : Tag:TranscriptionProfanityMaskingEnabled
EnableTranscription     : True
ShareData                : Defer
EnableTranscriptionProfanityMasking : True
EnableEditingCallAnswerRulesSetting : True
MaximumRecordingLength  : 00:05:00
EnableTranscriptionTranslation : True
```

```
Identity                : Tag:TranscriptionDisabled
EnableTranscription     : False
ShareData                : Defer
EnableTranscriptionProfanityMasking : False
EnableEditingCallAnswerRulesSetting : True
MaximumRecordingLength  : 00:05:00
EnableTranscriptionTranslation : True
```

Turning off transcription for your organization

Because the default setting for transcription is on for your organization, you may want to disable it by using [Set-CsOnlineVoicemailPolicy](#). To do this, run:

```
Set-CsOnlineVoicemailPolicy -EnableTranscription $false
```

Turning on transcription profanity masking for your organization

Transcription profanity masking is disabled by default for your organization. If there is a business requirement to enable it, you can enable transcription profanity masking by using [Set-CsOnlineVoicemailPolicy](#). To do this, run:

```
Set-CsOnlineVoicemailPolicy -EnableTranscriptionProfanityMasking $true
```

Changing the recording duration for your organization

The maximum recording length is set to five minutes by default for your organization. If there is a business requirement to increase or decrease the maximum recording length, this can be done by using [Set-CsOnlineVoicemailPolicy](#). For example, to set the maximum recording time to 60 seconds, run:

```
Set-CsOnlineVoicemailPolicy -MaximumRecordingLength ([TimeSpan]::FromSeconds(60))
```

Dual language system prompts for your organization

By default, the voicemail system prompts are presented to callers in the language selected by the user when setting up their voicemail. If there is a business requirement to have the voicemail system prompts presented in two languages, this can be done by using [Set-CsOnlineVoicemailPolicy](#). A primary and secondary language must be set and may not be the same. To do this, run:

```
Set-CsOnlineVoicemailPolicy -PrimarySystemPromptLanguage en-US -SecondarySystemPromptLanguage es-ES
```

Turning off transcription for a user

User policies are evaluated before the organizational default settings. For example, if voicemail transcription is enabled for all of your users, you can assign a policy to disable transcription for a specific user by using the [Grant-CsOnlineVoicemailPolicy](#) cmdlet.

To disable transcription for a single user, run:

```
Grant-CsOnlineVoicemailPolicy -PolicyName TranscriptionDisabled -Identity sip:amosmar@contoso.com
```

Turning on transcription profanity masking for a user

To enable transcription profanity masking for a specific user, you can assign a policy to enable transcription profanity masking for a specific user by using the [Grant-CsOnlineVoicemailPolicy](#) cmdlet.

To enable transcription profanity masking for a single user, run:

```
Grant-CsOnlineVoicemailPolicy -PolicyName TranscriptionProfanityMaskingEnabled -Identity sip:amosmar@contoso.com
```

Changing the recording duration for a user

You must first create a custom voicemail policy using the [New-CsOnlineVoicemailPolicy](#) cmdlet. The command shown below creates a per-user online voicemail policy OneMinuteVoicemailPolicy with MaximumRecordingLength set to 60 seconds and other fields set to tenant level global value.

```
New-CsOnlineVoicemailPolicy -Identity "OneMinuteVoicemailPolicy" -MaximumRecordingLength ([TimeSpan]::FromSeconds(60))
```

To assign this custom policy to a user, run:

```
Grant-CsOnlineVoicemailPolicy -PolicyName OneMinuteVoicemailPolicy -Identity sip:amosmar@contoso.com
```

Dual language system prompts for a user

You must first create a custom voicemail policy using the [New-CsOnlineVoicemailPolicy](#) cmdlet. The command shown below creates a per-user online voicemail policy enUS-esSP-VoicemailPolicy with the PrimarySystemPromptLanguage set to en-US (English - United States) and the SecondarySystemPromptLanguage set to es-SP (Spanish - Spain).

```
New-CsOnlineVoicemailPolicy -Identity "enUS-esES-VoicemailPolicy" -PrimarySystemPromptLanguage en-US -
SecondarySystemPromptLanguage es-ES
```

To assign this custom policy to a user, run:

```
Grant-CsOnlineVoicemailPolicy -PolicyName "enUS-esES-VoicemailPolicy" -Identity sip:amosmar@contoso.com
```

NOTE

The Get-CsOnlineVoicemailPolicy cmdlet is not currently returning the values for PrimarySystemPromptLanguage and SecondarySystemPromptLanguage. To see these values modify the command as follows:

```
(Get-CsOnlineVoicemailPolicy -Identity PolicyName).PrimarySystemPromptLanguage or
(Get-CsOnlineVoicemailPolicy -Identity PolicyName).SecondarySystemPromptLanguage
```

Replace **PolicyName** with the name of the policy.

IMPORTANT

The voicemail service in Microsoft 365 and Office 365 caches voicemail policies and updates the cache every 6 hours. So, policy changes that you make can take up to 6 hours to be applied.

Change the default language for greetings and emails

12/7/2021 • 2 minutes to read • [Edit Online](#)

If you are a [global administrator](#), you can set up Skype for Business to play its default voicemail greeting in another language. The default system greeting is something like, "Please leave a message for John Smith. After the tone, please record your message. When you finish recording, hang up, or press the pound key for more options."

First, read this important info:

- **The languages that are available to you are determined by the location of your organization.** For example, if your organization is located in the United States, you can set the default language to English or Spanish. If your organization is located in Canada, you can choose between English and French. For a list of supported languages in Teams and Skype for Business, see the following:
 - [Microsoft Teams supported languages](#)
 - [Skype for Business supported languages](#)
- **Changing languages for individual user's voicemail greeting and voicemail messages.** You can change the preferred language for users, which will change the language of their voicemail greeting and voicemail messages sent to their Outlook mailbox. For more information, see [How to set language and region settings for Microsoft 365 or Office 365](#).

NOTE

Users can change their own greeting language through their settings after they sign in. For more information, see [Change your display language and time zone in Microsoft 365 for Business](#)

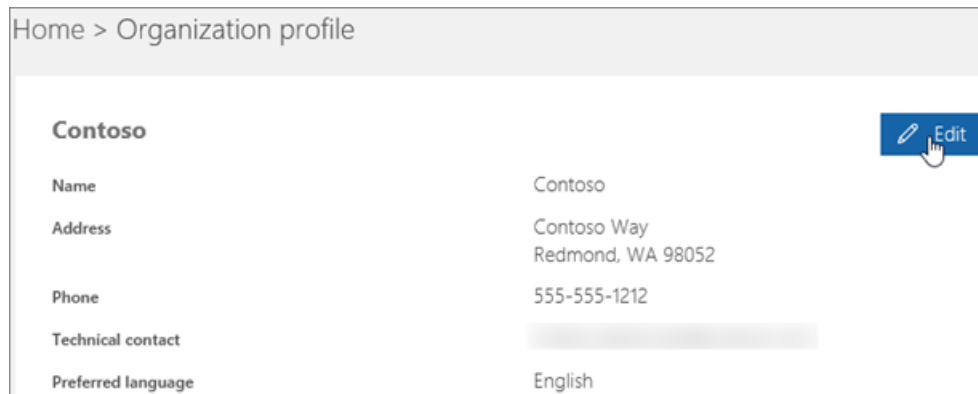

- **Do you want to record your outgoing voicemail message?** See [Check Skype for Business voicemail and options](#). For Microsoft Teams - Users can change their voicemail settings from the [Teams desktop client settings](#)
- **Do you want to change the voicemail prompt language?** For Skype for Business - <https://mysettings.lync.com/voicemail> and choose a new language under **Prompt Language**. For Microsoft Teams - Users can change their voicemail greeting from the [Teams desktop client settings](#)

Change the system language for everyone in your organization

1. Sign in with your [global administrator](#) account at <https://portal.office.com/adminportal/home>.
2. In the Microsoft 365 admin center, choose **Settings** > **Settings** > **Organization profile**.

3. Choose **Edit**.

4. Select a language from the **Preferred language** list for everyone in your organization.

5. Choose **Save**.

How can caller ID be used in your organization

12/7/2021 • 3 minutes to read • [Edit Online](#)

Caller ID consists of two user-facing identifiable pieces of information:

- A phone number (typically referred to as CLID or calling line ID). This is the Public Switched Telephone Number (PSTN) presented as the identification of the caller.
- A Calling party name (typically referred to as CNAM).

The caller ID functionality is available to all Phone System users regardless of PSTN connectivity option:

- Microsoft Calling Plans
- Phone System Direct Routing

You can control Caller ID for both inbound and outbound calls by using a policy called `CallingLineIdentity`. For more information, see [More about Calling Line ID and Calling Party Name](#).

Outbound PSTN caller ID

For the outbound PSTN caller ID, the following options are available.

- The telephone number assigned to the user, which is the default.
- Anonymous, which is available by removing the presentation of the user's PSTN number.
- A substitute phone number, which can be:
 - A telephone number that is classified as a service and toll-free number in your Calling Plans telephone number inventory. It is usually assigned to a Teams Auto Attendant or Call Queue.
 - An on-premises telephone number through Direct Routing that is assigned to a resource account used by a Teams Auto Attendant or Call Queue.
- The Calling Party Name or CNAM set on the outbound PSTN call.

For more information, see [Set the Caller ID for a user](#).

End user control of outbound caller ID

Users can change their caller ID setting to **Anonymous** by setting the `EnableUserOverride` attribute.

If the outbound caller ID is set to Anonymous, the `EnableUserOverride` has no effect and the caller ID is always set to Anonymous. The default value of `EnableUserOverride` is `False`.

Your end users can set their caller ID to Anonymous by going to **Settings > Calls**, and then under **Caller ID**, select **Hide my phone number and profile information for all calls**.

Notes

Keep the following in mind:

- You can't assign the following types of phone numbers for the outbound caller ID:
 - Any phone numbers that are classified as a user in your Calling Plans telephone number inventory.
 - Any on-premises telephone number via Direct Routing that is assigned to a user.

- A Skype for Business Server on-premises telephone number.
- The use of resource account phone number substitution only works for Teams users. The substitution of service phone number works for both Skype for Business Online and Teams users.
- Calling Party Name is only sent on calls where the caller ID is substituted with LineUri, a service or resource account phone number and when the caller is a Teams user.
- Calling Party Name can have a maximum of 200 characters, but downstream systems might support fewer characters.
- For Direct Routing, the phone number substitution and the Calling Party Name is sent in the FROM SIP header. If the corresponding OnlinePstnGateway is configured with ForwardPai = True, the P-ASSERTED-IDENTITY SIP header will contain the real calling user.
- EnableUserOverride has precedence over other settings in the policy--unless substitution is set to Anonymous. For example, assume policy instance has substitution using a resource account and EnableUserOverride is set and enabled by the user. In this case, the outbound caller ID will be blocked and Anonymous will be used. If a policy instance has substitution set to Anonymous and EnableUserOverride is set, then the outbound caller ID will always be Anonymous, regardless of the end user setting.

Inbound caller ID

Phone System will show the incoming external phone number as the caller ID. If the number is associated with a user or contact in Azure AD or a personal contact, the Skype for Business and Teams clients will show the caller ID based on that information. If the phone number is not in Azure AD or a personal contact, the telco-provided display name will be shown if it is available.

The BlockIncomingCallerID attribute allows for blocking the caller ID on incoming PSTN calls. You can set this attribute, but it isn't available to your end users on the user settings page. When this setting is enabled the incoming PSTN caller will be displayed as coming from Anonymous.

To block the inbound caller ID, see [Set the Caller ID for a user](#).

Manage caller ID policies in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

NOTE

To set the caller ID to a resource account phone number and to set the calling party name, use the PowerShell cmdlets `New-CsCallingLineIdentity` or `Set-CsCallingLineIdentity` in the Teams PowerShell module 2.3.1 or later. (These options are not currently available in the Microsoft Teams admin center.)

By default, when a Teams user makes a call to a PSTN phone, the phone number of the Teams user is visible. Likewise, when a PSTN caller makes a call to a Teams user, the PSTN caller's phone number is visible.

As an administrator, you can use caller ID policies to change or block the caller ID (also known as calling line ID). You can use caller ID policies to display an alternate phone number for Teams users in your organization, block the outbound phone number, block an incoming number from being displayed, or set the Calling Party Name (CNAM). For example, when a user makes a call, you can change the caller ID to display your organization's main phone number and company name instead of the user's phone number.

You manage caller ID policies by going to **Voice > Caller ID policies** in the Microsoft Teams admin center. You can use the global (Org-wide default) policy or create and assign custom policies. Users in your organization will automatically get the global policy unless you create and assign a custom policy.

Create a custom caller ID policy

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Caller ID policies**.
2. Click **Add**.

New caller ID policy

Add a friendly description so you know why it was created

Block incoming caller ID ☒ On

Override the caller ID policy ☒ On

Replace the caller ID with Anonymous

Replace the caller ID with this service number Choose a service number

Save Cancel

3. Enter a name and description for the policy.
4. From here, choose the settings that you want:
 - **Block incoming caller ID:** Turn on this setting to block the caller ID of incoming calls from being displayed.
 - **Override the caller ID policy:** Turn on this setting to let users override the settings in the policy regarding displaying their number to callees or not. This means that users can choose whether to display their caller ID. For more information, see [End user control of outbound caller ID](#).

- **Replace the caller ID with:** Set the caller ID to be displayed for users by selecting one of the following:
 - **User's number:** Displays the user's number.
 - **Service number:** Lets you set a service phone number to display as the caller ID.
 - **Anonymous:** Displays the caller ID as Anonymous.
- **Replace the caller ID with this service number:** Choose a service number to replace the caller ID of users. This option is available if you selected **Service number** in **Replace the caller ID with**.

5. Click **Save**.

Edit a caller ID policy

You can edit the global policy or any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Caller ID policies**.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. Change the settings that you want, and then click **Save**.

Assign a custom caller ID policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

[Assign policies to your users in Teams](#)

Set the Caller ID for a user

12/7/2021 • 4 minutes to read • [Edit Online](#)

Phone System in Microsoft 365 provides a default caller ID that is the user's assigned telephone number. You can either change or block the caller ID (also called a Calling Line ID) for a user. You can learn more about how to use caller ID in your organization by going [How can caller ID be used in your organization](#).

By default, the following caller ID settings are **turned off**. This means that the Teams user's phone number can be seen when that user makes a call to a PSTN phone. You can change these settings as follows:

- **Outgoing caller ID** You can replace a user's Caller ID, which by default is their telephone number, with another phone number. For example, you could change the user's Caller ID from their phone number to a main phone number for your business or to a main phone number for the legal department. Additionally, you can set the Calling ID number to any online service number (toll or toll-free) or to an on-premises phone number through Direct Routing that is assigned to a resource account used by an Auto Attendant or a Call Queue.

NOTE

If you want to use the *Service* parameter, you must specify a valid service number. You need to use the PowerShell cmdlets *New-CsCallingLineIdentity* or *Set-CsCallingLineIdentity* in the Teams PowerShell module 2.3.1 or later for the Resource account number if it is not visible in the dropdown.

- **Block outbound caller ID.** You can block the outgoing Caller ID from being sent on a user's outgoing PSTN calls. Doing this will block their phone number from being displayed on the phone of a person being called.
- **Block incoming caller ID.** You can block a user from receiving Caller ID on any incoming PSTN calls.
- **Set Calling Party Name (CNAM).** For your Microsoft Teams users you can send a CNAM on outbound PSTN calls.

IMPORTANT

Emergency calls will always send the user's telephone number (caller ID).

To learn more about these settings and how you can use them, see [How can caller ID be used in your organization](#).

Set your caller ID policy settings

NOTE

To set the caller ID to a resource account phone number and to set the calling party name, use the PowerShell cmdlets *New-CsCallingLineIdentity* or *Set-CsCallingLineIdentity* in the Teams PowerShell module 2.3.1 or later. (These options are not currently available in the Microsoft Teams admin center.)

Open a Windows PowerShell command prompt and run the following commands:

```
# When using Teams PowerShell Module

Import-Module MicrosoftTeams
$credential = Get-Credential
Connect-MicrosoftTeams -Credential $credential
```

View, create, and apply policy settings

1. To view all of the caller ID policy settings in your organization, run:

```
Get-CsCallingLineIdentity | fl
```

For more information, see [Get-CsCallingLineIdentity](#).

2. To create a new caller ID policy for your organization, use the New-CsCallingIdentity cmdlet:

```
New-CsCallingLineIdentity -Identity Anonymous -Description "Anonymous policy" -CallingIDSubstitute  
Anonymous -EnableUserOverride $false
```

In all cases, the "Service Number" field should not include an initial "+".

For more information, see [New-CsCallingLineIdentity](#).

3. Apply the new policy you created by using the Grant-CsCallingIdentity cmdlet. For example, the following example applies the new policy to user Amos Marble.

```
Grant-CsCallingLineIdentity -Identity "amos.marble@contoso.com" -PolicyName Anonymous
```

For more information, see [Grant-CsCallingLineIdentity](#) cmdlet.

4. If you want to block the incoming caller ID, run:

```
Set-CsCallingLineIdentity -Identity "Block Incoming" -BlockIncomingPstnCallerID $true
```

For more information, see [Set-CsCallingLineIdentity](#).

5. To apply the policy setting you created to a user in your organization, run:

```
Grant-CsCallingLineIdentity -Identity "amos.marble@contoso.com" -PolicyName "Block Incoming"
```

For more information, see [Grant-CsCallingLineIdentity](#).

6. To create a new Caller ID policy that sets the Caller ID to the phone number of the specified resource account and sets the Calling party name to Contoso:

```
$ObjId = (Get-CsOnlineApplicationInstance -Identity dkcq@contoso.com).ObjectId
New-CsCallingLineIdentity -Identity DKCQ -CallingIDSubstitute Resource -EnableUserOverride $false -  
ResourceAccount $ObjId -CompanyName "Contoso"
```

If you have already created a policy, you can use the [Set-CsCallingLineIdentity](#) cmdlet to make changes to the existing policy, and then use the [Grant-CsCallingLineIdentity](#) cmdlet to apply the settings to your users.

Remove a policy setting

To remove a policy from your organization, run:

```
Remove-CsCallingLineIdentity -Identity "My Caller ID Policy"
```

To remove a policy from a user, run:

```
Grant-CsCallingLineIdentity -Identity "amos.marble@contoso.com" -PolicyName $null
```

Want to know more about Windows PowerShell?

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 using a single point of administration that can simplify your daily work. To get started with Windows PowerShell, see these topics:

More about Calling Line ID and Calling Party Name

12/7/2021 • 2 minutes to read • [Edit Online](#)

CallerID consists of two user-facing pieces of information:

- A phone number (typically referred to as CLID or calling line ID).
- Calling party name (typically referred to as CNAM).

When a call is made, the CLID (phone number) is routed to the destination's carrier (also known as the terminating carrier). The CNAM information for the call may or may not be routed with the call because as this information depends on how the country has implemented CNAM (if at all). The reliability of CNAM delivery with the call varies depending on the country and carriers that handle the call--either as an intermediary or a terminating carrier.

CLID & CNAM transmission is the responsibility of the terminating carrier. The terminating carrier must support CLID & CNAM functionality as well as provide up-to-date records for both values. Microsoft reliably provides CLID values when originating calls, but those values may not be kept intact once they pass through an intermediary carrier or the terminating carrier. If the CLID value is changed, omitted, or truncated by the intermediary or terminating carrier, Microsoft has little to no recourse in correcting such problems in the public telephone network.

Inconsistencies in CNAM can be caused when the intermediate or terminating carriers delay refreshing the CNAM information in authoritative databases--as in the case of the United States. In countries where there are no authoritative databases for CNAM, individual carrier practices can also cause problems with CNAM information arriving intact with the call. Microsoft currently does not support originating CNAM information in countries other than the United States.

Plan for Teams auto attendants and call queues

12/7/2021 • 14 minutes to read • [Edit Online](#)

Auto attendants allow you to set up menu options to route calls based on caller input. Menu options, such as "For Sales, press 1. For Services press 2", for an auto attendant let an organization provide a series of choices that guide callers to their destination quickly, without relying on a human operator to handle incoming calls.

Call queues are waiting areas for callers. For situations where callers need to reach someone with a particular specialty - such as sales or service - rather than a specific person, you can use call queues to connect callers to the group of agents who can assist them. Callers are put on hold until an agent assigned to the queue is available to take their call.

Used together, auto attendants and call queues can easily route callers to the appropriate person or department in your organization.

Auto attendants

The primary purpose of an auto attendant is to direct a caller to an appropriate person or department based on the caller's input to the provided menu options. Callers can be directed to specific people within your organization, to call queues where they wait to talk to the next available agent, or to voicemail. Different call routing options can be specified for business hours, off hours, and holidays.

Menu prompts can be created by using text-to-speech (system-generated prompts) or by uploading a recorded audio file. Speech recognition accepts voice commands for hands-free navigation, but people calling in can also use the phone keypad to navigate menus.

Each auto attendant has a specific language and time zone. If you do business in multiple languages or multiple parts of the world, you can create as many different auto attendants as you need to accommodate your callers.

For each auto attendant, you can configure an operator. While you can configure operator calls to go to a variety of destinations, the operator feature is designed to allow callers to talk to a specific person in your organization who can help them.

Auto attendants can be configured to allow callers to search your organization's directory, either by name or by extension number. Within an auto attendant, you can specify who is available for the directory search by choosing groups of users to include or exclude. (This is known as *dial scope*.)

Callers can reach an auto attendant either by direct phone number, if configured, or by being redirected from another auto attendant or a call queue.

Call queues

A call queue is analogous to a waiting room in a physical building. Callers wait on hold while calls are routed to the agents in the queue. Call queues are commonly used for sales and service functions. However, call queues can be used for any situation where the number of calls exceeds your internal capacity, such as a receptionist in a busy facility.

Call queues allow for specific routing of calls in cases where the total number of callers in the queue or the wait time exceeds the limits that you specify. Calls can be routed to specific people, voicemail, other call queues, or auto attendants.

Like auto attendants, call queues each have a language setting. You can use different call queues if you do business in multiple languages. Agents can be members of more than one queue if they're multi-lingual.

For each call queue, you can specify if agents in the queue can opt out of taking calls and if calls should be routed to them based on their presence indication in Teams.

You can assign a phone number to a call queue, however call queues do not provide separate call routing for off hours and holidays. Unless your call queue is staffed 24/7, we recommend assigning the phone number to an auto attendant that redirects to the call queue during business hours.

Prerequisites

To configure auto attendants and call queues, you need the following resources:

- A resource account for each auto attendant and each call queue
- A free Phone System - Virtual User license for each resource account
- At least one [Microsoft service number](#), Operator Connect number, Direct Routing number, or a hybrid number for each resource account that you want to be directly dialable
- The service number may be a toll or toll-free number

NOTE

Resource accounts are disabled for sign in and must remain so. Chat and presence are not available for these accounts.

Agents who receive calls from the call queues must be Enterprise Voice enabled online or on-premise users. In addition, if the call queues are using Direct Routing numbers, agents who need to conference or transfer calls also require:

- An online voice routing policy assigned if the call queue uses transfer mode
- An Audio Conferencing license or online voice routing policy assigned if the call queue uses conference mode

If your agents are using the Microsoft Teams app for call queue calls, they need to be in TeamsOnly mode.

When transferring calls to an external phone number, the resource account performing the transfer (that is, the one associated with the auto attendant or call queue) must have a Microsoft 365 Phone System Virtual User license and one of the following assigned:

- A [Calling Plan](#) license and a phone number assigned
- An [Operator Connect](#) phone number assigned
- An [online voice routing policy](#) (phone number assignment is optional when using Direct Routing)

NOTE

Direct Routing service numbers for auto attendant and call queues are supported for Microsoft Teams users and call agents only.

Transfers between Calling Plan, Operator Connect, and Direct Routing trunks aren't supported.

In a Hybrid scenario, the resource account must be created on-premises. For more information, see [Plan Cloud call queues](#).

Business decisions

Before you set up your auto attendants and call queues, there are some decisions that you should make about how to use these features in your business. These decisions will determine the settings that you choose when you configure your auto attendants and call queues.

Document your answers to these questions and provide the information to the administrator doing the configuration.

- What languages do you need? Where are these languages needed - which department or group?
- Do you want to allow voice inputs from callers or only dialing inputs?
- Do you need separate call routing for off hours or holidays? What are the hours and holidays?
- Do you want to allow agents in a call queue to opt out of taking calls?
- Do you want agents in your call queues or your operator to have a specific caller ID if they dial out?
- Do you want to enable [call parking and retrieval](#) in your organization to assist in call handoffs between people or departments?
- For the voice prompts, do you want to record your own or use the system-generated voice? (The system-generated voice is easy to update.)

Technical decisions

When using auto attendants and call queues to connect callers to people in your organization, there are some technical decisions to make before you start the configuration.

Agents can be added to call queues in the following ways:

- Individual users
- Distribution lists
- Security groups, including mail-enabled security groups
- Microsoft 365 Groups or Teams

You can use a combination of these options for each queue if needed. Groups that have an email address can be used for voicemail. Using Teams offers a number of advantages, including shared file storage and chat between agents, a common mailbox where voicemails can be received, and an extensible platform that can include integration with your line-of-business applications or Power Apps.

We recommend choosing a strategy for adding call agents to queues before you start your configuration.

If you have an existing auto attendant and call queue infrastructure and you're migrating to Teams, you'll need a plan to transfer your existing phone numbers to the new auto attendants and call queues. You might need to create a [port order](#) to move your numbers from another providers. We recommend that you temporarily acquire one or more new phone numbers and test your auto attendant and call queue flows before switching them over the numbers you currently have in service.

Conference mode is an option in call queues that significantly reduces the amount of time it takes to connect Teams VOIP calls and PSTN calls to an agent. For conference mode to work, agents in the call queue must use one of the following clients:

- The latest version of the Microsoft Teams desktop client, Android app, or iOS app
- Microsoft Teams Phone version 1449/1.0.94.2020051601 or later

Set Agents' Teams accounts to Teams-only mode. Agents who don't meet the requirements aren't included in the call routing list.

We recommend enabling conference mode for your call queues if your agents are all using compatible clients.

Plan your call routing flow

As part of the planning process, we recommend that you work out the call routing for your organization in a diagram. The diagram helps determine the most efficient routing for people calling in to your organization. You can also use the diagram to determine the auto attendants and call queues that you need to create, along with

related requirements such as service numbers, licenses, and resource accounts.

Let's look at how auto attendants and call queues route calls.

Auto attendants route all calls in one of the following ways:

- **Redirect immediately** - calls can be redirected to one of the call routing destinations (listed below) immediately upon answering or after an initial greeting.
- **Redirect based on dial options** - callers can be directed to choose between options that are assigned to the numbers on their telephone keypad, 0-9. Each dial key can be assigned a call routing destinations.
- **Dial people by name or extension** - callers can be directed to dial the extension number of the person they're trying to reach in your organization's directory, or by spelling the person's name.
- **Disconnect** - an auto attendant can hang up the call.

NOTE

A single Auto attendant can only support a single "dial by" method. To allow callers to dial by name and by number, you will need to create an auto attendant that has an option for dial by name and the another for dial by extension. Each of these options will route to separate auto attendants configured for these "dial by" scenarios.

When calls are redirected by an auto attendant or call queue, you can choose from the following call routing destinations:

- **Person in the organization** - a person in your organization who is able to receive voice calls. This can be an online user or a user hosted on-premises using Skype for Business Server.
- **Voice app** - another auto attendant or a call queue. Choose the resource account associated with the destination.
- **External phone number** - any phone number. (See [external transfer technical details](#)).
- **Voicemail** - the voice mailbox associated with a Microsoft 365 group that you specify. You can choose if you want voicemail transcriptions and the "Please leave a message after the tone." system prompt.
- **Operator** (auto attendant only) - the operator defined for the auto attendant. Defining an operator is optional. An operator can be any of the other destinations in this list.

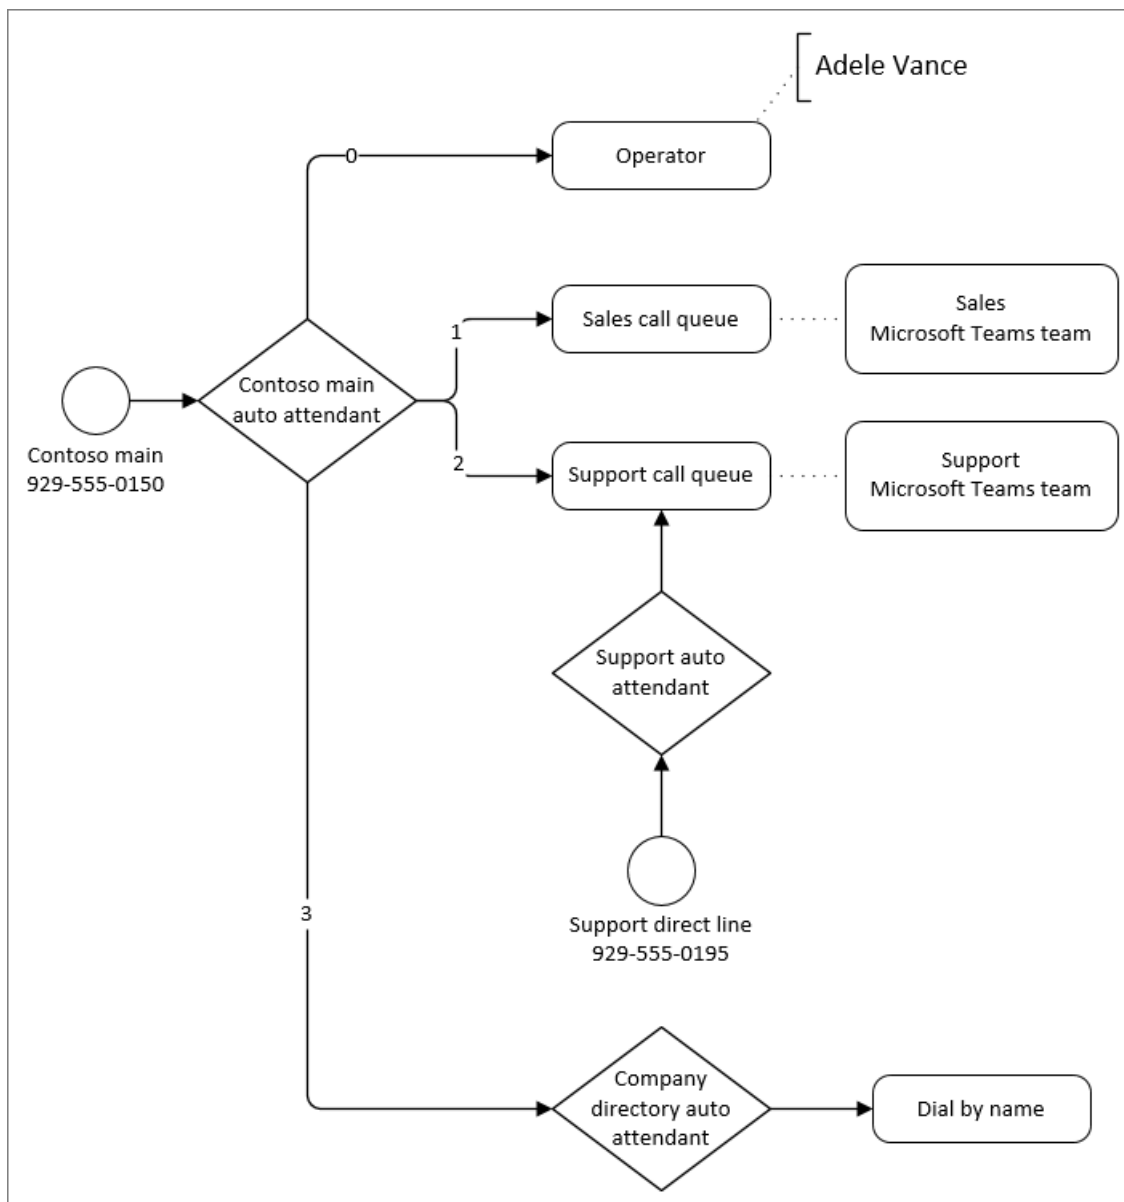

Auto attendants offer separate call routing options for calls received outside of business hours and on holidays. After-hours call routing allows all the options listed above, while holiday call routing allows only redirecting or disconnecting a call, but no dial key options.

Call queues place the caller on hold until an agent assigned to the queue is available to take their call. There are two situations where a caller might be directed out of the queue:

- **Call overflow** - if the number of calls in the queue exceeds the limit that you set, then new callers are redirected out of the queue.
- **Call timeout** - if a caller has been in the queue longer than the configured timeout setting, they're redirected out of the queue.

Calls redirected out of a queue can be sent to any of the call routing destinations listed above except for an operator. (Call queues don't have operators, but you can redirect callers to the same destination as an operator that you've configured for an auto attendant.)

The example below shows an example of call routing using auto attendants and call queues.

In the example above:

- The zero (0) key redirects callers to an operator. The operator for that auto attendant has been configured as a **Person in the organization**.
- The one (1) key redirects callers to the sales call queue. This call queue is connected to a team that contains the sales team assigned to the queue.
- The two (2) key redirects callers to the support call queue. This call queue is connected to a team that contains the support team assigned to the team.
- The support call queue has a direct phone number via an intervening auto attendant. Having an auto attendant answer the support line allows for separate off hours and holiday call routing.
- The three (3) key redirects users to another auto attendant for the company directory. The company directory auto attendant allows callers to call individuals in the organization by dialing their name or extension.

We recommend that you create one or more diagrams similar to the one above to map out your call routing. Be sure to include the following in your diagram or accompanying documentation:

- Which auto attendants will have direct access via phone numbers?
- What are the off-hours and holiday routing requirements for each auto attendants?
- The membership for each call queue. (You can add users individually or map the queue to different kinds of groups. Mapping a queue to a team provides the most versatile experience.)

Here are some call routing best practices:

- Look at your existing calling system and analyze the types and frequency of incoming calls. Use this information to help inform your auto attendant and call queue structure.
- Put the most common options earliest in the menu to route calls as quickly as possible.
- Avoid connecting service numbers directly to call queues unless the queues are available 24/7. Call queues don't allow for separate call handling for off hours or holidays. If you want to have a queue with a direct number, assign the number to an auto attendant that automatically redirects to the queue during business hours.
- If you receive numerous calls requesting basic information about your company, such as business hours, location, or web site address, consider creating an auto attendant to answer these questions with recorded messages.
- Keep the list of menu items to five or fewer. Callers can have trouble remembering more than five options. Use nested auto attendants if more options are needed to properly route a call.
- Describe the service first, followed by the option to press (eg: For Sales press 1) rather than the other way around (eg. Press 1 for Sales).
- Use terminology your callers will understand rather than what you may use internally.
- Avoid frequent updates to call routing. If you change your menu options for an auto attendant in the future, call that out in the voice prompts for the first 30 days.

Getting started

Once you've completed the planning tasks in this article, follow these steps to get your auto attendants and call queues set up:

1. Get the service numbers that you need for the auto attendants and call queues that you want to be accessible by direct dialing from outside your organization. This might include [transferring numbers from another provider](#) or [requesting new service numbers](#).
2. Get a [Phone System - Virtual User license](#) for each resource account that you plan to create. These licenses are free, so we suggest getting a few extra in case you decide to make changes to your resource accounts in the future.
3. [Create a resource account](#) for each auto attendant and call queue that you want to create. Assign each account a Phone System - Virtual User license and, optionally, a service number.
4. [Create the holidays](#) for which you want to have separate call routing in your auto attendants.
5. Optionally, [set up call parking and retrieval](#) if you want to use this feature to help with call transfers.
6. Create the groups that you want to use to contain the call agents for the call queues.
7. If you plan to allow dial by extension, ensure that you've added your users' extension number to their Azure Active Directory profile.

Once you've completed the steps above, you're ready to create your auto attendants and call queues. Because auto attendants and call queues can redirect calls to each other, refer to the workflow diagram that you created to determine which auto attendant or call queue should be created first. In the example in the diagram above, you would create the sales and support call queues before you create the Contoso main auto attendant because the main auto attendant needs to direct callers to the sales and support call queues.

See the following articles for information on how to create auto attendants and call queues:

- [Set up an auto attendant](#)
- [Create a call queue](#)

If you need more extensive capabilities, such as integration with workflows, bots, and SMS, consider [Azure Communication Services](#).

Set up an auto attendant

12/7/2021 • 11 minutes to read • [Edit Online](#)

Auto attendants let people call your organization and navigate a menu system to speak to the right department, call queue, person, or an operator. You can create auto attendants for your organization with the Microsoft Teams admin center, or with PowerShell.

TIP

This article is for large organizations. If your organization is a small business, read [Set up an auto attendant - small business tutorial](#) instead.

Be sure you have read [Plan for Teams auto attendants and call queues](#) and followed the [getting started steps](#) before you follow the procedures in this article.

Auto attendants can direct calls, based on callers' input, to one of the following destinations:

- **Operator** - the operator defined for the auto attendant. Defining an operator is optional. The operator can be defined as any of the other destinations in this list.
- **Person in the organization** - a person in your organization who can receive voice calls. This person can be an online user or a user hosted on-premises using Skype for Business Server.
- **Voice app** - another auto attendant or a call queue. (Choose the resource account associated with the auto attendant or call queue when choosing this destination.)
- **Voicemail** - the voice mailbox associated with a Microsoft 365 group that you specify. You can choose if you want voicemail transcriptions and the "Please leave a message after the tone." system prompt.
- **External phone number** - any phone number. (See [external transfer technical details](#)).
- **Announcement (Audio file)** - Play an audio file. A recorded announcement message you upload that's saved as audio in .WAV, .MP3, or .WMA format. The recording can be no larger than 5 MB. The system plays the announcement, and then returns to the auto attendant menu.
- **Announcement (Typed)** - Type in a message. Text you want the system to read. You can enter up to 1000 characters. The system plays the announcement, and then returns to the auto attendant menu.

You'll be prompted to choose one of these options at various stages as you set up an auto attendant.

To set up an auto attendant, in the Teams admin center, expand **Voice**, select **Auto attendants**, and then select **Add**.

Video demonstration

This video shows a basic example of how to create an auto attendant in Teams.

General info

Contoso main line

Operator (optional)

This lets you set up a person in your organization to answer calls when a caller wants to talk to another person. You can also link this auto attendant to another auto attendant or call queue.

Person in organization

=

Adele Vance
ADELEV@CONTOSO64.NET

Time zone

Setting the time zone will let calls be answered during the correct business and non-business hours.

(UTC-05:00) Eastern Time (US...

Language

This lets you set the language that will be used. The language set here will tell the system what language to use when reading prompts, greetings, and dial keys.

English (United States)

Enable voice inputs

On

1. Type a name for the auto attendant in the box at the top.
2. To designate an operator, specify the destination for calls to the operator. This designation is optional (but recommended). Set the **Operator** option to allow callers to break out of the menus and speak to a designated person.
3. Specify the time zone for this auto attendant. The time zone is used for calculating business hours if you [create a separate call flow for after hours](#).
4. Specify a [supported language](#) for this auto attendant. This is the language that will be used for system-generated voice prompts.
5. Choose if you want to enable voice inputs. When enabled, the name of every menu option becomes a speech-recognition keyword. For example, callers can say "One" to select the menu option mapped to key 1, or they can say "Sales" to select the menu option named "Sales."

NOTE

If you choose a language in Step 4 that doesn't support voice inputs this option will be disabled.

6. Select **Next**.

Call flow

First play a greeting message

☐ No greeting

☐ Play an audio file

☒ Type in a greeting message ⓘ

Thank you for calling Contoso.

Choose if you want to play a greeting when the auto attendant answers a call.

If you select **Play an audio file** you can use the **Upload file** button to upload a recorded greeting message saved as audio in .WAV, .MP3, or .WMA format. The recording can be no larger than 5 MB.

If you select **Type a greeting message** the system will read the text that you type (up to 1000 characters) when the auto attendant answers a call.

Then route the call

☐ Disconnect

☐ Redirect call ⓘ

☒ Play menu options

Set up the greeting and menu options.

☐ Play an audio file

☒ Type in a greeting message ⓘ

For sales, press 1. For support, press 2. If you know your party's extension, press 3. To speak to an operator, press 0.

Choose how you want to route the call.

If you select **Disconnect**, the auto attendant will hang up the call.

If you select **Redirect call**, you can choose one of the call routing destinations.

If you select **Play menu options**, you can choose to **Play an audio file** or **Type in a greeting message** and then choose between menu options and directory search.

Menu options

Set menu options ⓘ

+ Assign a dial key
Delete

Dial key	Voice command	Redirect to	Destination
0 ▾	Operator	Operator ▾	 Adele Vance X
1 ▾	Sales	Voice app ▾	 Contoso sales queue CQ-SALES@CONTOSO64.NET X
2 ▾	Support	Voice app ▾	 Contoso support queue CQ-SUPPORT@CONTOSO64.NET X
3 ▾	Directory	Voice app ▾	 Contoso directory AA-DIRECTORY@CONTOSO64.NET X

For dialing options, assign the 0-9 keys on the telephone keypad to one of the call routing destinations. (The keys * (asterisk) and # (pound) are reserved by the system and can't be reassigned. Pressing either of these keys will repeat the current menu.)

Key mappings don't have to be continuous. It's possible to create a menu with keys 0, 1, and 3 mapped to options, while the number 2 key isn't used.

We recommend mapping the zero key to the operator if you've configured one. If the operator isn't set to any key, the voice command "Operator" is also disabled.

For each menu option, specify the following settings:

- **Dial key** - the key on the telephone keypad to access this option. If voice inputs are available, callers can also say this number to access the option.
- **Voice command** - defines the voice command that a caller can give to access this option, if voice inputs are enabled. It can contain multiple words like "Customer Service" or "Operations and Grounds." For example, the caller can press 2, say "two," or say "Sales" to select the option mapped to the two keys. This text is also rendered by text to speech for the service confirmation prompt, which might be something like "Transferring your call to sales."
- **Redirect to** - the call routing destination used when callers choose this option. If you are redirecting to an auto attendant or call queue, choose the resource account associated with it.

Directory search

If you assign dial keys to destinations, we recommend that you choose **None** for **Directory search**. If a caller attempts to dial a name or extension using keys that are assigned to specific destinations, they might be unexpectedly routed to a destination before they finish entering the name or extension. We recommend that you create a separate auto attendant for directory search and have your main auto attendant link to it with a dial key.

If you didn't assign dial keys, then choose an option for **Directory search**.

Dial by name - If you enable this option, callers can say the user's name or type it on the telephone keypad. Any online user or any user hosted on-premises using Skype for Business Server, is an eligible user and can be found with Dial by name. (You can set who is and isn't included in the directory on the [Dial scope](#) page.)

Dial by extension - If you enable this option, callers can connect with users in your organization by dialing their phone extension. Any online user or any user hosted on-premises using Skype for Business Server, is an eligible user and can be found with **Dial by extension**. (You can set who is and isn't included in the directory on the [Dial scope](#) page.)

Users you want to make available for Dial By Extension need to have an extension specified as part of one of the

following phone attributes defined in Active Directory or Azure Active Directory (See [Add users individually or in bulk](#) for more information.)

- OfficePhone
- HomePhone
- Mobile/MobilePhone
- TelephoneNumber/PhoneNumber
- OtherTelephone

The required format to enter the extension in the user phone number field can be one of the following formats:

- *+ <phone number>;ext= <extension>*
- *+ <phone number>x<extension>*
- *x<extension>*
- Example 1: Set-MsolUser -UserPrincipalName usern@domain.com -Phonenumber "+15555555678;ext=5678"
- Example 2: Set-MsolUser -UserPrincipalName usern@domain.com -Phonenumber "+15555555678x5678"
- Example 3: Set-MsolUser -UserPrincipalName usern@domain.com -Phonenumber "x5678"

You can set the extension in the [Microsoft 365 admin center](#) or the [Azure Active Directory admin center](#). It can take up to 12 hours before changes are available to auto attendants and call queues.

NOTE

If you want to use both the **Dial by name** and **Dial by extension** features, you can assign a dial key on your main auto attendant to reach an auto attendant enabled for **Dial by name**. Within that auto attendant, you can assign the 1 key (which has no letters associated with it) to reach the **Dial by extension** auto attendant.

Once you have selected a **Directory search** option, select **Next**.

Call flow for after hours

[Reset to default](#)
[Clear all hours](#)

Day	Start at	End at	
Sunday	Select start time ▾	Select end time ▾	+ Add new time
Monday	8:00 AM ▾	5:00 PM ▾	+ Add new time
Tuesday	8:00 AM ▾	5:00 PM ▾	+ Add new time
Wednesday	8:00 AM ▾	5:00 PM ▾	+ Add new time
Thursday	8:00 AM ▾	5:00 PM ▾	+ Add new time
Friday	8:00 AM ▾	5:00 PM ▾	+ Add new time
Saturday	9:00 AM ▾	12:00 PM ▾	
	1:00 PM ▾	4:00 PM ▾	+ Add new time

Business hours can be set for each auto attendant. If business hours aren't set, all days and all hours in the day are considered business hours because a 24/7 schedule is set by default. Business hours can be set with breaks in time during the day, and all of the hours that are not set as business hours are considered after-hours. You can set different incoming call-handling options and greetings for after-hours.

Depending on how you have configured your auto attendants and call queues, you may only need to specify after-hours call routing for auto attendants with direct phone numbers.

If you want separate call routing for after-hours callers, then specify your business hours for each day. Select **Add new time** to specify multiple sets of hours for a given day, for example, to specify a lunch break.

Once you've specified your business hours, then choose your call routing options for after hours. The same options are available as for the business hours call routing that you specified above.

Select **Next** when you're done.

Call flows during holidays

New Years 2021

Holiday

New Years Day ▾

Greeting

☐ No greeting
 ☐ Play an audio file
 ☒ Type in a greeting message ⓘ

Thank you for calling Contoso. We are closed for the New Years holiday. Please leave us a message and we will return your call.

Your auto attendant can have a call flow for each [Holiday you've set up](#). You can add up to 20 scheduled holidays to each auto attendant.

1. On the Holiday call settings page, select **Add**.
2. Type a name for this holiday setting.
3. From the **Holiday** dropdown, choose the holiday that you want to use.
4. Choose the type of greeting that you want to use.

The 'Actions' panel shows two radio button options: 'Disconnect' and 'Redirect call'. The 'Redirect call' option is selected. Below it, the 'Redirect to' dropdown menu is set to 'Voicemail'. To the right of the dropdown is an equals sign, followed by a red circular icon with a white 'C' and the text 'Contoso'. Below the dropdown, there are two toggle switches: 'Transcription' is turned 'on' and 'Suppress voicemail system message' is turned 'off'.

5. Choose if you want to **Disconnect** or **Redirect** the call.
6. If you chose to redirect, choose the call routing destination for the call.
7. Select **Save**.

+ Add Edit Delete ⚙️				
✓	Name	Dates	Greeting	Actions
	Contoso Annual Picnic	8/24/2020 - 8/25/2020	Greeting message	Redirect call
	New Years 2021	1/1/2021 - 1/2/2021	Greeting message	Redirect call

Repeat the procedure as needed for each additional holiday.

When you've added all your holidays, select **Next**.

Dial scope

Include

Here you can select which users will be included and available in your organization's directory. ⓘ

☐ All online users
☒ Custom user group

Contoso Corporate
X
Enter user or groups as name@domain.com

Exclude

You can select which users or groups that you want to be explicitly excluded from the organization's directory. ⓘ

☐ None
☒ Custom user group

Executives
X
Enter user or groups as name@domain.com

The *dial scope* defines which users are available in the directory when a caller uses dial-by-name or dial-by-extension. The default of **All online users** includes all users in your organization that are Online users or hosted on-premises using Skype for Business Server.

You can include or exclude specific users by selecting **Custom user group** under **Include** or **Exclude** and choosing one or more Microsoft 365 groups, distribution lists, or security groups. For example, you might want to exclude executives in your organization from the dialing directory. (If a user is in both lists, they will be excluded from the directory.)

NOTE

It might take up to 36 hours for a new user to have their name listed in the directory.

When you're done setting the dial scope, select **Next**.

Resource accounts

All auto attendants must have an associated resource account. First-level auto attendants will need at least one resource account that has an associated service number. If you wish, you can assign several resource accounts to an auto attendant, each with a separate service number.

Add accounts

Search for resource accounts you want to add.

Search by display or username
Q

Accounts to add (1)

A
aa-contoso_main
X

To add a resource account, select **Add account** and search for the account that you want to add. Select **Add**, and then select **Add**.

+ Add account X Remove 1 item		
✓	Resource account	Phone number
	aa-contoso_main	+1 929 555 0150

When you have finished adding resource accounts, select **Submit** to complete auto attendant configuration.

See [Manage Teams resource accounts](#) for more information.

External phone number transfers - technical details

Refer to the [Prerequisites](#) in order to allow auto attendants to transfer calls externally. In addition:

- For a resource account with a [Calling Plan license](#) or [Operator Connect](#) number, the external transfer phone number must be entered in E.164 format (+[country code][area code][phone number]).
- For a resource account with a Phone System License and Direct Routing online voice routing policy, the external transfer phone number format is dependant on the [Session Border Controller \(SBC\)](#) settings.

The outbound phone number that's displayed is determined as follows:

- For Calling Plan and Operator Connect numbers, the original caller's phone number is displayed.
- For Direct Routing numbers, the number sent is based on the P-Asserted-Identity (PAI) setting on the SBC, as follows:
 - If set to Disabled, the original caller's phone number is displayed. This is the default and recommended setting.
 - If set to Enabled, the resource account phone number is displayed.

In a Skype for Business hybrid environment, to transfer an auto attendant call to the PSTN, create a new on-premises user with call forwarding set to the PSTN number. The user must be enabled for Enterprise Voice and have a voice policy assigned. To learn more, see [Auto attendant call transfer to PSTN](#).

Create an auto attendant with PowerShell

You can also use PowerShell to create and set up auto attendants. Here are the cmdlets that you need to manage an auto attendant:

- [New-CsAutoAttendant](#)
- [Set-CsAutoAttendant](#)
- [Get-CsAutoAttendant](#)
- [Get-CsAutoAttendantHolidays](#)
- [Remove-CsAutoAttendant](#)
- [New-CsAutoAttendantMenu](#)
- [New-CsOnlineAudioFile](#)
- [New-CsAutoAttendantCallFlow](#)
- [Export-CsAutoAttendantHolidays](#)
- [New-CsOnlineTimeRange](#)
- [New-CsOnlineDateTimeRange](#)
- [New-CsOnlineSchedule](#)
- [Get-CsAutoAttendantSupportedTimeZone](#)
- [New-CsAutoAttendantCallHandlingAssociation](#)
- [Get-CsAutoAttendantSupportedLanguage](#)

- [Import-CsAutoAttendantHolidays](#)
- [New-CsAutoAttendantCallableEntity](#)

Auto Attendant Diagnostic Tool

If you're an administrator, you can use the following diagnostic tool to validate that an auto attendant is able to receive calls:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.

[Run Tests: Teams Auto Attendant](#)

2. In the Run diagnostic pane, enter the Resource Account in the **Username or Email** field, and then select **Run Tests**.
3. The tests will identify tenant, policy, or resource account configurations that are preventing the auto attendant from being able to receive calls and provide steps to fix any problems identified.

Create a call queue

12/7/2021 • 10 minutes to read • [Edit Online](#)

Call queues provide a method of routing callers to people in your organization who can help with a particular issue or question. Calls are distributed one at a time to the people in the queue (who are known as *agents*).

TIP

This article is for large organizations. If your organization is a small business, read [Create a call queue - small business tutorial](#) instead.

Call queues provide:

- A greeting message.
- Music while people are waiting on hold in a queue.
- Call routing - in *First In, First Out* (FIFO) order - to agents.
- Handling options for queue overflow and timeout.

Be sure you have read [Plan for Teams auto attendants and call queues](#) and followed the [getting started steps](#) before you follow the procedures in this article.

Video demonstration

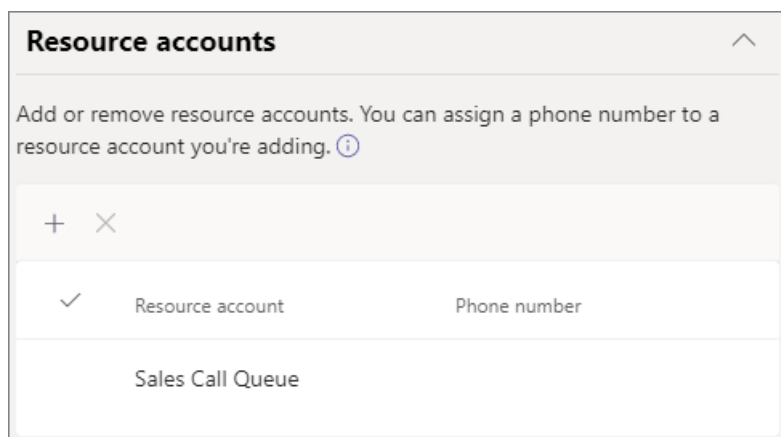

This video shows a basic example of how to create a call queue in Teams.

Create the call queue

To set up a call queue, in the Teams admin center, expand **Voice**, click **Call queues**, and then click **Add**.

Type a name for the call queue.

Resource accounts

Resource account	Phone number
✓ Sales Call Queue	

Click **Add accounts**, search for the resource account that you want to use with this call queue, click **Add**, and then click **Add**. (Agents will see the resource account name when they receive an incoming call.)

See [Manage Teams resource accounts](#) for more information.

Assign calling ID

Assign calling ID ^

Agents can make outbound calls using the phone numbers on the following Resource Accounts. ⓘ

+ ×

✓	Resource account	Phone number
	Contoso Main Line	+1 929 555 0150

If you plan to use a Teams channel for your call agents, you can assign an outbound caller ID number for the agents by specifying one or more resource accounts with a phone number.

Click **Add**, search for the resource accounts that you want to allow agents to for calling ID purposes when making outbound calls, click **Add**, and then click **Add**.

If you are not using a Teams channel to control agent membership, consider directly setting the caller ID for members of the call queue to the service number of the call queue or appropriate auto attendant. See [Manage caller ID policies in Microsoft Teams](#) for more information.

Language

Language ^

This lets you set the language used to transcribe voicemail messages and play system prompts to the caller.

English (United States) ▾

Choose a [supported language](#). This language will be used for system-generated voice prompts and voicemail transcription (if you enable them).

Greetings and music on hold in queue

Greeting ^

☐ No greeting

☒ Play an audio file

↑ Upload file

Audio file format in MP3, WAV, or WMA. File less than 5 MB.

Music on hold ^

☐ Play default music

☒ Play an audio file

↑ Upload file

Audio file format in MP3, WAV, or WMA. File less than 5 MB.

Specify if you want to play a greeting to callers when they arrive in the queue. You must upload an MP3, WAV, or

WMA file containing the greeting that you want to play. The uploaded recording can be no larger than 5 MB.

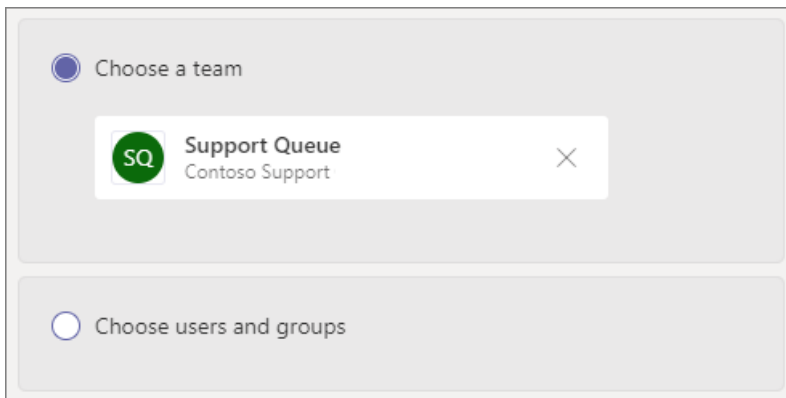

Teams provides default music to callers while they are on hold in a queue. The default music supplied in Teams call queues is free of any royalties payable by your organization. If you want to play a specific audio file, choose **Play an audio file** and upload an MP3, WAV, or WMA file.

NOTE

You are responsible for independently clearing and securing all necessary rights and permissions to use any music or audio file with your Microsoft Teams service, which may include intellectual property and other rights in any music, sound effects, audio, brands, names, and other content in the audio file from all relevant rights holders, which may include artists, actors, performers, musicians, songwriters, composers, record labels, music publishers, unions, guilds, rights societies, collective management organizations and any other parties who own, control or license the music copyrights, sound effects, audio and other intellectual property rights.

Call agents

Review the [prerequisites for adding agents to a call queue](#).

Teams channel

You can add up to 200 agents via a Teams channel. Note that you must be a member of the team or the creator or an owner of the channel to add a channel to the queue.

If you want to [use a Teams channel to manage the queue](#), select the **Choose a team** option and click **Add a channel**. Search for the team that you want to use, select it, and click **Add**. Select the channel that you want to use (only standard channels are supported) and click **Apply**.

The following clients are supported when using a Teams channel for call queues:

- Microsoft Teams Windows client
- Microsoft Teams Mac client

NOTE

If you use this option, it can take up to 24 hours for the call queue to be fully operational.

Users and groups

You can add up to 20 agents individually and up to 200 agents via groups.

If you want to add individual users or groups to the queue, select the **Choose users and groups** option.

To add a user to the queue, click **Add users**, search for the user, click **Add**, and then click **Add**.

To add a group to the queue, click **Add groups**, search for the group, click **Add**, and then click **Add**. You can use distribution lists, security groups, and Microsoft 365 groups or Microsoft Teams teams.

NOTE

New users added to a group can take up to eight hours for their first call to arrive.

Call routing

Conference mode ⓘ

☒ On

Call agents who use the Skype for Business client won't receive calls when conference mode is enabled.

Routing method

☒ Attendant routing ⓘ

☐ Serial routing ⓘ

☐ Round robin ⓘ

☐ Longest idle ⓘ

Conference mode significantly reduces the amount of time it takes for a caller to be connected to an agent, after the agent accepts the call. For conference mode to work, agents in the call queue must use one of the following clients:

- The latest version of the Microsoft Teams desktop client, Android app, or iOS app
- Microsoft Teams Phone version 1449/1.0.94.2020051601 or later

Agents' Teams accounts need to be set to Teams-only mode. Agents who don't meet the requirements aren't included in the call routing list. We recommend enabling conference mode for your call queues if your agents are all using compatible clients.

NOTE

Conference mode is not supported if phone calls are routed to the queue from a Direct Routing gateway that is enabled for Location Based Routing.

TIP

Setting **Conference mode** to **On** is the recommended setting.

Routing method determines the order in which agents receive calls from the queue. Choose from these options:

- **Attendant routing** rings all agents in the queue at the same time. The first call agent to pick up the call gets the call.
- **Serial routing** rings all call agents one by one in the order specified in the **Call agents** list. If an agent dismisses or does not pick up a call, the call will ring the next agent and will try all agents until it is picked up or times out.
- **Round robin** balances the routing of incoming calls so that each call agent gets the same number of calls from the queue. This may be desirable in an inbound sales environment to assure equal opportunity

among all the call agents.

- **Longest idle** routes each call to the agent who has been idle the longest time. An agent is considered idle if their presence state is Available. Agents whose presence state is not Available will not be eligible to receive calls until they change their presence to Available.

TIP

Setting **Routing Method** to **Round robin** or **Longest idle** is the recommended setting.

NOTE

If **Compliance recording** is enabled on the agents, the combination of **Conference mode** and **Attendant routing** is not supported. If you need to use **Conference mode**, select **Serial Routing**, **Round robin**, or **Longest idle** as the **Routing method**. If you need to use **Attendant routing**, set **Conference mode** to **Off**.

When using **Longest idle** there may be times when an agent receives a call from the queue shortly after becoming unavailable or if there is a short delay in receiving a call from the queue after becoming available.

Presence-based routing ⓘ

☒ On

Note - Agents who use the Skype for Business client will not receive calls when Longest idle or Presence-based routing is enabled.

Agents can opt out of taking calls ⓘ

☒ On

Agent alert time (seconds)

20

Presence-based routing uses the availability status of call agents to determine whether an agent should be included in the call routing list for the selected routing method. Call agents whose availability status is set to **Available** are included in the call routing list and can receive calls. Agents whose availability status is set to any other status are excluded from the call routing list and won't receive calls until their availability status changes back to **Available**.

You can enable presence-based call routing with any of the routing methods.

If an agent opts out of getting calls, they won't be included in the call routing list regardless of what their availability status is set to.

NOTE

When **Longest idle** is selected as the routing method, presence-based routing is required and automatically enabled even though the Presence-based routing toggle will be **Off** and grayed out.

If presence-based routing is not enabled and there are multiple calls in the queue, the system will present these calls simultaneously to the agents regardless of their presence status. This will result in multiple call notifications to agents, particularly if some agents don't answer the initial call presented to them.

Agents who use the Skype for Business client aren't included in the call routing list when presence-based routing is enabled. If you have agents who use Skype for Business, don't enable presence-based call routing.

TIP

Setting **Presence-based routing** to **On** is the recommended setting.

Agent alert time specifies how long an agent's phone will ring before the queue redirects the call to the next agent.

TIP

Setting **Agent alert time** to **20 seconds** is the recommended setting.

Call overflow handling

Maximum calls in the queue

20

You can choose up to a maximum of 200 calls.

When the maximum number of calls is reached

☐ Disconnect

☒ Redirect this call to

Redirect to ⓘ

=  Contoso support queue X

☒ Transcription on

☐ Play an audio file

☒ Type in a greeting message ⓘ

Please leave a message and someone from Contoso support will return your call

Maximum calls in the queue specifies the maximum number of calls that can wait in the queue at any given time. The default is 50, but it can range from 0 to 200. When this limit is reached, the call is handled as specified by the **When the maximum number of calls is reached** setting.

You can choose to disconnect the call or redirect it to any of the call routing destinations. For example, you might

have the caller leave a voicemail for the agents in the queue. For external transfers, please refer to [Prerequisites](#) and the [external phone number transfers - technical details](#) for number formatting.

NOTE

If the maximum number of calls is set to 0 then the greeting message will not play.

Call timeout handling

The screenshot shows a configuration panel for call timeout handling. At the top, under 'Maximum wait time', there are input fields for '10' minutes and '0' seconds, with a note stating 'You can choose up to a maximum of 45 minutes.' Below this, the 'When call times out' section has two radio button options: 'Disconnect' and 'Redirect this call to'. The 'Redirect this call to' option is selected. Under this option, there is a 'Redirect to' section with a dropdown menu set to 'Voicemail'. To the right of the dropdown is an equals sign followed by a blue circle icon with 'CQ' and the text 'Contoso support queue'. Below this, there is a toggle switch for 'Transcription on' which is turned on. Further down, there are two more radio button options: 'Play an audio file' and 'Type in a greeting message', with the latter being selected. Below the selected option is a text input field containing the message: 'Please leave a message and someone from Contoso support will return your call'.

Call Timeout: maximum wait time specifies the maximum time a call can be on hold in the queue before it is redirected or disconnected. You can specify a value from 0 seconds to 45 minutes.

You can choose to disconnect the call or redirect it to one of the call routing destinations. For example, you might have the caller leave a voicemail for the agents in the queue. For external transfers, please refer to [Prerequisites](#) and the [external phone number transfers - technical details](#) for number formatting.

When you have selected your call timeout options, click **Save**.

Summary of recommended call queue settings

The following settings are recommended:

- **Conference mode** to On
- **Routing method** to Round robin or Longest idle
- **Presence-based routing** to On
- **Agent alert time:** to 20 seconds

Supported clients

The following clients are supported for call agents in a call queue:

- Skype for Business desktop client 2016 (32-bit and 64-bit versions)

- Lync desktop client 2013 (32-bit and 64-bit versions)
- All IP phone models supported for Microsoft Teams. See [Getting phones for Skype for Business Online](#).
- Mac Skype for Business Client (version 16.8.196 and later)
- Android Skype for Business Client (version 6.16.0.9 and later)
- iPhone Skype for Business Client (version 6.16.0 and later)
- iPad Skype for Business Client (version 6.16.0 and later)
- Microsoft Teams Windows client (32-bit and 64-bit versions)
- Microsoft Teams Mac client
- Microsoft Teams on [Virtualized Desktop Infrastructure](#) (Windows Virtual Desktop, Citrix, and VMware)
- Microsoft Teams iPhone app
- Microsoft Teams Android app

NOTE

Call queues that are assigned a direct routing number don't support Skype for Business clients, Lync clients, or Skype for Business IP Phones as agents. The Teams client is only supported with a [co-existence mode of Teams Only](#).

Call queue cmdlets

You can also use Windows PowerShell to create and set up call queues. Here are the cmdlets that you use to manage a call queue.

- [New-CsCallQueue](#)
- [Set-CsCallQueue](#)
- [Get-CsCallQueue](#)
- [Remove-CsCallQueue](#)

Call Queue Diagnostic Tool

If you're an administrator, you can use the following diagnostic tool to validate that a call queue is able to receive calls:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.

[Run Tests: Teams Call Queue](#)

2. In the Run diagnostic pane, enter the Resource Account in the **Username or Email** field, and then select **Run Tests**.
3. The tests will return the best next steps to address any tenant, policy, and resource account configurations to validate that the call queue is able to receive calls.

Manage resource accounts in Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

A resource account is a disabled user object in Azure AD, and can be used to represent resources in general. For example, a resource account may be used in Exchange to represent conference rooms and allow them to have a phone number and calendar. A resource account can be homed in Microsoft 365 or on premises using Skype for Business Server 2019.

In Microsoft Teams, a resource account is required for each auto attendant or call queue. Resource accounts may also be assigned service telephone numbers. This is how you assign phone numbers to auto attendants and call queues allowing callers from outside Teams to reach the auto attendant or call queue.

This article covers how to create resource accounts and ready them for use with auto attendants and call queues.

Before you start the procedures in this article, ensure you've done the following:

- [Obtain virtual user licenses](#)
- [Obtain service numbers](#)

Obtain virtual user licenses

Each resource account requires a license in order to work with auto attendants and call queues. You can use a free *Microsoft 365 Phone System - Virtual User* license. To obtain these licenses, see [Virtual User license](#).

We cover how to assign the license to a resource account later in this article.

To get the Virtual User license, in the Microsoft 365 admin center, go to **Billing > Purchase services > Add-on subscriptions** and scroll to the end - you will see *Phone System - Virtual User* license. Select **Buy now**. There is a zero cost, but you still need to follow these steps to acquire the license.

Obtain service numbers

Service numbers are optional for auto attendants and call queues, however you will need at least one service number in order for callers to reach your auto attendant and call queue configuration. For any auto attendant or call queue that you want to be reachable directly by a service number, you must have a resource account with an associated service number.

Resource accounts can use either toll or toll-free service numbers. You can request new numbers or port existing numbers from another carrier.

To get new service numbers, see [Getting service phone numbers](#).

To port a number from another carrier, see [Transfer phone numbers to Teams](#).

Create a resource account

You can create a resource account in the Teams admin center.

Add resource account

Display name ⓘ

Contoso main line

Username ⓘ

aa-contoso-main @ contoso64....

Resource account type ⓘ

Auto attendant

1. In the Teams admin center, expand **Voice**, and then click **Resource accounts**.
2. Click **Add**.
3. In the **Add resource account** pane, fill out **Display name**, **Username**, and the **Resource account type**. The resource account type can be either **Auto attendant** or **Call queue**, depending how you intend to use this resource account.
4. Click **Save**.

✓	Display name ↑	Username	Phone number
✓	Contoso main line	aa-contoso-main@contoso64.net	
	Contoso sales queue	cq-contoso-sales-queue@contoso64.net	
	Contoso support queue	cq-contoso-support-queue@contoso64.net	

Assign a license

For each resource account, you must assign a *Microsoft 365 Phone System - Virtual User* license or *Phone System* license.

aa-contoso_main

☐ **Microsoft 365 Domestic Calling Plan**
 You have no more licenses for this trial subscription. You need to [buy a subscription](#) before you can assign a license.

☐ **Microsoft 365 E5 Compliance**
 You have no more licenses for this trial subscription. You need to [buy a subscription](#) before you can assign a license.

☒ **Microsoft 365 Phone System - Virtual User**
 4 of 10 licenses available

1. In the Microsoft 365 admin center, click the resource account to which you want to assign a license.
2. On the **Licenses and Apps** tab, under **Licenses**, select **Microsoft 365 Phone System - Virtual User**.
3. Click **Save changes**.

Assign a service number

If you're planning to use the resource account with an auto attendant or call queue that requires a service number, assign a number to the resource account.

Assign/unassign

Contoso main line

 To see a service number listed here, buy a Phone System or get a Phone System - Virtual user license and make sure it's not assigned to any other voice services. [Learn more](#)

Phone number type
 Online

Assigned phone number
 +1 929 555 0150

Assigned to
 Select an auto attendant
 Search by auto attendant

1. In the Teams admin center, on the **Resource accounts** page, select the resource account to which you want to assign a service number, and then click **Assign/unassign**.
2. In the **Phone number type** dropdown, choose the type of number that you want to use.
3. In the **Assigned phone number** box, search for the number you want to use and click **Add**.
4. Click **Save**.

To assign a direct routing or hybrid number to a resource account you need to use PowerShell:

```
Set-CsOnlineApplicationInstance -Identity aa-contoso_main@contoso64.net -OnpremPhoneNumber +19295550150
```

Next steps

Once you've completed the resource account setup and assigning a service number if needed, you're ready to use the resource account with an auto attendant or call queue.

See the following references:

- [Cloud auto attendant](#)
- [Cloud call queue](#)

You can edit the resource account **Display name** and **Resource account type** using the **Edit** option. Click **Save** when you are done.

Change an existing resource account to use a Virtual User license

If you decide to switch the licenses on your existing resource account from a **Phone System** license to a Virtual User license, you'll need to acquire the free Virtual User license, and then follow the steps in the Microsoft 365 admin center to [Move users to a different subscription](#).

WARNING

Always remove a full Phone System License and assign the Virtual User license in the same license activity. If you remove the old license, save the account changes, add the new license, and then save the account settings again, the resource account may no longer function as expected. If this happens, we recommend you create a new resource account for the Virtual User license and remove the broken resource account.

Skype For Business Server 2019

For resource accounts homed on Skype For Business Server 2019 that can be used with cloud call queues and cloud auto attendants, see [Plan Cloud call queues](#) or [Plan Cloud auto attendants](#). Hybrid implementations (numbers homed on Direct Routing) are configured using the [New-CsHybridApplicationEndpoint](#) cmdlet on an on-premises Skype for Business Server 2019 server.

The application IDs that you need to use while creating the application instances are:

- **Auto Attendant:** ce933385-9390-45d1-9512-c8d228074e07
- **Call Queue:** 11cd3e2e-fccb-42ad-ad00-878b93575e07

NOTE

If you want the call queue or auto attendant to be searchable by Skype For Business Server 2019 users, you should create your resource accounts on Skype For Business Server 2019, since online resource accounts are not synced down to Active Directory. When DNS SRV records for sipfederationtls resolve to Skype for Business Server 2019, then resource accounts **must** be created on Skype For Business Server 2019 using Sfb Management shell and synchronized to Azure AD.

For implementations that are hybrid with Skype for Business Server:

[Plan Cloud auto attendants](#)

[Plan Cloud call queues](#)

[Configure on-prem resource accounts](#)

Delete a resource account

Make sure you dissociate the telephone number from the resource account before deleting it, to avoid getting your service number stuck in pending mode.

After you do that, you can delete the resource account in the Microsoft 365 admin center, under the Users tab.

To disassociate a direct routing telephone number from the resource account, use the following cmdlet:

```
Set-CsOnlineApplicationInstance -Identity <Resource Account oid> -OnpremPhoneNumber ""
```

Set up holidays in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

You can use the Teams Holidays feature to provide alternate messages and routing to callers for specific dates and times when departments, call queues or people in your organization will be following different working hours or won't be available. For example, you might create a holiday for New Year's day when your organization may be closed.

The holidays you create here are available when you [set up an auto attendant](#), each with its own greeting and call routing settings.

Create a holiday

To create a holiday

1. In the Microsoft Teams admin center, go to **Org-wide settings** > **Holidays**.
2. Select **New holiday**.
3. Enter a name for the holiday.
4. Select **Add new date**.
5. Under **Start time**, select the calendar icon and choose the date when you'd like the holiday to begin.
6. Use the drop-down list to select a start time for the holiday.
7. Under **End time**, select the calendar icon and choose the date when you'd like the holiday to end.
8. Use the drop-down list to select an end time for the holiday. The **End time** must be after the **Start time**.

NOTE

If the holiday is for one full day (i.e., a 24 hour period), the **End time** should be set to the next day and the time to 12:00 AM. For example, if your organization is closed on January 1 for New Year's day, set the **Start time** to January 1 12:00 AM and set the **End time** to January 2 @ 12:00 AM.

9. Optionally, add more dates for recurring holidays.
10. Select **Save**.

New Years Day			
Dates			
Start time		End time	
1/1/2021		12:00 AM	
1/1/2022		12:00 AM	
1/1/2023		12:00 AM	
+ Add new date			

Change a holiday

To change a holiday

1. In the Microsoft Teams admin center, go to **Org-wide settings** > **Holidays**.
2. Select the holiday from the list.
3. Under **Start time**, select the calendar icon and choose the date when you'd like the holiday to begin.
4. Use the drop-down list to select a start time for the holiday.
5. Under **End time**, select the calendar icon and choose the date when you'd like the holiday to end.
6. Use the drop-down list to select an end time for the holiday. The **End time** must be after the **Start time**.
7. Select **Save**.

[Plan for Teams auto attendants and call queues?](#)

Answer auto attendant and call queue calls directly from Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams users can receive and answer calls from Cloud auto attendants and call queues directly from their Teams client.

What are auto attendants and call queues?

Cloud auto attendants provide a series of voice prompts or an audio file that callers hear instead of a human operator when they call in to an organization. An auto attendant lets callers move through the menu system, place calls, or locate users by using a phone keypad (DTMF) or voice inputs using speech recognition.

Cloud call queues include greetings that are used when someone calls in to a phone number for your organization, the ability to automatically put the calls on hold, and the ability to search for the next available call agent to handle the call while the people who call are listening to music on hold. You can create single or multiple call queues for your organization.

Handling an auto attendant or call queue call

Users will be able to differentiate incoming calls from an auto attendant or call queue before they answer the call. Along with the name and/or number of the caller, each call will include information about who the caller was trying to reach, giving users a better context for addressing the caller.

The following illustration shows how an incoming call from an auto attendant or call queue will appear to a user.

Once an auto attendant or call queue call is answered, the user can process the call like any other call — they can add or conference in another user or transfer the call to another party. Also, auto attendant calls will be forwarded based on the user's configuration.

NOTE

Call queue calls are not forwarded based on the user's configuration. This is to ensure callers remain in the queue until an agent can answer the call and the caller isn't forwarded unexpectedly.

Agents are not notified of any missed calls or voicemails for call queue calls.

Supported clients

Support for auto attendant and call queue calls is available in the following clients:

- Microsoft Teams Windows client (32 and 64-bit versions)
- Microsoft Teams Mac client
- Microsoft Teams iPhone app
- Microsoft Teams Android app

The Teams client is only supported with a [co-existence mode of Teams Only](#).

Configure auto attendant and call queue support for Microsoft Teams

To receive auto attendant and call queue calls on Microsoft Teams, you need to configure your interoperability policy and upgrade policy. Please review [Migration and interoperability for organizations using Teams together with Skype for Business](#). If you do not have auto attendant and/or call queue configured and would like to do so, see [Set up a Cloud auto attendant](#) and [Create a Cloud call queue](#).

Known Issues

When a call queue agents receives a call on their mobile device, calls may go on hold if the device is locked. User must unlock device first and then answer the call.

Auto Attendant & Call Queue Historical Report

12/7/2021 • 11 minutes to read • [Edit Online](#)

The Teams Auto Attendant & Call Queue Historical Report Power BI Template provides the following three reports:

- [Auto Attendant](#) – showing analytics for calls coming into your Auto Attendants.
- [Call Queue](#) – showing analytics for calls coming into your Call Queues.
- [Agent Timeline](#) – showing a timeline view of agents being active in Call Queue calls.

These reports use data from the [Call Quality Dashboard](#) data store. The reports allow organizations to report on the number of calls being processed by auto attendants and call queues. The reports also provide insight to agent performance in the call queues.

Prerequisites

Power BI Desktop

You need to have Power BI Desktop installed. You can install it from the [Microsoft Windows Store](#).

You can use the free version of Power BI Desktop. The minimum compatible version is 2.85.681.0 (September 2020).

Permissions to access the CQD pipeline

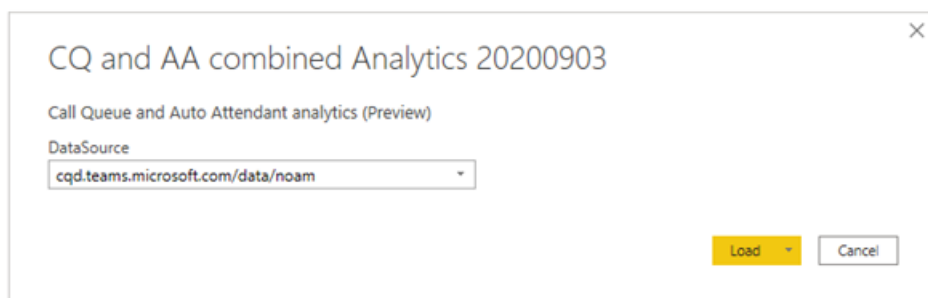

The account you use to view the historical report needs to have permissions to access the CQD data pipeline. For more information, see [CQD access role](#).

Installation

The following steps assume you have already installed Power BI Desktop on the computer, and that your account has the necessary permissions to access the CQD data pipeline.

Perform the following steps:

- Download the [CQD Power BI Query Templates](#) and save the zip file to a directory on your computer.
- Double-click on the zip file to open it.
- Double-click on the "CQ and AA combined Analytics 20201105.pbit" template file. The Power BI Desktop should launch.
- You will be prompted to select the CQD data pipeline region. Select the region where your tenant is located.

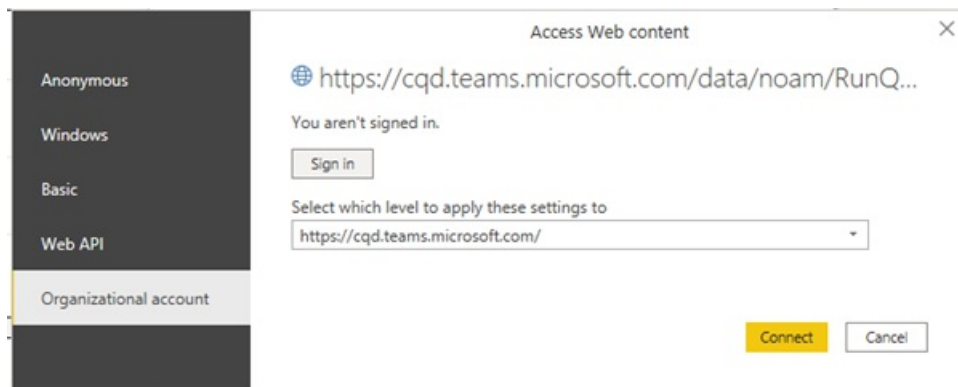

- The region where your tenant is located can be obtained by using the [Get-CsTenant](#) cmdlet.

```
(Get-CsTenant).ServiceInstance  
  
microsoftcommunicationsonline/noam-4a-s7
```

- The region will be displayed after the / as in the above example where the region is: noam
- The report will launch with sample data.
- To see your own data, select **Refresh** in the Home tab under Queries in Power BI Desktop.

- You will then be prompted to sign in. Select **Organization account** and then select **Sign in**.

- Select **Connect** and watch the data refresh.

Data latency and AA & CQ analytics

Data will be available in the CQD data pipeline within 30 minutes.

You will have to refresh the data to see the new analytics data.

Customization

You can customize certain visualization aspects of the reports, such as adding or removing fields to be shown in the various visualizations, changing chart type, and so on.

You cannot add additional data fields to the report.

Change color schema

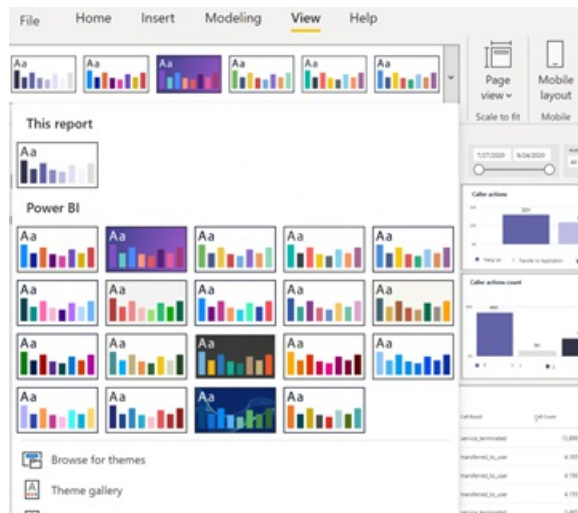

The following steps assume you have already completed the installation steps.

Perform the following steps:

- Select **View** tab on the ribbon.

- Select the color schema from the drop-down list.

Call Duration (Minute)	Whole number	Summarize: Sum Total call duration of call queue calls in minutes
Call Queue Name	Text	Name of resource account attached to Call Queue If the full Resource Account name is cq_test@microsoft.com then this value will be: cq_test
Date	Date	

NOTE

1. This report shows the call counts from the agents' perspective and therefore the call count total on this report will typically be higher than the total number of calls on the **Cloud Call Queue Analytics** report. Each call in the queue may be presented to one or more agents at least once before it is answered. Every call queue call presented to an agent is counted on this report, even if it wasn't answered by the agent. The difference in the call counts between these two reports is more pronounced with the **Attendant routing** option which rings every agent for every call.
2. When a call first arrives at the first call queue, if the number of calls already waiting in that queue exceeds the **Call overflow handling** limit and if the redirect option sends calls to a second call queue then the agents in the second call queue will be shown as being in the first call queue on this report.

Known Issues

- Call queue and auto attendants are shown by resource account's ID instead of call queue/auto attendant names. To show all the traffic for an auto attendant or call queue you must select all the resource accounts assigned to the auto attendant or call queue.
- Only 28 days of history are available in the dashboard as call queue/auto attendant data is considered personal data and is subject to data privacy retention policies.
- In some scenarios, the agent answered call count on the Cloud Call Queue Agent Timeline report may be different than the number of calls shown in the Teams client call history. The Teams client call history is correct. Support is investigating but there is no estimated time to repair available at this time.
- ¹ **Incoming call source** in the auto attendant and call queue graphs show the final call leg source rather than the initial call leg source. For example, if an auto attendant receives an external call and transfers the call to another auto attendant or call queue, the **Incoming call source** will be reported as Internal.

Auto attendant and call queue dialing and voice recognition reference

12/7/2021 • 6 minutes to read • [Edit Online](#)

Dial by Name is a feature of an auto attendant that is also known as directory search. It enables the people who call your auto attendant to use voice (speech recognition) or their phone keypad (DTMF) responses to enter a full or partial name to search company's directory, locate the person, and then have the call transferred to them. You set up dial by name when you [configure the call flow settings in an auto attendant](#).

Searching for users

Users you wish to have located and reached using Dial by Name **aren't required to have a phone number or have Calling Plans assigned to them, but they must be Enterprise Voice enabled for Skype for Business Server users**. Dial by Name will even be able to find and transfer calls to Microsoft Teams users who are hosted in different countries or regions for multi-national organizations. Given the prerequisites involved, you explicitly enable Dial by Name in an auto attendant.

Dial by extension is a feature of an auto attendant that is also part of directory search. It enables the people who call your auto attendant to use voice (speech recognition) or their phone keypad (DTMF) responses to enter the phone extension of the user they're trying to reach, and then have the call transferred to them. Users you wish to have located and reached using Dial by extension **aren't required to have a phone number or have Calling Plans assigned to them, but they must be Enterprise Voice enabled for Skype for Business Server users**. You will also need to have an appropriately configured dial plan for your users. Dial by extension will even be able to find and transfer calls to Microsoft Teams users who are hosted in different countries or regions for multi-national organizations. Given the prerequisites involved, you explicitly enable Dial by extension in an auto attendant.

Maximum directory size

There is no limit on the number of Active Directory users Dial by Name and Dial by Extension can support when a caller search for a specific person. A caller can enter partial or full names (FirstName + LastName, and also LastName + FirstName), but needs the full extension number. The maximum name list size that a single auto attendant can support using speech recognition is 80,000 users.

INPUT TYPE	SEARCH FORMAT	MAXIMUM NUMBER OF USERS IN AN ORGANIZATION
DTMF (keypad entry)	Partial FirstName + LastName LastName + FirstName	No limit
Speech (voice input)	FirstName LastName FirstName + LastName LastName + FirstName	80,000 users

NOTE

If you are using Dial by Name with speech recognition, but your organization's Active Directory is larger than 80,000 users and you haven't limited the scope of Dial by Name using Dial Scope feature, Dial by Name will still work for your callers using a phone keypad, and voice inputs will be available for all other scenarios. You can use the Dial Scope feature to narrow down the names that are reachable by changing the scope of Dial by Name for a particular auto attendant.

Dial by Name - Keypad (DTMF) entry

People calling in can use Dial by Name to reach users by specifying either the full or partial name of the person they are trying to reach. There are various formats that can be used when the name is entered.

When searching your organization's directory, people can use the '0' (zero) key to indicate a space between the first name and last or last name and first. When they are entering the name, they will be asked to terminate their keypad entry with the # key. For example, "After you enter the name of the person you are trying to reach, press #." If there are multiple names that are found, the person calling will be given a list of names to select from.

People can search for names in your organization using the following search formats on their phone keypad:

NAME FORMAT	SEARCH TYPE	EXAMPLE	SEARCH RESULT
FirstName + LastName	Full	Amos0Marble#	Amos Marble
LastName + FirstName	Full	Marble0Amos#	Amos Marble
FirstName	Full	Amos#	Press 1 for Amos Marble Press 2 for Amos Marcus
LastName	Full	Marble#	Press 1 for Amos Marble Press 2 for Mary Marble
FirstName or LastName	Partial	Mar#	Press 1 for Mary Marble Press 2 for Mary Jones Press 3 for Amos Marcus
FirsName + LastName	Partial	Amos0Mar#	Press 1 for Amos Marble Press 2 for Amos Marcus
LastName + FirstName	Partial	Mar0Am#	Press 1 for Amos Marble Press 2 for Amos Marcus

There are several special characters that are used when searching for people using a phone keypad. For example, the person will be asked to use the pound key (#), while the zero (0) key is used for a space between names. Pressing the star key (*) will repeat the list of matching names to the person.

SPECIAL PHONE KEYPAD CHARACTER	WHAT IT MEANS
#	End character when entering a name.
0	Space between names.
*	Repeat the list of matching names.

Dial by Name - Name recognition with speech

People can search for others in their organization with their voice (speech recognition). They can also reach anyone in Active Directory by saying the full or partial name of the person they are trying to locate. Using voice inputs can recognize names in various formats, including FirstName, LastName, FirstName + LastName, or LastName + FirstName.

You can enable speech recognition for an auto attendant, but phone keypad entry (DTMF) isn't disabled. Phone keypad entry can be used at any time even if speech recognition is enabled on the auto attendant.

As with phone keypad entry, if multiple names are found, the person calling hears a list of names to select from.

Callers can say names in the following formats:

NAME WITH SPEECH	SEARCH TYPE	EXAMPLE	SEARCH RESULT
FirstName + LastName	Full	Amos Marble	Amos Marble
LastName + FirstName	Full	Marble Amos	Amos Marble
FirstName	Full	Amos	Press or say 1 for Amos Marble Press or say 2 for Amos Jones
LastName	Full	Marble	Press or say 1 for Amos Marble Press or say 2 for Ben Marble
FirstName or LastName	Partial	Mar	Press or say 1 for Mary Marble Press or say 2 for Mary Jones Press or say 3 for Amos Marcus
FirsName + LastName	Partial	Amos Mar	Press or say 1 for Amos Marble Press or say 2 for Amos Marcus

NOTE

It might take up to 36 hours for a new user to have their name listed in the directory for Dial by Name with speech recognition due to Active Directory replication lag.

Language support

Language support for text-to-speech and speech recognition is available in these [supported languages](#).

The following voice commands are available for speech recognition:

VOICE COMMAND	CORRESPONDS TO
Yes	Press 1 for Yes.
No	Press 2 for No.

VOICE COMMAND	CORRESPONDS TO
Repeat	Repeats the list of options. Press * on the keypad to repeat the list of options.
Operator	Press 0 for "Operator"
Main Menu	Brings the caller to the main menu of the auto attendant.
Zero	Press 0 (by default, same as "Operator").
One	Press 1.
Two	Press 2.
Three	Press 3.
Four	Press 4.
Five	Press 5.
Six	Press 6.
Seven	Press 7.
Eight	Press 8.
Nine	Press 9.

Block inbound calls

12/7/2021 • 6 minutes to read • [Edit Online](#)

Microsoft Calling Plans, Direct Routing, and Operator Connect all support blocking inbound calls from the Public Switched Telephone Network (PSTN). This feature allows an administrator to define a list of number patterns at the tenant global level so that the caller ID of every incoming PSTN call to the tenant can be checked against the list for a match. If a match is made, an incoming call is rejected.

This inbound call blocking feature only works on inbound calls that originate from the PSTN and only works on a tenant global level. Individual Teams users can't manipulate this list. The Teams client does allow individual users to block PSTN calls. For information about how your end users can implement call blocking, see [Manage call settings in Teams](#).

NOTE

Blocked callers may experience slightly different behaviors when they've been blocked. The behavior is based on how the blocked caller's carrier handles the notification that the call isn't allowed to be successfully completed. Examples may include a carrier message stating the call can't be completed as dialed, or simply dropping the call.

Call blocking admin controls and information

Admin controls for blocking numbers are provided using PowerShell only. Number block patterns are defined as regular expression patterns. The order of the expressions is unimportant – the first pattern matched in the list results in the call being blocked. A new number or pattern that's added or removed in the blocked callers list may take up to 24 hours for the pattern to become active.

Call blocking PowerShell commands

You manage number patterns by using the **New-**, **Get-**, **Set-**, and **Remove-CsInboundBlockedNumberPattern** cmdlets. You can manage a given pattern by using these cmdlets, including the ability to toggle the activation of a given pattern.

- [Get-CsInboundBlockedNumberPattern](#) returns a list of all blocked number patterns added to the tenant list including Name, Description, Enabled (True/False), and Pattern for each.
- [New-CsInboundBlockedNumberPattern](#) adds a blocked number pattern to the tenant list.
- [Remove-CsInboundBlockedNumberPattern](#) removes a blocked number pattern from the tenant list.
- [Set-CsInboundBlockedNumberPattern](#) modifies one or more parameters of a blocked number pattern in the tenant list.

Viewing and activating the entire call blocking feature is managed through the **Get-** and **Set-CsTenantBlockingCallingNumbers** cmdlets.

- [Get-CsTenantBlockedCallingNumbers](#) returns the inbound block number patterns and the inbound exempt number patterns parameters for the global blocked number list. This cmdlet also returns whether blocking has been Enabled (True or False). There's a single global tenant policy that can't be modified manually other than to turn the feature on or off.
- [Set-CsTenantBlockedCallingNumbers](#) allows modifying the global tenant blocked calls to be turned on and off at the tenant level.

Examples

Block a number

In the following example, the tenant administrator wants to block all calls coming from the number range 1 (312) 555-0000 to 1 (312) 555-9999. The number pattern is created so that both numbers in range with + prefixed and numbers in the range without + prefixed are matched. You don't need to include the symbols – and () in the phone numbers because the system strips these symbols before matching. To turn on the number pattern, the **Enabled** parameter is set to True. To disable this specific number pattern, set the parameter to False.

```
New-CsInboundBlockedNumberPattern -Name "BlockRange1" -Enabled $True -Description "Block Contoso" -Pattern "^\\+?1312555\\d{4}$"
```

In the next example, the tenant administrator wants to block all calls coming from the number 1 (412) 555-1234. To turn on the number pattern, the **Enabled** parameter is set to True.

```
New-CsInboundBlockedNumberPattern -Name "BlockNumber1" -Enabled $True -Description "Block Fabrikam" -Pattern "^\\+?14125551234$"
```

Creating a new pattern adds the pattern as enabled by default. The description is an optional field to provide more information.

We recommend that you provide a meaningful name to easily understand why the pattern was added. In the case of simply blocking spam numbers, consider naming the rule the same as the number pattern that's being matched and add additional information in the description as required.

Patterns are matched using Regular Expressions (Regex). For more information, see [Using Regex](#).

Allow time for replication before you test and validate.

Allow a number

You can allow a number to call by removing the blocked number pattern. In the following example, the tenant administrator wants to allow 1 (412) 555-1234 to make calls again.

```
Remove-CsInboundBlockedNumberPattern -Identity "BlockNumber1"
```

If the identity isn't known, use the **Get-CsInboundBlockedNumberPattern** cmdlet to first locate the proper pattern and note the identity. Then, run the **Remove-CsInboundBlockedNumberPattern** cmdlet and pass the appropriate identity value.

Allow time for replication before you test and validate.

View all number patterns

Running this cmdlet returns a list of all blocked numbers that are entered for a tenant:

```
Get-CsInboundBlockedNumberPattern
```

Use built-in PowerShell filtering abilities to parse the returned values as required.

Add number exceptions

You can add exceptions to blocked number patterns by using the **New-**, **Get-**, **Set-**, and **Remove-CsInboundExemptNumberPattern** cmdlets.

- [New-CsInboundExemptNumberPattern](#) adds a number exception pattern to the tenant list.
- [Get-CsInboundExemptNumberPattern](#) returns a list of all number exception patterns added to the tenant list.
- [Set-CsInboundExemptNumberPattern](#) modifies one or more parameters to a number exception pattern in the

tenant list.

- [Remove-CsInboundExemptNumberPattern](#) removes a number exception pattern from the tenant list.

Examples

Add a number exception

In the following example, the tenant administrator wants to allow the phone numbers 1 (312) 555-8882 and 1 (312) 555-8883 to make calls to the tenant, even if these two phone numbers are in the range that has been blocked in the example above. To enable this, a new number exception pattern is created as follows:

```
New-CsInboundExemptNumberPattern -Identity "AllowContoso1" -Pattern "^\\+?1312555888[2|3]$" -Description "Allow Contoso helpdesk" -Enabled $True
```

To turn on the number pattern, the **Enabled** parameter is set to True. To disable this specific number pattern, set the parameter to False.

View all number exceptions

In this example, the **Identity** parameter is optional. If the **Identity** parameter isn't specified, this cmdlet returns a list of all number exception patterns entered for a tenant.

```
Get-CsInboundExemptNumberPattern -Identity <String>
```

```
Get-CsInboundExemptNumberPattern
```

Modify a number exception

The **Set-CsInboundExemptNumberPattern** cmdlet lets you modify one or more parameters for a given number pattern identity. In this example, the **Identity** parameter is required.

```
Set-CsInboundExemptNumberPattern -Identity <String> -Enabled <bool> -Description <string> -Pattern <string>
```

```
Set-CsInboundExemptNumberPattern -Identity "AllowContoso1" -Enabled $False
```

Remove a number exception

The **Remove-CsInboundExemptNumberPattern** cmdlet will remove the given number pattern from the tenant list. In this example, the **Identity** parameter is required.

If the identity isn't known, use the **Get-CsInboundExemptNumberPattern** cmdlet to first locate the proper pattern and note the identity. Then, run the **Remove-CsInboundExemptNumberPattern** cmdlet and pass the appropriate identity value. Allow time for replication before you test and validate.

```
Remove-CsInboundExemptNumberPattern -Identity <String>
```

```
Remove-CsInboundExemptNumberPattern -Identity "AllowContoso1"
```

Test whether a number is blocked

Use the **Test-CsInboundBlockedNumberPattern** cmdlet to verify whether a number is blocked in the tenant.

The **PhoneNumber** parameter is required, and should be a numeric string without any additional characters, such as +, - or (). The resulting **IsNumberBlocked** parameter returns a value of True if the number is blocked in the tenant; the parameter returns False if it's not blocked.

```
Test-CsInboundBlockedNumberPattern -Tenant <GUID> -PhoneNumber <String>
```

Examples

In these examples you can see that the phone number 1 (312) 555-8884 is blocked as it should be due to it being in the blocked range above, while the phone number 1 (312) 555-8883 is allowed to call as it should be based on the exemption created above.

```
Test-CsInboundBlockedNumberPattern -PhoneNumber 13125558884
```

```
RunspaceId      : 09537e45-6f0c-4001-8b85-a79002707b0c
httpStatusCode   : NoContent
IsNumberBlocked  : True
errorMessage     :
```

```
Test-CsInboundBlockedNumberPattern -PhoneNumber 13125558883
```

```
RunspaceId      : 09537e45-6f0c-4001-8b85-a79002707b0c
httpStatusCode   : NoContent
IsNumberBlocked  : False
errorMessage     :
```

Using Regex

The pattern matching for blocking callers is done by using Regex. Multiple tools are available online to help validate a Regex pattern match. If you aren't familiar with Regex patterns, we recommend that you take some time to familiarize yourself with the basics. To make sure you get expected results, use a tool for validating pattern matches before you add new blocked number matches to your tenant.

Call park and retrieve in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Call park and retrieve is a feature that lets a user place a call on hold. When a call is parked, the service generates a unique code for call retrieval. The user who parked the call or someone else can then use that code with a supported app or device to retrieve the call. (See [Park a call in Teams](#) for details.)

Some of the common scenarios for using call park are:

- A receptionist parks a call for someone working in a factory. The receptionist then announces the call and the code number over the public address system. The user who the call is for can then pick up a Teams phone on the factory floor and enter the code to retrieve the call.
- A user parks a call on a mobile device because the device battery is running out of power. The user can then enter the code to retrieve the call from a Teams desk phone.
- A support representative parks a customer call and sends an announcement on a Teams channel for an expert to retrieve the call and help the customer. An expert enters the code in Teams clients to retrieve the call.

To park and retrieve calls, a user must be an Enterprise Voice user and must be included in a call park policy.

NOTE

Call park and retrieve is only available in [Teams Only deployment mode](#) and is not supported on Skype for Business IP phones.

Configure call park and retrieve

You must be a Teams admin to configure call park and retrieve. It is disabled by default. You can enable it for users and create user groups using the call park policy. When you apply the same policy to a set of users, they can park and retrieve calls among themselves.

By default, the range of call pickup numbers is from 10-99. You can also create your own custom range between 10-9999. The first parked call will be rendered a pickup code of the start of range (for instance 10). The next parked call will be rendered a pickup code incremented by 1; that is, 11, and so on, until the end of the range is rendered as a pickup code. After which, the rendered pickup codes start over from the start of the range once again.

You can specify a timeout as the number of seconds to wait before ringing back when the parked call hasn't been picked up. The allowed range is 120-1800 seconds, and the default value is 300 seconds.

To set the custom park range and park timeout, use the New- and Set-CsTeamsCallParkPolicy cmdlets available in Teams PowerShell Module 2.6.0 or later. (Custom park range and park timeout changes are not manageable in the Teams admin center. Note that the Teams admin center will continue to show the default values.)

To enable a call park policy:

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Call park policies**.
2. On the **Manage policies** tab, click **Add**.
3. Give the policy a name, and then switch **Allow call park** to **On**. (The call pickup range and timeout can't be customized.)

Sales

Members of the sales call queue

Allow call park	<input checked="" type="checkbox"/> On
Call pickup start of range	<input type="text" value="10"/>
Call pickup end of range	<input type="text" value="99"/>
Park timeout (seconds)	<input type="text" value="300"/>

4. Select **Save**.

You can edit the policy by selecting it in the list and clicking **Edit**.

In order for the policy to work, it must be assigned to users. You can [assign the policy to users individually](#) or assign them to a group.

To assign a call park policy to a group

1. On the **Call park policies** page, on the **Group policy assignment** tab, click **Add group**.
2. Search for the group that you want to use, and then click **Add**.
3. Choose a rank compared to other group assignments.
4. Under **Select a policy**, choose the policy that you want to assign this group to.

Call sharing and group call pickup in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

The call sharing and group call pickup features of Microsoft Teams let users share their incoming calls with colleagues so that the colleagues can answer calls that occur while the user is unavailable.

Group call pickup is less disruptive to recipients than other forms of call sharing (such as call forwarding or simultaneous ringing) because users can configure how they want to be notified of an incoming shared call (via audio and visual notification, visual only, or banner in the Teams app), and they can decide whether to answer it.

To share calls with others, a user creates a call group and adds the users they want to share their calls with. Then they choose a simultaneous ring or forward setting. See [Call forwarding and simultaneous ring in Teams](#) for details. Note that mobile devices will only get notified if they're set for banner and ringtone.

IMPORTANT

Users, the call group owner, and members of the call group must be in Teams Only deployment mode. For more details on Teams deployment modes, see [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#).

License required

Users must be assigned a Microsoft Teams Phone System license to set up and use call sharing and group call pickup. For additional details on the licensing model, see [Here's what you get with Phone System](#).

Configure group call pickup

To set up group call pickup, a user first configures a call group (this is not the same as a security group or a Microsoft 365 group), and then adds the users they want to share their calls with. Then, they choose a simultaneous ring or call forward setting. For more information and step-by-step procedures, see [Call forwarding and simultaneous ring in Teams](#).

Call group creation and notification preferences are user-driven features; administrators do not have to configure these features for their users. Call groups cannot be created from security groups or Microsoft 365 groups; they must be created in Teams.

Admins should enable call groups via the **TeamsCallingPolicy AllowCallGroups** setting for a user. Admins can also enable this via Teams Admin portal. In addition, the configured user can also configure their call groups via the client directly. Admin or end users cannot block the configuration by each other, but Teams Admin portal and Teams client should show this relationship accurately in both places.

Important: When admins turn off call groups for users (after it has been turned on and the call group relationships are configured), the admins have to clean up the call group relationships for users in the Teams admin center to avoid incorrect call routing.

Limitations

Each configured call group can have a maximum of 25 users or 32,768 characters.

More information

Call forwarding and simultaneous ring in Teams

Calling and call-forwarding in Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

In Microsoft Teams, calling policies control which calling and call forwarding features are available to users. Calling policies determine whether a user can make private calls, use call forwarding or simultaneous ringing to other users or external phone numbers, route calls to voicemail, send calls to call groups, use delegation for inbound and outbound calls, and so on.

You can use the global (Org-wide default) policy that's created automatically or create and assign custom policies.

Create a custom calling policy

Follow these steps to create a custom calling policy.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Calling policies**.
2. Select **Add**.
3. Turn on or turn off the features that you want to use in your calling policy.
4. To control whether users can route inbound calls to voicemail, select **Enabled** or **User controlled**. To prevent routing to voicemail, select **Disabled**.
5. Select **Save**.

Edit a calling policy

Follow these steps to edit an existing calling policy.

1. In the left navigation of the Microsoft Teams admin center, select **Voice > Calling policies**.
2. Click next to the policy that you want to modify, and then select **Edit**.
3. Make the changes that you want, and then click **Save**.

Assign a custom calling policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Calling policy settings

Here are the settings that you can configure for calling policies.

Make private calls

This setting controls all calling capabilities in Teams. Turn this off to turn off all calling functionality in Teams.

Call forwarding and simultaneous ringing to people in your organization

This setting controls whether incoming calls can be forwarded to other users or can ring another person at the same time.

Call forwarding and simultaneous ringing to external phone numbers

This setting controls whether incoming calls can be forwarded to an external number or can ring an external

number at the same time.

Voicemail is available for routing inbound calls

This setting enables inbound calls to be sent to voicemail. Valid options are:

- **Enabled** Voicemail is always available for inbound calls.
- **Disabled** Voicemail is not available for inbound calls.
- **User controlled** Users can determine whether they want voicemail to be available.

Inbound calls can be routed to call groups

This setting controls whether incoming calls can be forwarded to a call group.

Delegation for inbound and outbound calls

This setting enables inbound calls to be routed to delegates, allowing delegates to make outbound calls on behalf of the users for whom they have delegated permissions. For more information, see [Share a phone line with a delegate](#).

Prevent toll bypass and send calls through the PSTN

Setting this to **On** will send calls through the PSTN and incur charges rather than sending them through the network and bypassing the tolls.

Busy on busy is available when in a call

Busy on Busy (Busy Options) lets you configure how incoming calls are handled when a user is already in a call or conference or has a call placed on hold. New or incoming calls can be rejected with a busy signal or can be routed accordingly to the user's unanswered settings. You can enable busy options at the tenant level or at the user level. Regardless of how their busy options are configured, users in a call or conference or those with a call on hold are not prevented from initiating new calls or conferences. This setting is disabled by default.

Web PSTN calling

This setting enables users to call PSTN numbers using the Teams web client.

Incoming meeting invites are automatically answered

This setting controls whether incoming meeting invites are automatically answered. It's turned off by default. Keep in mind that this setting applies only to incoming meeting invites. It doesn't apply to other types of calls.

Allow music on hold

This setting allows you to turn on or turn off music on hold when a PSTN caller is placed on hold. It's turned on by default. This setting doesn't apply to call park and boss delegate features, and is currently only available via PowerShell.

[Assign policies to your users in Teams](#)

Shared line appearance in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Shared line appearance is part of the delegation feature that lets a user choose a delegate to answer or handle calls on their behalf. This feature is helpful if a user has an administrative assistant who regularly handles the user's calls. In the context of shared line appearance, a manager is someone who authorizes a delegate to make or receive calls on their behalf, and a delegate can make and receive calls on behalf of someone else.

IMPORTANT

This feature is only available in Teams Only deployment mode. For more details on Teams deployment modes, see [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#)

License required

A user must have Phone System with PSTN connectivity (either a Calling Plan license or Direct Routing OnlineVoiceRoutingPolicy) to be a delegate or set up delegation and enable others to make or receive calls on their behalf.

Both managers and delegates need to have Phone System with PSTN connectivity (either a Calling Plan license or Direct Routing OnlineVoiceRoutingPolicy). The shared line experience is part of delegation and is included with Phone System. For additional details on the licensing model, See [Microsoft Teams service description](#).

Configuring delegation and shared line appearance

Delegation and shared line appearance are user-driven features: there are no admin settings to configure. For information about how to use the feature, see [Share a phone line with a delegate](#)

The tenant admin can enable delegation via the **TeamsCallingPolicy AllowDelegation** setting or via Teams Admin Portal for this feature to work.

The tenant admin can also configure delegation relationships for a user in the Teams admin center. In addition, the end user can also configure their delegation relationships directly in Teams. The Tenant admin or the user cannot block the configuration by each other, but the Teams admin center and Teams client should show this relationship accurately in both places.

IMPORTANT

When the tenant admin turns off delegation for a user (after it has been turned on), they also need to clean up delegation relationships for that user in the Teams admin center to avoid incorrect call routing.

Shared line appearance feature availability

Shared line appearance is currently supported by the following apps and devices.

CAPABILITY	TEAMS DESKTOP	TEAMS MAC APP	TEAMS WEB APP (EDGE)	TEAMS MOBILE IOS/ANDROID APP	TEAMS IP PHONE
Set up delegation	Yes	Yes	Yes	No	Yes
Receive calls on behalf of another	Yes	Yes	Yes	Yes	Yes
Call a phone number on behalf of another	Yes	Yes	Yes	Yes	Yes
Call a Teams user on behalf of another	Yes	Yes	Yes	Yes	Yes
See the delegate view of shared lines	Yes	Yes	Yes	No	No
See the delegate view of manager's call activities	Yes	Yes	Yes	No	No
See the manager view of delegates	Yes	Yes	Yes	No	No
Delegate or manager can hold or resume	Yes	Yes	Yes	No	No

Limitations

Managers can add up to 25 delegates, and delegates can have up to 25 managers. There is no limit to the number of delegation relationships that can be created in a tenant.

If the delegator and delegate are not in the same geographic location, it is up to the PSTN provider to allow caller ID to show up from a different geographic location for a delegated (on behalf of) call.

More information

[Share a phone line with a delegate](#)

Dial pad configuration

12/7/2021 • 3 minutes to read • [Edit Online](#)

In the Teams client, the dial pad enables users to access Public Switched Telephone Network (PSTN) functionality. The dial pad is available for users with a Phone System license, provided they are configured properly. The following criteria are all required for the dial pad to show:

- User has an enabled Phone System ("MCOEV") license
- User has Microsoft Calling Plan or is enabled for Direct Routing
- User has Enterprise Voice enabled
- User is homed online and not in Skype for Business on premises
- User has Teams Calling Policy enabled

The following sections describe how to use PowerShell to check the criteria. In most cases, you need to look at various properties in the output of the `Get-CsOnlineUser` cmdlet. Examples assume `$user` is either the UPN or sip address of the user.

User has an enabled Phone System ("MCOEV") license

You must ensure that the assigned plan for the user shows the **CapabilityStatus** attribute set to **Enabled** and the **Capability Plan** set to **MCOEV** (Phone System license). You might see MCOEV, MCOEV1, and so on. All are acceptable--as long as the Capability Plan starts with MCOEV.

To check that the attributes are set correctly, use the following command:

```
Get-CsOnlineUser -Identity $user|select AssignedPlan|fl
```

The output will look like the following. You only need to check the **CapabilityStatus** and the **Capability Plan** attributes:

```
<Plan SubscribedPlanId="2f9eda01-4630-4a5c-bdb3-cf195f22d240"
  ServiceInstance="MicrosoftCommunicationsOnline/NOAM-0M-DMT"
  CapabilityStatus="Enabled"
  AssignedTimestamp="2020-04-21T18:31:13Z"
  ServicePlanId="4828c8ec-dc2e-4779-b502-87ac9ce28ab7"
  xmlns="http://schemas.microsoft.com/online/directoryservices/change/2008/11">
  <Capability>
    <Capability Plan="MCOEV"
      xmlns="http://schemas.microsoft.com/online/MCO/2009/01"/>
  </Capability>
</Plan>
```

User has Microsoft Calling Plan OR is enabled for Direct Routing

If the user has Microsoft Calling Plan, you must ensure that the **CapabilityStatus** attribute is set to **Enabled**, and that the **Capability Plan** is set to **MCOPSTN**. You might see MCOPSTN1, MCOPSTN2, and so on. All are acceptable--as long as the Capability Plan starts with MCOPSTN.

To check the attributes, use the following command:

```
Get-CsOnlineUser -Identity $user|select AssignedPlan|fl
```

The output will look like the following. You only need to check the **CapabilityStatus** and the **Capability Plan** attributes:

```
<Plan SubscribedPlanId="71d1258e-a4e6-443f-884e-0f3d6f644bb1"
ServiceInstance="MicrosoftCommunicationsOnline/NOAM-0M-DMT"
CapabilityStatus="Enabled"
AssignedTimestamp="2018-09-18T18:41:42Z"
ServicePlanId="5a10155d-f5c1-411a-a8ec-e99aae125390"
xmlns="http://schemas.microsoft.com/online/directoryservices/change/2008/11">
  <Capability>
    <Capability Plan="MCOPSTN2"
      xmlns="http://schemas.microsoft.com/online/MCO/2009/01" />
  </Capability>
</Plan>
```

If the user is enabled for **Direct Routing**, the user must be assigned a non-null value for **OnlineVoiceRoutingPolicy**. To check the attribute, use the following command:

```
Get-CsOnlineUser -Identity $user|Select OnlineVoiceRoutingPolicy
```

The output should have a non-null value, for example:

```
OnlineVoiceRoutingPolicy
-----
Test_Policy
```

User has Enterprise Voice enabled

To check if the user has Enterprise Voice enabled, use the following command:

```
Get-CsOnlineUser -Identity $user|Select EnterpriseVoiceEnabled
```

The output should look like:

```
EnterpriseVoiceEnabled
-----
True
```

User is homed online and not in Skype for Business on premises

To ensure the user is homed online and not in Skype for Business on premises, the **RegistrarPool** must not be null and the **HostingProvider** must contain a value that starts with "sipfed.online." To check the values, use the following command:

```
Get-CsOnlineUser -Identity $user|Select RegistrarPool, HostingProvider
```

The output should be similar to:

RegistrarPool	HostingProvider
-----	-----
sippoolbn10M02.infra.lync.com	sipfed.online.lync.com

User has Teams Calling Policy enabled

The user's effective TeamsCallingPolicy must have AllowPrivateCalling set to true. By default, users inherit the global policy, which has AllowPrivateCallingPolicy set to true by default.

To get the TeamsCallingPolicy for a user and to check that AllowPrivateCalling is set to true, use the following command:

```
if (($p=(get-csonlineuser -Identity $user).TeamsCallingPolicy) -eq $null) {Get-CsTeamsCallingPolicy -Identity global} else {get-csteamscallingpolicy -Identity $p}
```

The output should look like:

```
Identity           : Global
Description        :
AllowPrivateCalling : True
AllowWebPSTNCalling : True
AllowVoicemail     : UserOverride
AllowCallGroups    : True
AllowDelegation    : True
AllowCallForwardingToUser : True
AllowCallForwardingToPhone : True
PreventTollBypass  : False
BusyOnBusyEnabledType : Disabled
MusicOnHoldEnabledType : Enabled
```

Additional notes

- You may need to restart the Teams client after making any of these configuration changes.
- If you recently updated any of the above criteria, you may need to wait a few hours for the client to receive the new settings.
- If you still don't see the dial pad, check if there is a provisioning error by using the following command:

```
Get-CsOnlineUser -Identity $user|Select McoValidationError
```

- If it has been more than 24 hours and you are still seeing problems, contact Support.

Music on Hold

12/7/2021 • 4 minutes to read • [Edit Online](#)

When a Microsoft Teams user places an incoming call from the Public Switched Telephone Network (PSTN) on hold, the PSTN caller can listen to selected music.

The music that is played is either the default music provided by Microsoft or custom music that you upload and configure. As the tenant administrator, you configure whether Music on Hold is available by creating a Teams calling policy and assigning the policy to the Teams user.

Note that PSTN callers can listen to Music on Hold in other scenarios as well; for example, when they call into a Cloud Call Queue or when their call is parked by a Microsoft Teams user. These scenarios are not covered or controlled by the features mentioned in this article.

Configure Music on Hold

To configure Music on Hold:

1. In the left navigation of the Teams admin center, go to **Voice > Calling policies**.
2. On the **Manage policies** tab select one of the existing policies or create a new one.
3. In the **Music on hold for PSTN callers** field select **Enabled** in the drop-down menu.

You can also configure Music on Hold by using the Teams PowerShell module. In the TeamsCallingPolicy, change the MusicOnHoldEnabledType parameter to Enabled and then grant that policy instance to one or more users.

If a Teams user has a Teams calling policy with Music on Hold set to Disabled, then no music will be played when the Teams user places the call on hold.

Configure custom music

In addition to playing default music to PSTN callers, you can upload a custom audio file with music or other audio content and configure that audio file to be played to the PSTN caller. For example a department or organization might want to play a custom announcement or custom music when external PSTN callers are put on hold.

NOTE

You are responsible for independently clearing and securing all necessary rights and permissions to use any music or audio file with your Microsoft Teams service. This may include intellectual property and other rights in any music, sound effects, audio, brands, names, and other content in the audio file from all relevant rights holders. Holders may include artists, actors, performers, musicians, songwriters, composers, record labels, music publishers, unions, guilds, rights societies, collective management organizations, and any other parties who own, control or license the music copyrights, sound effects, audio and other intellectual property rights.

To configure custom Music on Hold, use the PowerShell cmdlets New/Get/Set/Grant/Remove-CsTeamsCallHoldPolicy and Import/Get/Remove-CsOnlineAudioFile in Teams PowerShell module 2.5.0 or later.

1. Ensure that the Teams user has Music on hold for PSTN callers set to Enabled in the Teams calling policy.
2. Upload the custom audio file.

3. Create a Teams Call Hold policy referencing the custom audio file and assign it to the Teams user.

Upload the custom audio file

The configuration of custom Music on Hold starts with uploading the audio file. You use the PowerShell cmdlet `Import-CsOnlineAudioFile` for this purpose. An example of uploading an MP3 audio file using the PowerShell interface is shown below:

```
C:\> $content = Get-Content "C:\tmp\customMoH1.mp3" -Encoding byte -ReadCount 0
C:\> $AudioFile = Import-CsOnlineAudioFile -FileName "customMoH1.mp3" -Content $content
C:\> $AudioFile
Id                : 56a56961f2794f098a359885ec1454a1
FileName          : customMoH1.mp3
ApplicationId     : TenantGlobal
```

Reference the audio file in a Teams Call Hold Policy

After you have uploaded the audio file, you need to reference the file in a Teams Call Hold Policy by using the Id of the file when you create or set a Teams Call Hold Policy. For example:

```
C:\> New-CsTeamsCallHoldPolicy -Identity "CustomMoH1" -Description "Custom MoH using CustomMoH1.mp3" -
AudioFileId $AudioFile.Id
```

After you have created the new Teams Call Hold Policy, you can grant it to your users using `Grant-CsTeamsCallHoldPolicy` as follows:

```
C:\> Grant-CsTeamsCallHoldPolicy -PolicyName "CustomMoH1" -Identity user1@contoso.com
```

To get information about your uploaded audio files, use the `Get-CsOnlineAudioFile` cmdlet.

To remove an uploaded audio file, use the `Remove-CsOnlineAudioFile` cmdlet. Before removing an audio file, check that you are not using that audio file in a `TeamsCallHoldPolicy`.

Feature availability

The following table indicates which features on which clients and devices support Music on Hold and Custom Music on Hold. Microsoft continues to add feature support, so check back often for additional availability.

FEATURE	DESKTOP WINDOWS/MAC OS	BROWSER	MOBILE IOS	MOBILE ANDROID	TEAMS PHONE
Hold on 1:1 PSTN call	-Music on Hold -Custom Music on Hold	-Music on Hold -Custom Music on Hold	-Music on Hold -Custom Music on Hold	Music on Hold	Music on Hold
Hold on Consultative Transfer on 1:1 PSTN call	-Music on Hold -Custom Music on Hold				

Restrictions

- Music on Hold is only available in commercial cloud.
- Music on Hold is only available when the user is in TeamsOnly mode.

- If the called Teams user is enabled for Location-Based Routing, Music on Hold cannot be played to the caller.
- You can't export the audio file after it has been uploaded; you can only remove it.
- Custom Music on Hold is not available for users configured for Shared Line Appearance (delegation) and when Call Park is used. The standard Music on Hold will be played.
- In some scenarios, a Direct Routing media bypass call will be converted to non-media bypass for playing Music on Hold and the call will stay as non-media bypass until the call is terminated.

PSTN connectivity options

12/7/2021 • 8 minutes to read • [Edit Online](#)

Microsoft provides complete Private Branch Exchange (PBX) capabilities for your organization through Teams Phone. However, to enable users to make calls outside your organization, you need to connect Teams Phone to the Public Switched Telephone Network (PSTN).

This article focuses on PSTN connectivity options. For more information about Microsoft voice solutions, including details about Teams Phone features, see [Plan your Teams voice solution](#).

To connect Teams Phone to the PSTN, you can choose from the following options:

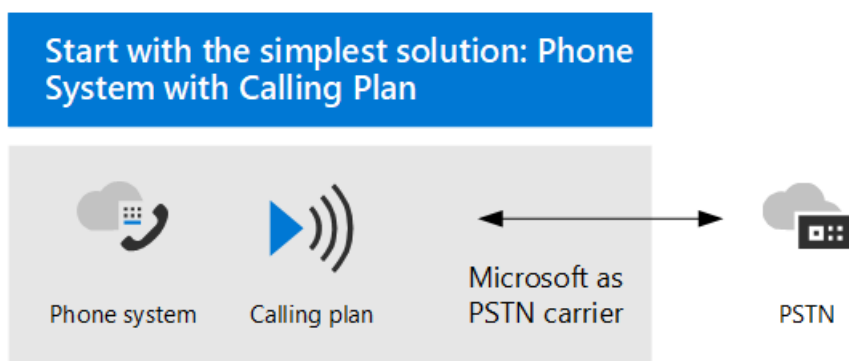

- **Calling Plan**. An all-in-the-cloud solution with Microsoft as your PSTN carrier.
- **Operator Connect**, which is currently available only in **public preview**. With Operator Connect, if your existing carrier is a participant in the Microsoft Operator Connect program, they can manage PSTN calling and Session Border Controllers (SBCs).
- **Direct Routing**, which enables you to use your own PSTN carrier by connecting your Session Border Controller(s) (SBC) to Teams Phone.

You can also choose a combination of options, which enables you to design a solution for a complex environment, or manage a multi-step migration.

Be aware that the option or options you choose affect how some Teams Phone features are configured. For more information, see [Configuration considerations](#) later in this article.

Teams Phone with Calling Plan

Teams Phone with Calling Plan is Microsoft's all-in-the-cloud voice solution for Teams users. This is the simplest option that connects Teams Phone to the PSTN. With this option, Microsoft acts as your PSTN carrier, as shown in the following diagram:

If you answer yes to the following, then Teams Phone with Calling Plan is the right solution for you:

- Calling Plan is available in your region.
- You do not need to retain your current PSTN carrier.
- You want to use Microsoft-managed access to the PSTN.

With this option:

- You get Teams Phone with added Domestic or International Calling Plans that enable calling to phones around the world (depending on the level of service being licensed).

- You do not require deployment or maintenance of an on-premises deployment—because Calling Plan operates out of Microsoft 365.
- Note: If necessary, you can choose to connect a supported Session Border Controller (SBC) through Direct Routing for interoperability with third-party PBXs, analog devices, and other third-party telephony equipment supported by the SBC.

This option requires uninterrupted connection to Microsoft 365.

For more information about Calling Plan, see the following articles:

- [Which Calling Plan is right for you?](#)
- [How to buy a Calling Plan](#)
- [Country and region availability for Calling Plan](#)
- [Set up Calling Plan](#)

Teams Phone with Operator Connect

With Operator Connect, currently in public preview, if your existing carrier is a participant in the Microsoft Operator Connect program, they can manage the service for bringing PSTN calling to Teams. Your carrier manages the PSTN calling services and Session Border Controllers (SBCs), allowing you to save on hardware purchase and management.

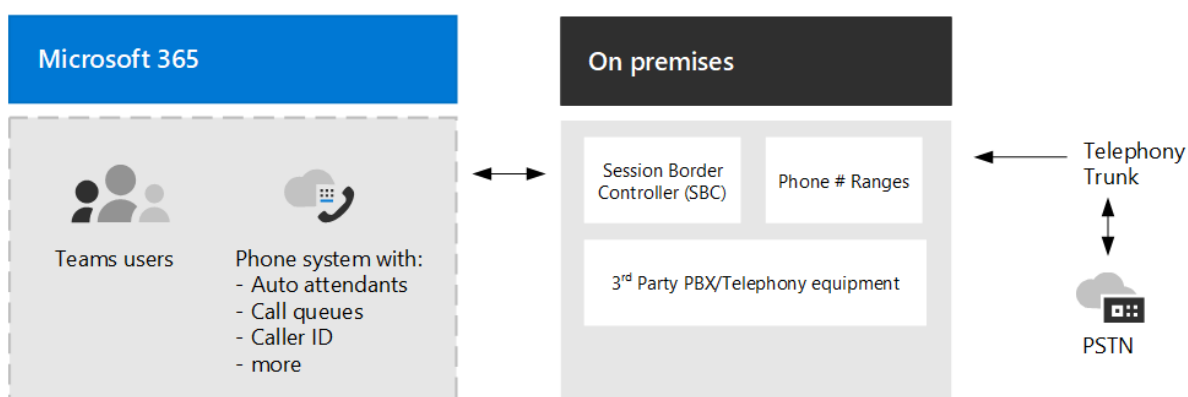

Operator Connect might be the right solution for your organization if:

- Microsoft Calling Plan isn't available in your geographic location.
- Your preferred carrier is a participant in the Microsoft Operator Connect program.
- You want to find a new carrier to enable calling in Teams.

For information on the benefits and requirements of Operator Connect, and for a list of carriers participating in this program, see [Plan Operator Connect](#). For information on how to configure Operator Connect, see [Configure Operator Connect](#).

Teams Phone with Direct Routing

This option connects Teams Phone to your telephony network by using Direct Routing, as shown in the following diagram:

If you answer yes to the following questions, then Teams Phone with Direct Routing is the right solution for you:

- You want to use Teams with Teams Phone.
- You need to retain your current PSTN carrier.
- You want to mix routing, with some calls going through Calling Plan, some through your carrier.
- You need to interoperate with third-party PBXs and/or equipment such as overhead pagers, analog devices, and so on.

With this option:

- You connect your own supported Session Border Controller (SBC) to Teams Phone without the need for additional on-premises software.
- You can use virtually any telephony carrier with Teams Phone.
- You can choose to configure and manage this option, or it can be configured and managed by your carrier or partner (ask if your carrier or partner provides this option).
- You can configure interoperability between your telephony equipment—such as a third-party PBX and analog devices—and Teams Phone.

This option requires the following:

- Uninterrupted connection to Microsoft 365.
- Deploying and maintaining a supported SBC.
- A contract with a third-party carrier. (Unless deployed as an option to provide connection to third-party PBX, analog devices, or other telephony equipment for users who are on Teams Phone with Calling Plan.)

For more information about Direct Routing, see the following articles:

- [Plan Direct Routing](#)
- [Configure Direct Routing](#)
- [Manage voice routing policies for use with Direct Routing](#)
- [Plan Location-Based Routing for Direct Routing](#)
- [List of Session Border Controllers certified for Direct Routing](#)

Configuration considerations

Most Teams Phone features are the same regardless of the PSTN connectivity option you choose. For example, call unanswered and forwarding settings, call transfer, custom music on hold, call park, shared line, and voice apps are all available. For a complete list of Teams Phone features, see [Here's what you get with Teams Phone](#).

There are some differences in functionality, however, that affect how you configure certain Teams Phone features. For example, Direct Routing requires additional steps to configure call routing. As another example, Direct Routing provides Location-Based-Routing (LBR)--so that you can restrict toll bypass in certain geographic locations where it is not allowed.

The following table highlights the primary configuration differences. The sections that follow the table provide links to more information and details.

OPTION	DESCRIPTION	PHONE NUMBER MANAGEMENT	CALL ROUTING	EMERGENCY CALLING AVAILABILITY
Calling Plans	-Microsoft acts as PSTN carrier. -You do not need to buy or manage SBCs.	Obtained through Microsoft.	-Managed by Microsoft. -Admin configures user dial plans for number translation.	-Enabled by Microsoft. -Admin registers addresses. -Dynamic calling supported.

OPTION	DESCRIPTION	PHONE NUMBER MANAGEMENT	CALL ROUTING	EMERGENCY CALLING AVAILABILITY
Operator Connect	-Carrier manages PSTN connectivity and SBCs. -You do not need to buy or manage SBCs.	-Obtained through carrier. - Numbers associated with emergency addresses managed by carrier.	-Managed by carrier. -Admin configures user dial plans for number translation.	-Enabled by carrier. -Admin registers addresses. -Dynamic calling supported.
Direct Routing	-Requires certified SBC purchased from third-party vendor. -Connect your SBC to Teams Phone. -Use your existing PSTN carrier.	Obtained through carrier.	-Requires extra configuration by admin. -Admin configures trunk dial plans for number translation. -LBR available to restrict toll bypass.	-Requires extra configuration by admin. -Registered addresses not supported. -Dynamic calling supported but requires additional configuration.

Phone number management

Microsoft has two types of telephone numbers available: subscriber (user) numbers, which can be assigned to users in your organization, and service numbers, available as toll and toll-free service numbers. Service numbers have higher concurrent call capacity than subscriber numbers and can be assigned to services such as Audio Conferencing, Auto Attendants, or Call Queues.

You will need to decide:

- Which user locations need new phone numbers from Microsoft?
- Which type of telephone number (subscriber or service) do I need?
- How do I port existing phone numbers to Teams?

How you acquire and manage phone numbers differs depending on your PSTN connectivity option.

- For information about managing phone numbers for Calling Plan, see [Manage phone numbers for your organization](#).
- For information about managing phone numbers with Operator Connect, see [Set up phone numbers with Operator Connect](#).
- For information about managing phone numbers for Direct Routing, see [Configure the phone number and enable enterprise voice and voicemail](#).

Call routing and dial plans

How you configure call routing differs depending on your PSTN connectivity option.

- For Calling Plans, most of call routing is handled by the Microsoft Calling Plan infrastructure. You configure user dial plans for purposes of number translation for call authorization and call routing. For more information, see [What are dial plans?](#).
- For Operator Connect, most of call routing is managed by the carrier. You configure user dial plans for purposes of number translation for call authorization and call routing. For more information, see [What are dial plans?](#).
- For Direct Routing, you must configure call routing by specifying the voice routes and assigning voice routing policies to users. You can configure dial plans for number translation at the trunk level to ensure

interoperability with Session Border Controllers (SBCs). For more information, see [Configure voice routing for Direct Routing](#), [Manage voice routing policies](#) and [Translate phone numbers](#).

Location-Based Routing for Direct Routing

In some countries and regions, it's illegal to bypass the PSTN carrier to decrease long-distance calling costs. Location-Based Routing (LBR) for Direct Routing enables you to restrict toll bypass for Teams users based on their geographic location. For more information about how to plan and configure LBR, see the following articles:

- [Plan Location-Based Routing for Direct Routing](#)
- [Configure network settings for Location-Based Routing](#)
- [Enable Location-Based Routing for Direct Routing](#)
- [Contoso case study: Location-Based Routing](#)

Describes how a fictional multi-national corporation, Contoso, implemented Location-Based Routing for their organization.

Emergency calling

How you configure emergency calling differs depending on your PSTN connectivity option.

- For Calling Plan, each user is automatically enabled for emergency calling and is required to have a registered emergency address associated with their assigned telephone number. Dynamic emergency calling (based on the location of the Teams client) is supported.
- For Operator Connect, each user is automatically enabled for emergency calling and is required to have a registered emergency address associated with their assigned telephone number but can only be set by the carrier partner. Dynamic emergency calling (based on the location of the Teams client) is supported.
- For Direct Routing, you must define emergency calling policies for users by using a Teams emergency call routing policy (TeamsEmergencyCallRoutingPolicy) to define emergency numbers and their associated routing destination. Registered emergency locations are not supported for Direct Routing users. For dynamic emergency calling, additional configuration is required for routing emergency calls and possibly for partner connectivity.

For more information about emergency calling concepts and terminology, and how to configure emergency calling and dynamic emergency calling, see the following articles:

- [Manage emergency calling](#)
- [Plan and configure dynamic emergency calling](#)
- [Manage emergency calling policies](#)
- [Manage emergency call routing policies for Direct Routing](#)
- [Contoso case study: Emergency calling](#)

Describes how a fictional multi-national corporation, Contoso, implemented emergency calling for their organization.

Network topology for voice features

If you are deploying dynamic emergency calling or Location-Based Routing for Direct Routing, you must configure network settings for use with these features in Microsoft Teams. To learn how to configure network settings for network regions, network sites, network subnets, and trusted IP addresses, see the following articles:

- [Network settings for cloud voice features in Microsoft Teams - Concepts and terminology](#)
- [Manage your network topology for cloud voice features in Microsoft Teams](#)

Which Calling Plan is right for you?

12/7/2021 • 2 minutes to read • [Edit Online](#)

You've completed the [Get started](#). You've rolled out Teams with [chat](#), [teams](#), [channels](#), & [apps](#) across your organization. Maybe you've deployed [Meetings & conferencing](#). Now you're ready to add cloud voice workloads, and you've decided to use Microsoft Phone System with Calling Plan to connect to the Public Switched Telephone Network (PSTN).

This article describes core deployment decisions for Calling Plans as well as additional considerations you may want to configure, based on your organization's needs. You should also read [Cloud Voice in Microsoft Teams](#) for more information about Microsoft's cloud voice offerings.

Learn more about Calling Plans

The following articles provide more information about deploying and using Microsoft Calling Plans:

- [Phone System in Microsoft 365 or Office 365](#)
- [Calling Plans for Microsoft 365 or Office 365](#)
- [Set up Calling Plans](#)

Core deployment decisions

To use Microsoft as your telephony carrier, you need to obtain Calling Plan licenses and assign them to your Phone System users.

There are two types of Calling Plans available:

- Domestic Calling Plans
- Domestic and International Calling Plans

ASK YOURSELF	ACTION
Are Calling Plans available in my area? Which user locations will have Calling Plan service?	For more information, see Country and region availability for Audio Conferencing and Calling Plans .
Do my users need international calling?	For more information, see Calling Plans for Microsoft 365 or Office 365 .
Do my users have Calling Plans licenses?	To buy and assign licenses, see Step 2: Buy and assign licenses .
Do my users each have a direct inward dial (DID) phone number?	To get phone numbers, see Step 3: Get phone numbers .

Transfer phone numbers to Microsoft 365 or Office 365

It's easy to transfer your phone numbers from your current service provider to Teams. After you port your phone numbers to Teams, Microsoft will become your service provider and will bill you for those phone numbers. For more information, see [Transfer phone numbers to Teams](#).

Phone numbers and emergency locations

With Calling Plans in Microsoft 365 or Office 365, every user in your organization needs to have a unique direct inward dial (DID) phone number and a corresponding validated emergency address. You can also specify an emergency location within the emergency address (for example, an office number or floor number).

ASK YOURSELF	ACTION
How detailed do I want the emergency address and location information to be?	For more information, see What are emergency locations, addresses, and call routing? .

Calling identity

By default, all outbound calls use the assigned phone number as calling identity (caller ID). The recipient of the call can quickly identify the caller and decide whether to accept or reject the call.

ASK YOURSELF	ACTION
Do I want to mask or disable caller ID?	To change or block the caller ID, see Set the caller ID for a user .

Set up Calling Plans

12/7/2021 • 3 minutes to read • [Edit Online](#)

Calls to other Teams users are free, but if you want your users to be able to call phones outside of your business, get a Domestic Calling Plan or an International Calling Plan in Microsoft 365 or Office 365. It's easy to set up Calling Plans for your business. For more information about Calling Plans, see [Which Calling Plan is right for you?](#).

Step 1: Find out if Calling Plans are available in your country/region

Go to [Country and region availability for Audio Conferencing and Calling Plans](#) and select your country or region to get availability information about Calling Plans, as well as information about Audio Conferencing, Phone System, toll and toll-free numbers, and Communications Credits.

If Calling Plans are not available for your country or region, consider using Direct Routing to connect your on-premises telephony infrastructure to Phone System. For more information, see [Phone System Direct Routing](#).

Step 2: Buy and assign licenses

1. If the Phone System feature isn't included in your Microsoft 365 or Office 365 plan, you may need to purchase **Phone System** add-on licenses. After you have **Phone System** licenses, purchase [Calling Plans for Microsoft 365 or Office 365](#). See [Microsoft Teams add-on licensing](#), and buy the licenses and plan.

TIP

Phone System licenses and Calling Plans in Microsoft 365 or Office 365 go together, so to see the option to purchase Calling Plans, you must first have the **Phone System** licenses.

2. First assign the licenses, and then assign a Calling Plan to the people in your organization. See [Assign Microsoft Teams add-on licenses](#).

Step 3: Get phone numbers

There are three ways to get new user numbers:

- **Use the Teams admin center.** For some countries/regions, you can get numbers for your users by using the Teams admin center, see [Getting phone numbers for your users](#).
- **Port your existing numbers.** You can port or transfer existing numbers from your current service provider or phone carrier to Microsoft 365 or Office 365. For more information, see [Transfer phone numbers to Teams](#) or [Manage phone numbers for your organization](#).
- **Use a request form for new numbers.** Sometimes (depending on your country/region) you won't be able to get your new phone numbers using the Teams admin center, or you will need specific phone numbers or area codes. If so, you will need to download a form and send it back to us. For more information, see [Manage phone numbers for your organization](#).

Step 4: Add emergency addresses and locations for your organization

An emergency address must be associated with a phone number. When this association happens can vary

among country and regions. For example, in the United States, you need to associate an emergency address when you assign the phone number to the user. In the United Kingdom, you need to associate an emergency address to the phone number when you are getting the phone numbers from Microsoft 365 or Office 365, or when transferring phone numbers from your current service provider.

For information about emergency calling and managing emergency addresses, see [Manage emergency calling](#) and [Add, change, or remove an emergency location for your organization](#).

Step 5: Assign an emergency address and a phone number to a user

When you are setting up Calling Plans in Office 365, you must assign a phone number and emergency address to each of your users. The emergency address must be created before you can associate it with a phone number. For more information, see [Assign or change an emergency address](#).

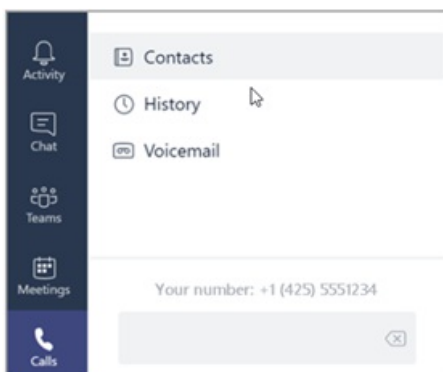

TIP

If you add more people to your business right before doing this step, it may take **several hours** for them to appear on the **Voice users** page. There's a latency.

Step 6: Tell your users about their new phone numbers

Microsoft recommends sending mail or using your business's preferred communication method to tell the people about their new phone numbers.

In **Microsoft Teams**, users can see their phone number by clicking **Calls** in the left navigation. The phone number is shown above the dial pad.

Do you want to automate assigning phone numbers?

If you know Windows PowerShell, you can use the following cmdlets to automate assigning phone numbers to your users.

- [Get-CsOnlineTelephoneNumber](#): Retrieves the telephone numbers from the Business Voice Directory.
- [Set-CsOnlineVoiceUser](#): Sets the telephone numbers.

To learn more, see [Teams PowerShell Overview](#).

Quick start guide: Configuring Calling Plans in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

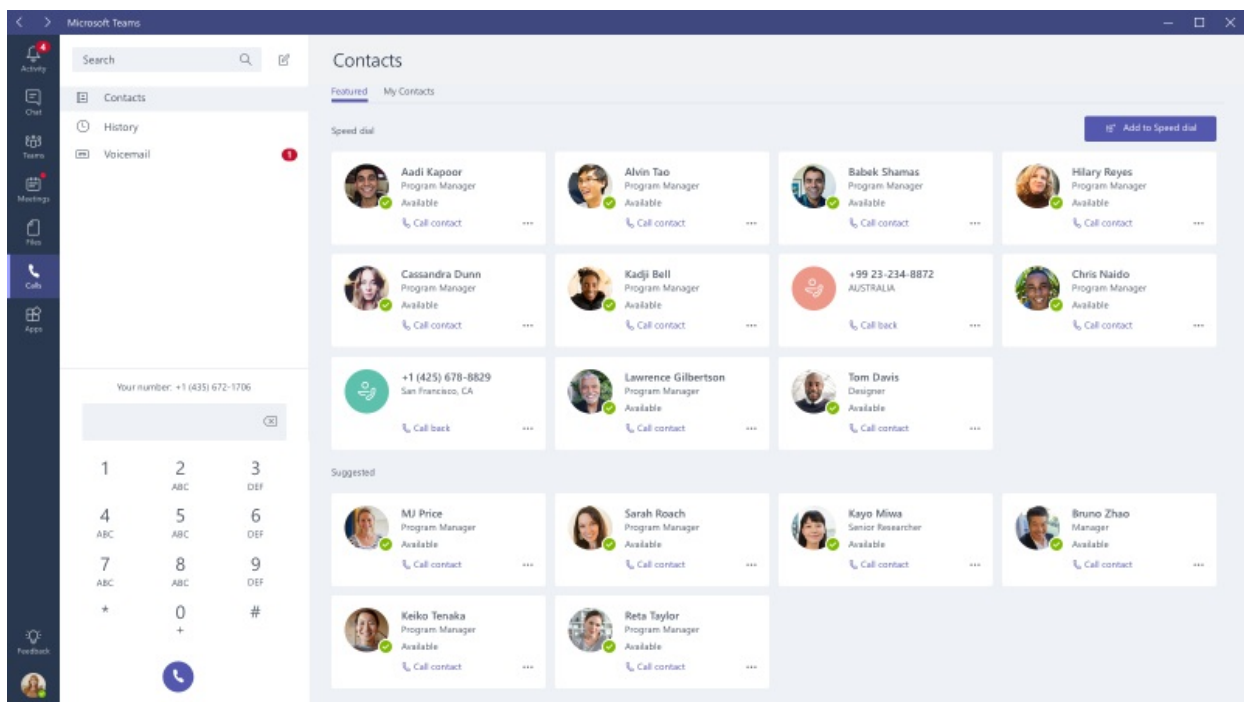

This guide will help you get a set of users up and running so they can explore Calling Plans in Teams.

Read the December 12, 2017, announcement of Calling Plans in Teams: [Intelligent Communications takes the next step with calling in Teams](#)

NOTE

We recommend that, in parallel with this quick-start guide, you read [Phone System with Calling Plans](#) and [FastTrack](#) to plan and drive a successful rollout.

By adding Calling Plans - a Microsoft 365 and Office 365 feature powered by Skype for Business - you can now use Teams to make and receive phone calls to or from land lines and mobile phones via the public switched telephone network (PSTN).

Prerequisites for enabling the Calls tab in Teams

To enable the Calls tab in Teams users need to have 1:1 calling enabled in Teams and using a Teams client that supports 1:1 Teams calling. To learn how to manage 1:1 calling in Teams, read [Set-CsTeamsCallingPolicy](#). To learn which clients support calling, please read [Limits and specifications for Microsoft Teams](#).

NOTE

Currently, Voicemail will not be available in the Calls tab unless the user is enabled for PSTN calls.

Prerequisites for enabling the Dial Pad in Teams

To enable the **Dial Pad** tab in Teams and allow your users to make and receive PSTN calls you will need to provision users for Phone System and Calling Plans. To learn how to set up Calling Plans, read [Set up Calling Plans](#). Additionally, for Teams only users, you must ensure that "Allow private calling" is enabled in the Teams calling policy. See [Manage Teams during the transition to the new Microsoft Teams admin center](#) for more information.

NOTE

You can also use Direct Routing to allow your users to make and receive PSTN calls. To learn how to set up Direct Routing, read [Configure Direct Routing](#).

Using TeamsUpgradePolicy to control where calls land

To control whether incoming calls (and chats) land in Teams or Skype for Business, administrators use TeamsUpgradePolicy, using either [Microsoft Teams admin center](#) or using a remote Windows PowerShell session with the [Skype for Business](#) cmdlets.

The default configuration of TeamsUpgradePolicy is Islands mode, which is designed to ensure that existing business workflows are not interrupted during a Teams deployment. By default, VoIP, PSTN, and federated calls to your users will continue to be routed to Skype for Business until you update the policy to enable inbound calling to Teams. When recipients are in islands mode:

- Incoming VOIP calls that originated in Skype for Business always land in the recipient's Skype for Business client.
- Incoming VOIP calls that originated in Teams land in Teams, *if the sender and receiver are in the same tenant*.
- Incoming federated VOIP (regardless of which client originates) and PSTN calls always land in the recipient's Skype for Business client.

To ensure that incoming VOIP and PSTN calls always land in a user's Teams client, update the user's coexistence mode to be TeamsOnly (which means, assign them the "UpgradeToTeams" instance of TeamsUpgradePolicy. For more information on coexistence modes and TeamsUpgradePolicy, see [Migration and interoperability guidance for organizations using Teams together with Skype for Business](#)

NOTES

- Skype for Business IP phones will receive calls, even if the user is in TeamsOnly mode.
- Users that have been provisioned with Phone System and Calling Plans licenses for use with Skype for Business Online (e.g. they have been assigned a value of OnlineVoiceRoutingPolicy) , will have the Calls tab enabled in Teams and can place outbound PSTN calls from Teams without administrators having to take any administrative action.

How to configure users to receive all incoming VOIP and PSTN calls in Teams

To ensure users receive all incoming VOIP and PSTN calls in Teams, set the user's coexistence mode to TeamsOnly in the Microsoft Teams admin center, or use Skype for Business remote Windows PowerShell session to update TeamsUpgradePolicy as follows:

```
Grant-CsTeamsUpgradePolicy -PolicyName UpgradeToTeams -Identity user@contoso.com
```

[Phone System with Calling Plans](#)

[Skype for Business PowerShell cmdlet reference](#)

Country and region availability for Audio Conferencing and Calling Plans

12/7/2021 • 7 minutes to read • [Edit Online](#)

You can select a country or region to see what cloud voice features are available to your organization.

Select your country or region to see what's available for your organization

If you're looking for a spreadsheet with all countries and regions, download and save the [Cloud voice feature country/region availability spreadsheet](#).

After you've verified if one of the Skype for Business or Microsoft Teams services are available, you can see [Skype for Business and Microsoft Teams add-on licensing](#) to help you buy licenses and assign them to your users.

NOTE

If you need to get more telephone numbers for your users, see [Getting phone numbers for your users](#) or, for phone number request forms, [Manage phone numbers for your organization](#).

Want to learn more about these services

Audio Conferencing

Sometimes people in your organization will need to use a phone to call in to a meeting. Skype for Business and Microsoft Teams includes the Audio Conferencing feature for just this situation! People can call in to meetings using a phone instead of using the Skype for Business and Microsoft Teams apps on a mobile device or PC. When you've decided that you want Audio Conferencing for your organization, buy one **Audio Conferencing** license for each person in your organization who is going to schedule/host an audio meeting.

With Audio Conferencing, there are toll and toll free phone numbers that can be used by your users to dial in to meetings. Toll numbers from the following countries or regions are automatically assigned as shared audio conferencing numbers to organizations when they're enabled for Audio Conferencing. Dedicated toll and toll free numbers can be assigned to your organization from additional cities.

IMPORTANT

There isn't a resource that contains a listing of all of the dial-in numbers for Audio Conferencing. To find out if there are dial-in phone numbers available in your area or country/region, go to **Skype for Business admin center > Voice > Phone Numbers**, click **Add**, and then click **New Service Numbers**. Use the lists for **Country/Region**, **State/Region**, and **City** to filter your search. If you are looking for toll free service numbers, select **toll free** from the **State/Region** list.

To see more about Audio Conferencing, see [Audio Conferencing common questions](#)

[Pricing for Audio Conferencing](#)

Using the Call Me feature or when adding other people to a meeting so they can join it

In Audio Conferencing, the "Call Me" feature is used to let other people join a dial-in meeting. Use the drop-

down list in this article to search for the country/region and see if this feature is available.

Caution

Dialing out to toll free or free phone numbers may not be possible, because some toll free numbers only function from within a certain country or area within a country. For example, if you dial out from the United States to a toll free number in Brazil, the call may not be successful because the call didn't originate from within Brazil or from a specific region within Brazil. The ability to dial out to toll free numbers varies widely depending on the restrictions of the toll free number dialed. Unfortunately, we can't control this behavior, and as a result, your experience may vary depending on the toll free number dialed and the restrictions of the toll free number.

Dialing out from a meeting to another country/region in the world that isn't listed below is available using [Communication Credits](#). For those users, you'll need to [Set up Communications Credits for your organization](#).

Phone System

With Phone System, you create auto attendants and call queues (with a toll or toll free number) to answer incoming calls for your organization. When you add a Calling Plan for users, they can use Skype for Business to take care of basic call-control tasks, such as placing and receiving calls, transferring calls, and muting and unmuting calls. **Phone System** users click a name in their address book, and Skype for Business will place a call to that person. To place and receive calls, **Phone System** users use their mobile devices, a headset with a laptop or PC, or one of many IP phones that work with Skype for Business.

The availability of toll phone numbers from some of these locations might vary at any given time depending on inventory levels. In addition to getting phone numbers for individual users, it's also possible to search and acquire toll or toll free phone numbers for services such as Audio Conferencing (for conference bridges), auto attendants and call queues. These are called service numbers. See [Getting service phone numbers](#) to get phone numbers. But for your users, after you assign a Calling Plan to them, you can assign a user phone number so they can make and receive phone calls. To find those phone numbers, go to [Getting phone numbers for your users](#). You can also see [Assign, change, or remove a phone number for a user](#).

Pricing for Phone System

NOTE

The availability of toll phone numbers from some of these locations might vary at any given time depending on inventory levels.

Use the drop-down list at the top of the page to search for a country or region and what services are available.

Calling Plans

Along with Phone System, a Calling Plans let users make and receive phone calls. You first get a user (subscriber) phone number (not a service number) to assign to the user, and then assign a Calling Plan. There are two types of Calling Plans available: **Domestic** and **Domestic and International**. See [Phone System and Calling Plans](#) for more details.

You can also see [Phone System and Calling Plans licensing](#) for licensing information.

NOTE

The country/region is based on the location of the user's license in the **Microsoft 365 admin center > Active Users** and **not** the billing address listed under the **Organization Profile** in the **Microsoft 365 admin center**.

Toll and toll free phone numbers for services

In addition to getting phone numbers for individual users, it's also possible to search and acquire toll or toll free phone numbers for services such as Audio Conferencing (for conference bridges), auto attendants, and call queues. These are called service numbers.

The following is a list of capitals and major cities from where you can get toll service numbers to use with Audio Conferencing and Calling Plans. You get toll service numbers from these locations using the **Skype for Business admin center**.

If you want to get a toll or toll free service number, you can see [Getting service phone numbers](#). If you already have a toll or toll free service number that you want to transfer from a different provider, see [Manage phone numbers for your organization](#).

Use the drop-down list at the top of the page to search for a country or region and what services are available.

Communications Credits

We recommend that you set up Communications Credits for your Audio Conferencing and Calling Plans users that need the ability to dial out to **any destination**. Many countries/regions are included, but some destinations might not be included in your Calling Plan or Audio Conferencing subscriptions.

If you don't set up Communications Credits and assign a license to users, and you run out of minutes for your organization (depending on your Calling Plan or Audio Conferencing plan or your country/region), they won't be able to make calls or dial out from meetings. You can find out more information including recommended funding amounts by reading [What are Communications Credits?](#)

Related topics

[Getting service phone numbers for Skype for Business and Microsoft Teams](#)

Plan for Operator Connect

12/7/2021 • 2 minutes to read • [Edit Online](#)

Operator Connect is another option for providing Public Switched Telephone Network (PSTN) connectivity with Teams and Phone System. For more information about Teams voice solutions and PSTN connectivity options, see [Plan your Teams voice solution](#) and [PSTN connectivity options](#).

This article describes benefits and requirements, and provides a link to the operators participating in the Microsoft Operator Connect Program. If you decide Operator Connect is the right solution for your organization, after reading this article, see [Configure Operator Connect](#).

Benefits

With Operator Connect, if your existing operator is a participant in the Microsoft Operator Connect Program, they can manage the service for bringing PSTN calling to Teams. The Operator Connect program provides the following benefits:

- **Leverage existing contracts, or find a new operator.** You keep your preferred operator and contracts, or choose a new one from a selection of participating operators to meet your business needs.
- **Operator-managed infrastructure.** Your operator manages the PSTN calling services and Session Border Controllers (SBCs), allowing you to save on hardware purchase and management.
- **Faster, easier deployment.** You can quickly connect to your operator and assign phone numbers to users — all from the Teams admin center.
- **Enhanced support and reliability.** Operators provide technical support and shared service level agreements to improve support service, while direct peering powered by Azure creates a one-to-one network connection for enhanced reliability.

Requirements

Operator Connect might be the right solution for your organization if:

- Microsoft Calling Plan isn't available in your geographic location.
- Your preferred operator is a participant in the Microsoft Operator Connect Program.
- You want to find a new operator to enable calling in Teams.

To enable phone number assignments with Operator Connect, make sure your users are:

- Teams Phone licensed. To learn more, see [What is Phone System?](#) and [Assign Teams add-on licenses to users](#).
- In TeamsOnly mode. Note that the user needs to be in TeamsOnly mode, but your entire organization does not. To learn more, see [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#).

For a list of operators participating in the Microsoft Operator Connect Program and the countries or regions where their service is available, see the [Microsoft 365 Operator Connect directory](#).

Configure Operator Connect

12/7/2021 • 5 minutes to read • [Edit Online](#)

This article describes how to configure Operator Connect. Before configuring Operator Connect, be sure to read [Plan for Operator Connect](#) for information about prerequisites and licensing.

Enable an operator

You can enable, edit, and remove operators in the Teams admin center. In the left navigation pane, go to **Voice > Operators**.

To enable an operator:

1. **Choose an operator.** In the **All operators** tab, filter available operators by region or service to find the right operator for your voice needs. Then select the operator you want to enable.
2. **Select countries.** Under **Operator settings**, select the countries you want to enable with your selected operator.
3. **Provide contact information** Your contact information, including your full name and email address, will be shared automatically with your operator. You can change this information later. Additionally, you'll need to provide company size, and you'll have the option to provide your phone number. Operators will use this information to contact you with more details about Operator Connect.
4. Accept the data transfer notice.
5. **Add your operator.** Select **Add as my operator** to save.

Set up phone numbers

How you set up phone numbers depends on whether you're setting up numbers for new users, or moving existing numbers from either Microsoft Calling Plans or Direct Routing.

- If you need to acquire phone numbers for new users, see [Acquire numbers for new Teams users](#).
- If you want to move existing numbers from Calling Plans to Operator Connect, see [Move numbers from Calling Plans to Operator Connect](#).
- If you want to move existing numbers from Direct Routing to Operator Connect, see [Move numbers from Direct Routing to Operator Connect](#).

Acquire numbers for new Teams users

To acquire numbers for new Teams users, follow these steps:

1. **Assign a Phone System license.** You can assign a Phone System license to your users from the Microsoft 365 admin center or using PowerShell. For more information, see [Assign Teams add-on licenses to users](#).
2. Users that will be assigned phone numbers acquired with Operator Connect need to be in TeamsOnly mode. If your organization is in TeamsOnly mode, then all your users are in TeamsOnly mode. To check this, in the Teams admin center, go to **Teams > Teams upgrade settings**. If your organization is in Islands mode, check if specific users are in TeamsOnly mode. Go to **Users** and select a user account. In the **Account** tab, under **Teams upgrade**, the coexistence mode should be set to 'TeamsOnly.'

3. **Acquire numbers.** Go to your operator's website to order and acquire phone numbers. For a list of operator websites, go to the [Microsoft 365 Operator Connect directory](#). You'll need to provide your tenant ID. If you don't know your tenant ID, see [Find your Microsoft 365 tenant ID](#) for more information.
4. **Assign numbers.** Once your operator completes the order, they'll upload numbers to your tenant. You can view the numbers and the provider in the Teams admin center by going to **Voice > Phone numbers**. Assign numbers to users from the Teams admin center or by using PowerShell. For more information, see [Assign numbers](#).

NOTE

In addition to [getting phone numbers for your users](#), you can get toll or toll-free phone numbers for services such as Audio Conferencing (for conference bridges), Auto Attendants, and Call Queues (also called service numbers). Service phone numbers have a higher concurrent calling capacity than user or subscriber phone numbers. For example, a service number can handle hundreds of calls simultaneously, whereas a user's phone number can only handle a few calls simultaneously. To get service numbers, contact your operator.

Emergency addresses

The emergency address is a static location associated with a number. Once you create emergency addresses in the Teams admin center, how you assign the addresses, or change them later, will depend on your operator.

To assign numbers to emergency addresses, your operator will implement one of three scenarios:

- The operator assigns emergency addresses to the phone numbers and allows you to change them later in the Teams admin center.
- The operator doesn't assign addresses and allows you to assign emergency addresses to the phone numbers in the Teams admin center.
- The operator assigns emergency addresses to the phone numbers, and doesn't allow you to change them. In this scenario, you'll need to contact your operator to make changes to phone numbers and their assigned emergency address.

For more information on emergency calling, see [Manage emergency calling](#) and [Plan and configure dynamic emergency calling](#).

Move numbers from Calling Plans to Operator Connect

1. Contact your operator to port your numbers to Operator Connect. See [Microsoft 365 Operator Connect directory](#) to find your operator's website.
2. After your operator completes the porting order, you can unassign your users' Calling Plan phone numbers, and remove the Calling Plan License. Then, your operator can upload the numbers to your tenant.
3. Assign Operator Connect numbers to users by using the Teams admin center or by using PowerShell. For more information, see [Assign numbers](#).

Move numbers from Direct Routing to Operator Connect

1. Remove the existing telephone number from the user as follows:

Get the existing On-prem Line URI by running the following PowerShell command:

```
Get-CsOnlineUser -Identity <user> | select OnPremLineURI
```

Remove the On-prem Line URI by running the following PowerShell command:

```
Set-CsUser -Identity <user> -OnPremLineURI $null
```

2. Remove any PSTNUsage associated with your users, otherwise calls will be routed to the gateway specified in the PSTN Usage. To learn how to remove PSTN usage, see [Set-CsOnlinePstnUsage](#).
3. Go to your operator's website to order and acquire phone numbers. To find your operators website, see the [Microsoft 365 Operator Connect directory](#). You'll need to provide your tenant ID. If you don't know your tenant ID, see [Find your Microsoft 365 tenant ID](#) for more information.
4. Once your operator completes the order, they'll upload numbers to your tenant. You can view the numbers and the provider in the Teams admin center by going to **Voice > Phone numbers**. Assign Operator Connect numbers to users by using the Teams admin center or by using PowerShell. For more information, see [Assign numbers](#).

Assign numbers

For information on how to assign phone numbers to your users, see [Assign, change, or remove a phone number for a user](#).

Manage your operators

From the **My operators** tab, you can view your operators and their status and make the following changes to your selections:

- Manage operator services by country
- Suspend an operator
- Remove an operator

NOTE

Before removing an operator from your organization or from a country, you must remove all phone numbers assigned to users in the organization or country and contact the operator to release the numbers.

Release numbers

To release phone numbers from the Teams admin center, go to the **Phone numbers** page and select a number.

- If the phone number isn't assigned to a user, select **Release**.
- If the phone number is assigned to a user, you'll need to unassign the number. Select **Edit**, then **Remove user**. After you save your changes, select **Release**.

Phone system direct routing

12/7/2021 • 2 minutes to read • [Edit Online](#)

You've completed [Get started](#). You've rolled out Teams with [chat](#), [teams](#), [channels](#), & [apps](#) across your organization. Maybe you've deployed [Meetings & conferencing](#). Now you're ready to add cloud voice workloads, and you've decided to use your own telephony carrier for Public Switched Telephone Network (PSTN) connectivity by using Phone System Direct Routing. With Direct Routing, you can use Phone System with virtually any telephony carrier.

This article describes core deployment decisions for Direct Routing as well as additional considerations you may want to think about, based on your organization's needs. You should also read [Cloud Voice in Microsoft Teams](#) for more information about Microsoft's cloud voice offerings.

Learn more about Direct Routing

The following articles provide more information about configuring and using Phone System Direct Routing. Configuring Direct Routing requires understanding of PSTN routing design. You should read all of these articles to understand how to plan and configure Direct Routing:

- [Plan Direct Routing](#)
- [Configure Direct Routing](#)
- [List of Session Border Controllers certified for Direct Routing](#)
- [Monitor and troubleshoot Direct Routing](#)

In addition, you might want to read the following articles depending on your requirements:

- [Configure a Session Border Controller for multiple tenants](#)
- [Migrate to Direct Routing](#)
- [User accounts in a hybrid environment with PSTN connectivity](#)
- Watch the following session to learn more about Direct Routing: [Direct Routing in Microsoft Teams](#)

Core deployment decisions

These are the core decisions to consider for Direct Routing.

ASK YOURSELF	ACTION
For which users will I enable Direct Routing?	For more information, see Enable users for Direct Routing Service .
Do I have the required licenses for Direct Routing?	For more information, see Licensing and other requirements .

Session Border Controller (SBC) considerations

With Direct Routing, you connect your own Session Border Controller (SBC) directly to Phone System. For a list of certified SBCs, see [Supported Session Border Controllers](#).

ASK YOURSELF	ACTION
Where and how will I deploy SBCs?	For more information, see Configure Direct Routing
Do I have multiple tenants?	For more information, see Configure a Session Border Controller for multiple tenants .

Voice routing considerations

You'll need to configure Phone System to route the calls to the specific SBCs.

ASK YOURSELF	ACTION
What voice routing policies, PSTN usage, and voice routes do I need to create?	For voice routing information, see Configure Voice Routing .
Which users will be assigned to the voice routing policy that I define?	See the examples in Configure Voice Routing .

Ensure incoming calls land in the Teams client using TeamsUpgradePolicy

Direct Routing is only supported with Microsoft Teams. To receive PSTN calls through Direct Routing, you need to configure TeamsUpgradePolicy to ensure incoming calls are received in Teams. Users must be in Teams Only mode, which you can do by assigning them the "UpgradeToTeams" instance of TeamsUpgradePolicy.

ASK YOURSELF	ACTION
What does Teams Only mode mean?	For more information, see Migration and interoperability guidance for organizations using Teams together with Skype for Business .

Additional deployment considerations

You may want to consider the following, based on your organization's needs and configuration:

ASK YOURSELF	ACTION
Do you have an existing Skype for Business Server deployment with hybrid connectivity configured?	To understand how user accounts in a hybrid environment are provisioned and managed, see User accounts in a hybrid environment with PSTN connectivity .
Are you migrating to Direct Routing from Calling Plan or from a Skype for Business on-premises environment?	To understand more about migrating to Direct Routing from an existing environment, see Migrating to Direct Routing .

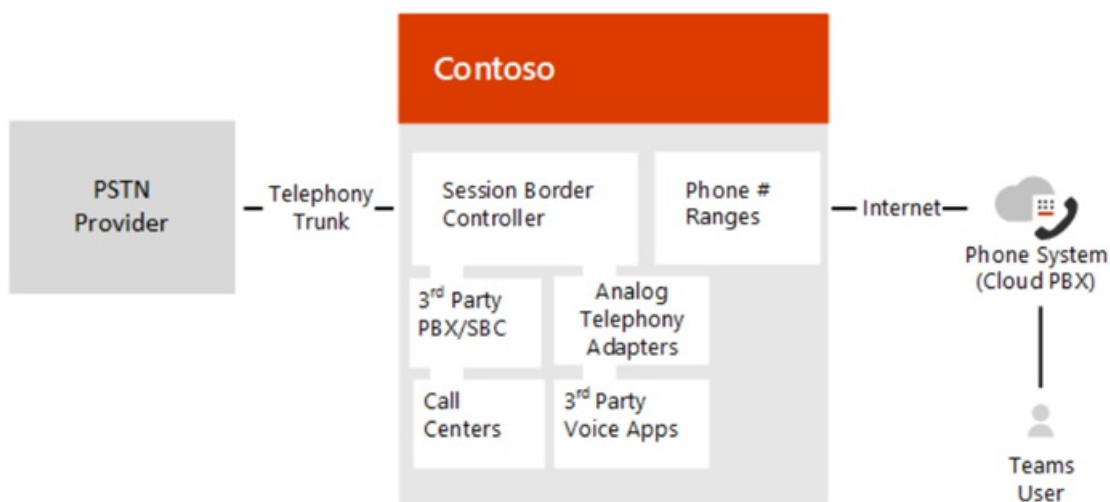

Plan Direct Routing

12/7/2021 • 16 minutes to read • [Edit Online](#)

TIP

Watch the following session to learn about the benefits of Direct Routing, how to plan for it, and how to deploy it: [Direct Routing in Microsoft Teams](#)

Microsoft Phone System Direct Routing lets you connect a supported, customer-provided Session Border Controller (SBC) to Microsoft Phone System. With this capability, for example, you can configure on-premises Public Switched Telephone Network (PSTN) connectivity with Microsoft Teams client, as shown in the following diagram:

NOTE

Skype for Business Online also lets you pair a customer-provided SBC, but this requires an on-premises Skype for Business Server deployment or a special edition of Skype for Business, called Cloud Connector, in between the SBC and the Microsoft Cloud. This scenario is known as hybrid voice. In contrast, Direct Routing allows a direct connection between the supported SBC and the Microsoft Cloud.

IMPORTANT

Cloud Connector Edition will retire July 31, 2021 along with Skype for Business Online. Once your organization has upgraded to Teams, learn how to connect your on-premises telephony network to Teams using [Direct Routing](#).

With Direct Routing, you can connect your SBC to almost any telephony trunk or interconnect with third-party PSTN equipment. Direct Routing enables you to:

- Use virtually any PSTN trunk with Microsoft Phone System.
- Configure interoperability between customer-owned telephony equipment, such as a third-party private branch exchange (PBX), analog devices, and Microsoft Phone System.

Microsoft also offers all-in-the-cloud voice solutions, such as Calling Plan. However, a hybrid voice solution might be best for your organization if:

- Microsoft Calling Plan is not available in your country.
- Your organization requires connection to third-party analog devices, call centers, and so on.
- Your organization has an existing contract with a PSTN carrier.

Direct Routing also supports users who have the additional license for the Microsoft Calling Plan. For more information, see [Phone System and Calling Plans](#).

With Direct Routing, when users participate in a scheduled conference, the dial-in number is provided by Microsoft Audio Conferencing service, which requires proper licensing. When dialing out, the Microsoft Audio Conferencing service places the call using online calling capabilities, which requires proper licensing. (Note if a user does not have a Microsoft Audio Conferencing license, the call routes through Direct Routing.) For more information, see [Online Meetings with Teams](#).

Planning your deployment of Direct Routing is key to a successful implementation. This article describes infrastructure and licensing requirements and provides information about SBC connectivity:

- [Infrastructure requirements](#)
- [Licensing and other requirements](#)
- [SBC domain names](#)
- [Public trusted certificate for the SBC](#)
- [SIP Signaling: FQDNs](#)
- [SIP Signaling: Ports](#)
- [Media traffic: Port ranges](#)
- [Supported Session Border Controllers \(SBCs\)](#)

For detailed information about configuring Direct Routing, see [Configure Direct Routing](#).

Infrastructure requirements

The infrastructure requirements for the supported SBCs, domains, and other network connectivity requirements to deploy Direct Routing are listed in the following table:

INFRASTRUCTURE REQUIREMENT	YOU NEED THE FOLLOWING
Session Border Controller (SBC)	A supported SBC. For more information, see Supported SBCs .
Telephony trunks connected to the SBC	One or more telephony trunks connected to the SBC. On one end, the SBC connects to the Microsoft Phone System via Direct Routing. The SBC can also connect to third-party telephony entities, such as PBXs, Analog Telephony Adapters, and so on. Any PSTN connectivity option connected to the SBC will work. (For configuration of the PSTN trunks to the SBC, please refer to the SBC vendors or trunk providers.)
Microsoft 365 or Office 365 organization	An Microsoft 365 or Office 365 organization that you use to home your Microsoft Teams users, and the configuration and connection to the SBC.

INFRASTRUCTURE REQUIREMENT	YOU NEED THE FOLLOWING
User registrar	<p>User must be homed in Microsoft 365 or Office 365. If your company has an on-premises Skype for Business or Lync environment with hybrid connectivity to Microsoft 365 or Office 365, you cannot enable voice in Teams for a user homed on-premises.</p> <p>To check the registrar of a user, use the following Skype for Business Online PowerShell cmdlet:</p> <pre>Get-CsOnlineUser -Identity <user> fl HostingProvider</pre> <p>The output of the cmdlet should show:</p> <pre>HostingProvider : sipfed.online.lync.com</pre>
Domains	<p>One or more domains added to your Microsoft 365 or Office 365 organizations.</p> <p>Note that you cannot use the default domain, *.onmicrosoft.com, that is automatically created for your tenant.</p> <p>To view the domains, you can use the following Skype for Business Online PowerShell cmdlet:</p> <pre>Get-CsTenant fl Domains</pre> <p>For more information about domains and Microsoft 365 or Office 365 organizations, see Domains FAQ.</p>
Public IP address for the SBC	A public IP address that can be used to connect to the SBC. Based on the type of SBC, the SBC can use NAT.
Fully Qualified Domain Name (FQDN) for the SBC	A FQDN for the SBC, where the domain portion of the FQDN is one of the registered domains in your Microsoft 365 or Office 365 organization. For more information, see SBC domain names .
Public DNS entry for the SBC	A public DNS entry mapping the SBC FQDN to the public IP Address.
Public trusted certificate for the SBC	A certificate for the SBC to be used for all communication with Direct Routing. For more information, see Public trusted certificate for the SBC .
Connection points for Direct Routing	<p>The connection points for Direct Routing are the following three FQDNs:</p> <pre>sip.pstnhub.microsoft.com</pre> – Global FQDN, must be tried first. <pre>sip2.pstnhub.microsoft.com</pre> – Secondary FQDN, geographically maps to the second priority region. <pre>sip3.pstnhub.microsoft.com</pre> – Tertiary FQDN, geographically maps to the third priority region. <p>For information on configuration requirements, see SIP Signaling: FQDNs.</p>

INFRASTRUCTURE REQUIREMENT	YOU NEED THE FOLLOWING
Firewall IP addresses and ports for Direct Routing media	<p>The SBC communicates to the following services in the cloud:</p> <p>SIP Proxy, which handles the signaling Media Processor, which handles media -except when Media Bypass is on</p> <p>These two services have separate IP addresses in Microsoft Cloud, described later in this document.</p> <p>For more information, see the Microsoft Teams section in URLs and IP address ranges.</p>
Media Transport Profile	<p>TCP/RTP/SAVP UDP/RTP/SAVP</p>
Firewall IP addresses and ports for Microsoft Teams media	For more information, see URLs and IP address ranges .

Licensing and other requirements

Users of Direct Routing must have the following licenses assigned in Microsoft 365 or Office 365:

- Microsoft Phone System.
- Microsoft Teams + Skype for Business Plan 2, if included in licensing.
- Microsoft Audio Conferencing (please read the notes and the paragraph below for specific examples about when the license is required).

NOTE

Skype for Business Plan should not be removed from any licensing agreement where it is included.

IMPORTANT

GCC High and DoD users should disable any Audio Conferencing licensing included in G5 and wait to enable any Audio Conferencing until Direct Routing has been fully configured. Users should have dial-in phone numbers configured and a working dial pad before enabling Audio Conferencing licenses. See [Audio Conferencing with Direct Routing for GCC High and DoD](#) for more details.

IMPORTANT

In the case that you would like to add external participants to scheduled meetings, either by dialing out to them or by providing the dial-in number, the audio conferencing license is required. For GCC High and DoD, do not assign an Audio Conferencing license for G5 users. For G3 users, do not assign an Audio Conferencing license until Direct Routing is fully configured and the user has a working dial pad.

Ad hoc call escalation and Audio Conferencing license

A Teams user can start a one-on-one Teams to PSTN or Teams to Teams call and add a PSTN participant to it. This scenario is called an ad hoc conference. The path that the call takes depends whether the user who escalates the call has a Microsoft Audio Conferencing license assigned or not:

- If the Teams user who escalates the call has a Microsoft Audio Conferencing license assigned, the escalation happens through the Microsoft Audio Conferencing service. The remote PSTN participant who is invited to the existing call receives a notification about the incoming call and sees the number of the Microsoft bridge assigned to the Teams user who initiated the escalation.
- If the Teams user who escalates the call does not have the Microsoft Audio Conferencing license assigned, the escalation happens through a Session Border Controller connected to the Direct Routing interface. The remote PSTN participant who is invited to the call receives a notification about the incoming call and sees the number of the Teams user who initiated the escalation. The specific SBC used for the escalation is defined by Routing Policy of the user.

In addition, you must ensure the following:

- CsOnlineVoiceRoutingPolicy is assigned to the user.
- Allow Private Calling is enabled at the tenant level for Microsoft Teams.

Direct Routing also supports users who are licensed for Microsoft Calling Plan. Microsoft Phone System with Calling Plan can route some calls using the Direct Routing interface. However, the users' phone numbers must be either acquired online or ported to Microsoft.

Mixing Calling Plan and Direct Routing connectivity for the same user is optional, but could be useful (for example, when the user is assigned a Microsoft Calling Plan but wants to route some calls using the SBC). One of the most common scenarios is calls to third-party PBXs. With third-party PBXs, all calls, except calls to the phones connected to that PBXs, are routed using Microsoft Calling Plan, but calls to the phones connected to third-party PBXs go to the SBC, and therefore stay within the enterprise network and not the PSTN.

For more information about Phone System licensing, see [Get the most from Office and Plan Options](#).

For more information about Phone System licensing, see [Microsoft Teams add-on licensing](#).

Supported end points

You can use as an end point:

- Any Teams client.
- Common Area Phones. See [Set up the Common Area Phone license for Microsoft Teams](#). Note you do not need a Calling Plan license when setting up a Common Area Phone with Direct Routing.
- Skype for Business 3PIP phones. See [Skype for Business phones \(3PIP\) support with Microsoft Teams](#)

SBC domain names

The SBC domain name must be from one of the names registered in Domains of the tenant. You cannot use the *.onmicrosoft.com tenant for the FQDN name of the SBC.

The following table shows examples of DNS names registered for the tenant, whether the name can be used as an FQDN for the SBC, and examples of valid FQDN names:

DNS NAME	CAN BE USED FOR SBC FQDN	EXAMPLES OF FQDN NAMES
contoso.com	Yes	Valid names: sbc1.contoso.com ssbcs15.contoso.com europe.contoso.com
contoso.onmicrosoft.com	No	Using *.onmicrosoft.com domains is not supported for SBC names

Assume you want to use a new domain name. For example, your tenant has contoso.com as a domain name registered in your tenant, and you want to use sbc1.sip.contoso.com. Before you can pair an SBC with the name sbc1.sip.contoso.com, you must register the domain name sip.contoso.com in Domains in your tenant. If you try pairing an SBC with sbc1.sip.contoso.com before registering the domain name, you will get the following error: "Cannot use the "sbc1.sip.contoso.com" domain as it was not configured for this tenant." After you add the domain name, you also need to create a user with UPN user@sip.contoso.com and assign a Teams license. It might take up to 24 hours to fully provision the domain name after it is added to Domains of your tenant, a user with a new name is created, and a license is assigned to the user.

It is possible that a company might have several SIP address spaces in one tenant. For example, a company might have contoso.com as a SIP address space and fabrikam.com as the second SIP address space. Some users have address user@contoso.com and some users have address user@fabrikam.com.

The SBC only needs one FQDN and can service users from any address space in the paired tenant. For example, an SBC with the name sbc1.contoso.com can receive and send the PSTN traffic for users with addresses user@contoso.com and user@fabrikam.com as long as these SIP address spaces are registered in the same tenant.

Public trusted certificate for the SBC

Microsoft recommends that you request the certificate for the SBC by generating a certification signing request (CSR). For specific instructions on generating a CSR for an SBC, refer to the interconnection instructions or documentation provided by your SBC vendors.

NOTE

Most Certificate Authorities (CAs) require the private key size to be at least 2048. Keep this in mind when generating the CSR.

The certificate needs to have the SBC FQDN as the common name (CN) or the subject alternative name (SAN) field. The certificate should be issued directly from a certification authority, not from an intermediate provider.

Alternatively, Direct Routing supports a wildcard in the CN and/or SAN, and the wildcard needs to conform to standard [RFC HTTP Over TLS](#). An example would be using *.contoso.com which would match the SBC FQDN sbc.contoso.com, but wouldn't match with sbc.test.contoso.com.

The certificate needs to be generated by one of the following root certificate authorities:

- AffirmTrust
- AddTrust External CA Root
- Baltimore CyberTrust Root*
- Buypass
- Cybertrust
- Class 3 Public Primary Certification Authority
- Comodo Secure Root CA
- Deutsche Telekom
- DigiCert Global Root CA
- DigiCert High Assurance EV Root CA
- Entrust
- GlobalSign
- Go Daddy
- GeoTrust
- Verisign, Inc.

- SSL.com
- Starfield
- Symantec Enterprise Mobile Root for Microsoft
- SwissSign
- Thawte Timestamping CA
- Trustwave
- TeliaSonera
- T-Systems International GmbH (Deutsche Telekom)
- QuoVadis
- USERTrust RSA Certification Authority
- Hongkong Post Root CA 1,2,3
- Sectigo Root CA
- Harica

For Direct Routing in Office 365 GCCH and DoD environments the certificate needs to be generated by one of the following root certificate authorities:

- DigiCert Global Root CA
- DigiCert High Assurance EV Root CA

NOTE

*If Mutual TLS (MTLS) support is enabled for the Teams connection on the SBC, then you must install the Baltimore CyberTrust Root Certificate in the SBC Trusted Root Store of the Teams TLS context. (This is because the Microsoft service certificates use the Baltimore root certificate.) To download the Baltimore root certificate, see [Office 365 Encryption chains](#).

Microsoft is working on adding additional certification authorities based on customer requests.

SIP Signaling: FQDNs

Direct Routing is offered in the following environments:

- Microsoft 365 or Office 365
- Office 365 GCC
- Office 365 GCC High
- Office 365 DoD

Learn more about [Office 365 and US Government environments](#) such as GCC, GCC High, and DoD.

Microsoft 365, Office 365, and Office 365 GCC environments

The connection points for Direct Routing are the following three FQDNs:

- **sip.pstnhub.microsoft.com** – Global FQDN – must be tried first. When the SBC sends a request to resolve this name, the Microsoft Azure DNS servers return an IP address pointing to the primary Azure datacenter assigned to the SBC. The assignment is based on performance metrics of the datacenters and geographical proximity to the SBC. The IP address returned corresponds to the primary FQDN.
- **sip2.pstnhub.microsoft.com** – Secondary FQDN – geographically maps to the second priority region.
- **sip3.pstnhub.microsoft.com** – Tertiary FQDN – geographically maps to the third priority region.

Placing these three FQDNs in order is required to:

- Provide optimal experience (less loaded and closest to the SBC datacenter assigned by querying the first FQDN).

- Provide failover when connection from an SBC is established to a datacenter that is experiencing a temporary issue. For more information, see [Failover mechanism](#) below.

The FQDNs – sip.pstnhub.microsoft.com, sip2.pstnhub.microsoft.com and sip3.pstnhub.microsoft.com – will be resolved to IP addresses from the following subnets:

- 52.112.0.0/14
- 52.120.0.0/14

You need to open ports for all these IP address ranges in your firewall to allow incoming and outgoing traffic to and from the addresses for signaling.

Office GCC DoD environment

The connection point for Direct Routing is the following FQDN:

sip.pstnhub.dod.teams.microsoft.us – Global FQDN. As the Office 365 DoD environment exists only in the US data centers, there is no secondary and tertiary FQDNs.

The FQDN sip.pstnhub.dod.teams.microsoft.us will be resolved to an IP address from the following subnet:

- 52.127.64.0/21

You need to open ports for all these IP addresses in your firewall to allow incoming and outgoing traffic to and from the addresses for signaling.

Office 365 GCC High environment

The connection point for Direct Routing is the following FQDN:

sip.pstnhub.gov.teams.microsoft.us – Global FQDN. As the GCC High environment exists only in the US data centers, there is no secondary and tertiary FQDNs.

The FQDN sip.pstnhub.gov.teams.microsoft.us will be resolved to an IP address from the following subnet:

- 52.127.88.0/21

You need to open ports for all these IP addresses in your firewall to allow incoming and outgoing traffic to and from the addresses for signaling.

SIP Signaling: Ports

You must use the following ports for Microsoft 365 or Office 365 environments where Direct Routing is offered:

- Microsoft 365 or Office 365
- Office 365 GCC
- Office 365 GCC High
- Office 365 DoD

TRAFFIC	FROM	TO	SOURCE PORT	DESTINATION PORT
SIP/TLS	SIP Proxy	SBC	1024 – 65535	Defined on the SBC (For Office 365 GCC High/DoD only port 5061 must be used)
SIP/TLS	SBC	SIP Proxy	Defined on the SBC	5061

Failover mechanism for SIP Signaling

The SBC makes a DNS query to resolve sip.pstnhub.microsoft.com. Based on the SBC location and the datacenter performance metrics, the primary datacenter is selected. If the primary datacenter experiences an issue, the SBC will try the sip2.pstnhub.microsoft.com, which resolves to the second assigned datacenter, and, in the rare case that datacenters in two regions are not available, the SBC retries the last FQDN (sip3.pstnhub.microsoft.com), which provides the tertiary datacenter IP.

The table below summarizes the relationships between primary, secondary, and tertiary datacenters:

IF THE PRIMARY DATACENTER IS	EMEA	NOAM	ASIA
The secondary datacenter (sip2.pstnhub.microsoft.com)	US	EU	US
The tertiary datacenter (sip3.pstnhub.microsoft.com)	ASIA	ASIA	EU

Media traffic: Port ranges

Note that the requirements below apply if you want to deploy Direct Routing without Media Bypass. For firewall requirements for Media Bypass, please refer to [Plan for media bypass with Direct Routing](#).

The media traffic flows to and from a separate service in the Microsoft Cloud. The IP address ranges for Media traffic are as follows.

Microsoft 365, Office 365, and Office 365 GCC environments

- 52.112.0.0/14 (IP addresses from 52.112.0.1 to 52.115.255.254).
- 52.120.0.0/14 (IP addresses from 52.120.0.1 to 52.123.255.254).

Office 365 DoD environment

- 52.127.64.0/21

Office 365 GCC High environment

- 52.127.88.0/21

Port range (applicable to all environments)

The port range of the Media Processors is shown in the following table:

TRAFFIC	FROM	TO	SOURCE PORT	DESTINATION PORT
UDP/SRTP	Media Processor	SBC	3478-3481 and 49152 – 53247	Defined on the SBC
UDP/SRTP	SBC	Media Processor	Defined on the SBC	3478-3481 and 49152 – 53247

NOTE

Microsoft recommends at least two ports per concurrent call on the SBC.

Media traffic: Media processors geography

The media traffic flows via components called media processors. Media processors are placed in the same datacenters as SIP proxies:

- NOAM (US South Central, two in US West and US East datacenters)
- Europe (UK South, France Central, Amsterdam and Dublin datacenters)
- Asia (Singapore datacenter)
- Japan (JP East and West datacenters)
- Australia (AU East and Southeast datacenters)
- LATAM (Brazil South)
- Africa (South Africa North)

Media traffic: Codecs

Leg between SBC and Cloud Media Processor or Microsoft Teams client.

Applies to both media bypass case and non-bypass cases.

The Direct Routing interface on the leg between the Session Border Controller and Cloud Media Processor (without media bypass) or between the Teams client and the SBC (if Media Bypass enabled) can use the following codecs:

- Non-Media bypass (SBC to Cloud Media Processor): SILK, G.711, G.722, G.729
- Media Bypass (SBC to Teams client): SILK, G.711, G.722, G.729

You can force use of the specific codec on the Session Border Controller by excluding undesirable codecs from the offer.

Leg between Microsoft Teams Client and Cloud Media Processor

Applies to non-media bypass case only. With Media Bypass, the media flows directly between the Teams client and the SBC.

On the leg between the Cloud Media Processor and Microsoft Teams client either SILK or G.722 is used. The codec choice on this leg is based on Microsoft algorithms, which take into consideration multiple parameters.

Supported Session Border Controllers (SBCs)

Microsoft only supports certified SBCs to pair with Direct Routing. Because Enterprise Voice is critical for businesses, Microsoft runs intensive tests with the selected SBCs, and works with the SBC vendors to ensure the two systems are compatible.

Devices that have been validated are listed as Certified for Teams Direct Routing. The certified devices are guaranteed to work in all scenarios.

For more information about supported SBCs, see [List of Session Border Controllers certified for Direct Routing](#).

See also

[Configure Direct Routing](#)

Session Border Controllers certified for Direct Routing

12/7/2021 • 5 minutes to read • [Edit Online](#)

Microsoft partners with selected Session Border Controllers (SBC) vendors to certify that their SBCs work with Direct Routing.

Microsoft works with each vendor to:

- Jointly work on the SIP interconnection protocols.
- Perform intense tests using a third-party lab. Only devices that pass the tests are certified.
- Run daily tests with all certified devices in production and pre-production environments. Validating the devices in pre-production environments guarantees that new versions of Direct Routing code in the cloud will work with certified SBCs.
- Establish a joint support process with the SBC vendors.

NOTE

Microsoft only supports Phone System if a certified device or devices are connected through Direct Routing. In case of issues, customer must contact SBC vendors customer support first. If needed, SBC vendor will escalate the issue to Microsoft via internal channels. Microsoft reserves the right to reject support cases where a non-certified device is connected to the Phone System through Direct Routing. If Microsoft determines that a customer's Direct Routing issue is with a vendor's SBC device, the customer will need to re-engage the SBC vendor for support.

The certification is granted to specific SBC firmware versions. Any SBC firmware version documented below is both certified and supported. Firmware versions that are higher than what is documented are supported as long as the major:minor version is the same.

Example:

- Supported 6.10.258 - in this case, we also support firmware versions 6.10.(258 or higher).
- Recommended 6.20.100 - in this case, we also recommend firmware versions 6.20.(100 or higher).
- For supportability questions about specific version, reach out to your SBC vendor.

The tables that follow list devices certified for Direct Routing. (For information about which SBC vendors support Local Media Optimization, see [Configure Local Media Optimization for Direct Routing](#).)

[Learn more about Direct Routing](#). If you have any questions about the SBC certification program for Direct Routing, please contact drsbccertification@microsoft.com. Please note: we are not accepting new nominations for certification until further notice.

To give us product feedback about Teams, such as ideas for new features, see [Uservoice](#).

NOTE

Microsoft will be moving from UserVoice to our own customer feedback solution on a product-by-product basis during 2021. [Learn more.](#)

Note the certification granted to a major version. That means that firmware with any number in the SBC firmware following the major version is supported.

Configure Direct Routing

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Phone System Direct Routing enables you to connect your on-premises telephony infrastructure to Microsoft Teams. The article lists the high-level steps required for connecting a supported on-premises Session Border Controller (SBC) to Direct Routing, and how to configure Teams users to use Direct Routing to connect to the Public Switched Telephone Network (PSTN). This article links to associated articles for details.

For information about whether Direct Routing is the right solution for your organization, see [Phone System Direct Routing](#). For information about prerequisites and planning your deployment, see [Plan Direct Routing](#).

TIP

You can also watch the following session to learn about the benefits of Direct Routing, how to plan for it, and how to deploy it: [Direct Routing in Microsoft Teams](#).

To complete the steps explained in this article, administrators need some familiarity with PowerShell cmdlets. For more information about using PowerShell, see [Set up your computer for Windows PowerShell](#).

Before performing the steps in these articles, Microsoft recommends that you confirm that your SBC has already been configured as recommended by your SBC vendor:

- [AudioCodes deployment documentation](#)
- [Oracle deployment documentation](#)
- [Ribbon Communications deployment documentation](#)
- [TE-Systems \(anynode\) deployment documentation](#)
- [Metaswitch deployment documentation](#)

For a complete list of supported SBCs, see [List of Session Border Controllers certified for Direct Routing](#).

To configure Microsoft Phone System and enable users to use Direct Routing, follow these steps:

- **Step 1.** [Connect the SBC with Microsoft Phone System and validate the connection](#)
- **Step 2.** [Enable users for Direct Routing, voice, and voicemail](#)
- **Step 3.** [Configure call routing](#)
- **Step 4.** [Translate numbers to an alternate format](#)

If you are configuring an SBC for multiple tenants, you'll also want to read [Configure an SBC for multiple tenants](#).

[Plan Direct Routing](#)

Connect your Session Border Controller (SBC) to Direct Routing

12/7/2021 • 7 minutes to read • [Edit Online](#)

This article describes how to configure a Session Border Controller (SBC) and connect it to Phone System Direct Routing. This is step 1 of the following steps to configure Direct Routing:

- **Step 1. Connect your SBC with Phone System and validate the connection** (This article)
- Step 2. [Enable users for Direct Routing](#)
- Step 3. [Configure call routing](#)
- Step 4. [Translate numbers to an alternate format](#)

For information on all the steps required to set up Direct Routing, see [Configure Direct Routing](#).

You can use the [Microsoft Teams admin center](#) or [PowerShell](#) to configure and connect an SBC to Direct Routing.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Voice > Direct Routing**, and then click the **SBCs** tab.
2. Click **Add**.
3. Enter a FQDN for the SBC.

Make sure the domain name portion of the FQDN matches a domain that's registered in your tenant and keep in mind that the `*.onmicrosoft.com` domain name isn't supported for the SBC FQDN domain name.

For example, if you have two domain names, `contoso.com` and `contoso.onmicrosoft.com`, use `sbc.contoso.com` as the SBC name. If using a subdomain, make sure this subdomain is also registered in your tenant. For example, if you want to use `sbc.service.contoso.com`, then `service.contoso.com` needs to be registered.

4. Configure the following settings for the SBC, based on your organization's needs. For details on each of these settings, see [SBC settings](#).

Add an FQDN for the SBC

You must use the SBC's FQDN that has the host name registered in DNS. For example, if your organization owns **contoso.com** then **sbc.contoso.com** is good name for the SBC, but **sbc.contoso.onmicrosoft.com** isn't.

SBC settings

When you are adding this SBC, you can turn on or off the SBC and change settings that are specific to the SBC.

Enabled	<input type="checkbox"/> Off
SIP signaling port	10
Send SIP options ⓘ	<input checked="" type="checkbox"/> On
Forward call history	<input type="checkbox"/> Off
Forward P-Asserted-Identity (PAI) header ⓘ	<input type="checkbox"/> Off
Concurrent call capacity	
Failover response codes	408, 503, 504
Failover time (seconds) ⓘ	10
Preferred country or region for media traffic	Auto ▼
SBC supports PIDF/LO for emergency calls	<input type="checkbox"/> Off
Ring phone while trying to find the user	<input checked="" type="checkbox"/> On

5. When you're done, click **Save**.

Using PowerShell

To connect your SBC to Direct Routing, you'll need to:

1. [Connect to Skype for Business Online by using PowerShell](#).
2. [Connect the SBC to the tenant](#).
3. [Verify the SBC connection](#).

Connect to Skype for Business Online by using PowerShell

You can use a PowerShell session connected to the tenant to pair the SBC to the Direct Routing interface. To open a PowerShell session, follow the steps outlined in [Set up your computer for Windows PowerShell](#).

After you establish a remote PowerShell session, verify that you can see the commands to manage the SBC. To verify the commands, type or copy and paste the following command in the PowerShell session, and then press Enter:

```
Get-Command *onlinePSTNGateway*
```

The command returns the four functions shown here that will let you manage the SBC.

CommandType	Name	Version	Source
-----	----	-----	-----
Function	Get-CsOnlinePSTNGateway	1.0	tmp_v5fiu1no.wxt
Function	New-CsOnlinePSTNGateway	1.0	tmp_v5fiu1no.wxt
Function	Remove-CsOnlinePSTNGateway	1.0	tmp_v5fiu1no.wxt
Function	Set-CsOnlinePSTNGateway	1.0	tmp_v5fiu1no.wxt

Connect the SBC to the tenant

Use the [New-CsOnlinePSTNGateway](#) cmdlet to connect the SBC to the tenant. In a PowerShell session, type the

following, and then press Enter:

```
New-CsOnlinePSTNGateway -Fqdn <SBC FQDN> -SipSignalingPort <SBC SIP Port> -MaxConcurrentSessions <Max  
Concurrent Sessions the SBC can handle> -Enabled $true
```

NOTE

1. We recommend that you set a maximum call limit in the SBC using information that can be found in the SBC documentation. The limit will trigger a notification if the SBC is at the capacity level.
2. You can only connect the SBC if the domain portion of its FQDN matches one of the domains registered in your tenant, except *.onmicrosoft.com. Using *.onmicrosoft.com domain names is not supported for the SBC FQDN name. For example, if you have two domain names, **contoso.com** and **contoso.onmicrosoft.com**, you can use **sbcs.contoso.com** for the SBC name. If you try to connect the SBC with a name such as **sbcs.contoso.abc**, the system won't let you, as the domain is not owned by this tenant.

In addition to the domain registered in your tenant, it's important that there's a user with that domain and an assigned E3 or E5 license. If not, you'll receive the following error:

```
Can not use the "sbcs.contoso.com" domain as it was not configured for this tenant .
```

Here's an example:

```
New-CsOnlinePSTNGateway -Identity sbcs.contoso.com -Enabled $true -SipSignalingPort 5067 -  
MaxConcurrentSessions 100
```

Which returns:

```
Identity           : sbcs.contoso.com  
Fqdn               : sbcs.contoso.com  
SipSignalingPort   : 5067  
FailoverTimeSeconds : 10  
ForwardCallHistory : False  
ForwardPai         : False  
SendSipOptions     : True  
MaxConcurrentSessions : 100  
Enabled            : True
```

NOTE

This example shows only the minimum required parameters. There are additional parameters that you can set with the [New-CsOnlinePSTNGateway](#) cmdlet during the connection process. To learn more, see [SBC settings](#).

Verify the SBC connection

To verify the connection:

- [Check whether the SBC is on the list of paired SBCs](#).
- [Validate SIP options](#).

Check whether the SBC is on the list of paired SBCs

After you connect the SBC, use the [Get-CsOnlinePSTNGateway](#) cmdlet to verify that the SBC is present in the list of paired SBCs. Type the following in a remote PowerShell session, and then press Enter:

```
Get-CsOnlinePSTNGateway -Identity sbcs.contoso.com
```

The paired gateway should appear in the list as shown in the example below, and the **Enabled** parameter

should display a value of **True**.

Which returns:

```
Identity           : sbc.contoso.com
Fqdn               : sbc.contoso.com
SipSignalingPort   : 5067
CodecPriority       : SILKWB,SILKNB,PCMU,PCMA
ExcludedCodecs     :
FailoverTimeSeconds : 10
ForwardCallHistory : False
ForwardPai         : False
SendSipOptions     : True
MaxConcurrentSessions : 100
Enabled            : True
```

Validate SIP options

To validate the pairing using outgoing SIP options, use the SBC management interface and confirm that the SBC receives 200 OK responses to its outgoing OPTIONS messages.

When Direct Routing sees incoming OPTIONS, it will start sending outgoing SIP Options messages to the SBC FQDN configured in the Contact header field in the incoming OPTIONS message.

To validate the pairing using incoming SIP options, use the SBC management interface and see that the SBC sends a reply to the OPTIONS messages coming in from Direct Routing and that the response code it sends is 200 OK.

SBC settings

This table lists the options that you can set for the SBC in the Microsoft Teams admin center and by using the [New-CsOnlinePSTNGateway](#) cmdlet.

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTION S
Yes	Add an FQDN for the SBC	FQDN	None	FQDN name, limit 63 characters	String, see the list of allowed and disallowed characters on Naming conventions in Active Directory for computers, domains, sites, and OUs	

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTIONS
No	Enabled	Enabled	Use to turn on the SBC for outbound calls. You can use this to temporarily remove the SBC from service while it's being updated or during maintenance.	False	True False	Boolean
Yes	SIP signaling port	SipSignalingPort	This is the listening port that's used to communicate with Direct Routing by using the Transport Layer (TLS) protocol.	None	Any port	0 to 65535
No	Send SIP options	SendSIPOptions	Defines whether the SBC will send SIP options messages. We highly recommend that you turn on this setting. When this setting is off, the SBC is excluded from the Monitoring and Alert system.	True	True False	Boolean

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTION S
No	Forward call history	ForwardCallHistory	Indicates whether call history information is forwarded through the trunk. When you turn this on, the Microsoft 365 or Office 365 proxy sends a History-info and Referred-by header.	False	True False	Boolean
No	Forward P-Asserted-identity (PAI) header	ForwardPAI	Indicates whether the PAI header is forwarded along with the call. The PAI header provides a way to verify the identity of the caller. If this setting is on, the Privacy:ID header is also sent.	False	True False	Boolean

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTION S
No	Concurrent call capacity	MaxConcurrentSessions	When you set a value, the alerting system will notify you when the number of concurrent sessions is 90 percent or higher than this value. If you don't set a value, alerts aren't generated. However, the monitoring system will report the number of concurrent sessions every 24 hours.	Null	Null 1 to 100,000	

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTIONS
No	Failover response codes	FailoverResponseCodes	<p>If Direct Routing receives any 4xx or 6xx SIP error code in response to an outgoing Invite, the call is considered completed by default. Outgoing means a call from a Teams client to the PSTN with traffic flow: Teams client -> Direct Routing -> SBC -> telephony network).</p> <p>When you specify a failover response code, this forces Direct Routing to try another SBC (if another SBC exists in the voice routing policy of the user) when it receives the specified codes if the SBC can't make a call because of network or other issues. To learn more, see Failover of specific SIP codes received from the Session Border Controller (SBC).</p>	408, 503, 504		Int

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTIONS
No	Failover times (seconds)	FailoverTimeSeconds	When you set a value, outbound calls that aren't answered by the gateway within the time that you set are routed to the next available trunk. If there are no additional trunks, the call is automatically dropped. The default value is 10 seconds. In an organization with slow networks and gateway responses, this could potentially result in calls being dropped unnecessarily.	10	Number	Int
No	Preferred country or region for media traffic	MediaRelayRoutingLocationOverride	Not applicable to Direct Routing. This parameter is reserved for use with managed carriers in Calling Plans	None		
No	SBC supports PIDF/LO for emergency calls	PidfloSupported	Specify whether the SBC supports Presence Information Data Format Location Object (PIDF/LO) for emergency calls.			

REQUIRED?	MICROSOFT TEAMS ADMIN CENTER SETTING	POWERSHELL PARAMETER	DESCRIPTION	DEFAULT	POSSIBLE VALUES	TYPE AND RESTRICTION S
No	-	MediaBypass	This setting indicates whether the SBC supports media bypass and whether you want to use it for this SBC.	None	True False	Boolean

[Plan Direct Routing](#)

[Configure Direct Routing](#)

[Teams PowerShell overview](#)

Enable users for Direct Routing, voice, and voicemail

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article describes how to enable users for Phone System Direct Routing. This is step 2 of the following steps for configuring Direct Routing:

- Step 1. [Connect the SBC with Microsoft Phone System and validate the connection](#)
- **Step 2. Enable users for Direct Routing, voice, and voicemail** (this article)
- Step 3. [Configure voice routing](#)
- Step 4. [Translate numbers to an alternate format](#)

For information on all the steps required for setting up Direct Routing, see [Configure Direct Routing](#).

When you are ready to enable users for Direct Routing, follow these steps:

1. Create a user in Microsoft 365 or Office 365 and assign a Phone System license.
2. Ensure that the user is homed in Skype for Business Online.
3. Configure the phone number and enable enterprise voice and voicemail.
4. Assign Teams Only mode to users.

Create a user and assign the license

There are two options for creating a new user in Microsoft 365 or Office 365. However, Microsoft recommends that your organization choose one option to avoid routing issues:

- Create the user in on-premises Active Directory and sync the user to the cloud. See [Integrate your on-premises directories with Azure Active Directory](#).
- Create the user directly in the Microsoft 365 admin center. See [Add users individually or in bulk to Microsoft 365 or Office 365 - Admin Help](#).

If your Skype for Business Online deployment coexists with Skype for Business 2015 or Lync 2010 or 2013 on-premises, the only supported option is to create the user in the on-premises Active Directory and sync the user to the cloud (Option 1).

For information about license requirements, see [licensing and other requirements](#) in [Plan Direct Routing](#).

Ensure that the user is homed online

This step is applicable to Skype for Business Server Enterprise Voice enabled users being migrated to Teams Direct Routing.

Direct Routing requires the user to be homed online. You can check by looking at the RegistrarPool parameter, which needs to have a value in the infra.lync.com domain. It's also recommended, but not required, to change management of the LineURI from on-premises to online when migrating users to Teams Direct Routing.

1. Connect a Skype for Business Online PowerShell session.
2. Issue the command:

```
Get-CsOnlineUser -Identity "<User name>" | fl  
RegistrarPool,OnPremLineUriManuallySet,OnPremLineUri,LineUri
```

In case OnPremLineUriManuallySet is set to False and LineUri is populated with a <E.164 phone number>, the phone number was assigned on-premises and synchronized to O365. If you want manage the phone number online, clean the parameter using on-premises Skype for Business Management Shell and synchronize to O365, before configuring the phone number using Skype for Business Online PowerShell.

3. From Skype for Business Management Shell issue the command:

```
Set-CsUser -Identity "<User name>" -LineUri $null
```

NOTE

Do not set EnterpriseVoiceEnabled to False as there is no requirement to do so and this can lead to dial plan normalization issues if legacy Skype for Business phones are in use and the Tenant hybrid configuration is set with UseOnPremDialPlan \$True.

After the changes have synced to Office 365 the expected output of

```
Get-CsOnlineUser -Identity "<User name>" | fl RegistrarPool,OnPremLineUriManuallySet,OnPremLineUri,LineUri
```

would be:

```
RegistrarPool           : pool.infra.lync.com  
OnPremLineUriManuallySet : True  
OnPremLineUri           :  
LineURI                  :
```

NOTE

All user's phone attributes must be managed online before you [decommission your on-premises Skype for Business environment](#).

Configure the phone number and enable enterprise voice and voicemail online

After you have created the user and assigned a license, the next step is to configure the user's online phone settings.

1. Connect a Skype for Business Online PowerShell session.
2. If managing the user's phone number on-premises, issue the command:

```
Set-CsUser -Identity "<User name>" -EnterpriseVoiceEnabled $true -HostedVoiceMail $true
```

3. If managing the user's phone number online, issue the command:

```
Set-CsUser -Identity "<User name>" -EnterpriseVoiceEnabled $true -HostedVoiceMail $true -  
OnPremLineUri tel:<phone number>
```

For example, to add a phone number for user "Spencer Low," enter the following:

```
Set-CsUser -Identity "spencer.low@contoso.com" -OnPremLineURI tel:+14255388797 -  
EnterpriseVoiceEnabled $true -HostedVoiceMail $true
```

If the users "Spencer Low" and "Stacy Quinn" share the same base number with unique extensions, enter the following

```
Set-CsUser -Identity "spencer.low@contoso.com" -OnPremLineURI "tel:+14255388701;ext=1001" -  
EnterpriseVoiceEnabled $true -HostedVoiceMail $true  
Set-CsUser -Identity "stacy.quinn@contoso.com" -OnPremLineURI "tel:+14255388701;ext=1002" -  
EnterpriseVoiceEnabled $true -HostedVoiceMail $true
```

It's recommended, but not required, that the phone number used is configured as a full E.164 phone number with country code. It is supported to configure phone numbers with extensions which will be used to lookup users when the lookup against the base number returns more than one result. This allows companies to configure phone numbers with the same base number and unique extensions. For lookup to be successful, the invite must include the full number with extension as follows:

```
To: <sip:+14255388701;ext=1001@sbc1.adatum.biz
```

NOTE

If the user's phone number is managed on premises, use on-premises Skype for Business Management Shell or Control Panel to configure the user's phone number.

Configure sending calls directly to voicemail

Direct Routing allows you to end the call to a user and send it directly to the user's voicemail. If you want to send the call directly to voicemail, attach `opaque=app:voicemail` to the Request URI header. For example, "sip:user@yourdomain.com;opaque=app:voicemail". In this case, the Teams user will not receive the calling notification, the call will be connected to the voicemail of the user directly.

Assign Teams Only mode to users to ensure calls land in Microsoft Teams

Direct Routing requires that users be in Teams Only mode to ensure incoming calls land in the Teams client. To put users in Teams Only mode, assign them the "UpgradeToTeams" instance of TeamsUpgradePolicy. For more information, see [Upgrade strategies for IT administrators](#). If your organization uses Skype for Business Server or Skype for Business Online, see the following article for information about interoperability between Skype and Teams: [Migration and interoperability with Skype for Business](#).

[Configure Direct Routing](#)

Configure call routing for Direct Routing

12/7/2021 • 15 minutes to read • [Edit Online](#)

This article describes how to configure call routing for Direct Routing. This is step 3 of the following steps for configuring Direct Routing:

- Step 1. [Connect the SBC with Microsoft Phone System and validate the connection](#)
- Step 2. [Enable users for Direct Routing, voice, and voicemail](#)
- **Step 3. Configure call routing** (This article)
- Step 4. [Translate numbers to an alternate format](#)

For information on all the steps required for setting up Direct Routing, see [Configure Direct Routing](#).

Call routing overview

Microsoft Phone System has a routing mechanism that allows a call to be sent to a specific Session Border Controller (SBC) based on:

- The called number pattern
- The called number pattern plus the specific user who makes the call

SBCs can be designated as active and backup. When the SBC that is configured as active is not available for a specific call route, then the call will be routed to a backup SBC.

Call routing is made up of the following elements:

- **Call routing policy** – Also called a voice routing policy. A container for PSTN usages, which can be assigned to a user or to multiple users.
- **PSTN usages** – A container for voice routes and PSTN usages, which can be shared in different voice routing policies.
- **Voice routes** – A number pattern and set of online PSTN gateways to use for calls where the calling number matches the pattern.
- **Online PSTN gateway** – A pointer to an SBC that also stores the configuration that is applied when a call is placed through the SBC, such as forward P-Asserted-Identity (PAI) or Preferred Codecs; can be added to voice routes.

Voice routing policy considerations

If a user has a Calling Plan license, that user's outgoing calls are automatically routed through the Microsoft Calling Plan PSTN infrastructure. If you configure and assign an online voice routing policy to a Calling Plan user, that user's outgoing calls are checked to determine whether the dialed number matches a number pattern defined in the online voice routing policy. If there's a match, the call is routed through the Direct Routing trunk. If there's no match, the call is routed through the Calling Plan PSTN infrastructure.

Caution

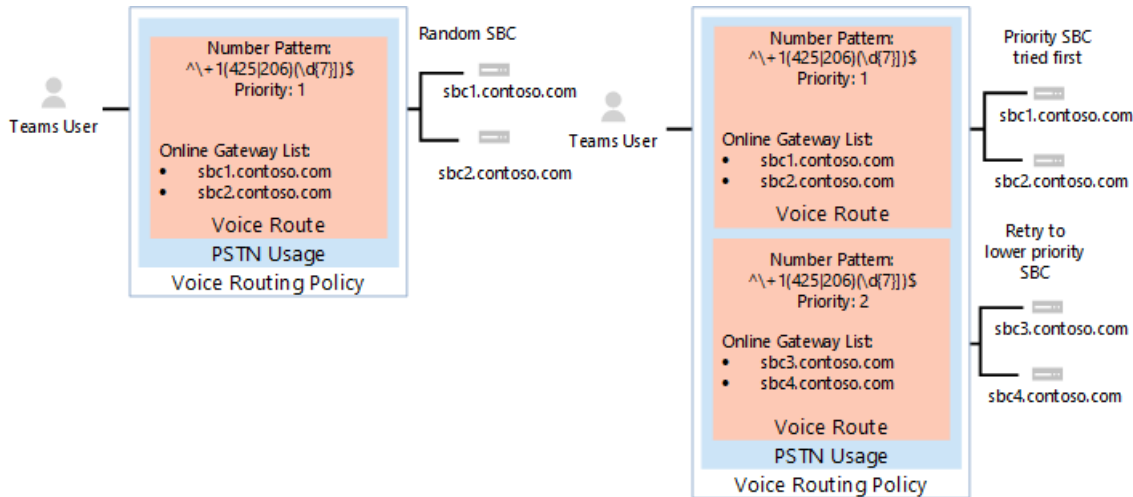

If you configure and apply the global (Org-wide default) online voice routing policy, all voice-enabled users in your organization will inherit that policy, which may result in PSTN calls from Calling Plan users being inadvertently routed to a Direct Routing trunk. If you don't want all users to use the global online voice routing policy, configure a custom online voice routing policy and assign it to individual voice-enabled users.

Example 1: Voice routing with one PSTN usage

The following diagram shows two examples of voice routing policies in a call flow.

Call Flow 1 (on the left): If a user makes a call to +1 425 XXX XX XX or +1 206 XXX XX XX, the call is routed to SBC sbc1.contoso.biz or sbc2.contoso.biz. If neither sbc1.contoso.biz nor sbc2.contoso.biz are available, the call is dropped.

Call Flow 2 (on the right): If a user makes a call to +1 425 XXX XX XX or +1 206 XXX XX XX, the call is first routed to SBC sbc1.contoso.biz or sbc2.contoso.biz. If neither SBC is available, the route with lower priority will be tried (sbc3.contoso.biz and sbc4.contoso.biz). If none of the SBCs are available, the call is dropped.

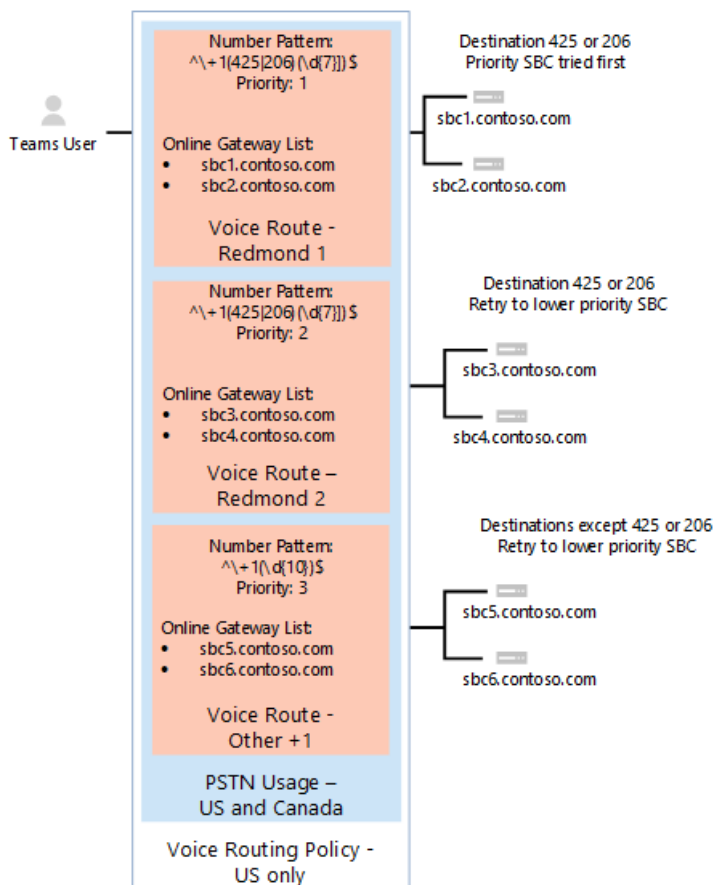

In both examples, while the voice route is assigned priorities, the SBCs in the routes are tried in random order.

NOTE

Unless the user also has a Microsoft Calling Plan license, calls to any number except numbers matching the patterns +1 425 XXX XX XX or +1 206 XXX XX XX in the example configuration are dropped. If the user has a Calling Plan license, the call is automatically routed according to the policies of the Microsoft Calling Plan. The Microsoft Calling Plan applies automatically as the last route to all users with the Microsoft Calling Plan license and does not require additional call routing configuration.

In the example shown in the following diagram, a voice route is added to send calls to all other US and Canadian numbers (calls that go to called number pattern +1 XXX XXX XX XX).

For all other calls, if a user has both licenses (Microsoft Phone System and Microsoft Calling Plan), the automatic route is used. If nothing matches the number patterns in the administrator-created online voice routes, then the call is routed through Microsoft Calling Plan. If the user only has Microsoft Phone System, the call is dropped because no matching rules are available.

NOTE

The Priority value for route "Other +1" doesn't matter in this case because there is only one route that matches the pattern +1 XXX XXX XX XX. If a user makes a call to +1 324 567 89 89 and both sbc5.contoso.biz and sbc6.contoso.biz are unavailable, the call is dropped.

The following table summarizes the configuration using three voice routes. In this example, all three routes are part of the same PSTN usage, "US and Canada". All routes are associated with the "US and Canada" PSTN usage and the PSTN usage is associated with the "US Only" voice routing policy.

PSTN USAGE	VOICE ROUTE	NUMBER PATTERN	PRIORITY	SBC	DESCRIPTION
US and Canada	"Redmond 1"	$\wedge + 1 (425 206) (\d{7}) \$$	1	sbc1.contoso.biz sbc2.contoso.biz	Active route for called numbers +1 425 XXX XX XX or +1 206 XXX XX XX
US and Canada	"Redmond 2"	$\wedge + 1 (425 206) (\d{7}) \$$	2	sbc3.contoso.biz sbc4.contoso.biz	Backup route for called numbers +1 425 XXX XX XX or +1 206 XXX XX XX

PSTN USAGE	VOICE ROUTE	NUMBER PATTERN	PRIORITY	SBC	DESCRIPTION
US and Canada	"Other +1"	^\+1(\d{10})\$	3	sbcs5.contoso.biz sbcs6.contoso.biz	Route for called numbers +1 XXX XX XX (except +1 425 XXX XX XX or +1 206 XXX XX XX)

Example 1: Configuration steps

The following example shows how to:

1. Create a single PSTN usage.
2. Configure three voice routes.
3. Create a voice routing policy.
4. Assign the policy to a user named Spencer Low.

You can use the [Microsoft Teams admin center](#) or [PowerShell](#) to perform these steps.

Using the Microsoft Teams admin center

Step 1: Create the "US and Canada" PSTN usage

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Direct Routing**, and then in the upper-right corner, select **Manage PSTN usage records**.
2. Click **Add**, type **US and Canada**, and then click **Apply**.

Step 2: Create three voice routes (Redmond 1, Redmond 2, and Other +1)

The following steps describe how to create a voice route. Use these steps to create the three voice routes named Redmond 1, Redmond 2, and Other +1 for this example by using the settings outlined in the earlier table.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Direct Routing**, and then select the **Voice routes** tab.
2. Click **Add**, and then enter a name and description for the voice route.
3. Set the priority and specify the dialed number pattern.
4. To enroll an SBC with the voice route, under **SBCs enrolled (optional)**, click **Add SBCs**, select the SBCs you want to enroll, and then click **Apply**.
5. To add PSTN usage records, under **PSTN usage records (optional)**, click **Add PSTN usage**, select the PSTN records you want to add, and then click **Apply**.
6. Click **Save**.

Step 3: Create a voice routing policy named "US Only" and add the "US and Canada" PSTN usage to the policy

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Voice routing policies**, and then click **Add**.
2. Type **US Only** as the name and add a description.
3. Under **PSTN usage records**, click **Add PSTN usage**, select the "US and Canada" PSTN usage record, and then click **Apply**.
4. Click **Save**.

To learn more, see [Manage voice routing policies](#).

Step 4: Assign the voice routing policy to a user named Spencer Low

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then click the user.

2. Click **Policies**, and then next to **Assigned policies**, click **Edit**.
3. Under **Voice routing policy**, select the "US Only" policy, and then click **Save**.

To learn more, see [Manage voice routing policies](#).

Using PowerShell

Step 1: Create the "US and Canada" PSTN usage

In a remote PowerShell session in Skype for Business Online, type:

```
Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="US and Canada"}
```

Verify that the usage was created by entering:

```
Get-CSOnlinePSTNUsage
```

Which returns a list of names that may be truncated:

```
Identity      : Global
Usage         : {testusage, US and Canada, International, karlUsage. . .}
```

The following example shows the result of running the `(Get-CSOnlinePSTNUsage).usage` PowerShell command to display full names (not truncated):

```
testusage
US and Canada
International
karlUsage
New test env
Tallinn Lab Sonus
karlUsage2
Unrestricted
Two trunks
```

Step 2: Create three voice routes (Redmond 1, Redmond 2, and Other +1)

To create the "Redmond 1" route, in a PowerShell session in Skype for Business Online, enter:

```
New-CsOnlineVoiceRoute -Identity "Redmond 1" -NumberPattern "^+1(425|206)
(\d{7})$" -OnlinePstnGatewayList sbc1.contoso.biz, sbc2.contoso.biz -Priority 1 -OnlinePstnUsages "US and
Canada"
```

Which returns:

```
Identity          : Redmond 1
Priority           : 1
Description        :
NumberPattern      : ^+1(425|206) (\d{7})$
OnlinePstnUsages   : {US and Canada}
OnlinePstnGatewayList : {sbc1.contoso.biz, sbc2.contoso.biz}
Name              : Redmond 1
```

To create the Redmond 2 route, enter:

```
New-CsOnlineVoiceRoute -Identity "Redmond 2" -NumberPattern "\+1(425|206)
(\d{7})$" -OnlinePstnGatewayList sbc3.contoso.biz, sbc4.contoso.biz -Priority 2 -OnlinePstnUsages "US and
Canada"
```

To create the Other +1 route, enter:

```
New-CsOnlineVoiceRoute -Identity "Other +1" -NumberPattern "\+1(\d{10})$"
-OnlinePstnGatewayList sbc5.contoso.biz, sbc6.contoso.biz -OnlinePstnUsages "US and Canada"
```

Caution

Make sure that your regular expression in the NumberPattern attribute is a valid expression. You can test it using this website: <https://www.regexpal.com>

In some cases, there is a need to route all calls to the same SBC; use -NumberPattern ".*"

Route all calls to the same SBC.

```
Set-CsOnlineVoiceRoute -id "Redmond 1" -NumberPattern ".*" -OnlinePstnGatewayList sbc1.contoso.biz
```

Verify that you've correctly configured the route by running the `Get-CsOnlineVoiceRoute` PowerShell command using options as shown:

```
Get-CsOnlineVoiceRoute | Where-Object {($_.priority -eq 1) -or ($_.priority -eq 2) or ($_.priority -eq 4) -
Identity "Redmond 1" -NumberPattern "\+1(425|206) (\d{7})$" -OnlinePstnGatewayList sbc1.contoso.biz,
sbc2.contoso.biz -Priority 1 -OnlinePstnUsages "US and Canada"
```

Which should return:

```
Identity          : Redmond 1
Priority           : 1
Description       :
NumberPattern     : "\+1(425|206) (\d{7})$"
OnlinePstnUsages  : {US and Canada}
OnlinePstnGatewayList : {sbc1.contoso.biz, sbc2.contoso.biz}
Name              : Redmond 1
Identity          : Redmond 2
Priority           : 2
Description       :
NumberPattern     : "\+1(425|206) (\d{7})$"
OnlinePstnUsages  : {US and Canada}
OnlinePstnGatewayList : {sbc3.contoso.biz, sbc4.contoso.biz}
Name              : Redmond 2

Identity          : Other +1
Priority           : 4
Description       :
NumberPattern     : "\+1(\d{10})$"
OnlinePstnUsages  : {US and Canada}
OnlinePstnGatewayList : {sbc5.contoso.biz, sbc6.contoso.biz}
Name              : Other +1
```

In the example, the route "Other +1" was automatically assigned priority 4.

Step 3: Create a voice routing policy named "US Only" and add the "US and Canada" PSTN usage to the policy

In a PowerShell session in Skype for Business Online, type:

```
New-CsOnlineVoiceRoutingPolicy "US Only" -OnlinePstnUsages "US and Canada"
```

The result is shown in this example:

```
Identity           : Tag:US only
OnlinePstnUsages   : {US and Canada}
Description        :
RouteType          : BYOT
```

Step 4: Assign the voice routing policy to a user named Spencer Low

In a PowerShell session in Skype for Business Online, type:

```
Grant-CsOnlineVoiceRoutingPolicy -Identity "Spencer Low" -PolicyName "US Only"
```

Validate the policy assignment by entering this command:

```
Get-CsOnlineUser "Spencer Low" | select OnlineVoiceRoutingPolicy
```

The command returns the following:

```
OnlineVoiceRoutingPolicy
-----
US Only
```

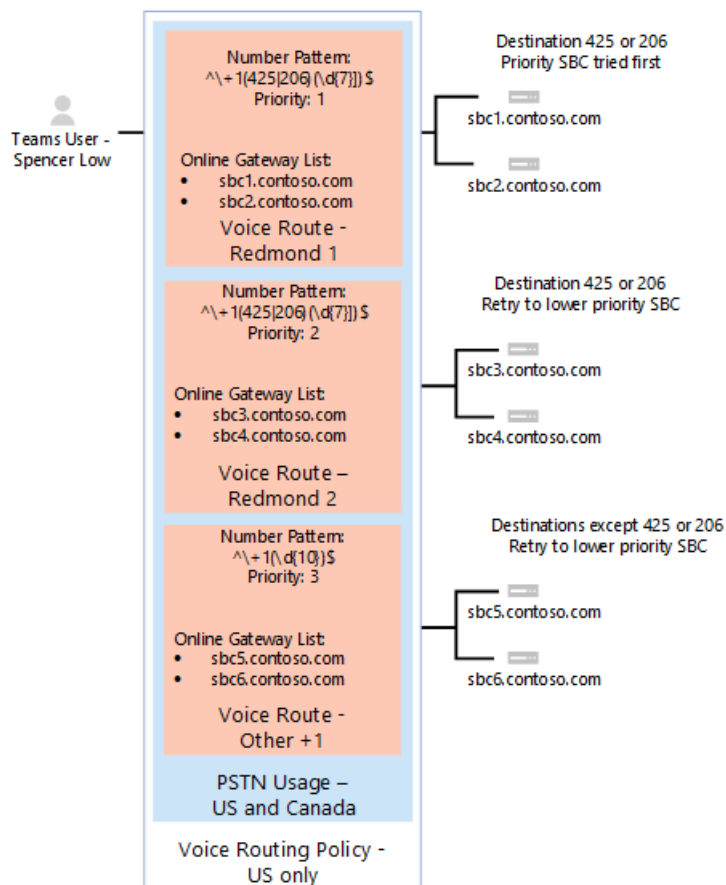

Example 2: Voice routing with multiple PSTN usages

The voice routing policy created in Example 1 only allows calls to phone numbers in the US and Canada--unless the Microsoft Calling Plan license is also assigned to the user.

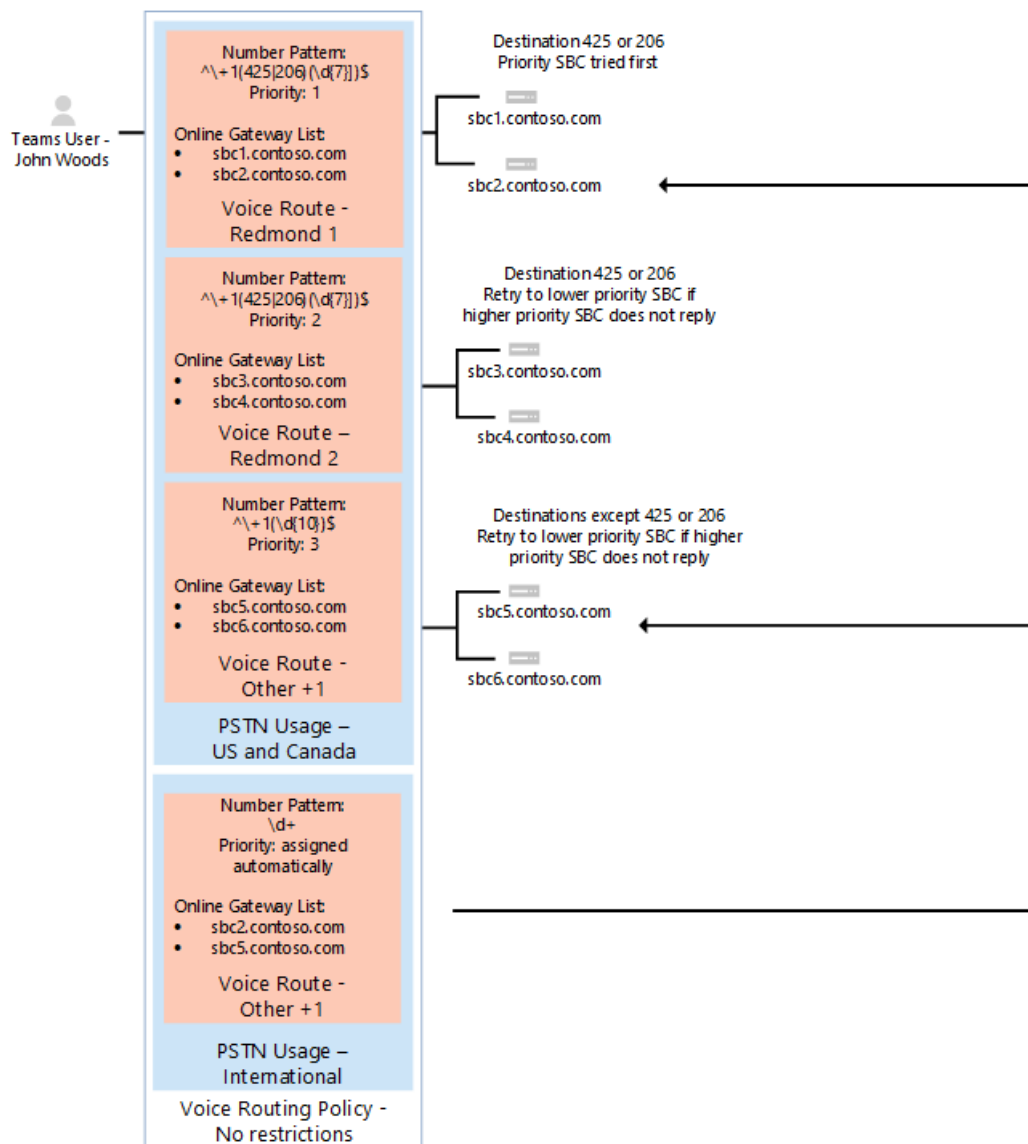

In the example that follows, you can create the "No Restrictions" voice routing policy. The policy reuses the "US and Canada" PSTN usage created in Example 1, as well as the new "International" PSTN usage. This policy routes all other calls to the SBCs sbc2.contoso.biz and sbc5.contoso.biz.

The examples that are shown assign the US Only policy to user Spencer Low, and the No Restrictions policy to the user John Woods so that routing occurs as follows:

- Spencer Low – US Only policy. Calls are allowed only to US and Canadian numbers. When calling to the Redmond number range, the specific set of SBCs must be used. Non-US numbers will not be routed unless the Calling Plan license is assigned to the user.
- John Woods – International policy. Calls are allowed to any number. When calling to the Redmond number range, the specific set of SBCs must be used. Non-US numbers will be routed using sbc2.contoso.biz and sbc5.contoso.biz.

For all other calls, if a user has both licenses (Microsoft Phone System and Microsoft Calling Plan), automatic route is used. If nothing matches the number patterns in the administrator-created online voice routes, then the call is routed using Microsoft Calling Plan. If the user has only Microsoft Phone System, the call is dropped because no matching rules are available.

The following table summarizes routing policy "No Restrictions" usage designations and voice routes.

PSTN USAGE	VOICE ROUTE	NUMBER PATTERN	PRIORITY	SBC	DESCRIPTION
US and Canada	"Redmond 1"	$\wedge\backslash+1(425 206)(\backslash d\{7\})\$$	1	sbc1.contoso.biz sbc2.contoso.biz	Active route for callee numbers +1 425 XXX XX XX or +1 206 XXX XX XX
US and Canada	"Redmond 2"	$\wedge\backslash+1(425 206)(\backslash d\{7\})\$$	2	sbc3.contoso.biz sbc4.contoso.biz	Backup route for callee numbers +1 425 XXX XX XX or +1 206 XXX XX XX
US and Canada	"Other +1"	$\wedge\backslash+1(\backslash d\{10\})\$$	3	sbc5.contoso.biz sbc6.contoso.biz	Route for callee numbers +1 XXX XX XX XX (except +1 425 XXX XX XX or +1 206 XXX XX XX)

PSTN USAGE	VOICE ROUTE	NUMBER PATTERN	PRIORITY	SBC	DESCRIPTION
International	International	\d+	4	sbc2.contoso.biz sbc5.contoso.biz	Route for any number pattern

NOTE

- The order of PSTN usages in voice routing policies is critical. The usages are applied in order, and if a match is found in the first usage, then other usages are never evaluated. The "International" PSTN usage must be placed after the "US and Canada" PSTN usage. To change the order of the PSTN usages, run the `Set-CsOnlineVoiceRoutingPolicy` command.
For example, to change the order from "US and Canada" first and "International" second to the reverse order run:

```
Set-CsOnlineVoiceRoutingPolicy -id tag:"no Restrictions" -OnlinePstnUsages @{Replace="International", "US and Canada"}
```
- The priority for "Other +1" and "International" voice routes are assigned automatically. They don't matter as long as they have lower priorities than "Redmond 1" and "Redmond 2."

Example 2: Configuration steps

The following example shows how to:

1. Create a new PSTN usage called International.
2. Create a new voice route called International.
3. Create a voice routing policy called No Restrictions.
4. Assign the policy to user John Woods.

You can use the [Microsoft Teams admin center](#) or [PowerShell](#) to perform these steps.

Using the Microsoft Teams admin center

Step 1: Create the "International" PSTN usage

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Direct Routing**, and then in the upper-right corner, select **Manage PSTN usage records**.
2. Click **Add**, type **International**, and then click **Apply**.

Step 2: Create the "International" voice route

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Direct Routing**, and then select the **Voice routes** tab.
2. Click **Add**, enter "International" as the name, and then add the description.
3. Set the priority to 4, and then set the dialed number pattern to \d+.
4. Under **SBCs enrolled (optional)**, click **Add SBCs**, select sbc2.contoso.biz and sbc5.contoso.biz, and then click **Apply**.
5. Under **PSTN usage records (optional)**, click **Add PSTN usage**, select the "International" PSTN usage record, and then click **Apply**.
6. Click **Save**.

Step 3: Create a voice routing policy named "No Restrictions" and add the "US and Canada" and "International" PSTN usages to the policy

The PSTN usage "US and Canada" are reused in this voice routing policy to preserve special handling for calls to number "+1 425 XXX XX XX" and "+1 206 XXX XX XX" as local or on-premises calls.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Voice routing policies**, and then click **Add**.

2. Type **No Restrictions** as the name and add a description.
3. Under **PSTN usage records**, click **Add PSTN usage**, select the "US and Canada" PSTN usage record, and then select the "International" PSTN usage record. Click **Apply**.

Take note of the order of PSTN usages:

- If a call made to number "+1 425 XXX XX XX" with the usages configured as in this example, the call follows the route set in "US and Canada" usage and the special routing logic is applied. That is, the call is routed using sbc1.contoso.biz and sbc2.contoso.biz first, and then sbc3.contoso.biz and sbc4.contoso.biz as the backup routes.
- If "International" PSTN usage is before "US and Canada," calls to +1 425 XXX XX XX are routed to sbc2.contoso.biz and sbc5.contoso.biz as part of the routing logic.

4. Click **Save**.

To learn more, see [Manage voice routing policies](#).

Step 4: Assign the voice routing policy to a user named John Woods

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then click the user.
2. Click **Policies**, and then next to **Assigned policies**, click **Edit**.
3. Under **Voice routing policy**, select the "No Restrictions" policy, and then click **Save**.

The result is that the voice policy applied to John Woods' calls is unrestricted and will follow the logic of call routing available for US, Canada, and International calling.

Using PowerShell

Step 1: Create the "International" PSTN usage

In a remote PowerShell session in Skype for Business Online, enter:

```
Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="International"}
```

Step 2: Create a new voice route named "International"

```
New-CsOnlineVoiceRoute -Identity "International" -NumberPattern ".*" -OnlinePstnGatewayList  
sbc2.contoso.biz, sbc5.contoso.biz -OnlinePstnUsages "International"
```

Which returns:

```
Identity           : International  
Priority            : 5  
Description        :  
NumberPattern      : .*  
OnlinePstnUsages   : {International}  
OnlinePstnGatewayList : {sbc2.contoso.biz, sbc5.contoso.biz}  
Name               : International
```

Step 3: Create a voice routing policy named "No Restrictions"

The PSTN usage "Redmond 1" and "Redmond" are reused in this voice routing policy to preserve special handling for calls to number "+1 425 XXX XX XX" and "+1 206 XXX XX XX" as local or on-premises calls.

```
New-CsOnlineVoiceRoutingPolicy "No Restrictions" -OnlinePstnUsages "US and Canada", "International"
```

Take note of the order of PSTN usages:

- If a call made to number "+1 425 XXX XX XX" with the usages configured as in the following example, the call follows the route set in "US and Canada" usage and the special routing logic is applied. That is, the call is routed using sbc1.contoso.biz and sbc2.contoso.biz first, and then sbc3.contoso.biz and sbc4.contoso.biz as the backup routes.
- If "International" PSTN usage is before "US and Canada," calls to +1 425 XXX XX XX are routed to sbc2.contoso.biz and sbc5.contoso.biz as part of the routing logic. Enter the command:

```
New-CsOnlineVoiceRoutingPolicy "No Restrictions" -OnlinePstnUsages "US and Canada", "International"
```

Which returns:

```
Identity           : International
OnlinePstnUsages   : {US and Canada, International}
Description        :
RouteType          : BYOT
```

Step 4: Assign the voice routing policy to the user named John Woods

```
Grant-CsOnlineVoiceRoutingPolicy -Identity "John Woods" -PolicyName "No Restrictions"
```

Then verify the assignment using the command:

```
Get-CsOnlineUser "John Woods" | Select OnlineVoiceRoutingPolicy
```

Which returns:

```
OnlineVoiceRoutingPolicy
-----
No Restrictions
```

The result is that the voice policy applied to John Woods' calls is unrestricted, and will follow the logic of call routing available for US, Canada, and International calling.

Translate phone numbers to an alternate format

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes how to translate numbers for outbound and inbound calls to an alternate format. This is step 4 of the following steps for configuring Direct Routing:

- Step 1. [Connect the SBC with Microsoft Phone System and validate the connection](#)
- Step 2. [Enable users for Direct Routing, voice, and voicemail](#)
- Step 3. [Configure voice routing](#)
- **Step 4. Translate numbers to an alternate format** (This article)

For information on all the steps required for setting up Direct Routing, see [Configure Direct Routing](#).

Sometimes tenant administrators may want to change the number for outbound and/or inbound calls based on the patterns they created to ensure interoperability with Session Border Controllers (SBCs). This article describes how you can specify a Number Translation Rules policy to translate numbers to an alternate format.

You can use the Number Translation Rules policy to translate numbers for the following:

- Inbound calls: Calls from a PSTN endpoint (caller) to a Teams client (callee)
- Outbound calls: Calls from a Teams client (caller) to a PSTN endpoint (callee)

The policy is applied at the SBC level. You can assign multiple translation rules to an SBC, which are applied in the order that they appear when you list them in PowerShell. You can also change the order of the rules in the policy.

To create, modify, view, and delete number manipulation rules, use the [New-CsTeamsTranslationRule](#), [Set-CsTeamsTranslationRule](#), [Get-CsTeamsTranslationRule](#), and [Remove-CsTeamsTranslationRule](#) cmdlets.

To assign, configure, and list number manipulation rules on SBCs, use the [New-CSOnlinePSTNGateway](#) and [Set-CSOnlinePSTNGateway](#) cmdlets together with the `InboundTeamsNumberTranslationRules`, `InboundPSTNNumberTranslationRules`, `OutboundTeamsNumberTranslationRules`, `OutboundPSTNNumberTranslationRules`, `InboundTeamsNumberTranslationRules`, `InboundPSTNNumberTranslationRules`, `OutboundTeamsNumberTranslationRules`, and `OutboundPSTNNumberTranslationRules` parameters.

NOTE

The maximum total number of translation rules is 400, maximum translation parameter name length is 100 symbols, maximum translation parameter pattern length is 1024 symbols, and maximum translation parameter translation length is 256 symbols.

Example SBC configuration

For this scenario, the `New-CSOnlinePSTNGateway` cmdlet is run to create the following SBC configuration:

```
New-CSOnlinePSTNGateway -Identity sbc1.contoso.com -SipSignalingPort 5061 -  
InboundTeamsNumberTranslationRules 'AddPlus1', 'AddE164SeattleAreaCode' -InboundPSTNNumberTranslationRules  
'AddPlus1' -OutboundPSTNNumberTranslationRules 'AddSeattleAreaCode', -OutboundTeamsNumberTranslationRules  
'StripPlus1'
```

The translation rules assigned to the SBC are summarized in the following table:

NAME	PATTERN	TRANSLATION
AddPlus1	^\d{10})\$	+1\$1
AddE164SeattleAreaCode	^\d{4})\$	+1206555\$1
AddSeattleAreaCode	^\d{4})\$	425555\$1
StripPlus1	^+1\d{10})\$	\$1

In the following examples, there are two users, Alice and Bob. Alice is a Teams user whose number is +1 206 555 0100. Bob is a PSTN user whose number is +1 425 555 0100.

Example 1: Inbound call to a ten-digit number

Bob calls Alice using a non-E.164 ten-digit number. Bob dials 2065550100 to reach Alice. SBC uses 2065550100 in the RequestURI and To headers and 4255550100 in the From header.

HEADER	ORIGINAL	TRANSLATED HEADER	PARAMETER AND RULE APPLIED
RequestURI	INVITE sip:2065550100@sbc.contoso.com	INVITE sip:+12065550100@sbc.contoso.com	InboundTeamsNumberTranslationRules 'AddPlus1'
TO	TO: <sip:2065550100@sbc.contoso.com>	TO: <sip:+12065550100@sbc.contoso.com>	InboundTeamsNumberTranslationRules 'AddPlus1'
FROM	FROM: <sip:4255550100@sbc.contoso.com>	FROM: <sip:+14255550100@sbc.contoso.com>	InboundPSTNNumberTranslationRules 'AddPlus1'

Example 2: Inbound call to a four-digit number

Bob calls Alice using a four-digit number. Bob dials 0100 to reach Alice. SBC uses 0100 in the RequestURI and To headers and 4255550100 in the From header.

HEADER	ORIGINAL	TRANSLATED HEADER	PARAMETER AND RULE APPLIED
RequestURI	INVITE sip:0100@sbc.contoso.com	INVITE sip:+12065550100@sbc.contoso.com	InboundTeamsNumberTranslationRules 'AddE164SeattleAreaCode'
TO	TO: <sip:0100@sbc.contoso.com>	TO: <sip:+12065550100@sbc.contoso.com>	InboundTeamsNumberTranslationRules 'AddE164SeattleAreaCode'
FROM	FROM: <sip:4255550100@sbc.contoso.com>	FROM: <sip:+14255550100@sbc.contoso.com>	InboundPSTNNumberTranslationRules 'AddPlus1'

Example 3: Outbound call using a ten-digit non-E.164 number

Alice calls Bob using a ten-digit number. Alice dials 425 555 0100 to reach Bob. SBC is configured to use non-E.164 ten-digit numbers for both Teams and PSTN users.

In this scenario, a dial plan translates the number before sending it to the Direct Routing interface. When Alice enters 425 555 0100 in the Teams client, the number is translated to +14255550100 by the country dial plan. The resulting numbers are a cumulative normalization of the dial plan rules and Teams translation rules. The Teams translation rules remove the "+1" that was added by the dial plan.

HEADER	ORIGINAL	TRANSLATED HEADER	PARAMETER AND RULE APPLIED
RequestURI	INVITE sip:+14255550100@sbc.contoso.com	INVITE sip:4255550100@sbc.contoso.com	OutboundPSTNNumberTranslationRules 'StripPlus1'
TO	TO: <sip:+14255550100@sbc.contoso.com>	TO: <sip:4255555555@sbc.contoso.com>	OutboundPSTNNumberTranslationRules 'StripPlus1'
FROM	FROM: <sip:+12065550100@sbc.contoso.com>	FROM: <sip:2065550100@sbc.contoso.com>	OutboundTeamsNumberTranslationRules 'StripPlus1'

Example 4: Outbound call using a four-digit non-E.164 number

Alice calls Bob using a four-digit number. Alice uses 0100 to reach Bob from Calls or by using a contact. SBC is configured to use non-E.164 four-digit numbers for Teams users and ten-digit numbers for PSTN users. The dial plan isn't applied in this scenario.

HEADER	ORIGINAL	TRANSLATED HEADER	PARAMETER AND RULE APPLIED
RequestURI	INVITE sip:0100@sbc.contoso.com	INVITE sip:4255550100@sbc.contoso.com	InboundTeamsNumberTranslationRules 'AddSeattleAreaCode'
TO	TO: <sip:0100@sbc.contoso.com>	TO: <sip:4255555555@sbc.contoso.com>	InboundTeamsNumberTranslationRulesList 'AddSeattleAreaCode'
FROM	FROM: <sip:+12065550100@sbc.contoso.com>	FROM: <sip:2065550100@sbc.contoso.com>	InboundPSTNNumberTranslationRules 'StripPlus1'

[Plan Direct Routing](#)

[Configure Direct Routing](#)

Configure a Session Border Controller for multiple tenants

12/7/2021 • 11 minutes to read • [Edit Online](#)

Direct Routing supports configuring one Session Border Controller (SBC) to serve multiple tenants.

NOTE

This scenario is designed for Microsoft partners and/or PSTN carriers, referred to as carriers later in this document. A carrier sells telephony services delivered to Microsoft Teams to their customers.

A carrier:

- Deploys and manages an SBC in their datacenter (customers do not need to implement an SBC, and they receive telephony services from the carrier in the Teams client).
- Interconnects the SBC to multiple tenants.
- Provides PSTN services to customers.
- Manages call quality end to end.
- Charges separately for PSTN services.

Microsoft does not manage carriers. Microsoft offers a PBX (Microsoft Phone System) and a Teams client. Microsoft also certifies phones, and certifies SBCs that can be used with the Microsoft Phone System. Before choosing a carrier, please ensure that your choice has a certified SBC and can manage voice quality end to end.

The following are the technical implementation steps to configure the scenario.

Carrier only:

1. Deploy the SBC and configure it for the hosting scenario according to the [instructions from the certified SBC vendors](#).
2. Register a base domain name in the carrier tenant and request a wildcard certificate.
3. Register a subdomain for every customer, which is part of the base domain.

Carrier with a Customer Global Administrator:

1. Add the subdomain name to the customer tenant.
2. Activate the subdomain name.
3. Configure the trunk from the carrier to the customer tenant and provision users.

Please make sure you understand DNS basics and how the domain name is managed in Microsoft 365 or Office 365. Review [Get help with Microsoft 365 or Office 365 domains](#) before proceeding further.

Deploy and configure the SBC

For the detailed steps on how to deploy and configure SBCs for an SBC hosting scenario, please refer to the SBC vendor's documentation.

- **AudioCodes:** [Direct Routing Configuration notes](#), the configuration of the SBC hosting scenario described in "Connecting AudioCodes SBC to Microsoft Teams Direct Routing Hosting Model Configuration Note."
- **Oracle:** [Direct Routing Configuration notes](#), the configuration of the SBC hosting scenario is described in the

"Microsoft" section.

- **Ribbon Communications:** Please refer to the [Ribbon Communications SBC Core Microsoft Teams Configuration Guide](#) for documentation on how to configure Ribbon Core Series SBCs and to this page [Ribbon Best Practice - Configuring Carriers for Microsoft Teams Direct Routing SBC Edge](#)
- **TE-Systems (anynode):** Please register on the [TE-Systems Community page](#) for documentation and examples on how to configure anynode SBC for multiple tenants.
- **Metaswitch:** Please register on the [Metaswitch Community page](#) for documentation on how to enable Perimeta SBC for multiple tenants.

NOTE

Please pay attention to how to configure the "Contact" header. The Contact header is used to find the customer tenant on the incoming invite message.

Register a base domain and subdomains

For the hosting scenario, you need to create:

- One base domain name owned by the carrier.
- A subdomain that is part of the base domain name in every customer tenant.

In the following example:

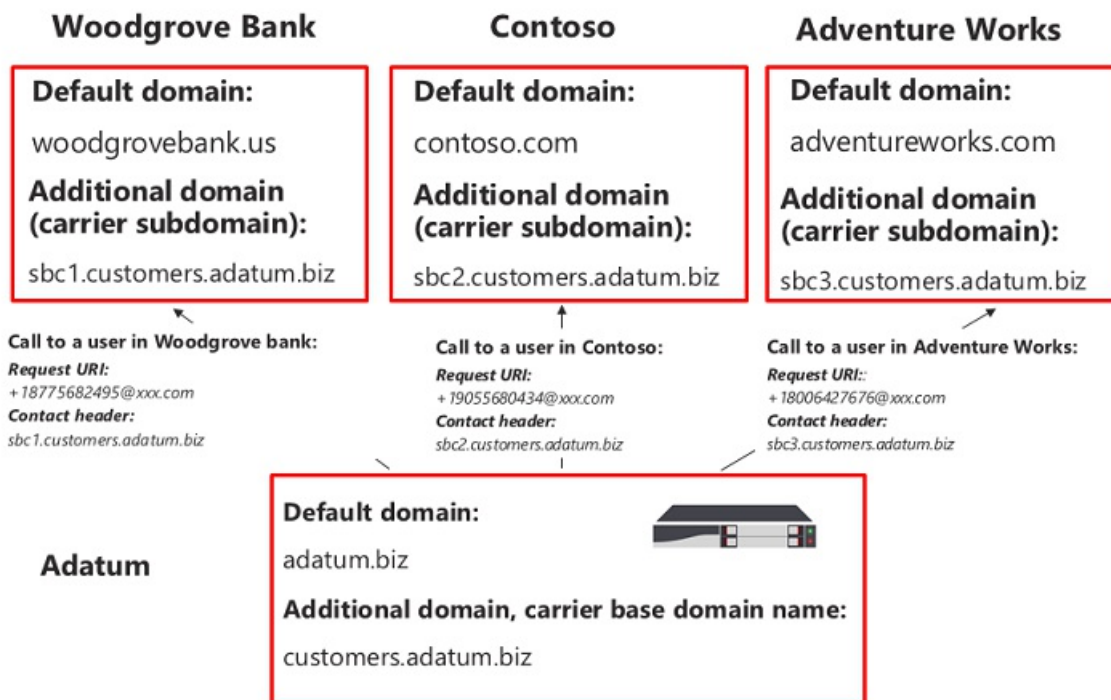

- Adatum is a carrier that serves several customers by providing Internet and telephony services.
- Woodgrove Bank, Contoso, and Adventure Works are three customers that have Microsoft 365 or Office 365 domains but receive the telephony services from Adatum.

Subdomains **MUST** match the FQDN name of the trunk that will be configured for the customer and the FQDN in the Contact header when sending the Invite to Microsoft 365 or Office 365.

When a call arrives at the Microsoft 365 or Office 365 Direct Routing interface, the interface uses the Contact header to find the tenant where the user should be looked up. Direct Routing does not use phone number lookup on the Invite, as some customers might have non-DID numbers that can overlap in several tenants. Therefore, the FQDN name in the Contact header is required to identify the exact tenant to look up the user by the phone number.

Please review [Get help with Office 365 domains](#) for more information about creating domain names in Microsoft 365 or Office 365 organizations.

The following diagram summarizes the requirements to base domain, subdomains, and Contact header.

The SBC requires a certificate to authenticate the connections. For the SBC hosting scenario, the carrier needs to request a certificate with CN and/or SAN **.base_domain* (for example, **.customers.adatum.biz*). This certificate can be used to authenticate connections to multiple tenants served from a single SBC.

The following table is an example of one configuration.

NEW DOMAIN NAME	TYPE	REGISTERED	CERTIFICATE CN/SAN FOR SBC	TENANT DEFAULT DOMAIN IN THE EXAMPLE	FQDN NAME THAT SBC MUST PRESENT IN THE CONTACT HEADER WHEN SENDING CALLS TO USERS
customers.adatum.biz	Base	In carrier tenant	*.customers.adatum.biz	adatum.biz	NA, this is a service tenant, no users
sbc1.customers.adatum.biz	Subdomain	In a customer tenant	*.customers.adatum.biz	woodgrovebank.us	sbc1.customers.adatum.biz
sbc2.customers.adatum.biz	Subdomain	In a customer tenant	*.customers.adatum.biz	contoso.com	sbc2.customers.adatum.biz
sbc3.customers.adatum.biz	Subdomain	In a customer tenant	*.customers.adatum.biz	adventureworks.com	sbc3.customers.adatum.biz

To configure the base and subdomains, please follow the steps described below. In the example, we will configure a base domain name (customers.adatum.biz) and a subdomain for one customer (sbc1.customers.adatum.biz in Woodgrove Bank tenant).

NOTE

Use sbcX.customers.adatum.biz to enable voice in the carrier tenant. sbcX can be any unique and valid alphanumeric hostname.

Register a base domain name in the carrier tenant

These actions are performed in the carrier tenant.

Ensure that you have appropriate rights in the carrier tenant

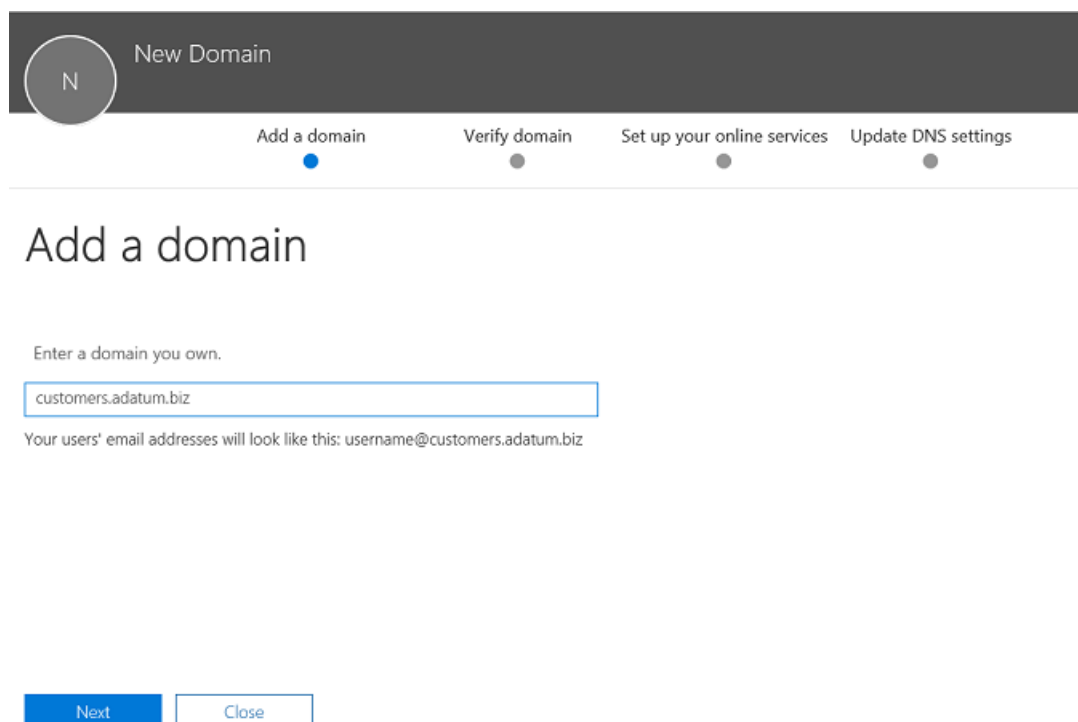

You can only add new domains if you signed in to the Microsoft 365 admin center as a Global Administrator.

To validate the role you have, please sign in to the Microsoft 365 admin center (<https://portal.office.com>), go to **Users > Active Users**, and then verify that you have a Global Administrator role.

For more information about admin roles and how to assign a role in Microsoft 365 or Office 365, see [About admin roles](#).

Add a base domain to the tenant and verify it

1. In the Microsoft 365 admin center, go to **Setup > Domains > Add domain**.
2. In the **Enter a domain you own** box, type the FQDN of the base domain. In the following example, the base domain is *customers.adatum.biz*.

New Domain

Add a domain Verify domain Set up your online services Update DNS settings

Add a domain

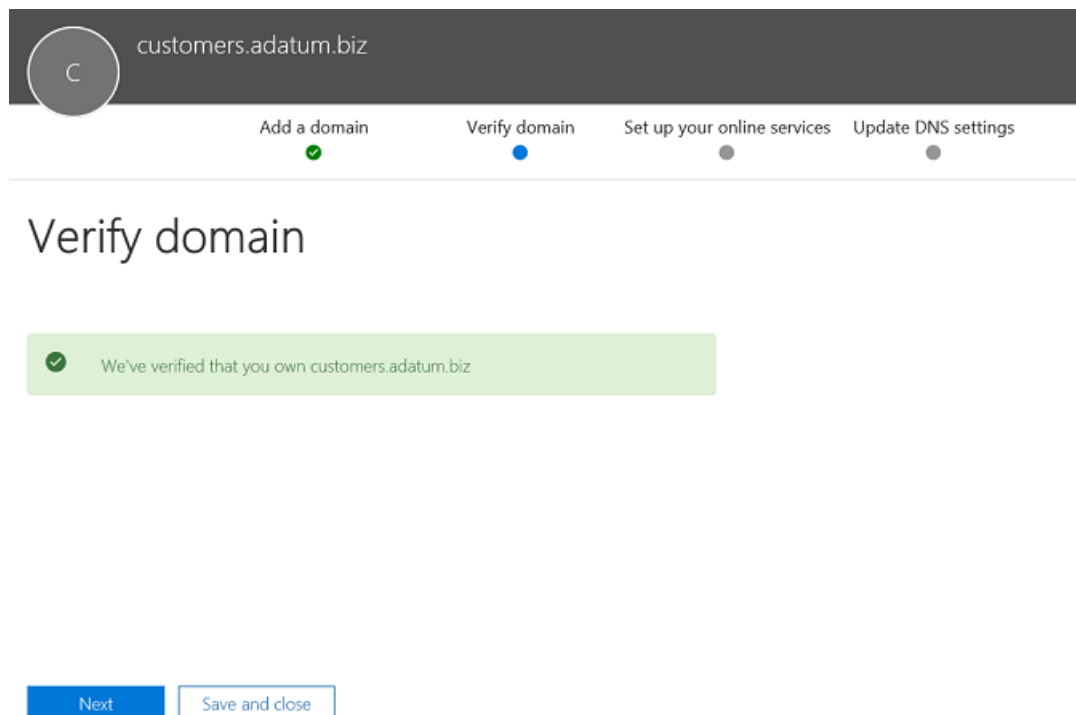

Enter a domain you own.

customers.adatum.biz

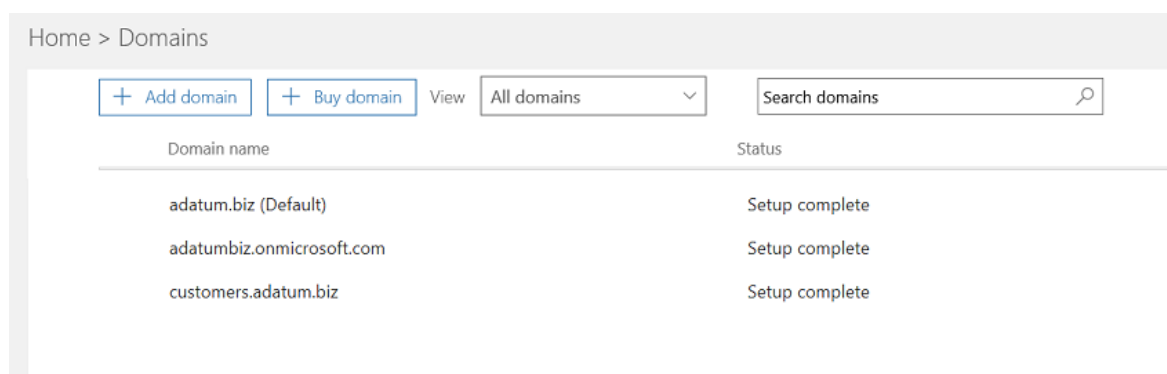

Your users' email addresses will look like this: username@customers.adatum.biz

Next Close

3. Click **Next**.
4. In the example, the tenant already has adatum.biz as a verified domain name. The wizard will not ask for additional verification because customers.adatum.biz is a subdomain for the already registered name. However, if you add an FQDN that has not been verified before, you will need to go through the process of verification. The process of verification is [described below](#).

5. Click **Next**, and on the **Update DNS Settings** page, select **I'll add the DNS records myself** and click **Next**.
6. On the next page, clear all values (unless you want to use the domain name for Exchange, SharePoint, or Teams/Skype for Business), click **Next**, and then click **Finish**. Make sure your new domain is in the Setup complete status.

Activate the domain name

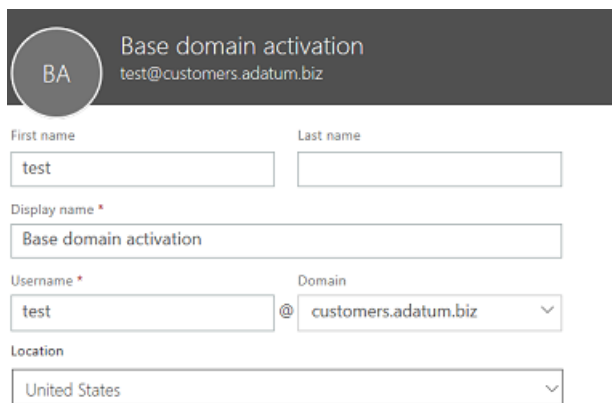

After you have registered a domain name, you need to activate it by adding at least one user with Phone System license and assigning a SIP address with the FQDN portion of the SIP address matching the created base domain.

NOTE

The Carrier tenant must keep at least one Phone System license assigned to the tenant to avoid removal of the Skype for Business configuration.

Please review [Get help with Microsoft 365 or Office 365 domains](#) for more information about adding users in Microsoft 365 or Office 365 organizations.

For example: test@customers.adatum.biz

Register a subdomain name in a customer tenant

You will need to create a unique subdomain name for every customer. In this example, we will create a subdomain sbc1.customers.adatum.biz in a tenant with the default domain name woodgrovebank.us.

All actions below are in the customer tenant.

Ensure that you have appropriate rights in the customer tenant

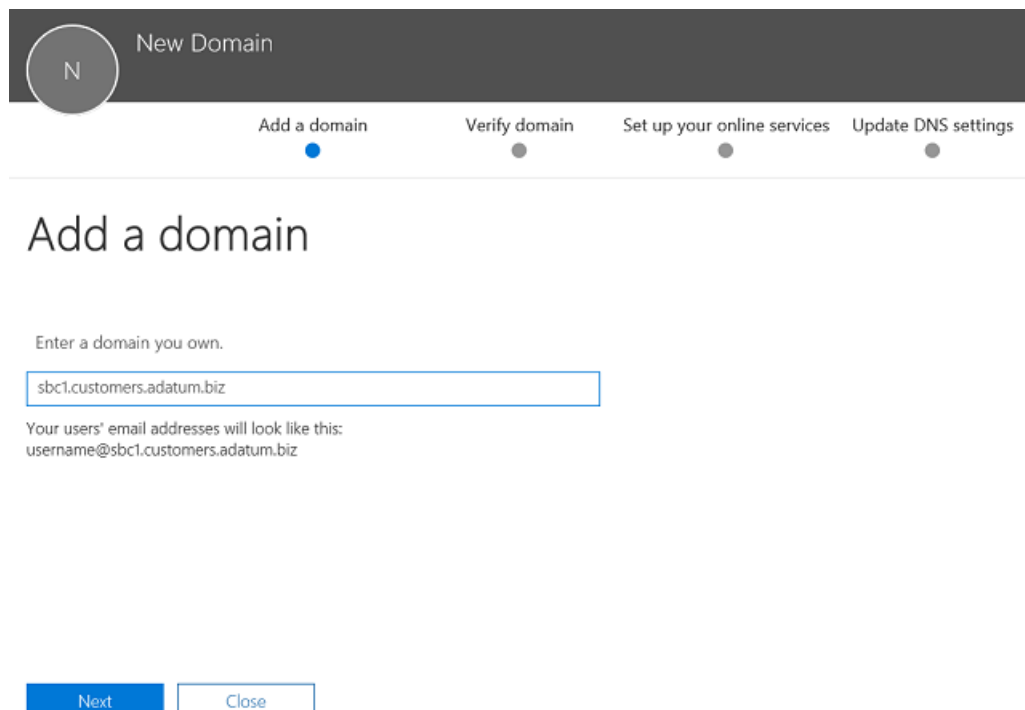

You can only add new domains if you signed in to the Microsoft 365 admin center as a Global Administrator.

To validate the role you have, please sign in to the Microsoft 365 admin center (<https://portal.office.com>), go to **Users > Active Users**, and then verify that you have a Global Administrator role.

For more information about admin roles and how to assign a role in Microsoft 365 or Office 365, see [About admin roles](#).

Add a subdomain to the customer tenant and verify it

1. In the Microsoft 365 admin center, go to **Setup > Domains > Add domain**.
2. In the **Enter a domain you own** box, type the FQDN of the subdomain for this tenant. In the example below, the subdomain is sbc1.customers.adatum.biz.

New Domain

Add a domain Verify domain Set up your online services Update DNS settings

Add a domain

Enter a domain you own.

sbc1.customers.adatum.biz

Your users' email addresses will look like this:
username@sbc1.customers.adatum.biz

Next Close

3. Click **Next**.
4. The FQDN has never been registered in the tenant. In the next step, you will need to verify the domain.

Select **Add a TXT record** instead.

Create a trunk and provision users

With the initial release of Direct Routing, Microsoft required a trunk to be added to each served tenant (customer tenant) using New-CSOnlinePSTNGateway.

However, this has not proved optimal for two reasons:

- **Overhead management.** Offloading or draining an SBC, for example, changes some parameters, like enabling or disabling media bypass. Changing the port requires changing parameters in multiple tenants (by running Set-CSOnlinePSTNGateway), but it is in fact the same SBC.
- **Overhead processing.** Gathering and monitoring trunk health data - SIP options collected from multiple logical trunks that are, in reality, the same SBC and the same physical trunk, slows down processing of the routing data.

Based on this feedback, Microsoft is bringing in a new logic to provision the trunks for the customer tenants.

Two new entities were introduced:

- A carrier trunk registered in the carrier tenant using the command `New-CSOnlinePSTNGateway`, for example `New-CSOnlinePSTNGateway -FQDN customers.adatum.biz -SIPSignalingport 5068 -ForwardPAI $true`.
- A derived trunk, that does not require registration. It is simply a desired host name added in from of the carrier trunk. It derives all of its configuration parameters from the carrier trunk. The derived trunk doesn't need to be created in PowerShell, and the association with the carrier trunk is based on the FQDN name (see details below).

Provisioning logic and example

- Carriers only need to set up and manage a single trunk (carrier trunk in the carrier domain), using the `Set-CSOnlinePSTNGateway` command. In the example above it is `adatum.biz`;
- In the customer tenant, the carrier need only to add the derived trunk FQDN to the voice routing policies of the users. There is no need to run `New-CSOnlinePSTNGateway` for a trunk.
- The derived trunk, as the name suggests, inherits or derives all the configuration parameters from the carrier trunk. Examples:
- `Customers.adatum.biz` – the carrier trunk which needs to be created in the carrier tenant.
- `Sbc1.customers.adatum.biz` – the derived trunk in a customer tenant that does not need to be created in PowerShell. You can simply add the name of the derived trunk in the customer tenant in the online voice routing policy without creating it (use derived trunk FQDN when setting up voice routing policy in TAC under Teams-Voice-Direct Routing-Voice Routes field SBCs enrolled).
- Carrier will need to setup DNS record resolving derived trunk FQDN to carrier SBC ip address.
- Any changes made on a carrier trunk (on carrier tenant) is automatically applied to derived trunks. For example, carriers can change an SIP port on the carrier trunk, and this change applies to all derived trunks. New logic to configure the trunks simplifies the management as you don't need to go to every tenant and change the parameter on every trunk.
- The options are sent only to the carrier trunk FQDN. The health status of the carrier trunk is applied to all derived trunks and is used for routing decisions. Find out more about [Direct Routing options](#).
- The carrier can drain the carrier trunk, and all derived trunks will be drained as well.

NOTE

Number translation rules applied on the carrier trunk do not apply to derived trunks. This is a known issue. As an alternative solution, number translation rule must be created for each customer's tenant.

Migration from the previous model to the carrier trunk

For migration from the current implementation of the carrier hosted model to the new model, the carriers will need to reconfigure the trunks for customer tenants. Remove the trunks from the customer tenants using `Remove-CSOnlinePSTNGateway` (leaving the trunk in the carrier tenant)-

We highly encourage migrating to the new solution as soon as possible as we will be enhancing monitoring and provisioning using the carrier and derived trunk model.

Please refer to the [SBC vendor instructions](#) on configuring sending the FQDN name of subdomains in the Contact header.

Considerations for setting up multi-tenant failover

To set up failover for a multi-tenant environment, you'll need to do the following:

- For each tenant, add the FQDNs for two different SBCs. For example:

customer1.sbc1.contoso.com

customer1.sbc2.contoso.com

- In the Online Voice Routing policies of the users, specify both SBCs. If one SBC fails, the routing policy will route calls to the second SBC.

[Configure Direct Routing](#)

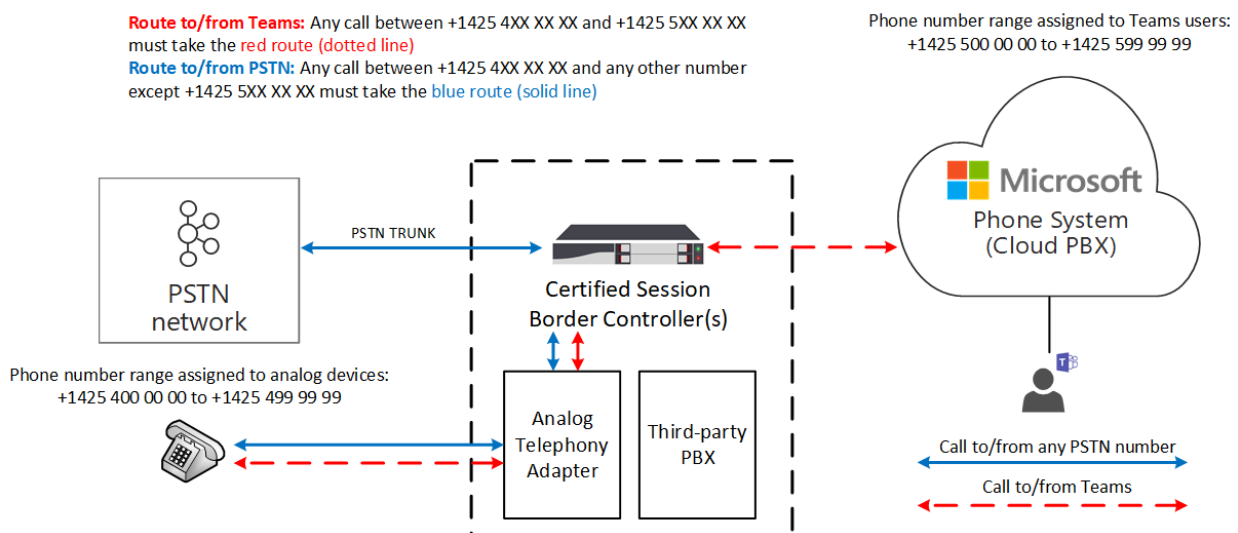

How to use analog devices with Phone System Direct Routing

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article describes how to use analog devices with Phone System Direct Routing. To connect analog devices to Direct Routing, you must use an Analog Telephony Adapter (ATA), and this adapter must be supported by the certified Session Border Controller (SBC) vendor.

When a user makes a call from an analog device, the signaling and media flow through the Analog Telephony Adapter (ATA) to the SBC. The SBC sends the call to a Microsoft Teams endpoint or to the Public Switched Telephone Network (PSTN) based on the internal routing table. When a device makes a call, the route it takes depends on the routing policies created for the device.

In the following diagram, Direct Routing is configured so that any Teams calls to and from the numbers between +1425 4XX XX XX and +1425 5XX XX XX must take the red route (dotted line), and any PSTN call to and from numbers between +1425 4XX XX XX and any other number except number range +1425 5XX XX XX must take the blue route (solid line).

Example: How to configure the use of analog devices with Direct Routing

To configure the use of analog devices with Direct Routing, you must connect the Analog Telephony Adapter to the SBC, and configure the SBC to work with Direct Routing.

This example walks you through the following steps:

1. Connect the SBC to Direct Routing.
2. Create the PSTN Usage.
3. Create a voice route and associate it with the PSTN Usage.
4. Assign the voice route to the PSTN Usage.
5. Enable the online user.
6. Assign the voice route policy to the user.
7. Create a voice route for an analog device.

For information on how to connect an ATA to an SBC and configure the SBC, see your SBC manufacturer

configuration guide:

- [AudioCodes configuration documentation](#)
- [Ribbon configuration documentation](#)
- [Oracle configuration documentation](#)

Step 1. Connect the SBC to Direct Routing

The following command configures the SBC connection as follows:

- FQDN sbc.contoso.com
- Signaling port 5068
- Media bypass mode
- Call history information forwarded to the SBC-
- P-Asserted-Identity (PAI) header forwarded along with the call

```
PS C:\> New-CsOnlinePSTNGateway -FQDN sbc.contoso.com -SIPSignalingPort 5068 -ForwardCallHistory $true -ForwardPAI $true -MediaBypass $true -Enabled $true
```

Step 2: Create the PSTN usage

The next command creates an empty PSTN usage. Online PSTN usages are string values that are used for call authorization. An online PSTN usage links an online voice policy to a route. This example adds the string "Interop" to the current list of available PSTN usages.

```
PS C:\> Set-CsOnlinePstnUsage -Identity global -Usage @{add="Interop"}
```

Step 3: Create a voice route and associate it with the PSTN usage:

This command creates a new online voice route with the identity "analog-interop" for the number range +1425 XXX XX XX. The voice route is applicable to a list of online gateways sbc.contoso.com and associates the route with online PSTN usage "Interop". A voice route includes a regular expression that identifies which phone numbers will be routed through a given voice route:

```
PS C:\> New-CsOnlineVoiceRoute -Identity analog-interop -NumberPattern "^+1(425)(\d{7})$" -OnlinePstnGatewayList sbc.contoso.com -Priority 1 -OnlinePstnUsages "Interop"
```

Step 4: Assign the voice route to the PSTN usage:

This command creates a new online per-user voice routing policy with the Identity "AnalogInteropPolicy". This policy is assigned a single online PSTN usage: "Interop".

```
PS C:\> New-CsOnlineVoiceRoutingPolicy -Identity "AnalogInteropPolicy" -Name "AnalogInteropPolicy" -OnlinePstnUsages "Interop"
```

Step 5: Enable the online user

This command modifies the user account with the Identity exampleuser@contoso.com. In this case, the account is modified to enable Enterprise Voice, the Microsoft implementation of VoIP, with enabled voice mail and

assigns the number +14255000000 to this user. This command should be run for each Teams user (excluding ATA device users) in the company tenant.

```
PS C:\> Set-CsUser -Identity "exampleuser@contoso.com" -EnterpriseVoiceEnabled $True -HostedVoiceMail $True -OnPremLineUri "tel:+14255000000"
```

Step 6: Assign the voice route policy to a user

This command assigns the per-user online voice routing policy AnalogInteropPolicy to the user with the identity exampleuser@contoso.com. This command should be run for each Teams user (excluding ATA device users) in the company tenant.

```
PS C:\> Grant-CsOnlineVoiceRoutingPolicy -Identity "exampleuser@contoso.com" -PolicyName "AnalogInteropPolicy"
```

Step 7: Create a voice route for an analog device

This command creates an online voice route with identity "analog-interop" for number range +1425 4XX XX XX applicable to a list of online gateways sbc.contoso.com and associates it with online PSTN usage "Interop". This command should be run for each analog device with appropriate phone number pattern. Alternatively, a proper number pattern for analog devices can be used while configuring the online voice route during one of the previous steps.

```
PS C:\> New-CsOnlineVoiceRoute -Identity analog-interop -NumberPattern "^+1(4254)(\d{6})$" -OnlinePstnGatewayList sbc.contoso.com -Priority 1 -OnlinePstnUsages "Interop"
```

Considerations

- Unless otherwise note, an analog device is any device that can send DTMF digits to place a call. For example, analog phones, fax machines, and overhead pagers.
- Analog phones connected to an ATA are not searchable from Teams. Teams users must manually enter the phone number associated with the device to call that device.

[Configure Direct Routing](#)

Manage call routing policies for Direct Routing

12/7/2021 • 2 minutes to read • [Edit Online](#)

If you've deployed [Direct Routing](#) in your organization, you use call routing policies to allow Teams users to receive and make phone calls to the Public Switched Telephone Network (PSTN) using your on-premises telephony infrastructure.

A call routing policy (also called a voice routing policy) is a container for PSTN usage records. You create and manage voice routing policies by going to **Voice > Voice routing policies** in the Microsoft Teams admin center or by using Windows PowerShell.

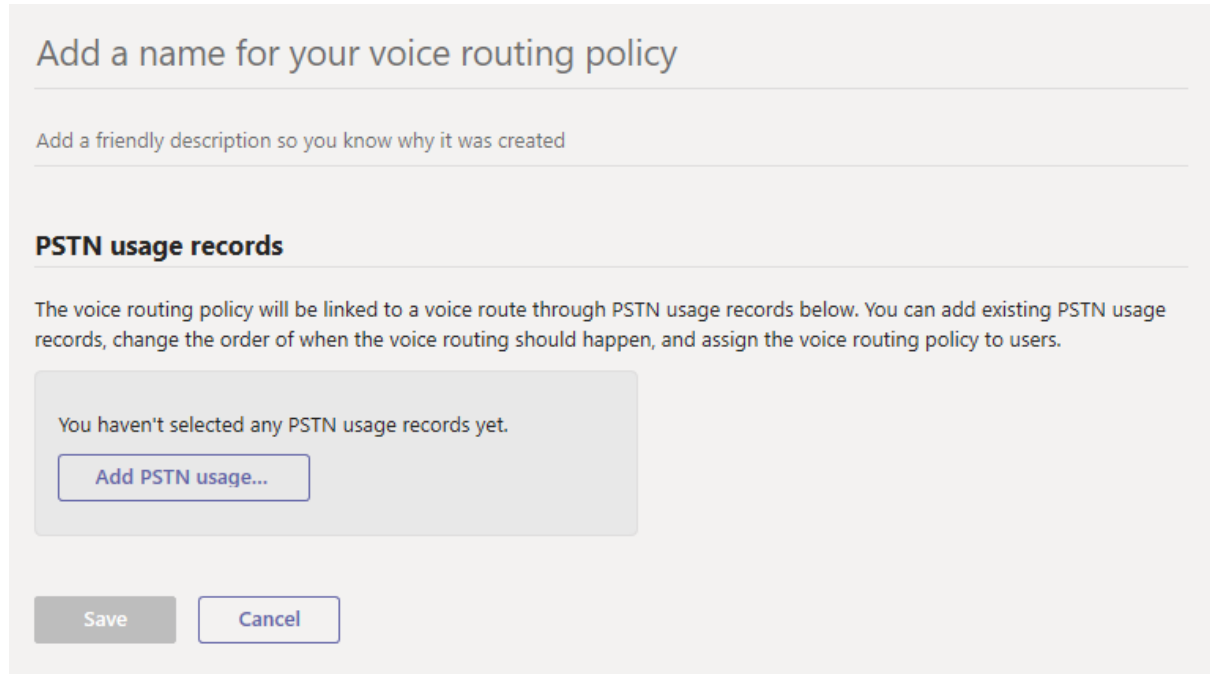

You can use the global (Org-wide default) policy or create and assign custom policies. Users will automatically get the global policy unless you create and assign a custom policy. Keep in mind that you can edit the settings in the global policy but you can't rename or delete it.

It's important to know that assigning a voice routing policy to a user doesn't enable them to make PSTN calls in Teams. You'll also need to enable the user for Phone System Direct Routing and complete other configuration steps. To learn more, see [Configure Direct Routing](#).

Create a custom call routing policy

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Voice routing policies**, and then click **Add**.

The screenshot shows a dialog box titled "Add a name for your voice routing policy". It has a text input field for a name and a smaller text input field for a description with the placeholder "Add a friendly description so you know why it was created". Below these is a section titled "PSTN usage records" with explanatory text: "The voice routing policy will be linked to a voice route through PSTN usage records below. You can add existing PSTN usage records, change the order of when the voice routing should happen, and assign the voice routing policy to users." Under this section is a message box that says "You haven't selected any PSTN usage records yet." with a button labeled "Add PSTN usage...". At the bottom of the dialog are "Save" and "Cancel" buttons.

2. Enter a name and description for the policy.
3. Under **PSTN usage records**, click **Add PSTN usage**, and then select the records that you want to add. If you need to create a new PSTN usage record, click **Add**.
4. If you added multiple PSTN usage records, arrange them in the order that you want.
5. When you're done, click **Apply**.
6. Click **Save**.

Using PowerShell

See [New-CsOnlineVoiceRoutingPolicy](#).

Edit a call routing policy

Using the Microsoft Teams admin center

You can edit the global policy or any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Voice routing policies**.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. Click **Add/remove PSTN usage records**, make the changes that you want, and then click **Save**.

Using PowerShell

See [Set-CsOnlineVoiceRoutingPolicy](#).

Assign a custom call routing policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

See also [Grant-CsOnlineVoiceRoutingPolicy](#).

Manage call notifications

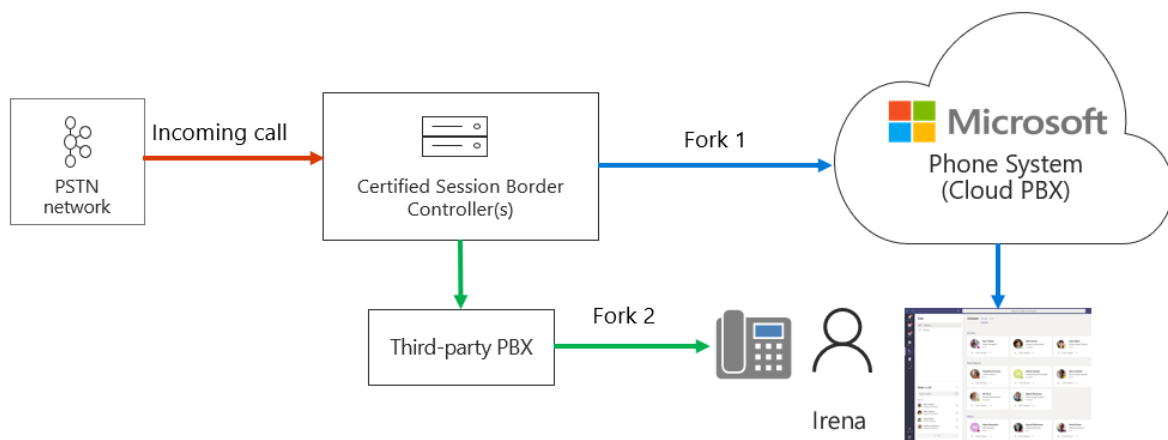

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article describes how to manage call notifications for your users. You can configure call endpoints to both Teams and to a third-party Private Branch Exchange (PBX) or Session Border Controller (SBC). This setup is useful, for example, if you want to send a call to a user's mobile and desk phones at the same time.

In the following diagram, user Irena has two endpoints:

- A Teams endpoint
- A SIP phone connected to a third-party SBC

When a call arrives, the SBC forks the call between Phone System Direct Routing and the third-party SBC.

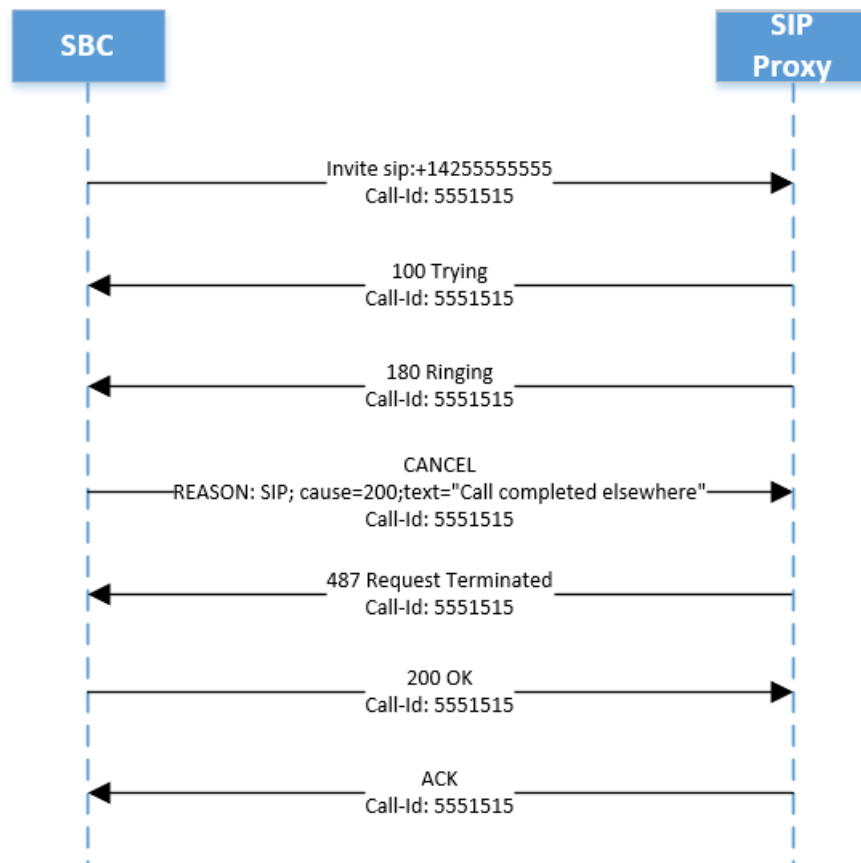

If the call is accepted on Fork 2 (by the third-party SBC), Teams will generate a "Missed Call" notification.

You can prevent the "Missed Call" notification by configuring the SBC to send a Cancel on Fork 1 as follows:

REASON: SIP; cause=200;text"Call completed elsewhere"

The call won't be registered in the call detail records of Microsoft Phone System as a successful call. The call will be registered as an "Attempt" with Final SIP Code "487", Final Microsoft subcode "540200", and Final SIP Code Phrase "Call completed elsewhere". (To view the call detail records, go the Teams Admin portal, Analytics and Reports, Usage Reports, and select PSTN Usage.)

The diagram below illustrates the SIP ladder for Fork 1, explains the call flow, and the expected REASON in the Cancel message.

Plan Location-Based Routing for Direct Routing

12/7/2021 • 17 minutes to read • [Edit Online](#)

Overview of Location-Based Routing

In some countries and regions, it's illegal to bypass the Public Switched Telephone Network (PSTN) provider to decrease long-distance calling costs. This article describes how to use Location-Based Routing to restrict toll bypass for Microsoft Teams users based on their geographic location. This article applies only to Phone System Direct Routing.

Here you'll get an overview of Location-Based Routing and guidance to help you plan for it. When you're ready to apply and enable Location-Based Routing, see:

- [Deploy network settings for Location-Based Routing](#)
- [Enable Location-Based Routing for Direct Routing](#)

NOTE

Location-Based Routing isn't available in Microsoft 365 Government Community Cloud (GCC) High or DoD deployments.

Location-Based Routing is a feature that lets you restrict toll bypass based on policy and the user's geographic location at the time of an inbound or outbound PSTN call. Location-Based Routing is intended to provide a mechanism to prevent toll bypass. It shouldn't be used as a mechanism to dynamically route PSTN calls based on the location of the user or unintended consequences may result.

When a Teams user is enabled for Location-Based Routing, the following applies:

- To make an outbound PSTN call, one of the following must be true:
 - The user's endpoint is located in a network site that's enabled for Location-Based Routing and calls egress through the corresponding gateway that's enabled for Location-Based Routing.
 - The user's endpoint is located in a network site that's not enabled for Location-Based Routing and calls egress through a gateway that's not enabled for Location-Based Routing.

Outbound calls aren't allowed in any other scenario.

- To receive an inbound PSTN call, the user's answering endpoint must be located in the same network site where the call ingresses through the gateway that's enabled for Location-Based Routing. In any other scenario, such as if the user is roaming, the call isn't allowed and is routed to the user's call forwarding settings (typically voicemail).
- To transfer a PSTN call to another Teams user, the target user's endpoint must be located in the same network site as the user who initiates the transfer. Transfers aren't allowed in any other scenario.
- To transfer another Teams user to the PSTN, the call must be transferred through a Location-Based Routing enabled gateway located at the same network site as the initial caller. Transfers aren't allowed in any other scenario.

Location-Based Routing uses the same network region, site, and subnet definitions that Skype for Business Server uses. When toll bypass is restricted for a location, an admin associates each IP subnet and each PSTN gateway for that location to a network site. A user's location is determined by the IP subnet that the user's Teams endpoints are connected to at the time of a PSTN call. A user may have multiple Teams clients located at different sites, in which case Location-Based Routing enforces each client's routing separately depending on the

location of its endpoint.

To get familiar with some of the network terminology used in this article, see [Network settings for cloud voice features in Teams](#).

Apply Location-Based Routing

You must apply Location-Based Routing to users, network sites, and PSTN gateways.

Apply Location-Based Routing at the user location

As mentioned earlier, Location-Based Routing only applies to users who are set up for Direct Routing. Location-Based Routing doesn't apply to users who are set up for Calling Plan. Users must be enabled for Location-Based Routing if they are under toll bypass restriction, which controls the conditions in which they can make and receive PSTN calls and the PSTN gateway that can be used. When a user who is enabled for Location-Based Routing is located at a site that's enabled for Location-Based Routing, the user must make calls through a Location-Based Routing enabled gateway connected to the site.

Location-Based Routing works by determining the user's current location based on the IP address of the user's Teams endpoint and applies the rules accordingly. The location of a user who is enabled for Location-Based Routing can be categorized in the following ways:

- **The user is located at the same Location-Based Routing enabled site associated to the PSTN gateway where their DID is assigned.**
In this scenario, the user is located in a known network site that's enabled for Location-Based Routing and the user's Direct Inward Dial (DID) number terminates on a PSTN gateway that's in the same network site. For example, the user is at their office.
- **The user is located at a different Location-Based Routing enabled site not associated to PSTN gateway where their DID is assigned.**
In this scenario, the user is located in a known network site that's enabled for Location-Based Routing, and that site isn't associated with the PSTN gateway where the user's DID number is assigned. For example, the user travels to another office.
- **The user is located at an internal site that's not enabled for Location-Based Routing.**
In this scenario, the user is located in a known internal network site that's not enabled for Location-Based Routing.
- **The user is located at an unknown site.**
 - The user is located within the internal network that's not defined as a network site.
 - The user is located outside the internal network. For example, the user is on the Internet at home or in a coffee shop.

Apply Location-Based Routing at the network site

Network sites must be enabled for Location-Based Routing to help determine which gateways to route Location-Based Routing enabled users when roaming. If a user who is enabled for Location-Based Routing roams to a site that's enabled for Location-Based Routing, only the PSTN gateway that's enabled for Location-Based Routing at that site can be used for outbound calls. If a user who is enabled for Location-Based Routing roams to a site that's not enabled for Location-Based Routing, any gateway that's not enabled for Location-Based Routing can be used for outbound calls.

Apply Location-Based Routing at the PSTN gateway

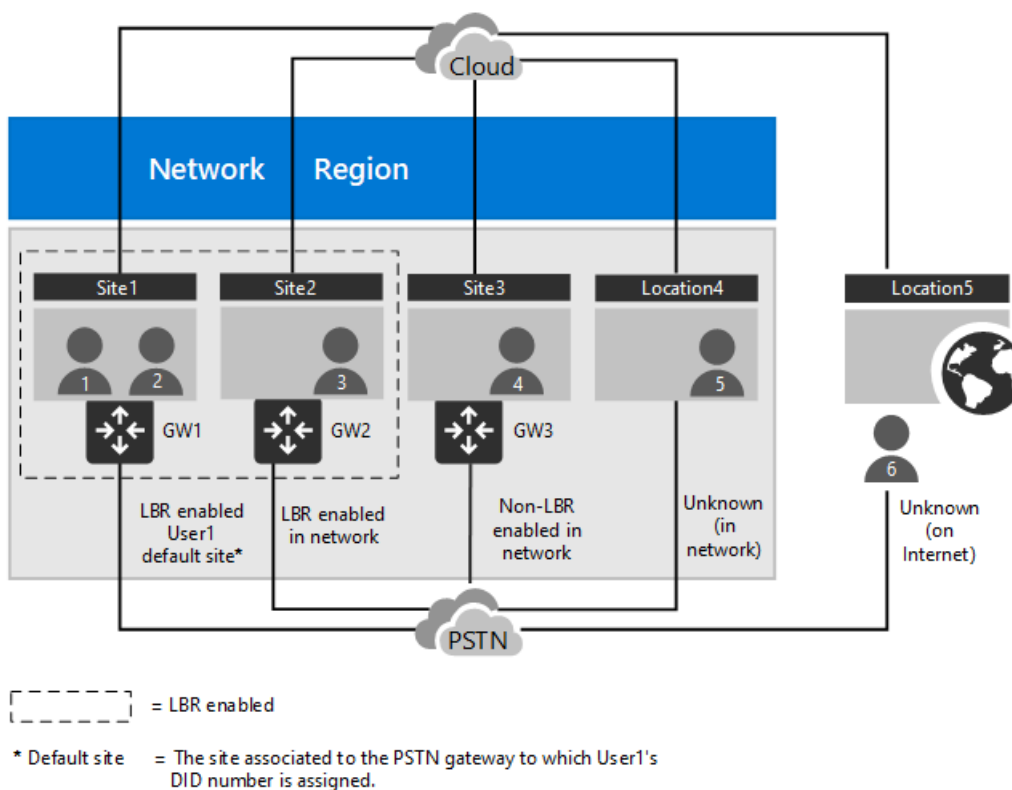

Gateways are associated to sites to determine where a user who is enabled for Location-Based Routing can be located when they make or receive a PSTN call. Gateways must be enabled for Location-Based Routing to ensure that it's under toll bypass restrictions and can't be used by users who aren't enabled for Location-Based Routing. The same gateway may be associated to multiple sites and it can be configured to be enabled for Location-Based Routing or not enabled for Location-Based Routing, depending on the site.

Scenarios for Location-Based Routing

This section describes different scenarios for restricting toll bypass by using Location-Based Routing and compares how calls are routed for users who aren't enabled for Location-Based Routing with users who are enabled for Location-Based Routing.

- Teams user places an outbound call to the PSTN
- Teams user receives an inbound call from the PSTN
- Teams user transfers or forwards call to another Teams user
- Teams user transfers or forwards call to PSTN endpoint
- Simultaneous ringing
- Delegation

The following diagram shows the restrictions enabled by Location-Based Routing in each scenario. Users, network sites, and gateways that are enabled for Location-Based Routing have a border around them. Use the diagram as a guide to help you understand how Location-Based Routing works in each scenario.

Teams user places an outbound call to the PSTN

User not enabled for Location-Based Routing

A user who isn't enabled for Location-Based Routing can make outbound calls using any gateway at any site that's not enabled for Location-Based Routing through their assigned voice routing policy. However, if a gateway is enabled for Location-Based Routing, the user can't make outbound calls through the gateway even if it's assigned to their voice routing policy. If the user roams to a site that's enabled for Location-Based Routing, they can only make calls through their normal routing gateways that aren't enabled for Location-Based Routing.

User enabled for Location-Based Routing

In comparison, the routing of outbound calls for users who are enabled for Location-Based Routing is affected by the network location of the user's endpoint. The following table shows how Location-Based Routing affects the routing of outbound calls of User1, depending on the location of User1.

USER1 ENDPOINT LOCATION	ROUTING OF OUTBOUND CALLS FOR USER1
Same site where user's DID is assigned, site enabled for Location-Based Routing (Site1)	Call routed through gateway that's enabled for Location-Based Routing (GW1) at Site1, based on the user's voice routing policy
Different site than where user's DID is assigned, site enabled for Location-Based Routing (Site2)	Call routed through gateway that's enabled for Location-Based Routing (GW2) at room Site2, based on user's voice routing policy
Different site than where user's DID is assigned, site not enabled for Location-Based Routing (Site3)	Call routed through gateway that's not enabled for Location-Based Routing at site that's not enabled for Location-Based Routing (GW3), based on user's voice routing policy
Unknown internal network (Location4)	PSTN calling not allowed
Unknown external network (Location5)	PSTN calling not allowed

Teams user receives an inbound call from the PSTN

User not enabled for Location-Based Routing

A user who isn't enabled for Location-Based Routing can receive an inbound call from the gateway that's not enabled for Location-Based Routing from which their assigned DID number ingresses. If the user roams to a site that's not enabled for Location-Based Routing, they can still receive calls through their normal PSTN gateways.

User enabled for Location-Based Routing

In comparison, users enabled for Location-Based Routing can only receive inbound calls from the PSTN gateway their DID is assigned to when they are located at the same site. The following table shows how User1 receives inbound calls when User1 moves to different network locations. If the call isn't routed to the endpoint of the user, it goes to the user's call forwarding settings, if the settings are configured. Typically, this is voicemail.

USER1 ENDPOINT LOCATION	ROUTING OF INBOUND CALLS TO USER1
Same site as where user's DID is assigned, site enabled for Location-Based Routing (Site1)	Calls routed to User1's endpoint in Site1
Different site than where user's DID is assigned, site enabled for Location-Based Routing (Site2)	Calls not routed to endpoints in Site2
Different site than where user's DID is assigned, site not enabled for Location-Based Routing (Site3)	Calls not routed to endpoints in Site3
Unknown internal network (Location4)	Calls not routed to endpoints in Location4
Unknown external network (Location5)	Calls not routed to endpoints in Location5

Teams user transfers or forwards call to another Teams user

When a PSTN endpoint is involved, Location-Based Routing analyzes whether one or both users are enabled for Location-Based Routing and determines whether the call should be transferred or forwarded depending on the location of both endpoints.

Call transfer requires the initiating user to pick up the call while call forwarding doesn't require the initial call to be answered. This means that calls can be forwarded even if User1 isn't at a location to receive inbound calls (see the table in the [Teams user receives an inbound call from the PSTN](#) section) and calls can't be transferred if User1 is unable to receive the inbound call.

User not enabled for Location-Based Routing

A user who isn't enabled for Location-Based Routing can transfer or forward PSTN calls to other users who aren't enabled for Location-Based Routing. The user will typically not be allowed to transfer or forward a PSTN call to a user who is enabled for Location-Based Routing because Location-Based Routing enabled users are generally only allowed to be co-located at Location-Based Routing enabled gateways for PSTN calls. The exception is when a Location-Based Routing enabled user roams to a site that's not enabled for Location-Based Routing. In this scenario, the transferred call is allowed.

Likewise, a user who isn't enabled for Location-Based Routing can only receive a transfer or forwarded PSTN call from another user who isn't enabled for Location-Based Routing.

User enabled for Location-Based Routing

Generally, transferring and forwarding inbound PSTN calls from a gateway that's enabled for Location-Based Routing is allowed only if the target user is enabled for Location-Based Routing and is located at the same site. Otherwise, transferring and forwarding calls isn't allowed.

The following table shows whether call forwarding and call transfers are allowed, depending on the location of the target user. In this table, User1, located in Site1, initiates the transfer or forward to other Teams users who are also enabled for Location-Based Routing and who are in different locations.

TARGET USER ENDPOINT LOCATION	USER1 INITIATES CALL TRANSFER	USER1 INITIATES CALL FORWARD
Same network site as initiator (User2)	Allowed	Allowed
Different network site, site enabled for Location-Based Routing (User3)	Not allowed	Not allowed
Different network site, site not enabled for Location-Based Routing (User4)	Not allowed	Not allowed
Unknown internal network (User5)	Not allowed	Not allowed
Unknown external network (User6)	Not allowed	Not allowed

Teams user transfers or forwards call to PSTN endpoint

User not enabled for Location-Based Routing

- Transferring and forwarding a PSTN call to another PSTN number is allowed.
- Transferring and forwarding an inbound VOIP call to the PSTN must honor the caller's toll bypass restrictions.
 - If the caller isn't enabled for Location-Based Routing, they can be transferred to any PSTN gateway that's not enabled for Location-Based Routing.
 - If the caller is enabled for Location-Based Routing, they can only be transferred to a Location-Based Routing enabled gateway located at the same network site.

User enabled for Location-Based Routing

- Transferring and forwarding inbound a PSTN call to another PSTN number must be routed out the same Location-Based Routing enabled gateway that the inbound call arrived on.
- Transferring and forwarding an inbound VOIP call to the PSTN must honor both the caller and called user's toll bypass restrictions.
 - If the caller isn't enabled for Location-Based Routing, they can be transferred to any PSTN gateway that's not enabled for Location-Based Routing.
 - If the caller is enabled for Location-Based Routing, they can be only be transferred to a Location-Based Routing enabled gateway located at the same network site.

The following table shows how Location-Based Routing affects routing of a VOIP call from User1 at Site1 to users in different locations who transfer or forward the call to a PSTN endpoint.

USER INITIATING CALL TRANSFER OR FORWARD	TRANSFER TO PSTN	FORWARD TO PSTN
Same network site, site enabled for Location-Based Routing (User2)	Call transfer can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User2's voice routing policy	Call forward can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User2's voice routing policy
Different network site, site enabled for Location-Based Routing (User3)	Call transfer can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User3's voice routing policy	Call forward can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User3's voice routing policy
Different network site, site not enabled for Location-Based Routing (User4)	Call transfer can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User4's voice routing policy	Call forward can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User4's voice routing policy
Unknown internal network (User5)	Call transfer can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User5's voice routing policy	Call forward can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User5's voice routing policy
Unknown external network (User6)	Call transfer can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User6's voice routing policy	Call forward can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User6's voice routing policy

Simultaneous ringing

When a user who's enabled for Location-Based Routing receives a call and has simultaneous ringing enabled, Location-Based Routing analyzes the location of the calling party and the endpoints of the called parties to determine whether the call should be routed. Simultaneous ringing follows the same Location-Based rules as call transfers and forwards.

Simultaneous ringing for another Teams user

The following table shows whether Location-Based Routing allows simultaneous ringing to different users for an inbound PSTN call for User1.

TARGET USER ENDPOINT LOCATION	SIMULTANEOUS RING
Same network site as initiator (User2)	Allowed
Different roamed network site enabled for Location-Based Routing (User3)	Not allowed
Roamed network site not enabled for Location-Based Routing (User4)	Not allowed
Unknown internal network (User5)	Not allowed
Unknown external network (User6)	Not allowed

TARGET USER ENDPOINT LOCATION	SIMULTANEOUS RING
Target user is a PSTN number	Call can only be routed through Location-Based Routing enabled Gateway1 at Site1, based on User1's voice routing policy

Simultaneous ringing to a PSTN endpoint

The following table shows Location-Based Routing behavior for an inbound VOIP call from User1 located at Site1 to users in different locations with simultaneous ring set to a PSTN number.

CALLED USER ENDPOINT LOCATION	SIMULTANEOUS RING TARGET IS PSTN ENDPOINT
Same network site, site enabled for Location-Based Routing (User2)	Call can be only be routed through Location-Based Routing Gateway1 at Site1, based on User2's voice routing policy
Different network site enabled for Location-Based Routing (User3)	Call can only be routed through Location-Based Routing Gateway1 at Site1, based on User3's voice routing policy
Different network site not enabled for Location-Based Routing (User4)	Call can only be routed through Location-Based Routing Gateway1 at Site1, based on User4's voice routing policy
Unknown internal network (User5)	Call can only be routed through Location-Based Routing Gateway1 at Site1, based on User5's voice routing policy
Unknown external network (User6)	Call can only be routed through Location-Based Routing Gateway1 at Site1, based on User6's voice routing policy

Inbound calls through voice app (Auto Attendant or Call Queue)

Inbound PSTN calls from a Location-Based Routing enabled gateway are allowed to connect to an auto attendant or call queue. Users enabled for Location-Based Routing can only receive inbound call transfers from these applications when they are located at the same site the inbound PSTN call originates from.

Call forwarding and simultaneous ringing to users and PSTN is allowed for voice app transfers. Completing the call to the target is subject to the same Location-Based Routing rules listed earlier.

Forwarding to voicemail is also allowed.

Delegation

A Teams user may choose delegates who can make and receive calls on their behalf. Delegation capabilities in Teams are affected by Location-Based Routing as follows:

- For outbound calls from a Location-Based Routing enabled delegate on behalf of a delegator, the same rules apply. Call routing is based on the delegate's call authorization policy, voice routing policy, and location. For more information, see [Teams user places an outbound call to the PSTN](#).
- For inbound PSTN calls to a delegator, the same Location-Based Routing rules that apply for call forwarding or simultaneously ringing to other users also apply to delegates. For more information, see [Teams user transfers or forwards call to another Teams user](#), [Teams user transfers or forwards call to PSTN endpoint](#), and [Simultaneous ringing](#). When a delegate sets a PSTN endpoint as a simultaneous ring target, the voice routing policy of the delegate is used to route the call to the PSTN.
- For delegation, it's recommended that the delegator and associated delegates be located in the same network site.

Other planning considerations

Changes from an on-premises Location-Based Routing deployment

Network site voice routing policy is no longer used. Instead, we use the user's voice routing policy. This means that to allow users to roam to other sites, the voice routing policy must include the gateways of the roamed sites.

Technical considerations for Location-Based Routing

IPv4 and IPv6 subnets are supported, however, IPv6 takes precedence when checking for a match.

Client support for Location-Based Routing

The following Teams clients are supported:

- Teams desktop clients (Windows and Mac)
- Teams mobile clients (iOS and Android)
- Teams IP phones

The Teams web client and Skype for Business clients aren't supported.

Capabilities not supported by Location-Based Routing

Location-Based Routing doesn't apply to the following types of interactions. Location-Based Routing isn't enforced when Teams endpoints interact with PSTN endpoints in the following scenarios:

- Call park or retrieval of PSTN calls through Call Park
- An on-premises Skype for Business user or a Skype for Business Online user calls a Teams user

Location-Based Routing for conferencing

A Location-Based Routing enabled user on a PSTN call isn't allowed to start a conference with another user or PSTN number. Connecting to auto attendants or call queues is allowed. If the user has a conferencing license, the user must start a conference with the relevant users and call the PSTN through the conference bridge to start a conference call.

Media bypass requirement for Location-Based Routing

If you're deploying Location-Based Routing in India, it's a requirement to also configure media bypass. To learn more, see [Plan for media bypass with Direct Routing](#) and [Local Media Optimization for Direct Routing](#).

Direct Voice over IP (VoIP)

Direct Voice over IP (VoIP) must not be deployed with any telephony equipment in India.

Next steps

Configure network settings for Location-Based Routing

12/7/2021 • 2 minutes to read • [Edit Online](#)

If you haven't already done so, read [Plan Location-Based Routing for Direct Routing](#) to review other steps you'll need to take before you configure network settings for Location-Based Routing.

This article describes how to configure network settings for Location-Based Routing. After you deploy Phone System Direct Routing in your organization, the next steps are to create and set up network regions, network sites, and network subnets.

Define network regions

A network region contains a collection of network sites and interconnects various parts of a network across multiple geographic areas. For steps on how to configure network regions, go to [Manage your network topology for cloud features in Teams](#).

Define network sites

A network site represents a location where your organization has a physical venue, such as an office, a set of buildings, or a campus. You must associate each network site in your topology with a network region. For steps on how to configure network sites, see [Manage your network topology for cloud features in Teams](#).

A best practice for Location-Based Routing is to create a separate site for each location that has unique PSTN connectivity. You can create a site that's enabled for Location-Based Routing or a site that's not enabled for Location-Based Routing. For example, you may want to create a site that's not enabled for Location-Based Routing to allow users who are enabled for Location-Based Routing to make PSTN calls when they roam to that site.

Define network subnets

Each subnet must be associated with a specific network site. You can associate multiple subnets with the same network site but you can't associate multiple sites with the same subnet. For steps on how to configure network subnets, go to [Manage your network topology for cloud features in Teams](#).

For Location-Based Routing, IP subnets at the location where Teams endpoints can connect to the network must be defined and associated to a defined network to enforce toll bypass. This association of subnets enables Location-Based Routing to locate the endpoints geographically to determine whether a given PSTN call should be allowed. Both IPv6 and IPv4 subnets are supported. When determining whether a Teams endpoint is located at a site, Location-Based Routing first checks for a matching IPv6 address. If an IPv6 address isn't present, Location-Based Routing checks for an IPv4 address.

Define trusted IP addresses (external subnets)

Trusted IP addresses are the internet external IP addresses of the enterprise network and are used to determine whether the user's endpoint is inside the corporate network. For steps on how to configure trusted IP addresses, go to [Manage your network topology for cloud features in Teams](#).

If the user's external IP address matches an IP address that's in the trusted IP address list, Location-Based Routing checks to determine the internal subnet where the user's endpoint is located. If the user's external IP

address doesn't match any IP address that's defined in the trusted IP address list, the endpoint is classified as being at an unknown location and any PSTN calls to or from a user who is enabled for Location-Based Routing are blocked.

Next steps

Go to [Enable Location-Based Routing for Direct Routing](#).

Enable Location-Based Routing for Direct Routing

12/7/2021 • 5 minutes to read • [Edit Online](#)

Before you follow the steps in this article, make sure you've read [Plan Location-Based Routing for Direct Routing](#) and completed the steps in [Configure network settings for Location-Based Routing](#).

This article describes how to enable Location-Based Routing for Direct Routing. After you deploy Phone System Direct Routing and set up network regions, sites, and subnets, you're ready to enable Location-Based Routing. To complete the steps in this article, you'll need some familiarity with PowerShell cmdlets. To learn more, see [Teams PowerShell Overview](#).

You have to enable Location-Based Routing for the following:

- Users
- Network sites
- Gateway configurations
- Calling policies

You can use the [Microsoft Teams admin center](#) or [PowerShell](#) to enable Location-Based Routing.

Using the Microsoft Teams admin center

Enable Location-Based Routing for users

1. Create a voice routing policy and assign PSTN usages to the policy. When you assign PSTN usages to a policy, make sure you do one of the following:
 - Use PSTN usages associated to voice routes that use a PSTN gateway local to the site.
 - Use PSTN usages associated to voice routes that use a PSTN gateway located in a region where Location-Based Routing restrictions aren't needed.
2. Assign the voice routing policy to users who require routing restrictions to be enforced.

To learn more about how to create voice routing policies and assign them to users, see [Manage voice routing policies in Microsoft Teams](#).

Enable Location-Based Routing for network sites

Enable Location-Based Routing for your sites that need to enforce routing restrictions. To do this, in the left navigation of the Microsoft Teams admin center, go to **Locations > Network topology**, select a network site, click **Edit**, and then turn on **Location based routing**.

To learn more, see [Manage your network topology](#).

Enable Location-Based Routing for gateways

Enable Location-Based Routing to gateways that route calls to PSTN gateways that route calls to the PSTN, and associate the network site where the gateway is located.

1. In the left navigation, go to **Voice > Direct Routing**, and then click the **SBCs** tab.
2. Select the SBC, and then click **Edit**.
3. Under **Location based routing and media optimization**, turn on **Enable location based routing**.
4. Specify the gateway site ID, and then set the bypass mode.
5. Click **Save**.

Enable Location-Based Routing for calling policies

To enforce Location-Based Routing for specific users, set up the user's calling policy to prevent PSTN toll bypass. To do this, turn on the **Prevent toll bypass** setting in the calling policy.

To learn more, see [Calling policies in Teams](#).

Using PowerShell

Enable Location-Based Routing for users

1. Use the [Set-CsOnlinePstnUsage](#) cmdlet to set PSTN usages. For multiple usages, separate each usage with a comma.

```
Set-CsOnlinePstnUsage -Usage <usages>
```

For example:

```
Set-CsOnlinePstnUsage -Usage "Long Distance", "Local", "Internal"
```

2. Use the [New-CsOnlineVoiceRoutingPolicy](#) cmdlet to create a voice routing policy to associate the user with the appropriate PSTN usages.

```
New-CsOnlineVoiceRoutingPolicy -Identity <voice routing policy ID> -Description <voice routing policy name> -OnlinePstnUsages <usages>
```

When you assign PSTN usages to a voice routing policy, make sure you do one of the following:

- Use PSTN usages associated to voice routes that use a PSTN gateway local to the site
- Use PSTN usages associated to voice routes that use a PSTN gateway located in a region where Location-Based Routing restrictions aren't needed.

In this example, we create two new voice routing policies and assign PSTN usages to them.

```
New-CsOnlineVoiceRoutingPolicy -Identity "DelhiVoiceRoutingPolicy" -Description "Delhi voice routing policy" -OnlinePstnUsages "Long Distance"
New-CsOnlineVoiceRoutingPolicy -Identity "HyderabadVoiceRoutingPolicy" -Description "Hyderabad voice routing policy" -OnlinePstnUsages "Long Distance", "Local", "Internal"
```

The following table shows the voice routing policies defined in this example.

	VOICE ROUTING POLICY 1	VOICE ROUTING POLICY 2
Online voice policy ID	Delhi online voice routing policy	Hyderabad online voice routing policy
Online PSTN usages	Long Distance	Long Distance, Local, Internal

3. Use the [Grant-CsOnlineVoiceRoutingPolicy](#) cmdlet to associate online voice routing policies to users who require routing restrictions to be enforced.

```
Grant-CsOnlineVoiceRoutingPolicy -Identity <User> -Tenant <TenantId>
```

Enable Location-Based Routing for network sites

1. Use the [Set-CsTenantNetworkSite](#) cmdlet to enable Location-Based Routing and associate voice routing policies to your network sites that need to enforce routing restrictions.

```
Set-CsTenantNetworkSite -Identity <site ID> -EnableLocationBasedRouting <$true|$false>
```

In this example, we enable Location-Based Routing for the Delhi site and the Hyderabad site.

```
Set-CsTenantNetworkSite -Identity "Delhi" -EnableLocationBasedRouting $true
Set-CsTenantNetworkSite -Identity "Hyderabad" -EnableLocationBasedRouting $true
```

The following table shows the sites enabled for Location-Based Routing in this example.

	SITE 1 (DELHI)	SITE 2 (HYDERABAD)
Site name	Site 1 (Delhi)	Site 2 (Hyderabad)
EnableLocationBasedRouting	True	True
Subnets	Subnet 1 (Delhi)	Subnet 2 (Hyderabad)

Enable Location-Based Routing for gateways

1. Use the [New-CsOnlinePSTNGateway](#) cmdlet to create a gateway configuration for each gateway or network site.

```
New-CsOnlinePSTNGateway -Fqdn <FDQN registered for the SBC> -Identity <gateway configuration ID> -
SipSignalingPort <listening port used> -Enabled $true
```

If multiple gateways are associated with a system (for example, Gateway or PBX), modify each gateway to enable Location-Based Routing restrictions.

In this example, we create one gateway configuration for each gateway.

```
New-CsOnlinePSTNGateway -Fqdn sbc.contoso.com -Enabled $true -SipSignalingPort 5067
```

For more information, see [Configure Direct Routing](#).

2. Use the [Set-CSOnlinePSTNGateway](#) cmdlet to enable Location-Based Routing for your gateways that need to enforce routing restrictions.

Enable Location-Based Routing to gateways that route calls to PSTN gateways that route calls to the PSTN, and associate the network site where the gateway is located.

```
Set-CSOnlinePSTNGateway -Identity <gateway configuration ID> -GatewaySiteLbrEnabled $true -
GatewaySiteID <site ID>
```

In this example, we enable Location-Based Routing for each gateway that's associated to PSTN gateways in the Delhi and Hyderabad sites.

```
Set-CSOnlinePSTNGateway -Identity sbc.contoso.com -GatewaySiteLbrEnabled $true -GatewaySiteID
"Delhi"
Set-CSOnlinePSTNGateway -Identity sbc1.contoso.com -GatewaySiteLbrEnabled $true -GatewaySiteID
"Hyderabad"
```

Don't enable Location-Based Routing for gateways that don't route calls to the PSTN. However, you still have to associate the gateway to the network site where the system is located. This is because Location-Based Routing restrictions need to be enforced for PSTN calls reaching endpoints that are connected via this gateway. In this example, Location-Based Routing isn't enabled for each gateway that's associated to PBX systems in the Delhi and Hyderabad sites.

```
Get-CSOnlinePSTNGateway -Identity sbc.contoso.com

Identity: sbc.contoso.com
GatewaySiteLbrEnabled: $false

Get-CSOnlinePSTNGateway -Identity sbc2.contoso.com

Identity: sbc2.contoso.com
GatewaySiteLbrEnabled: $false
```

Enable Location-Based Routing for calling policies

To enforce Location-Based Routing for specific users, set up the users' voice policy to prevent PSTN toll bypass.

Use the [Grant-CsTeamsCallingPolicy](#) cmdlet to enable Location-Based routing by preventing PSTN toll bypass.

```
Grant-CsTeamsCallingPolicy -PolicyName <policy name> -id <user id>
```

In this example, we prevent PSTN toll bypass to User1's calling policies.

```
Grant-CsTeamsCallingPolicy -PolicyName "AllowCallingPreventTollBypass" -id "User1"
```

Plan for media bypass with Direct Routing

12/7/2021 • 13 minutes to read • [Edit Online](#)

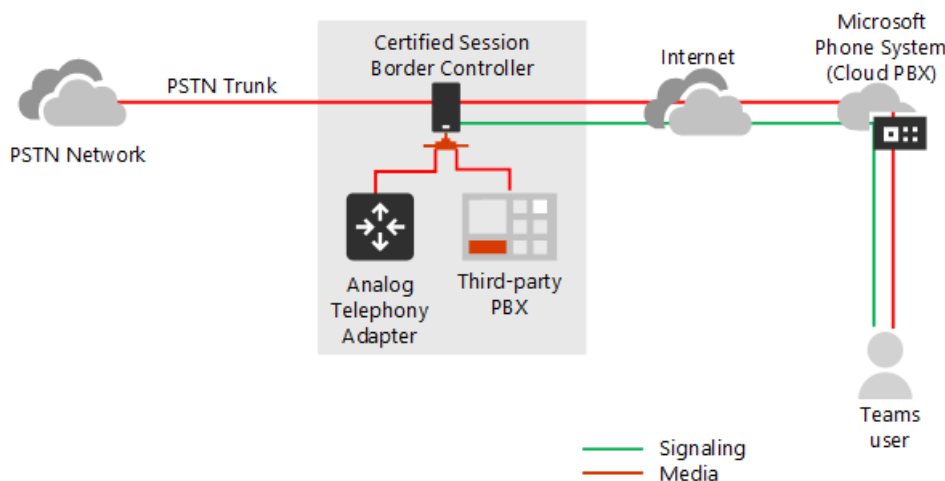

About media bypass with Direct Routing

Media bypass enables you to shorten the path of media traffic and reduce the number of hops in transit for better performance. With media bypass, media is kept between the Session Border Controller (SBC) and the client instead of sending it via the Microsoft Phone System. To configure media bypass, the SBC and the client must be in the same location or network.

You can control media bypass for each SBC by using the **Set-CSOnlinePSTNGateway** command with the **MediaBypass** parameter set to true or false. If you enable media bypass, this does not mean that all media traffic will stay within the corporate network. This article describes the call flow in different scenarios.

The diagrams below illustrate the difference in call flow with and without media bypass.

Without media bypass, when a client makes or receives a call, both signaling and media flow between the SBC, the Microsoft Phone System, and the Teams client, as shown in the following diagram:

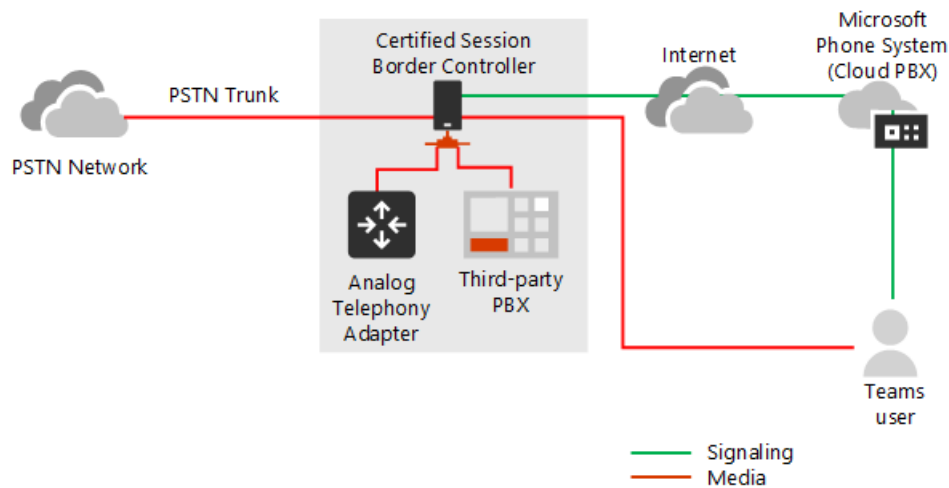

But let's assume that a user is in the same building or network as the SBC. For example, assume a user who is in a building in Frankfurt makes a call to a PSTN user:

- **Without media bypass**, media will flow via either Amsterdam or Dublin (where Microsoft datacenters are deployed) and back to the SBC in Frankfurt.

The datacenter in Europe is selected because the SBC is in Europe, and Microsoft uses the datacenter closest to the SBC. While this approach does not affect call quality due to optimization of traffic flow within Microsoft networks in most geographies, the traffic has an unnecessary loop.

- **With media bypass**, the media is kept directly between the Teams user and the SBC as shown in the following diagram:

Media bypass leverages protocols called Interactive Connectivity Establishment (ICE) on the Teams client and ICE lite on the SBC. These protocols enable Direct Routing to use the most direct media path for optimal quality. ICE and ICE Lite are WebRTC standards. For detailed information about these protocols, see RFC 5245.

Call flow and firewall planning

Call flow and firewall planning depends on whether the user has direct access to the public IP address of the SBC, and whether the user is inside or outside of the network.

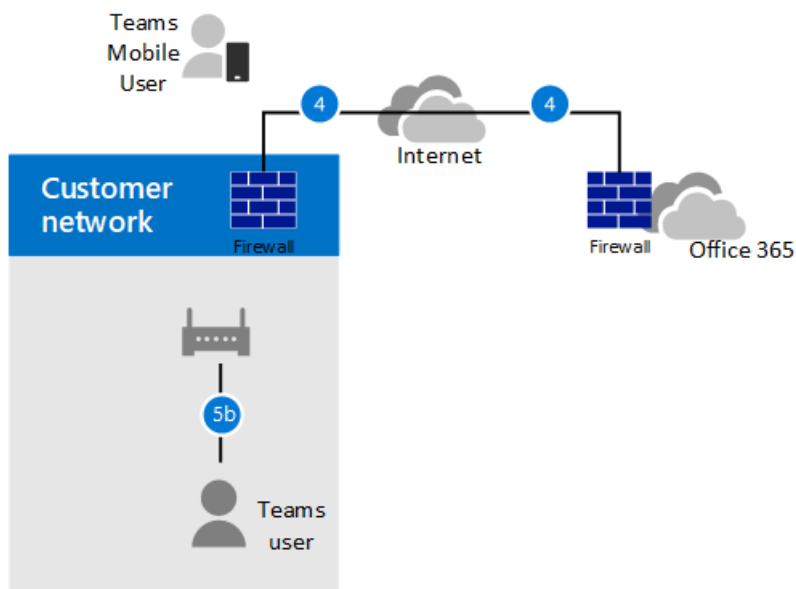

Call flow if the user has direct access to the public IP address of the SBC

If the user has direct access to the public IP address of the SBC, the call flow is as follows:

- For media bypass, the Teams client must have access to the public IP address of the SBC even from an internal network. If direct media is not desired, the media can flow via Transport Relays.
- This is the recommended solution when a user is in the same building and/or network as the SBC – remove Microsoft Cloud components from the media path.
- Signaling always flows via the Microsoft cloud.

The following diagram shows call flow when media bypass is enabled, the client is internal, and the client can reach the public IP address of the SBC (direct media):

- The arrows and numeric values of the paths are in accordance with [Microsoft Teams call flows](#).
- The SIP signaling always takes paths 4 and 4' (depending on the direction of the traffic). Media stays local and takes path 5b.

Call flow if the user does not have access to the public IP address of the SBC

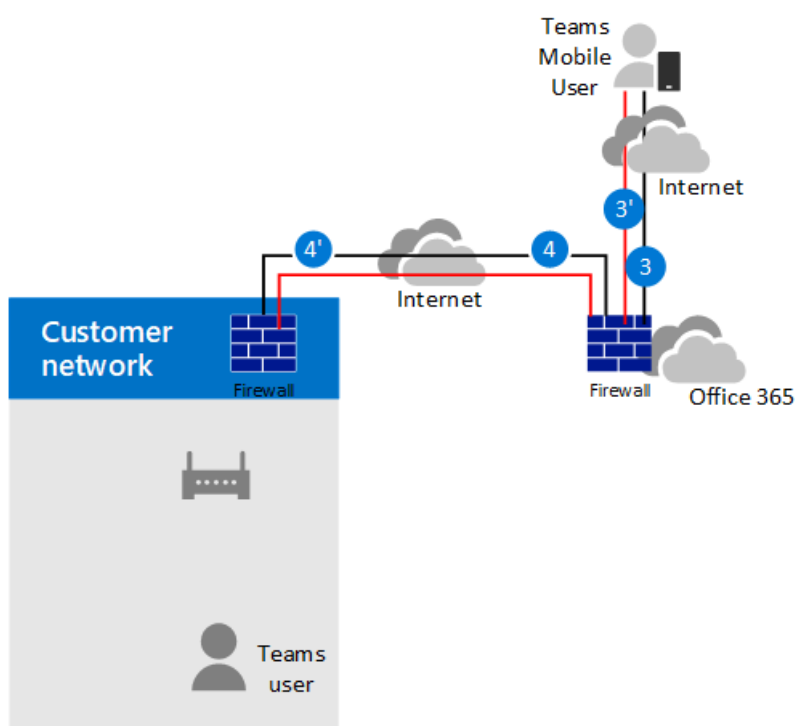

The following describes call flow if the user does not have access to the public IP address of the SBC.

For example, assume the user is external, and the tenant administrator decided not to open the public IP address of the SBC to everyone in the Internet, but only to the Microsoft Cloud. The internal components of traffic can flow via the Teams Transport Relays. Consider the following:

- Teams Transport Relays are used.
- For media bypass, Microsoft uses a version of Transport Relays that requires opening ports 50 000 to 59 999 between the Teams Transport Relays and the SBC (in the future we plan to move to the version which requires 3478-3481 ports).

The following diagram shows call flow when media bypass is enabled, the client is external, and the client cannot reach the public IP address of the Session Border Controller (media is relayed by Teams Transport Relay).

- The arrows and numeric values of the paths are in accordance with [Microsoft Teams call flows](#).
- Media is relayed via paths 3, 3', 4 and 4'

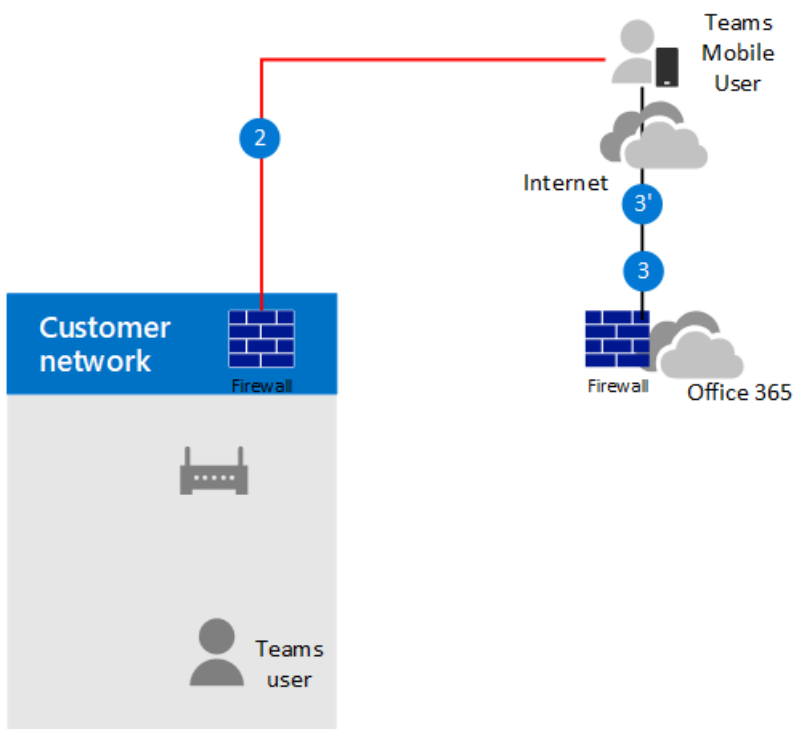

Call flow if a user is outside the network and has access to the public IP of the SBC

NOTE

This is not a recommended configuration because it does not take advantage of Teams Transport Relays. Instead, you should consider the previous scenario where the user does not have access to the public IP address of the SBC.

The following diagram shows call flow when media bypass is enabled, the client is external, and the client can reach the public IP address of the SBC (direct media).

- The arrows and numeric values of the paths are in accordance with the [Microsoft Teams call flows](#) article.
- The SIP signaling always takes paths 3 and 3' (depending on the direction of the traffic). Media flows using path 2.

Use of Media Processors and Transport Relays

There are two components in the Microsoft Cloud that can be in the path of media traffic: Media Processors and Transport Relays.

- The Media Processor is a public facing component that handles media in non-bypass cases and handles media for voice applications.

Media Processors are always in the path for end user non-bypassed calls, but never in the path for bypassed calls. Media Processors are always in the path for all voice applications such as Call Park, Organizational Auto Attendant, and Call Queues.

- The Transport Relay is used to connect to the closest Transport Service to send real time traffic.

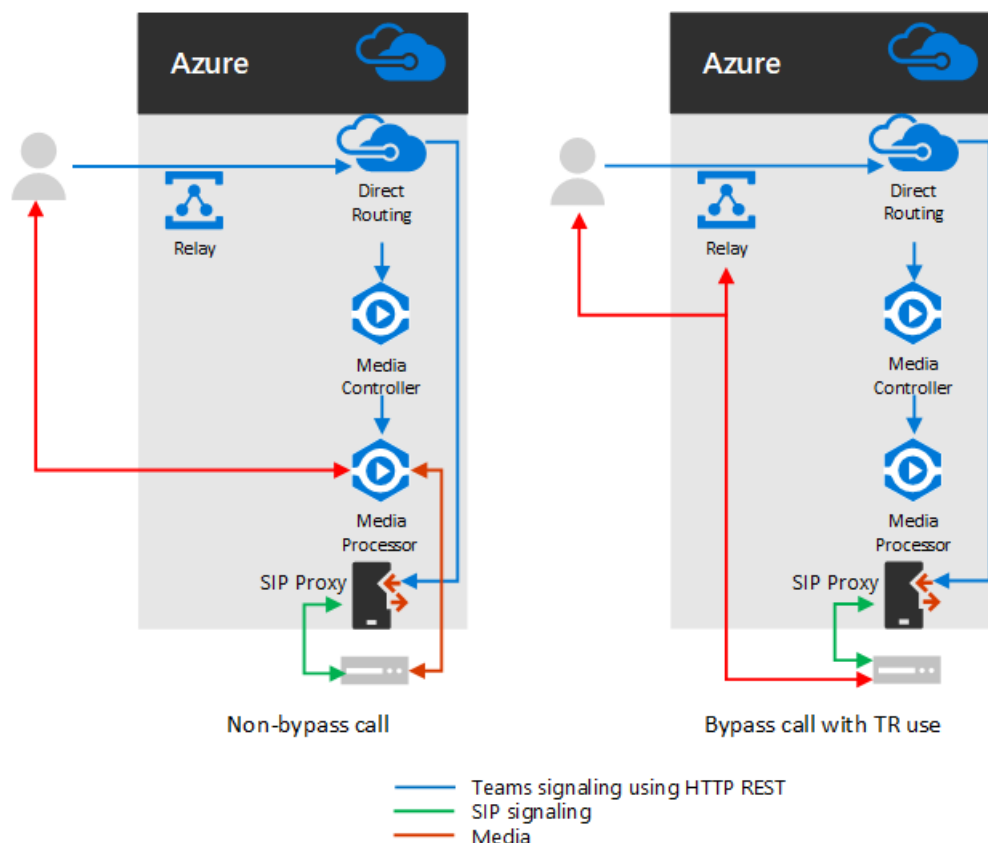

Transport Relays might or might not be in the path for bypassed calls--originating from or destined to end users--depending on where the user is and how the network is configured .

The following diagram shows two call flows – one with media bypass enabled and the second with media bypass disabled.

NOTE

The diagram only illustrates traffic originating from--or destined to--end users.

- The Media Controller is a microservice in Azure that assigns Media Processors and creates Session Description Protocol (SDP) offers.
- The SIP Proxy is a component that translates HTTP REST signaling used in Teams to SIP.

The table below summarizes the difference between Media Processors and Transport Relays.

	MEDIA PROCESSORS	TRANSPORT RELAYS
In media path for non-bypassed calls for end users	Always	If client cannot reach the Media Processor directly
In media path for bypassed calls for end users	Never	If client cannot reach the SBC on the public IP address
In media path for voice applications	Always	Never
Can do transcoding (B2BUA)*	Yes	No, only relays audio between endpoints
Number of instances worldwide and location	10 total: 2 in US East and West; 2 in Amsterdam and Dublin; 2 in Hong Kong and Singapore; 2 in Japan ; 2 in Australia East and Southeast	Multiple

The IP ranges are:

- 52.112.0.0/14 (IP addresses from 52.112.0.1 to 52.115.255.254)

- 52.120.0.0/14 (IP addresses from 52.120.0.1 to 52.123.255.254)

* Transcoding explanation:

- Media Processor is B2BUA, which means it can change a codecs (for example, SILK from Teams client to MP and G.711 between MP and SBC).
- Transport Relays are not B2BUA, which means the codec is never changed between the client and the SBC--even if traffic flows via relays.

Use of Teams Media Processors if trunk is configured for media bypass

Teams Media Processors are always inserted in the media path in the following scenarios:

- Call is escalated from 1:1 to a group call
- Call is going to a federated Teams user
- Call is forwarded or transferred to a Skype for Business user

Ensure your SBC has access to the Media Processors and Transport Relays ranges as described below.

SIP Signaling: FQDNs

For SIP signaling, the FQDN and firewall requirements are the same as for non-bypassed cases.

Direct Routing is offered in the following Microsoft 365 or Office 365 environments:

- Microsoft 365 or Office 365
- Office 365 GCC
- Office 365 GCC High
- Office 365 DoD Learn more about [Office 365 and US Government environments](#) such as GCC, GCC High, and DoD.

Microsoft 365, Office 365, and Office 365 GCC environments

The connection points for Direct Routing are the following three FQDNs:

- **sip.pstnhub.microsoft.com** – Global FQDN – must be tried first. When the SBC sends a request to resolve this name, the Microsoft Azure DNS servers return an IP address pointing to the primary Azure datacenter assigned to the SBC. The assignment is based on performance metrics of the datacenters and geographical proximity to the SBC. The IP address returned corresponds to the primary FQDN.
- **sip2.pstnhub.microsoft.com** – Secondary FQDN – geographically maps to the second priority region.
- **sip3.pstnhub.microsoft.com** – Tertiary FQDN – geographically maps to the third priority region.

You must place these three FQDNs in order to:

- Provide optimal experience (less loaded and closest to the SBC datacenter assigned by querying the first FQDN).
- Provide failover when a connection from an SBC is established to a datacenter that is experiencing a temporary issue. For more information, see Failover mechanism below.

The FQDNs **sip.pstnhub.microsoft.com**, **sip2.pstnhub.microsoft.com**, and **sip3.pstnhub.microsoft.com** will be resolved to IP addresses from the following subnets:

- 52.112.0.0/14
- 52.120.0.0/14

You need to open ports for all these IP ranges in your firewall to allow incoming and outgoing traffic to and from the addresses for signaling.

Office 365 GCC DoD environment

The connection point for Direct Routing is the following FQDN:

sip.pstnhub.dod.teams.microsoft.us – Global FQDN. As the Office 365 DoD environment exists only in the US data centers, there is no secondary and tertiary FQDNs.

The FQDN sip.pstnhub.dod.teams.microsoft.us will be resolved to an IP address from the following subnet:

- 52.127.64.0/21

You need to open ports for all these IP ranges in your firewall to allow incoming and outgoing traffic to and from the addresses for signaling. If your firewall supports DNS names, the FQDN sip.pstnhub.dod.teams.microsoft.us resolves to all these IP subnets.

Office 365 GCC High environment

The connection point for Direct Routing is the following FQDN:

sip.pstnhub.gov.teams.microsoft.us – Global FQDN. As the GCC High environment exists only in the US data centers, there is no secondary and tertiary FQDNs.

The FQDN sip.pstnhub.gov.teams.microsoft.us will be resolved to an IP address from the following subnet:

- 52.127.88.0/21

You need to open ports for all these IP ranges in your firewall to allow incoming and outgoing traffic to and from the addresses for signaling. If your firewall supports DNS names, the FQDN sip.pstnhub.gov.teams.microsoft.us resolves to all these IP subnets.

SIP Signaling: Ports

Port requirements are the same for all Office 365 environments where Direct Routing is offered:

- Microsoft 365 or Office 365
- Office 365 GCC
- Office 365 GCC High
- Office 365 DoD

You must use the following ports:

TRAFFIC	FROM	TO	SOURCE PORT	DESTINATION PORT
SIP/TLS	SIP Proxy	SBC	1024 - 65535	Defined on the SBC
SIP/TLS	SBC	SIP Proxy	Defined on the SBC	5061

Media traffic: IP and Port ranges

Media traffic flows between the SBC and Teams client if direct connectivity is available or via Teams Transport Relays if the client cannot reach the SBC using the public IP address.

Requirements for direct media traffic (between the Teams client and the SBC)

The client must have access to the specified ports (see table) on the public IP address of the SBC.

NOTE

If the client is in an internal network, the media flows to the public IP address of the SBC. You can configure hair pinning on your NAT device so traffic never leaves the enterprise network equipment.

TRAFFIC	FROM	TO	SOURCE PORT	DESTINATION PORT
UDP/SRTP	Client	SBC	3478-3481 and Tenant admin configured ports for the client (default is 50000-50020)	Defined on the SBC
UDP/SRTP	SBC	Client	Defined on the SBC	3478-3481 and Tenant admin configured ports for the client (default is 50000-50020)

NOTE

If you have a network device that translates the client's source ports, please make sure that translated ports are opened between the network equipment and the SBC.

Requirements for using Transport Relays

Transport Relays are in the same range as Media Processors (for non-bypass cases):

Microsoft 365, Office 365, and Office 365 GCC environments

- 52.112.0.0 /14 (IP addresses from 52.112.0.1 to 52.115.255.254)

Office 365 GCC DoD environment

- 52.127.64.0/21

Office 365 GCC High environment

- 52.127.88.0/21

The port range of the Teams Transport Relays (applicable to all environments) is shown in the following table:

TRAFFIC	FROM	TO	SOURCE PORT	DESTINATION PORT
UDP/SRTP	Transport Relay	SBC	50 000 -59 999	Defined on the SBC
UDP/SRTP	SBC	Transport Relay	Defined on the SBC	50 000 – 59 999, 3478-3481

NOTE

Microsoft recommends at least two ports per concurrent call on the SBC. Because Microsoft has two versions of Transport Relays, the following are required:

- v4, which can only work with port range 50 000 to 59 999
- v6, which works with ports 3478-3481

At this time, media bypass only supports v4 version of Transport Relays. We will introduce support of v6 in the future.

You need to open ports 3478-3481 for transitioning. When Microsoft introduces support for v6 Transport Relays with Media Bypass, you will not need to reconfigure your network equipment or SBCs.

Requirements for using media processors

Media Processors are always in the media path for voice applications and for Web clients (for example, Teams clients in Edge or Google Chrome). The requirements are the same as for non-bypass configuration.

The IP range for media traffic is

Office 365 and Office 365 GCC environments

- 52.112.0.0 /14 (IP addresses from 52.112.0.1 to 52.115.255.254)

Office 365 GCC DoD environment

- 52.127.64.0/21

Office 365 GCC High environment

- 52.127.88.0/21

The port range of the Media Processors (applicable to all environments) is shown in the following table:

TRAFFIC	FROM	TO	SOURCE PORT	DESTINATION PORT
UDP/SRTP	Media Processor	SBC	3478-3481 and 49152 – 53 247	Defined on the SBC
UDP/SRTP	SBC	Media Processor	Defined on the SBC	3478-3481 and 49152 – 53 247

Configure separate trunks for media bypass and non-media bypass

If you are migrating to media bypass from non-media bypass and want to confirm functionality before migrating all usage to media bypass, you can create a separate trunk and separate Online Voice Routing policy to route to the media bypass trunk and assign to specific users.

High-level configuration steps:

- Identify users to test media bypass.
- Create two separate trunks with different FQDNs: one enabled for media bypass; the other not.

Both trunks point to the same SBC. The ports for TLS SIP signaling must be different. The ports for media must be the same.

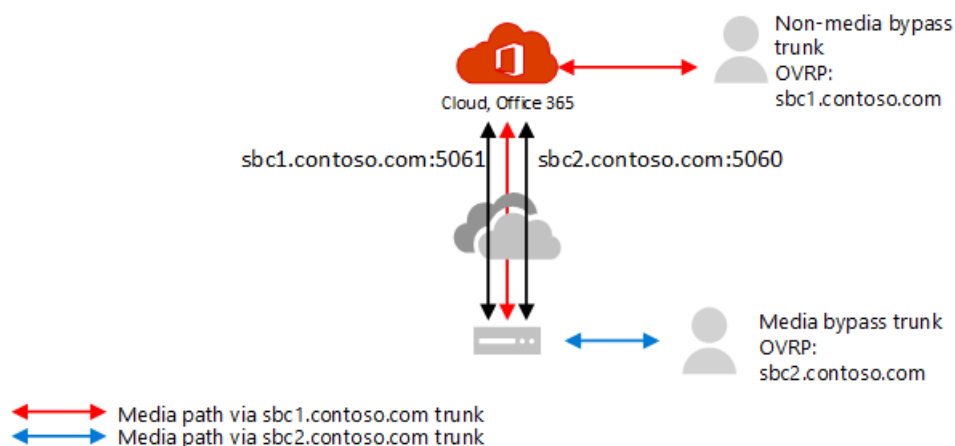

- Create a new Online Voice Routing policy and assign the media bypass trunk to the corresponding routes associated with the PSTN usage for this policy.
- Assign the new Online Voice Routing policy to users you have identified to test media bypass.

The example below illustrates this logic.

SET OF USERS	NUMBER OF USERS	TRUNK FQDN ASSIGNED IN OVRP	MEDIA BYPASS ENABLED
Users with non-media bypass trunk	980	sbc1.contoso.com:5061	false

SET OF USERS	NUMBER OF USERS	TRUNK FQDN ASSIGNED IN OVRP	MEDIA BYPASS ENABLED
Users with media bypass trunk	20	sbc2.contoso.com:5060	true

Both trunks can point to the same SBC with the same public IP address. The TLS signaling ports on the SBC must be different, as shown in the following diagram. Note you will need to make sure that your certificate supports both trunks. In SAN, you need to have two names (**sbc1.contoso.com** and **sbc2.contoso.com**) or have a wildcard certificate.

For information about how to configure two trunks on the same SBC, see the documentation provided by your SBC vendor:

- [AudioCodes deployment documentation](#)
- [Oracle deployment documentation](#)
- [Ribbon Communications deployment documentation](#)
- [TE-Systems \(anynode\) deployment documentation](#)

Client endpoints supported with media bypass

Media bypass is supported with all standalone Teams Desktop clients, Android and iOS clients and Teams Phone Devices.

For all other endpoints that do not support media bypass, we will convert the call to non-bypass even if it started as a bypass call. This happens automatically and does not require any actions from the administrator. This includes Skype for Business 3PIP Phones, and Teams Web Clients that support Direct Routing calling (WebRTC based clients running on Microsoft Edge, Google Chrome, Mozilla Firefox).

[Configure media bypass with Direct Routing](#)

Configure media bypass with Direct Routing

12/7/2021 • 2 minutes to read • [Edit Online](#)

Before configuring media bypass with Direct Routing, be sure you have read [Plan for media bypass with Direct Routing](#).

To turn on media bypass, the following conditions must be met:

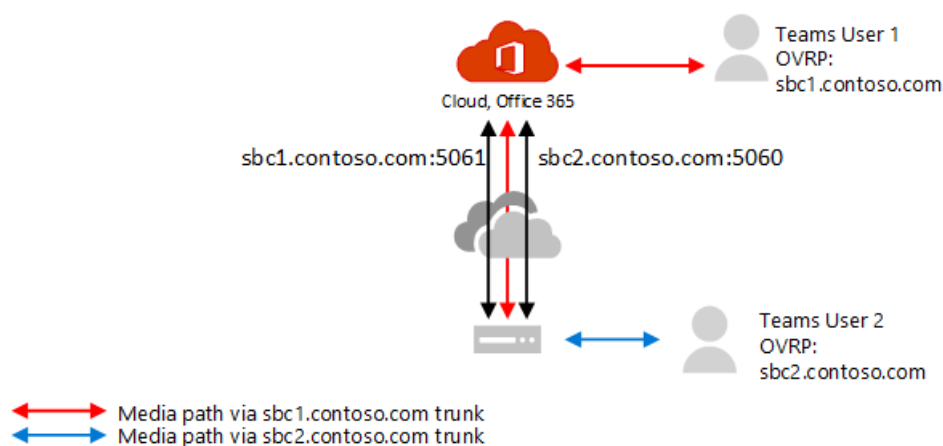

1. Make sure that your Session Border Controller (SBC) vendor of choice supports media bypass and provides instructions on how to configure bypass on the SBC. Please refer to the certification page to learn about SBCs, which ones support media bypass, and for instructions.
2. You need to turn on media bypass on the trunk using the following command: `Set-CSOnlinePSTNGateway -Identity <sbc_FQDN> -MediaBypass $true`.
3. Make sure that the required ports are opened.

Migrate from non-bypassed trunks to bypass-enabled trunks

You can switch all users at once or you can implement a phased approach (recommended).

- **Switch all users at once.** If all conditions are met, you can turn bypass mode on. However, all your production users will be switched at the same time. Because you might experience some issues initially when you configure trunks and ports, your production user experience might be affected.
- **Phased approach. (Recommended).** Create a new trunk for the same SBC (with a different port), test it, and change the online voice routing policy for the users to point to the new trunk.

This is the recommended approach because it allows for a smoother transition and uninterrupted user experience. This approach requires configuration of the SBC, a new FQDN name, and configuration of the firewall. Note you will need to make sure that your certificate supports both trunks. In SAN, you need to have two names (`sbc1.contoso.com` and `sbc2.contoso.com`) or have a wildcard certificate.

For instructions on how to configure the trunks and perform migration, see the documentation from your SBC vendor:

- [AudioCodes deployment documentation](#)
- [Oracle deployment documentation](#)
- [Ribbon Communications deployment documentation](#)
- [TE-Systems \(anynode\) deployment documentation](#)

For a list of Session Border Controllers (SBCs) certified for Direct Routing, see [List of Session Border Controllers certified for Direct Routing](#).

[Plan media bypass with Direct Routing](#)

Plan for Local Media Optimization for Direct Routing

12/7/2021 • 19 minutes to read • [Edit Online](#)

Public Switched Telephone Network (PSTN) voice is considered a business-critical application with high expectations for voice quality. Direct Routing lets you control media traffic flows to accommodate a multitude of network topologies and local telephony setups for various enterprises all over the world.

Local Media Optimization for Direct Routing lets you manage voice quality by:

- Controlling how media traffic flows between the Teams clients and the customer Session Border Controllers (SBCs).
- Keeping media local within the boundaries of corporate network subnets.
- Allowing media streams between the Teams clients and the SBCs even if the SBCs are behind corporate firewalls with private IPs and not visible to Microsoft directly.

Local Media Optimization supports two scenarios:

- Centralization of all local trunks through a centralized SBC connected to the main Session Initiation Protocol (SIP) trunk--providing telephony services to all local branch offices of the company.
- Building a virtual network topology of SBCs--where the SBCs in the local branch offices are connected to a centralized proxy SBC that is visible to, and communicating with, Microsoft Phone System through its external IP address. In a virtual network topology, downstream SBCs are communicating through internal IPs and are not directly visible to Phone System.

This article describes feature functionality, and customer scenarios and solutions. For details on configuration, see [Configure Local Media Optimization](#).

NOTE

If you want to keep media local within the boundaries of your intranet, Local Media Optimization is recommended. If you already have Media Bypass and you use only the public IP addresses of your SBCs, it is not mandatory to move to Local Media Optimization. You can continue to use Media Bypass. For more information, see [Plan Media Bypass](#).

For information on which SBC vendors support Local Media Optimization, see [Session Border Controllers Certified for Direct Routing](#).

Supported customer scenarios

For this discussion, assume that Contoso runs multiple businesses across the globe as follows. (Note that Europe and APAC regions are used as examples only. A company might have several different regions with similar requirements.)

- **In Europe**, Contoso has offices in approximately 30 countries. Each office has its own Private Branch Exchange (PBX).

Contoso was offered an option to centralize the trunks in one location--Amsterdam--for all 30 European offices. Contoso deployed the SBC in Amsterdam, provided enough bandwidth to run calls through the centralized location, connected a central SIP trunk to the centralized location, and started serving all European locations from Amsterdam.

- **In the APAC region**, Contoso has multiple offices in different countries.

In many countries, the company still has time-division multiplexing (TDM) trunks in local branch offices. Centralization of the TDM trunks is not an option in the APAC region, so switching to SIP is not possible. Assume there are more than fifty Contoso branch offices across the APAC region with hundreds of gateways (SBCs). In this scenario, it is not possible to pair all gateways to the Direct Routing interface because of a lack of public IP addresses and/or local internet breakouts. In addition, some countries impose regulatory requirements that cannot be fulfilled without having local PSTN network connectivity.

Based on their business requirements, Contoso implemented two solutions with Local Media Optimization for Direct Routing:

- **In Europe**, all trunks are centralized and media flows between the central SBC and the users, based on the user location.
 - If a user is connected to the local subnet of a corporate network (that is, the user is internal), media flows between the internal IP of the central SBC and the user's Teams client.
 - If a user is outside the boundaries of the corporate network--for example, if the user is using a public wireless Internet connection--then the user is considered to be external. In this case, the media flows between the external IP of the central SBC and the Teams client.
- **In the APAC region**, a centralized proxy SBC is paired to Microsoft Direct Routing, which directs media between the Direct Routing interface and the downstream SBCs in local branch offices.

The downstream SBCs in the local branch offices are not directly visible to Direct Routing in APAC, but they are paired by using the Set-CSOnlinePSTNGateway cmdlet to create a virtual network topology within Microsoft Phone System. Media always stays local when possible. External users have media flowing between the Teams client and the public IP of the proxy SBC.

Central SBC with centralized trunks

To build a solution where PSTN services are provided to all local branch offices through a single central SBC with a connected centralized SIP trunk, the Contoso tenant administrator pairs one SBC (centralsbc.contoso.com) to the service; the SBC has a centralized SIP trunk connected to it.

- When a user is in the internal network of the company, the SBC provides the internal IP of the SBC for media.
- When a user is outside of the corporate network, the SBC provides the external (public) IP of the SBC.

NOTE

All values within examples, tables, or diagrams are presented for illustration purposes only.

Table 1. Example network parameters for SBCs

LOCATION	SBC FQDN	INTERNAL SUBNET	EXTERNAL NAT (TRUSTED IP)	SBC EXTERNAL IP ADDRESS	SBC INTERNAL IP ADDRESS
Amsterdam	centralsbc.contoso.com	192.168.5.0/24	172.16.76.73	172.16.76.71	192.168.5.5
Germany	Not deployed	192.168.6.0/24	172.16.76.74	Not deployed	Not deployed
France	Not deployed	192.168.7.0/24	172.16.76.75	Not deployed	Not deployed

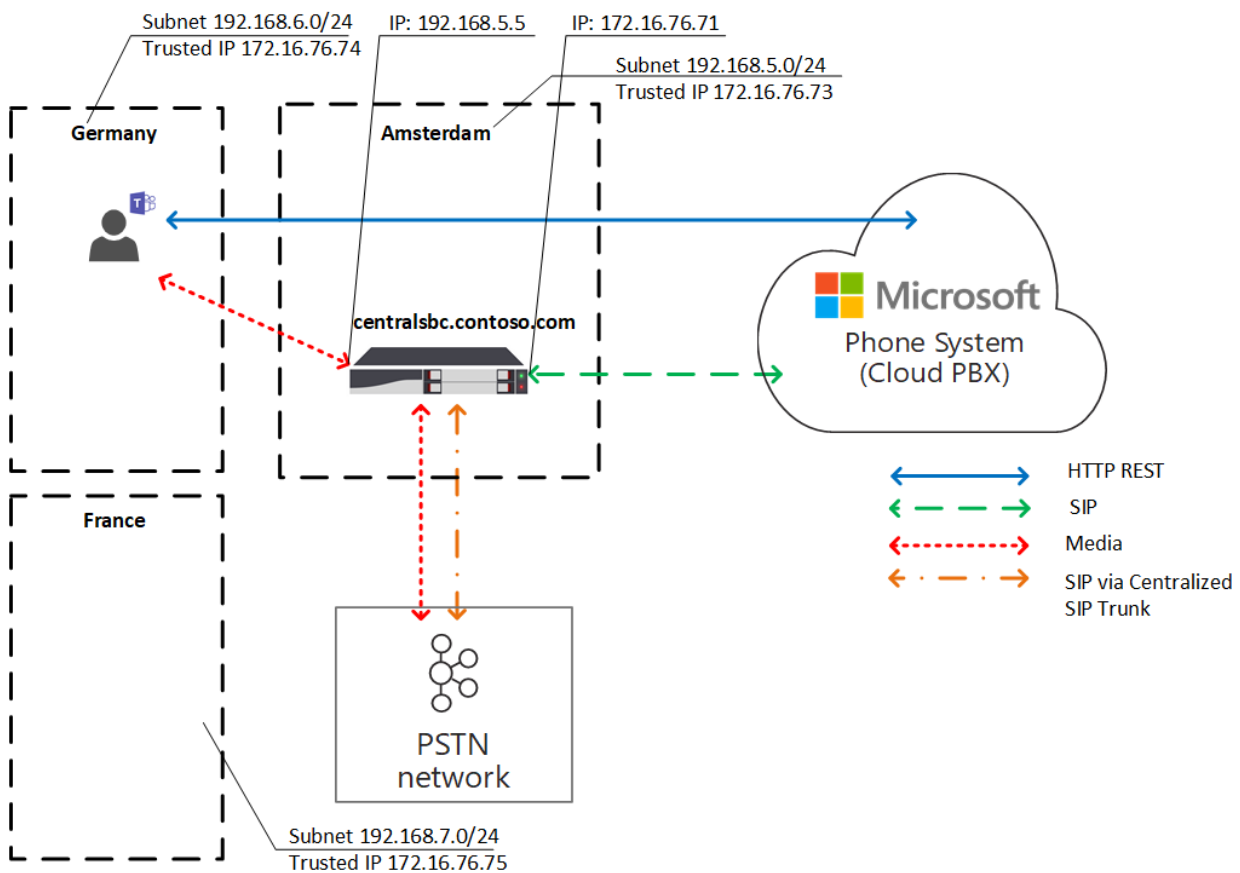

Internal user

The following diagram shows the traffic flow when a user is connected to the corporate network in the user's home branch office or site.

While on premises, the user is assigned to the local branch office in Germany. The user makes a Direct Routing phone call through Teams.

- The user's Teams client communicates to Phone System directly through the REST API, but the media generated during the call flows to the central SBC's internal IP address.
- The SBC redirects the flow to Phone System and the connected PSTN network.
- The central SBC is visible to Phone System through the external IP address only.

Diagram 1. Traffic flow when the user is in the 'home' site with a centralized SBC and with a connected centralized SIP Trunk

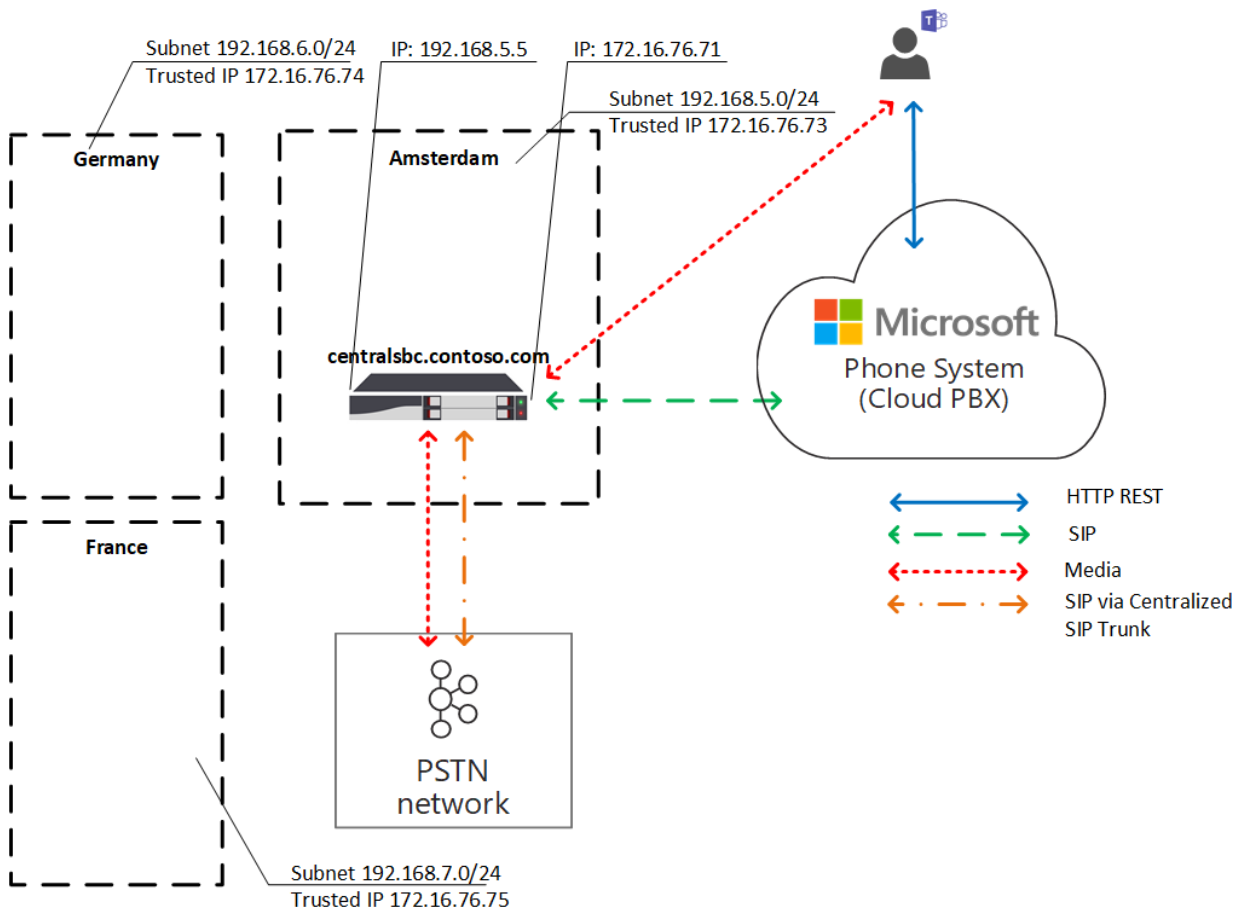

External user

The following diagram shows the traffic flow when a user is not on premises and is not connected to the corporate network (that is, the user's device is connected to the Internet through a mobile device or public Wi-Fi). The user makes a Direct Routing phone call through Teams:

- The user's Teams client communicates to Phone System directly through the REST API, but, in this case, the media generated during the call flows to the central SBC's external IP address.
- The SBC redirects the flow to Phone System and the connected PSTN network.
- The central SBC is visible to Phone System through the external IP address only.

In this case, the behavior is similar whether the user is local to the branch office in Germany or to any other branch office. The user is considered external because the user is outside the boundaries of the corporate network.

Diagram 2. Traffic flow when the user is external with a centralized SBC and with a connected centralized SIP Trunk

Proxy SBC with connected downstream SBCs

To build a solution where PSTN services are provided in all local branch offices in the APAC region where centralization of the TDM trunks is not an option, the Contoso administrator pairs one SBC (proxysbc.contoso.com), also called the proxy SBC, to the Direct Routing service.

Afterwards, the Contoso administrator adds some downstream SBCs indicating that they can be reached through the proxy SBC proxysbc.contoso.com. Downstream SBCs do not have public IPs, however, they can be assigned to voice routes. The table below shows example network parameters and configuration.

When a user is in the local branch office where the downstream SBC is located, the media traffic flows between the user and the local downstream SBC directly. If a user is outside of the office (on a public internet), the media flows from the user to the public IP of the Proxy SBC, which proxies it to the relevant downstream SBC(s).

Table 2. Example SBC network information

LOCATION	SBC FQDN	INTERNAL SUBNET	EXTERNAL NAT (TRUSTED IP)	SBC EXTERNAL IP ADDRESS	SBC INTERNAL IP ADDRESS
Vietnam	VNsbc.contoso.com	192.168.1.0/24	172.16.240.110	None	192.168.1.5
Indonesia	IDSbc.contoso.com	192.168.2.0/24	172.16.240.120	None	192.168.2.5
Singapore	proxysbc.contoso.com	192.168.3.0/24	172.16.240.130	172.16.240.133	192.168.3.5

Internal user

The following diagram shows the high-level traffic flow for the scenario when a user is inside the office in the APAC region. The user, who is assigned to a local branch office in Vietnam, and is on premises, makes a Direct Routing phone call through Teams.

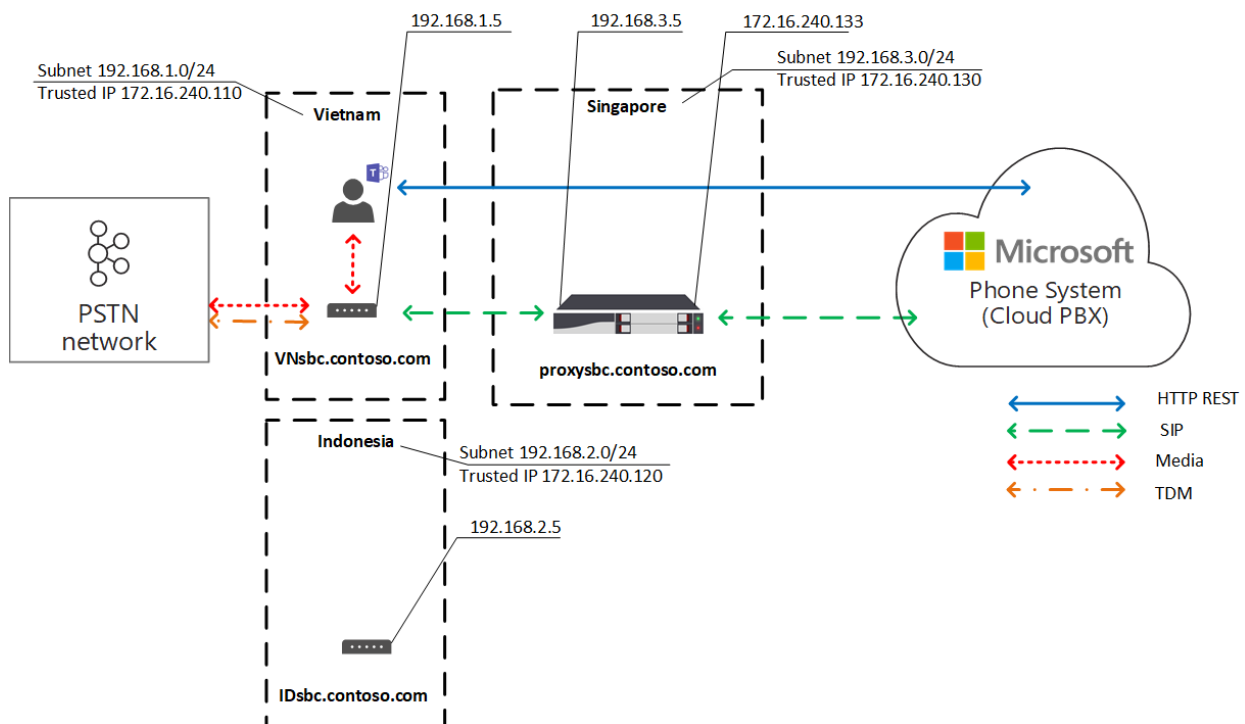

- The user's Teams client communicates with Phone System directly through the REST API, but media generated during the call flows to local SBC's internal IP address.
- The local SBC redirects the flow to the proxy SBC in Singapore and to the connected local PSTN network.
- The proxy SBC is visible to Phone System through the external IP address only and routes the flow from the downstream SBC (in this case the local SBC in Vietnam) to Phone System.
- The downstream SBC in the local branch office is not visible to Phone System directly but is mapped within the virtual network topology that is defined by the Contoso administrator while setting up Local Media Optimization.

NOTE

The behavior might be different for local users and non-local users depending on the configured Local Media Optimization mode.

For more information on possible modes and relevant behavior, see [Configure Local Media Optimization](#).

Diagram 3. Traffic flow when the user is in the "home" network with a proxy SBC and with connected downstream SBCs

External user

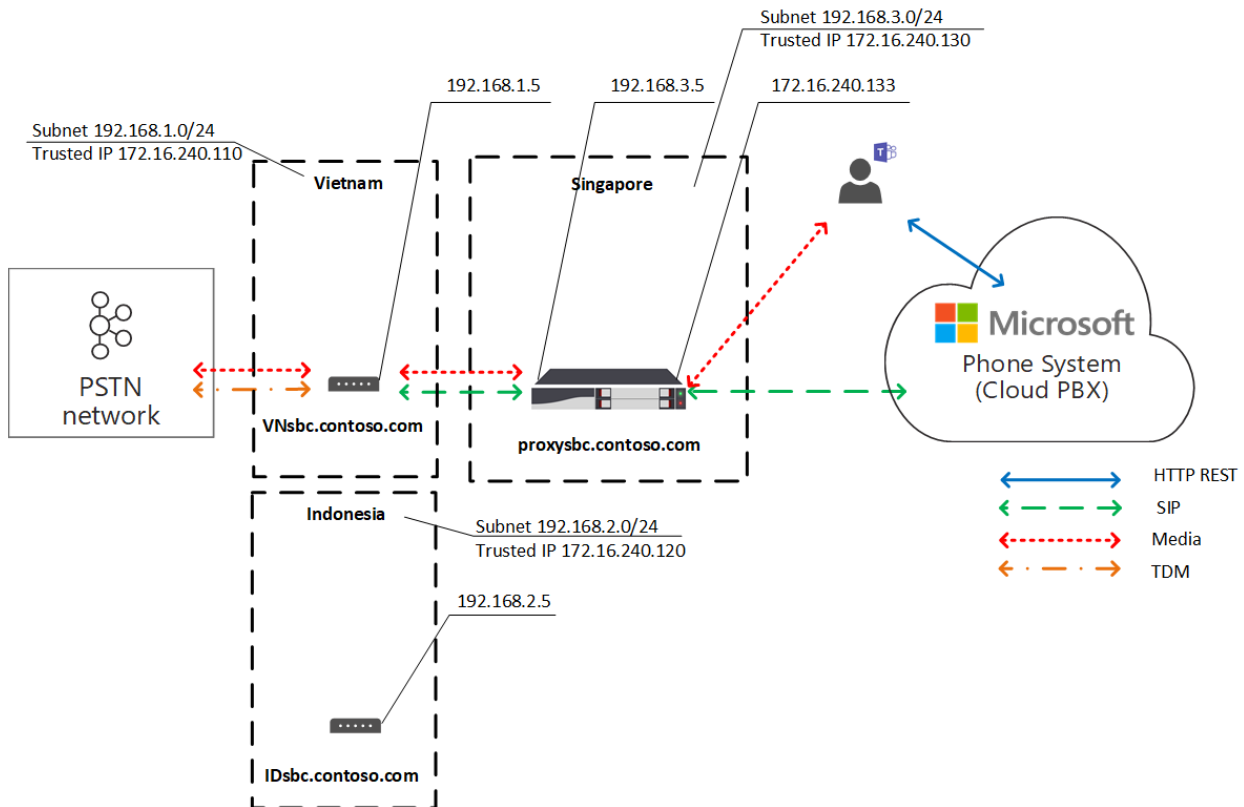

The following diagram shows the traffic flow when a user is outside of the corporate network boundaries. The user is not on premises (is not within the boundaries of corporate network). The user makes a Direct Routing phone call through Teams to a phone number in Vietnam.

- The user's Teams client communicates with Phone System directly through the REST API, but the media generated during the call flows first to the external IP address of the proxy SBC in Singapore.
- Based on configuration and voice policies (see [Configure Local Media Optimization](#) for details), the proxy

SBC redirects the flow to the downstream SBC in Vietnam.

- The downstream SBC in Vietnam redirects the flow to the connected local PSTN network.
- The proxy SBC is visible to Phone System through the external IP address only.
- The downstream SBC in the local branch office is not visible to Phone System directly, but is mapped within the virtual network topology that is defined by the Contoso administrator while setting up Local Media Optimization. In the example, the user is considered external because the user is outside the boundaries of the corporate network.

Diagram 4. Traffic flow when the user is external with a proxy SBC and with connected downstream SBCs

Local Media Optimization modes

Local Media Optimization supports two modes:

- **Mode 1: Always bypass.** In this case, if the user is internal, the media will flow through the local downstream SBC's internal IP address regardless of the actual location of the internal user; for example, within the same branch office where the downstream SBC is located or in some other branch office.
- **Mode 2: Only for local users.** In this mode, media will flow directly to the local downstream SBC's internal IP address only when generated by the internal user located in the same branch office as the downstream SBC.

To distinguish between Local Media Optimization modes, the tenant administrator needs to set the - BypassMode parameter to either 'Always' or 'OnlyForLocalUsers' for every SBC by using the Set-CsOnlinePSTNGateway cmdlet. For more information, see [Configure Local Media Optimization](#).

NOTE

When users are internal, media connectivity between the user and the SBC over the internal IP address is **required**. There is no fallback to public transport relays for media in this case as the SBC will be providing an internal IP for media connectivity.

Mode 1: Always bypass

If you have good connection between branch offices, the recommended mode is Always bypass.

For example, assume a company has a centralized SIP trunk in Amsterdam, which serves 30 countries and has good connectivity between all 30 sites and local users. There is also a branch in Germany where a local SBC is deployed.

The SBC in Germany can be configured in "Always bypass" mode. Users, regardless of their location, will connect to the SBC directly through the internal IP address of the SBC (for example from France to Germany; see the diagram below for reference).

The following describes two scenarios:

- Scenario 1. The user is in the same location as the SBC defined in the Online Voice Routing Policy.
- Scenario 2. The user and gateways are in different sites.

Scenario 1. The user is in the same location as the SBC defined in the Online Voice Routing Policy

The SBC in Amsterdam is configured to be a proxy SBC for a local downstream SBC in Germany. The user is in Germany within the same subnet as the corporate network of the local SBC. Both SBCs (proxy and downstream) are configured for Always Bypass mode. Online voice routing policies specify that in case of calls within Germany (with area code +49) they should be routed to the local SBC in Germany. All other calls--and in case the SBC in Germany fails, calls in Germany--should be routed to the proxy SBC in Amsterdam. The following table summarizes the example configuration.

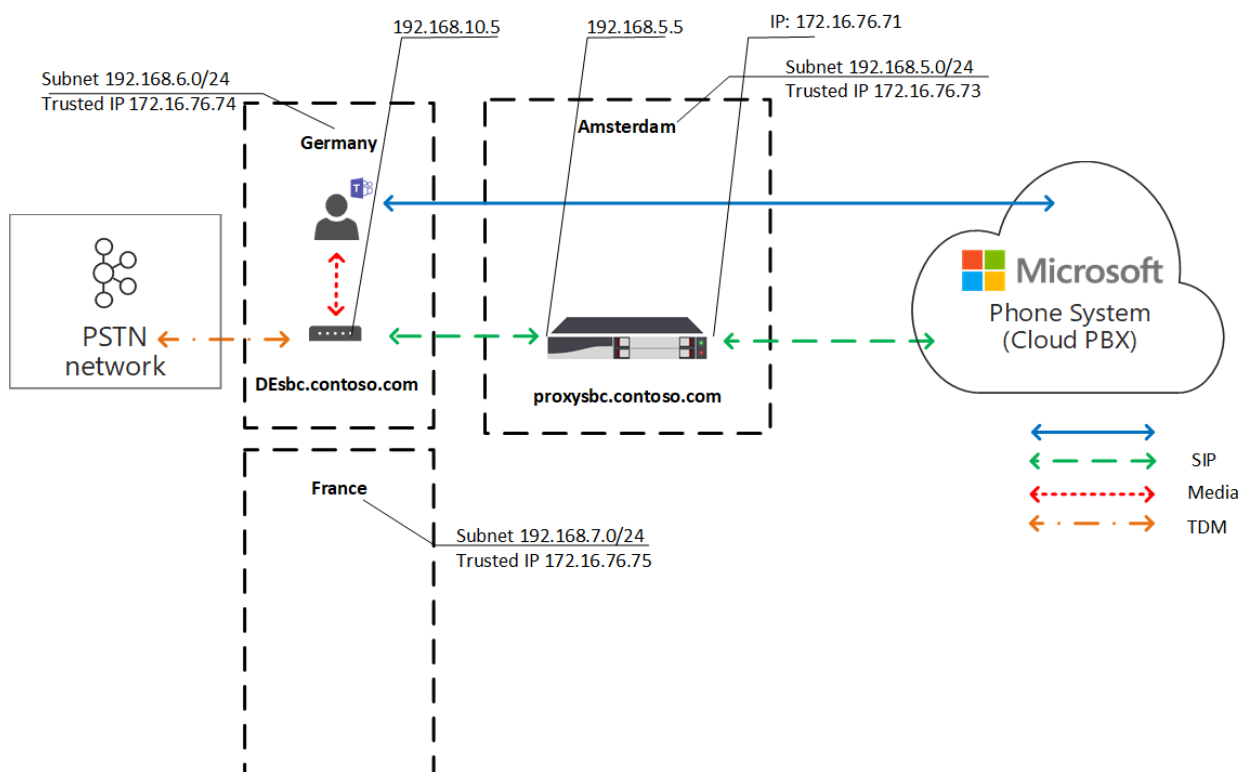

Table 3. Example configuration for Scenario 1

USER PHYSICAL LOCATION	USER MAKES A CALL TO A NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC	MEDIA FLOW
Germany	+49 1 437 2800	Priority 1: ^+49(\d{8})\$ - DEsbc.contoso.com Priority 2: .* - proxysbc.contoso.com	DEsbc.contoso.com – Always Bypass proxysbc.contoso.com – Always Bypass	Teams User <--> DEsbc.contoso.com

The diagram below shows the high-level traffic flow for the internal user in Germany making a Direct Routing phone call through Teams to the number in Germany.

- The user's Teams client communicates with Phone System directly through the REST API.
- The media generated during the call flows to the local SBC's internal IP address.
- The local SBC redirects the flow to the proxy SBC in Amsterdam and to the connected local PSTN network.
- The proxy SBC is visible to Phone System through the external IP address only and routes the flow from the downstream SBC (in this case, the local SBC in Germany) to Phone System.
- The downstream SBC in the local branch office is not visible to Phone System directly but is mapped within the virtual network topology that is defined by the Contoso administrator while setting up Local Media Optimization.

Diagram 5. Traffic flow with "Always Bypass" mode and the user is in the "home" site

Scenario 2: The user and gateways are in different sites

The SBC in Amsterdam is configured to be a proxy SBC for a local downstream SBC in Germany. Both SBCs (proxy and downstream) are configured for Always Bypass mode. The internal user in France, located in the local branch office, is making a Direct Routing call to Germany. Online voice routing policies specify that calls to Germany (with area code +49) should be routed to the local SBC in Germany. All other calls--and, in case the SBC in Germany fails, all calls in Germany--should be routed to the proxy SBC in Amsterdam. The following table summarizes the example configuration.

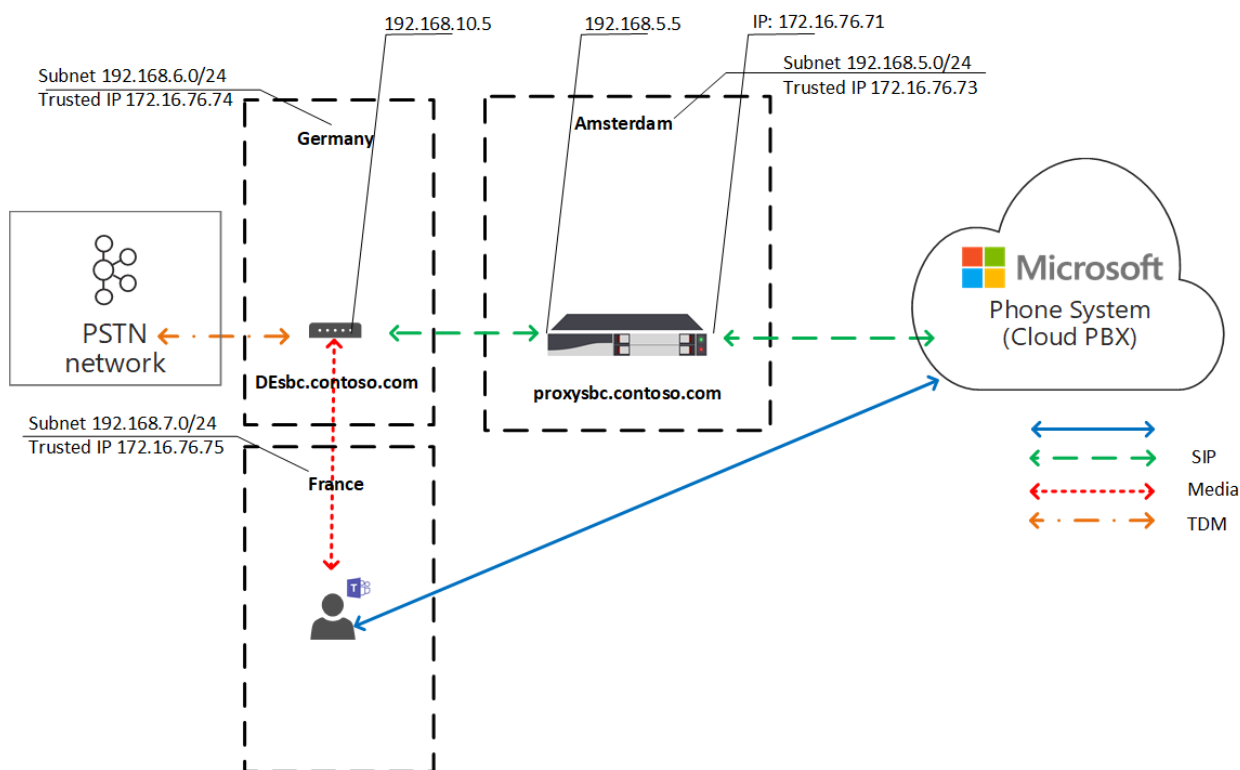

Table 4. Example configuration for Scenario 2

USER PHYSICAL LOCATION	USER MAKES A CALL TO A NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC	MEDIA FLOW
France	+49 1 437 2800	Priority 1: ^+49(\d{8})\$ - DEsbc.contoso.com Priority 2: .* - proxysbc.contoso.com	DEsbc.contoso.com – Always Bypass proxysbc.contoso.com – Always Bypass	Teams User <-> DEsbc.contoso.com

The following diagram shows the high-level traffic flow when the internal German user located in France makes a Direct Routing phone call through Teams to the number in Germany.

- The user's Teams client communicates with Phone System directly through the REST API.
- The media generated during the call flows directly to the SBC in Germany's internal IP address.
- The SBC in Germany redirects the flow to the proxy SBC in Amsterdam and to the connected local PSTN network.

Diagram 6. Traffic flow with "Always Bypass" mode and the user is not in "home" site but in the internal network

Mode 2: Only for local users

If there are bad connections between local branch offices but good connections between each local branch office and regional office, then the recommended mode is "Only For Local Users".

For example, in the APAC region, assume Contoso has multiple offices in different countries. For many countries, switching to SIP is not possible because the company still has TDM trunks in many local branch offices. Centralization of the TDM trunks is not an option in the APAC region. Moreover, there are more than fifty Contoso branch offices across the APAC region with hundreds of gateways (SBCs).

To build a solution where PSTN services are provided in all local branch offices in the APAC region where centralization of the TDM trunks is not an option, the Contoso administrator pairs one regional SBC in Singapore as the proxy SBC to the Direct Routing service. The direct connection between the local branch offices is not good, but there is a good connection between each local branch office and the regional SBC in Singapore. For the regional SBC, the administrator chooses 'Always Bypass' mode, and for the local downstream SBCs, the administrator chooses 'Only For Local Users' mode.

The following describes two scenarios:

- Scenario 1. The user is in the same location as the SBC defined in the Online Voice Routing Policy
- Scenario 2. The user and gateways are in different sites

Scenario 1. The user is in the same location as the SBC defined in Online Voice Routing Policy

Assume the SBC in Singapore is configured to be a proxy SBC for the local downstream SBCs in Vietnam and Indonesia. The user is in Vietnam within the same location as the local SBC. Online voice routing policies specify that calls in Vietnam (with area code +84) should be routed to the local SBC in Vietnam. All other calls--and, if the SBC in Vietnam fails, calls in Vietnam--should be routed to the proxy SBC in Singapore. The following table summarizes the example configuration.

Table 5. Example configuration for 'Only For Local Users' mode Scenario 1

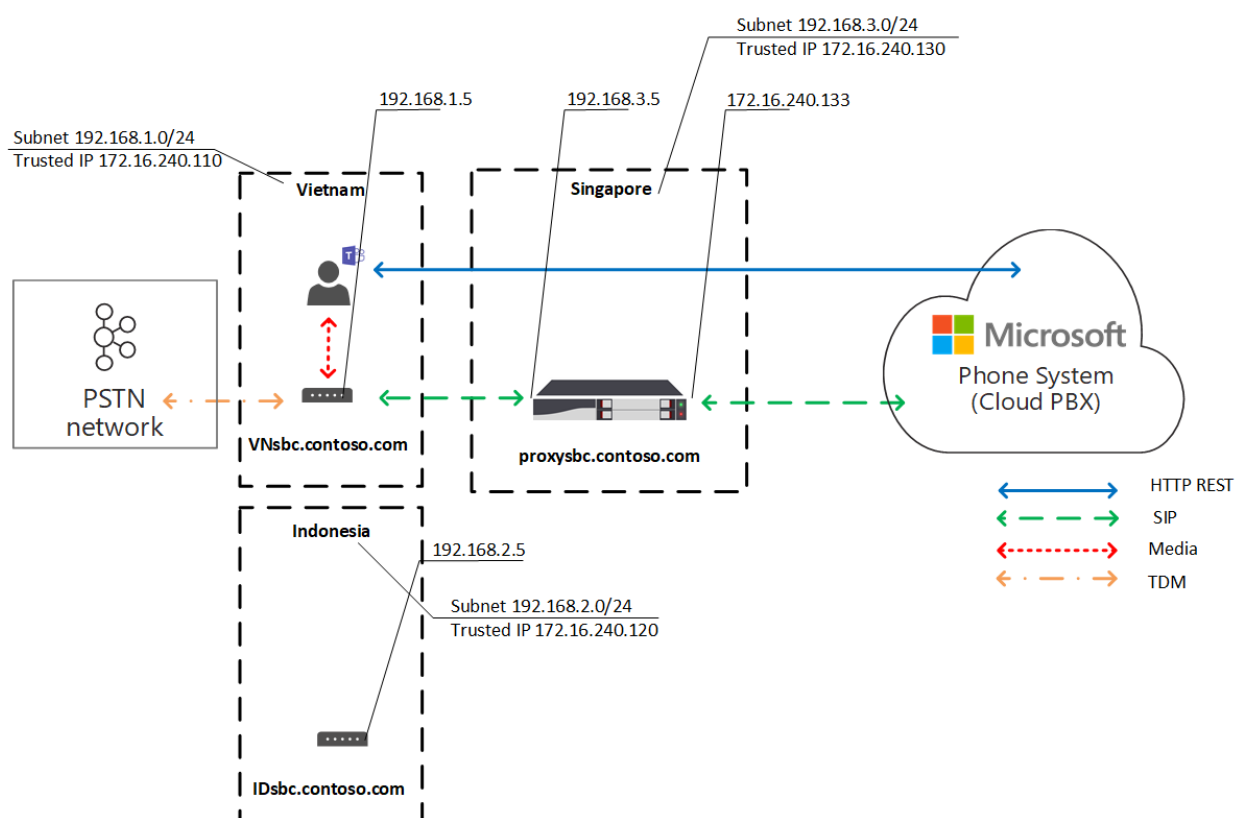

USER PHYSICAL LOCATION	USER MAKES A CALL TO A NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC	MEDIA FLOW
------------------------	-------------------------------	-----------------------------	-------------------------	------------

USER PHYSICAL LOCATION	USER MAKES A CALL TO A NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC	MEDIA FLOW
Vietnam	+84 4 3926 3000	Priority 1: ^+84(\d{9})\$ - VNsbcsbc.contoso.com Priority 2: .* - proxysbc.contoso.com	VNsbcsbc.contoso.com – Only For Local Users proxysbc.contoso.com – Always Bypass	Teams User <--> VNsbcsbc.contoso.com

In the following diagram, a user assigned to the local branch office in Vietnam, while on premises, makes a Direct Routing phone call through Teams.

- The user's Teams client communicates with Phone System directly through the REST API.
- Media generated during the call flows to the local SBC's internal IP address.
- The local SBC redirects the flow to the proxy SBC in Singapore and to the connected local PSTN network.
- The proxy SBC is visible to Phone System through the external IP address only and routes the flow from the downstream SBC (in this case, the local SBC in Vietnam) to Phone System.
- The downstream SBC in the local branch office is not visible to Phone System directly but is mapped within the virtual network topology.

Diagram 7. Traffic flow with "Only For Local Users" mode and the user is in "home" site

Scenario 2. The user and gateways are in different sites

Assume the SBC in Singapore is configured to be a proxy SBC for the local downstream SBCs in Vietnam and Indonesia. The internal user in Indonesia, located in the local branch office, is making a Direct Routing call to Vietnam. Online Voice routing policies specify that calls to Vietnam (with area code +84) should be routed to the local SBC in Vietnam. All other calls--and, in case the SBC in Vietnam fails, calls to Vietnam--should be routed to the proxy SBC in Singapore. The proxy SBC in Singapore is set to 'Always Bypass' mode, and the local SBC in Vietnam is set to 'Only For Local Users' mode. The following table summarizes the example configuration.

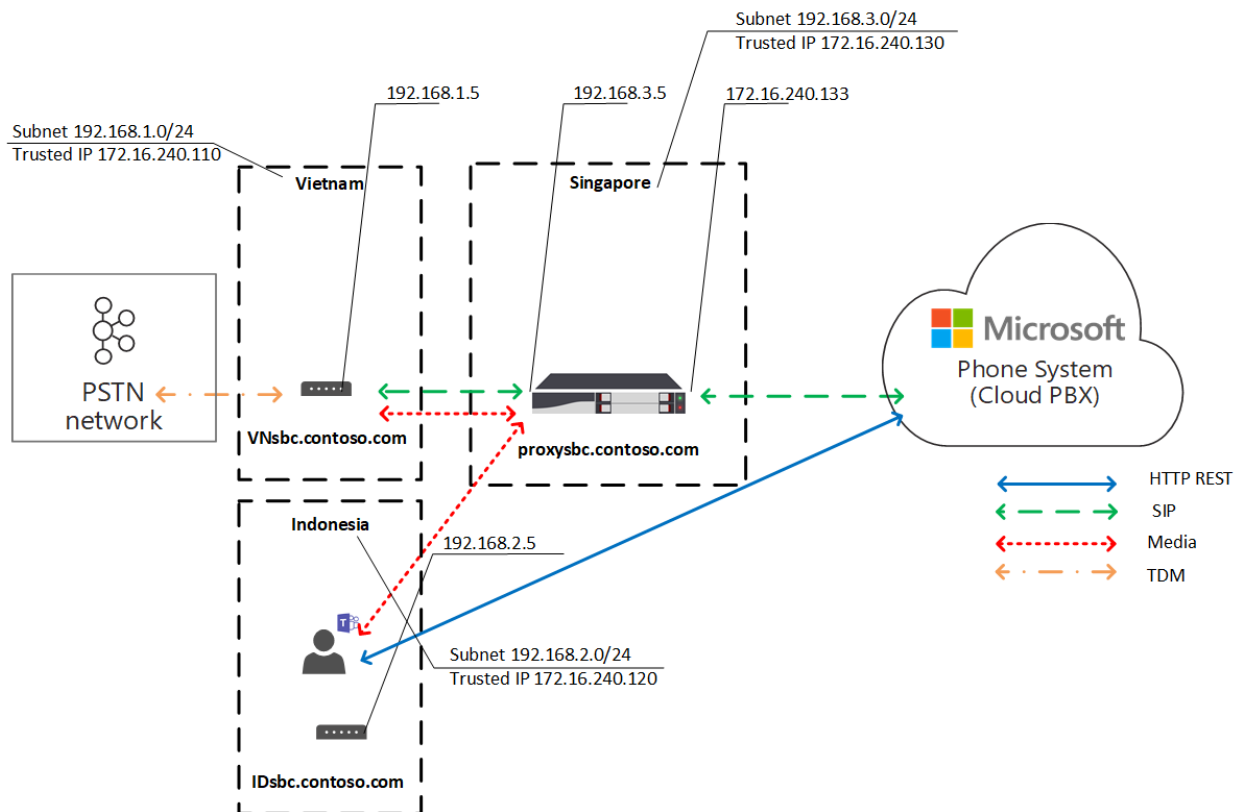

Table 6. User configuration

USER PHYSICAL LOCATION	USER MAKES A CALL TO A NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC	MEDIA FLOW
Indonesia	+84 4 3926 3000	Priority 1: ^+84(\d{9})\$ - VNsbcsbc.contoso.com Priority 2: .* - proxysbc.contoso.com	VNsbcsbc.contoso.com – Only For Local Users proxysbc.contoso.com – Always Bypass	Teams User <--> proxysbc.contoso.com <--> VNsbcsbc.contoso.com

In the following diagram, the internal user, while on premises in the Indonesian branch office, makes a Direct Routing phone call through Teams to a number in Vietnam.

- The user's Teams client communicates with Phone System directly through the REST API.
- Media generated during the call flows to proxy SBC's internal IP address first.
- The proxy SBC in Singapore redirects the flow to the internal IP address of the downstream SBC in Vietnam and to Phone System.
- The Downstream SBC in Vietnam routes the flow to the connected local PSTN network.
- The proxy SBC is visible to Phone System through the external IP address only.
- The downstream SBCs in local branch offices are not visible to Phone System directly but are mapped within the virtual network topology.

Diagram 8. Traffic flow with "Only For Local Users" mode, and the user is not in "home" site but in the internal network

Known issues

The following is a list of known issues that are currently present in Local Media Optimization. Microsoft is working on addressing these issues.

ISSUE	WORKAROUND
Teams client is not identified as internal when the Teams client Public IP matches the customer Trusted IP list.	Local Media Optimization requires that the Teams client subnet matches a tenant configured network subnet
Call escalations result in dropped calls when the Teams client is identified as internal.	Disable Local Media Optimization on the Direct Routing SBC.
Call escalations from 1 to 1 call between internal customers to multiparty call with external customer/resource result in dropped calls	Work in progress on a fix. Alternatively, disable Local Media Optimization on the Direct Routing SBC.
Teams user puts the call On Hold. Music plays on the PSTN end and Local Media Optimization is working. The Teams user resumes the call. The call to PSTN resumes but Local Media Optimization is not working and the call continues via Central (Proxy) SBC	When a user parks a call to initiate music on hold (MoH), it is being escalated from 1:1 to a multiparty call by the Call Controller to invoke Media Controller and Media Processor (serving as AVMCU mixer) through which MoH reaches a user who has been put on hold. De-escalation to a 1:1 call after the call resumes never happens as per design. Disable Local Media Optimization on the Direct Routing SBC.
While a call is being established for a few seconds, the user might hear silence.	Due to the complexity of Local Media Optimization architecture, this might occur in some cases.

Configure Local Media Optimization for Direct Routing

12/7/2021 • 11 minutes to read • [Edit Online](#)

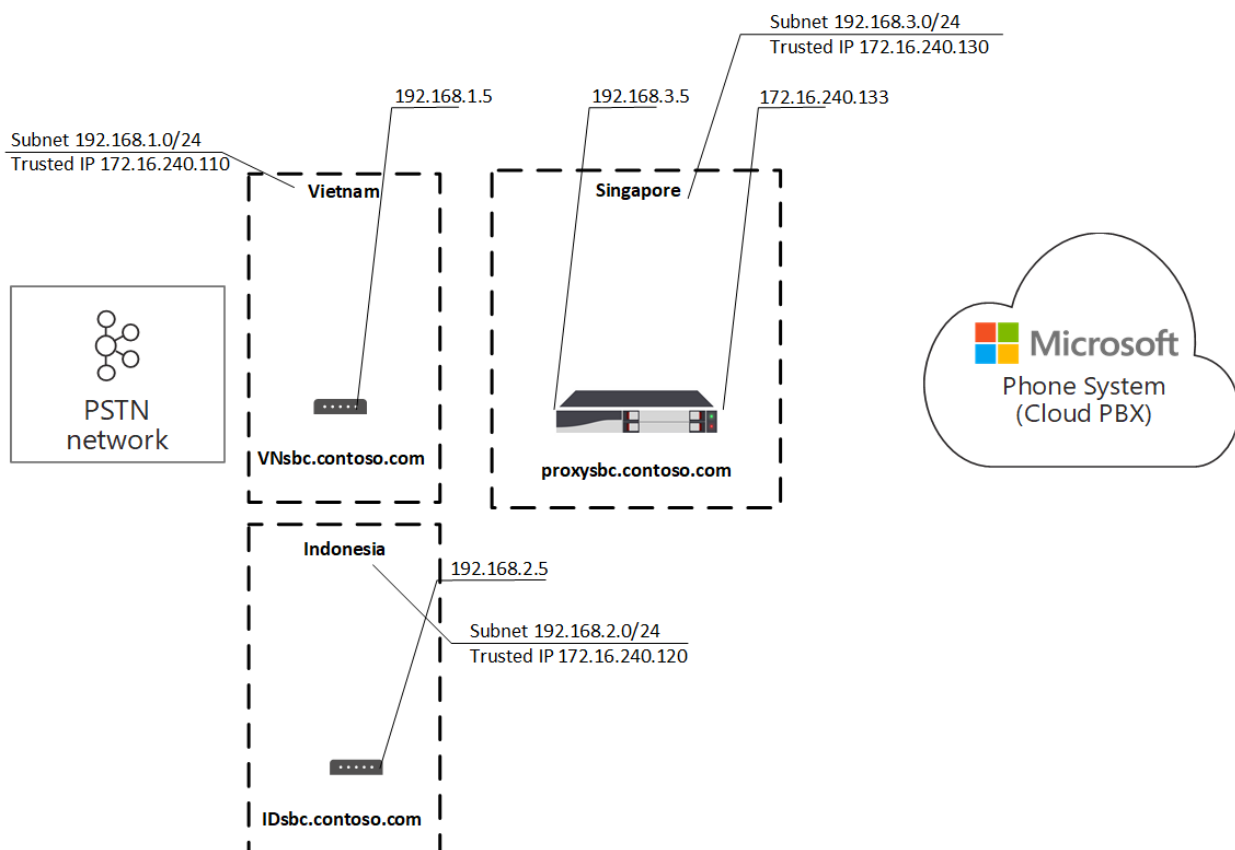

Configuration for Local Media Optimization is based on network settings that are common to other cloud voice features, such as Location-Based Routing and dynamic emergency calling. To learn more about network regions, network sites, network subnets, and trusted IP addresses, see [Network settings for cloud voice features](#).

Before you configure Local Media Optimization, see [Local media Optimization for Direct Routing](#).

To configure Local Media Optimization, the following steps are required. You can use the Teams Admin Center or PowerShell. For details, see [Manage your network topology](#).

1. Configure the user and the SBC sites (as described in this article).
2. Configure the SBCs for Local Media Optimization (according to your SBC vendor specification).

The following diagram shows the network setup used in the examples throughout this article.

Configure the user and the SBC sites

To configure the user and the SBC sites, you will need to:

1. [Manage external trusted IP addresses](#).
2. [Define the network topology](#) by configuring the network regions, network sites, and network subnets.
3. [Define the virtual network topology](#) by assigning SBC(s) to site(s) with relevant modes and proxy SBC values.

NOTE

Local Media Optimization relies on client locations being detected as external or internal relative to the company networks with reach to a Direct Routing (DR) Session Border Controller (SBC) internal interface. In split-tunnel VPN scenarios when the client endpoint is detected as external to the customer's network, Microsoft will signal the external location to the SBC even though the client can reach the internal interface of the customer's Direct Routing SBC. Direct Routing customers using Local Media Optimization may experience prolonged call setup times and in some cases no audio when receiving calls from the PSTN. To avoid this, VPN administrators must block access between remote VPN users and Direct Routing SBC internal interface.

Configure SBC(s) for Local Media Optimization according to the SBC vendor specification

This article describes configuration for Microsoft components. For information on SBC configuration, see your SBC vendor documentation. For information on which SBC vendors support Local Media Optimization, see [Session Border Controllers Certified for Direct Routing](#).

Manage external trusted IP addresses

External trusted IPs are the Internet external IPs of the enterprise network. These IP's are the IP addresses used by Microsoft Teams clients when they connect to Microsoft 365. You need to add these external IPs for each site where you have users using Local Media Optimization.

To add the public IP addresses for each site, use the `New-CsTenantTrustedIPAddress` cmdlet. You can define an unlimited number of trusted IP addresses for a tenant. If the external IPs seen by Microsoft 365 are both IPv4 and IPv6 addresses, you need to add both types of IP addresses. For IPv4, use mask 32. For IPv6, use mask 128. You can add both individual external IP addresses and external IP subnets by specifying different MaskBits on the cmdlet.

```
New-CsTenantTrustedIPAddress -IPAddress <External IP address> -MaskBits <Subnet bitmask> -Description <description>
```

Example of adding trusted IP addresses.

```
New-CsTenantTrustedIPAddress -IPAddress 172.16.240.110 -MaskBits 32 -Description "Vietnam site trusted IP"
New-CsTenantTrustedIPAddress -IPAddress 172.16.240.120 -MaskBits 32 -Description "Indonesia site trusted IP"
New-CsTenantTrustedIPAddress -IPAddress 172.16.240.130 -MaskBits 32 -Description "Singapore site trusted IP"
```

Define the network topology

This section describes how to define the network regions, network sites, and network subnets for your network topology.

All parameters are case sensitive so you need to ensure that you use the same case that was used during setup. (For example, GatewaySiteID values "Vietnam" and "vietnam" will be treated as different sites.)

Define network regions

To define network regions, use the `New-CsTenantNetworkRegion` cmdlet. The RegionID parameter is a logical name that represents the geography of the region and has no dependencies or restrictions. The CentralSite `<site ID>` parameter is optional.

```
New-CsTenantNetworkRegion -NetworkRegionID <region ID>
```

The following example creates a network region named APAC:

```
New-CsTenantNetworkRegion -NetworkRegionID "APAC"
```

Define network sites

To define network sites, use the `New-CsTenantNetworkSite` cmdlet. Each network site must be associated with a network region.

```
New-CsTenantNetworkSite -NetworkSiteID <site ID> -NetworkRegionID <region ID>
```

The following example creates three new network sites, Vietnam, Indonesia, and Singapore in the APAC region:

```
New-CsTenantNetworkSite -NetworkSiteID "Vietnam" -NetworkRegionID "APAC"  
New-CsTenantNetworkSite -NetworkSiteID "Indonesia" -NetworkRegionID "APAC"  
New-CsTenantNetworkSite -NetworkSiteID "Singapore" -NetworkRegionID "APAC"
```

Define network subnets

To define network subnets and associate them to network sites, use the `New-CsTenantNetworkSubnet` cmdlet. Each network subnet can only be associated with one site.

```
New-CsTenantNetworkSubnet -SubnetID <Subnet IP address> -MaskBits <Subnet bitmask> -NetworkSiteID <site ID>
```

The following example defines three network subnets and associates them with the three network sites: Vietnam, Indonesia, and Singapore:

```
New-CsTenantNetworkSubnet -SubnetID 192.168.1.0 -MaskBits 24 -NetworkSiteID "Vietnam"  
New-CsTenantNetworkSubnet -SubnetID 192.168.2.0 -MaskBits 24 -NetworkSiteID "Indonesia"  
New-CsTenantNetworkSubnet -SubnetID 192.168.3.0 -MaskBits 24 -NetworkSiteID "Singapore"
```

Define the virtual network topology

First, the tenant administrator creates a new SBC configuration for each relevant SBC by using the `New-CsOnlinePSTNGateway` cmdlet. The tenant administrator defines the virtual network topology by specifying the network sites for the PSTN gateway objects using the `Set-CsOnlinePSTNGateway` cmdlet:

```
PS C:\> Set-CsOnlinePSTNGateway -Identity <Identity> -GatewaySiteID <site ID> -MediaBypass <true/false> -  
BypassMode <Always/OnlyForLocalUsers> -ProxySBC <proxy SBC FQDN or $null>
```

Note the following:

- If the customer has a single SBC, the `-ProxySBC` parameter must be either mandatory `$null` or SBC FQDN value (Central SBC with centralized trunks scenario).
- The `-MediaBypass` parameter must be set to `$true` in order to support Local Media Optimization.
- If the SBC doesn't have the `-BypassMode` parameter set, X-MS headers will not be sent.
- All parameters are case sensitive so you need to ensure that you use the same case that was used during setup. (For example, `GatewaySiteID` values "Vietnam" and "vietnam" will be treated as different sites.)

The following example adds three SBCs to the network sites Vietnam, Indonesia, and Singapore in the APAC region with mode Always bypass:

```
Set-CSOnlinePSTNGateway -Identity "proxysbc.contoso.com" -GatewaySiteID "Singapore" -MediaBypass $true -  
BypassMode "Always" -ProxySBC $null  
  
Set-CSOnlinePSTNGateway -Identity "VNsbc.contoso.com" -GatewaySiteID "Vietnam" -MediaBypass $true -  
BypassMode "Always" -ProxySBC "proxysbc.contoso.com"  
  
Set-CSOnlinePSTNGateway -Identity "IDSbc.contoso.com" -GatewaySiteID "Indonesia" -MediaBypass $true -  
BypassMode "Always" -ProxySBC "proxysbc.contoso.com"
```

NOTE

To ensure uninterrupted operations when Local Media Optimization and Location-Based Routing (LBR) are configured at the same time, downstream SBCs must be enabled for LBR by setting the GatewaySiteLbrEnabled parameter to \$true for each downstream SBC. (This setting is not mandatory for the proxy SBC.)

Based on the information above, Direct Routing will include three proprietary SIP Headers to SIP Invites and Re-invites as shown in the following table.

X-MS Headers introduced in Direct Routing on Invites and Re-Invites if BypassMode is defined:

HEADER NAME	VALUES	COMMENTS
X-MS-UserLocation	internal/external	Indicates if user is internal or external
Request-URI INVITE sip: +84439263000@VNsbc.contoso.com SIP /2.0	SBC FQDN	The FQDN which is targeted for the call even if the SBC is not directly connected to Direct Routing
X-MS-MediaPath	Example: proxysbc.contoso.com, VNsbc.contoso.com	Order of SBCs that should be used for Media path between the user and target SBC. The final SBC is always last
X-MS-UserSite	usersitelD	String defined by tenant administrator

Call flows

The following shows call flows for two modes:

- [Always Bypass](#)
- [Only for local users](#)

Always Bypass mode

Always Bypass mode is the simplest option to configure. The tenant administrator can configure a single site for all users and SBCs if all SBCs are reachable from any site.

The examples show Always bypass mode for the following scenarios:

- [Outbound calls and the user is in the same location as the SBC](#)
- [Inbound calls and the user is in the same location as the SBC](#)
- [Outbound calls and the user is external](#)
- [Inbound calls and the user is external](#)

The following table shows the FQDN and IP addresses used in the examples:

FQDN	SBC EXTERNAL IP ADDRESS	SBC INTERNAL IP ADDRESS	INTERNAL SUBNET	LOCATION	EXTERNAL NAT (TRUSTED IP)
VNsbc.contoso.com	None	192.168.1.5	192.168.1.0/24	Vietnam	172.16.240.110
IDsbc.contoso.com	None	192.168.2.5	192.168.2.0/24	Indonesia	172.16.240.120
proxysbc.contoso.com	172.16.240.133	192.168.3.5	192.168.3.0/24	Singapore	172.16.240.130

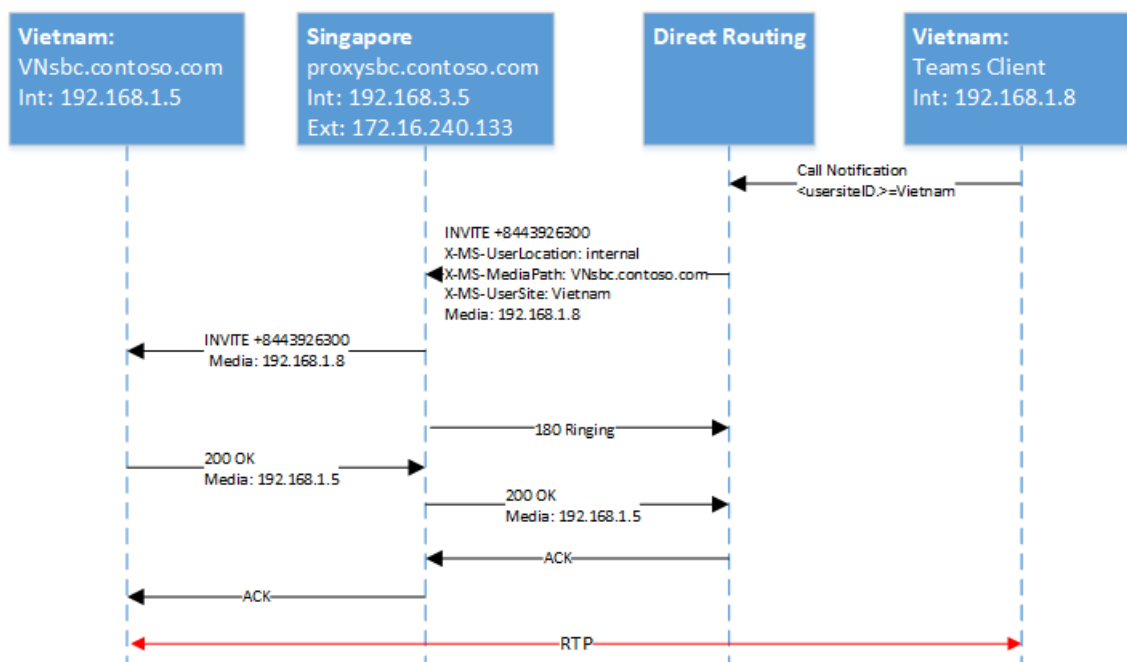

Outbound calls and the user is in the same location as the SBC with Always Bypass

MODE	USER	LOCATION	CALL DIRECTION
AlwaysBypass	Internal	The same site as SBC	Outbound

The following table shows the end user configuration and action:

USER PHYSICAL LOCATION	USER MAKES OR RECEIVES A CALL TO/FROM NUMBER	USER PHONE NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC
Vietnam	+84 4 3926 3000	+84 4 5555 5555	Priority 1: ^+84(\d{9})\$ - VNsbc.contoso.com Priority 2: .* - proxysbc.contoso.com	VNsbc.contoso.com – Always Bypass proxysbc.contoso.com – Always Bypass

The following diagram shows the SIP ladder for an outbound call with Always bypass mode, and the user in the same location as the SBC.

The following table shows the X-MS headers sent by Direct Routing:

PARAMETER	EXPLANATION
Invite +8443926300@VNsbcs.contoso.com	The target FQDN of the SBC as defined in the Online Voice Routing Policy is sent in the Request URI
X-MS-UserLocation: internal	The field indicated that user is located inside the corporate network
X-MS-MediaPath: VNsbcs.contoso.com	Specifies which SBC the client must traverse to the target SBC. In this case as we have Always Bypass, and the client is internal the target name sent as the only name in the header.
X-MS-UserSite: Vietnam	The field indicated within the site the user is located.

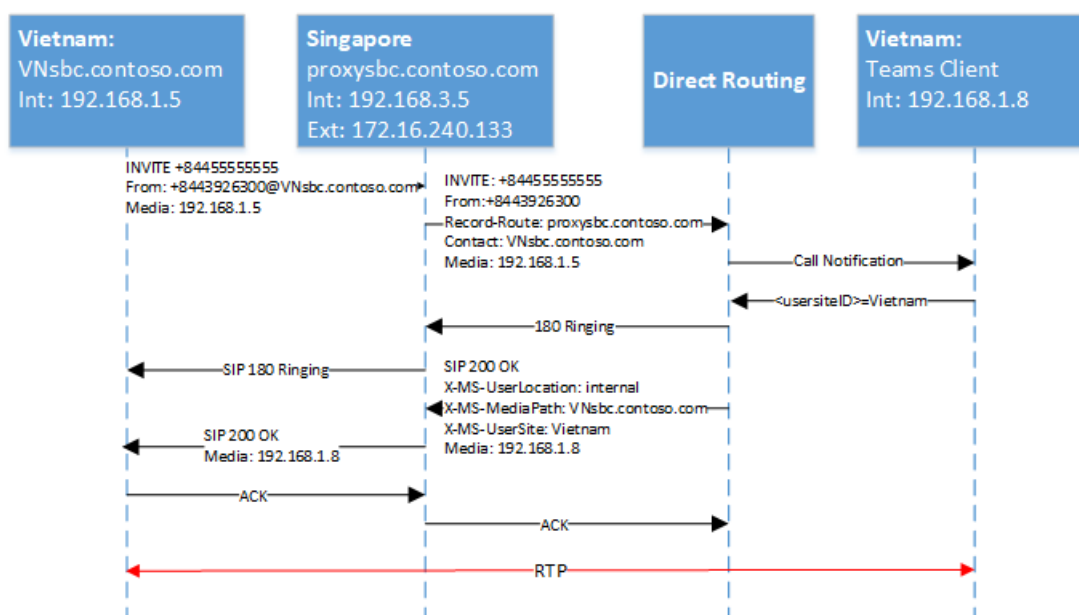

Inbound calls and the user is in the same location as the SBC with Always Bypass

MODE	USER	LOCATION	CALL DIRECTION
AlwaysBypass	Internal	The same site as SBC	Inbound

On an inbound call, the location of the user is unknown, and the SBC must guess where the user is. If the guess is not correct, a re-invite will be required. This case assumes user is internal, media can flow directly, and no further actions are required (re-invite). The SBC connected to the Direct Routing service reports the originating SBC location by providing Record-Route and Contact fields. Based on these fields, the media path is calculated by Direct Routing.

Note: Given that a user can have multiple endpoints, support of 183 is not possible. The Direct Routing will always use 180 Ringing in this case.

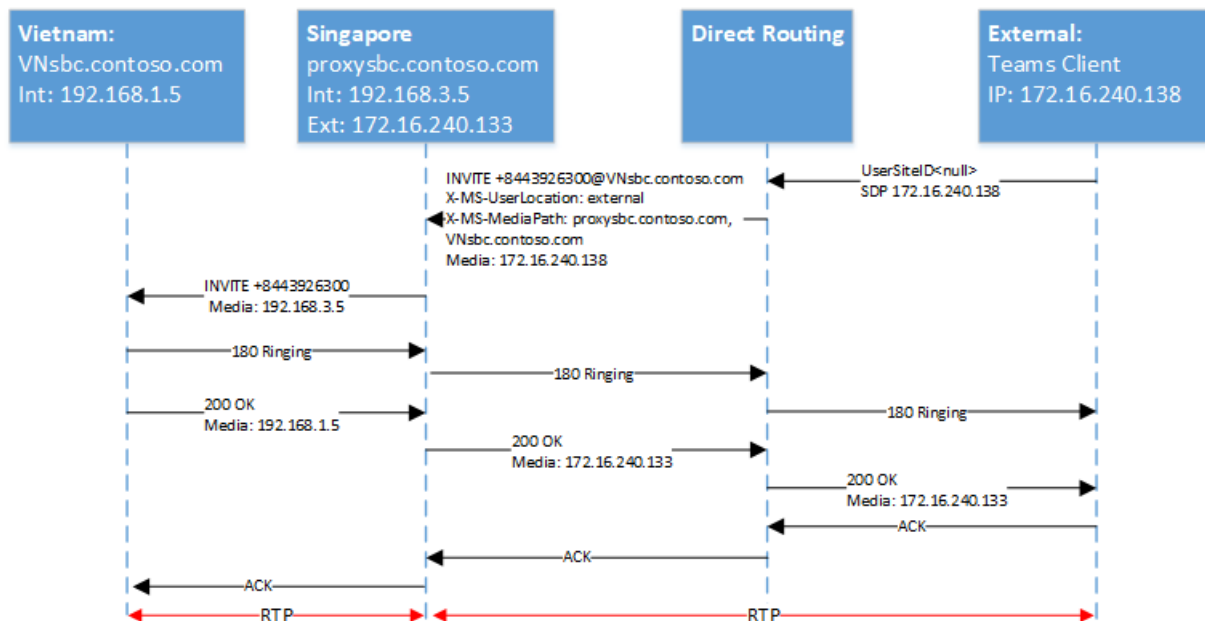

The following diagram shows the SIP ladder for in inbound call with AlwaysBypass mode, and the user is in the same location as the SBC.

Outbound calls and the user is external with Always Bypass

MODE	USER	SITE	CALL DIRECTION
AlwaysBypass	External	N/A	Outbound

The following diagram shows the SIP ladder for an outbound call with AlwaysBypass mode, and the user is external:

The following table shows the X-MS headers sent by the Direct Routing service:

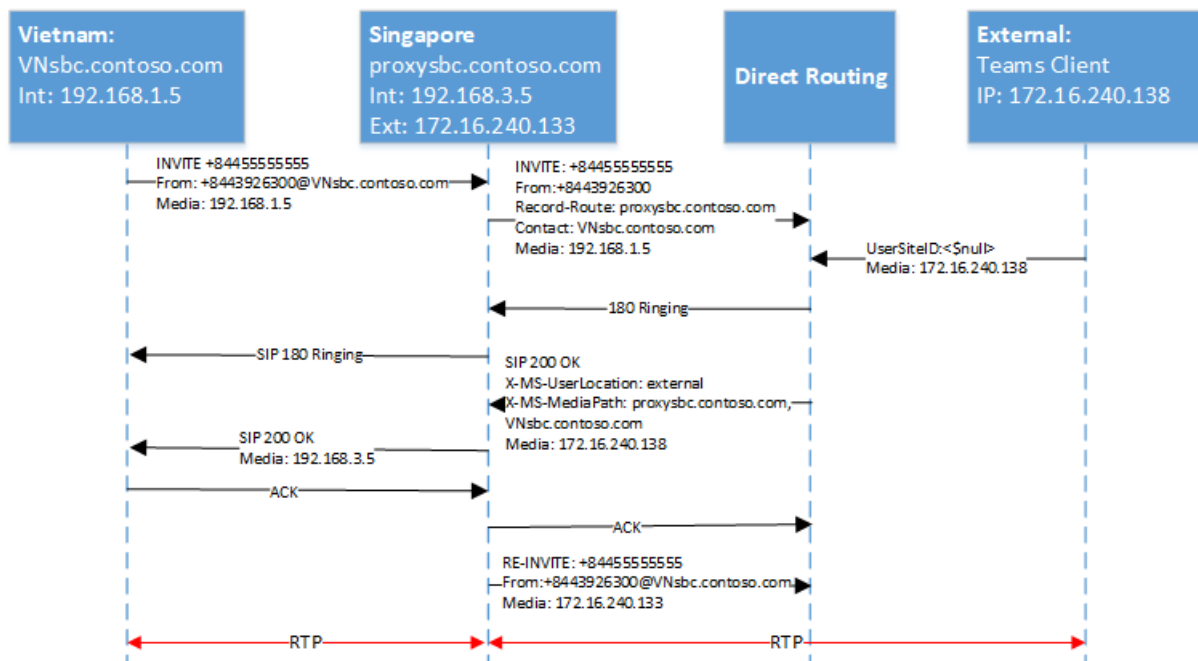

PARAMETER	EXPLANATION
Invite +8443926300@VNsbc.contoso.com	The target FQDN of the SBC as defined in the Online Voice Routing Policy is sent in the Request URI.
X-MS-UserLocation: external	The field indicated that user is located outside the corporate network.
X-MS-MediaPath: proxysbc.contoso.com, VNsbc.contoso.com	Specifies which SBC the client must traverse to the target SBC. In this case as we have Always Bypass, and the client is external.

Inbound calls and the user is external with Always Bypass

MODE	USER	SITE	CALL DIRECTION
AlwaysBypass	External	N/A	Inbound

For an inbound call, the SBC connected to Direct Routing needs to send a re-invite (by default, local media candidates are always offered) if the location of the user is external. The X-MediaPath is calculated based on Record-Route and the SBC user specified.

The following diagram shows the SIP ladder for an inbound call with AlwaysBypass mode, and the user is external.

Only for local users mode

Local media candidates of the target SBC will be offered only if a user is in the same location as the SBC. In all other cases, media will flow through either an internal or external IP of the proxy SBC.

The following scenarios are described:

- Outbound calls and the user is in the same location as the SBC
- Inbound calls and the user is in the same location as the SBC
- User is not at the same location as the SBC but is in the corporate network
- Inbound calls and the user is internal but is not at the same location as the SBC

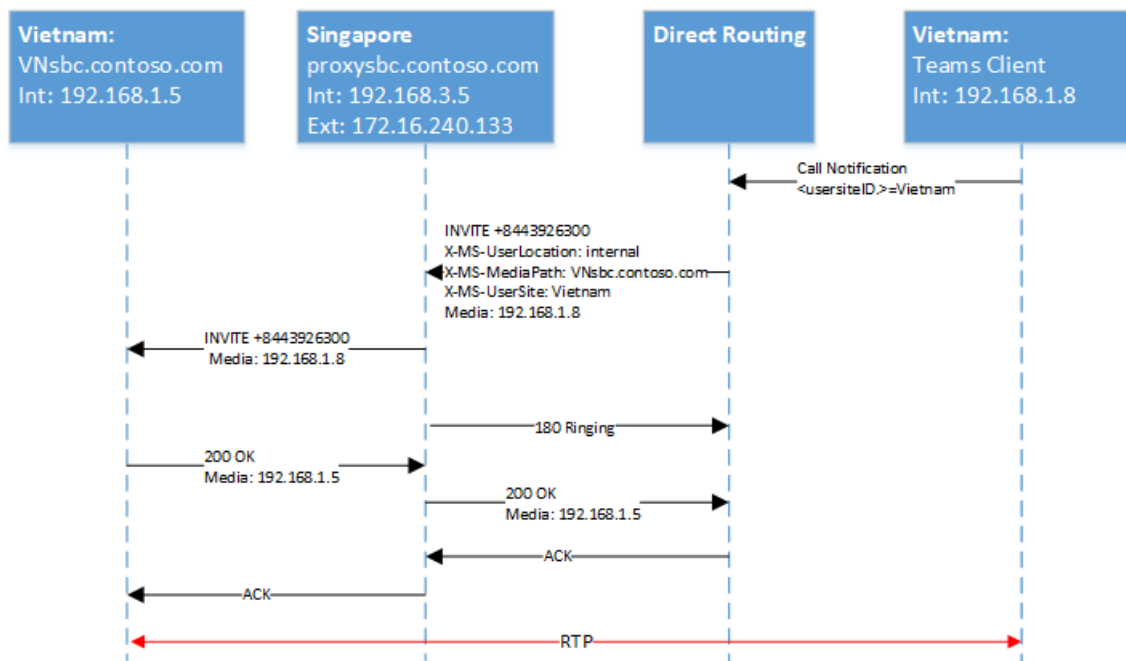

The following table shows end user configuration and action:

USER PHYSICAL LOCATION	USER MAKES OR RECEIVES A CALL TO/FROM NUMBER	USER PHONE NUMBER	ONLINE VOICE ROUTING POLICY	MODE CONFIGURED FOR SBC
Vietnam	+84 4 3926 3000	+84 4 5555 5555	Priority 1: ^+84(\d{9})\$ - VNsbc.contoso.com Priority 2: .* - proxysbc.contoso.com	VNsbc.contoso.com – OnlyForLocalUsers Proxysbc.contoso.com – Always Bypass

Outbound calls and the user is in the same location as the SBC with Only for local users

MODE	USER	SITE	CALL DIRECTION
OnlyForLocalUsers	Internal	Same as SBC	Outbound

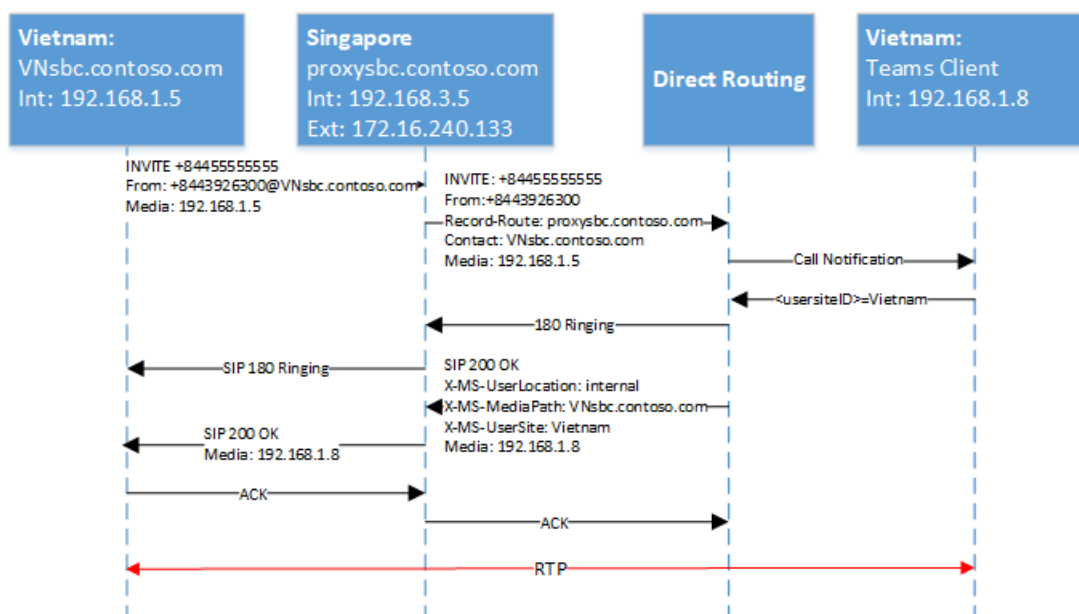

The following diagram shows an outbound call with OnlyForLocalUsers mode, and the user is in the same location as the SBC. This is the same flow shown in [Outbound calls when the user is in the same location as the SBC](#).

Inbound calls and the user is in the same location as the SBC with Only for local users

MODE	USER	SITE	CALL DIRECTION
OnlyForLocalUsers	Internal	Same as SBC	Inbound

The following diagram shows an inbound call with OnlyForLocalUsers mode, and the user is in the same location as the SBC. This is the same flow as shown in [Inbound calls when the user is in the same location as the SBC](#).

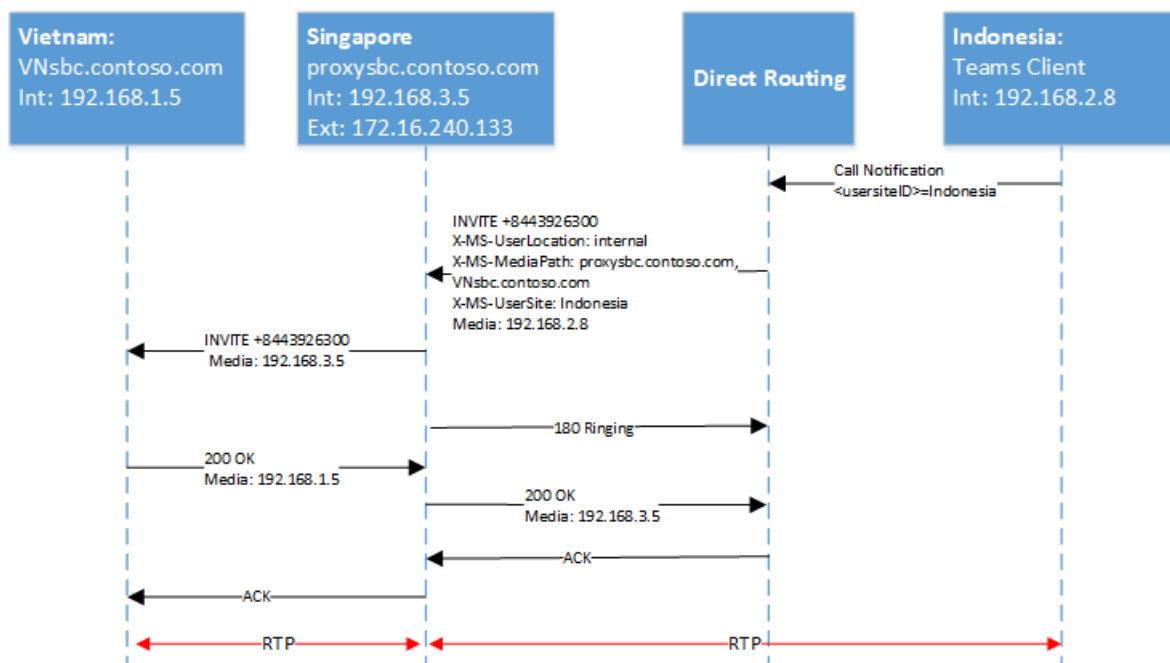

User is not at the same location as the SBC but is in the corporate network with Only for local users

MODE	USER	SITE	CALL DIRECTION
OnlyForLocalUsers	Internal	Different from SBC	Outbound

Direct routing calculates X-MediaPath based on the reported location of the user and mode configured on the SBC.

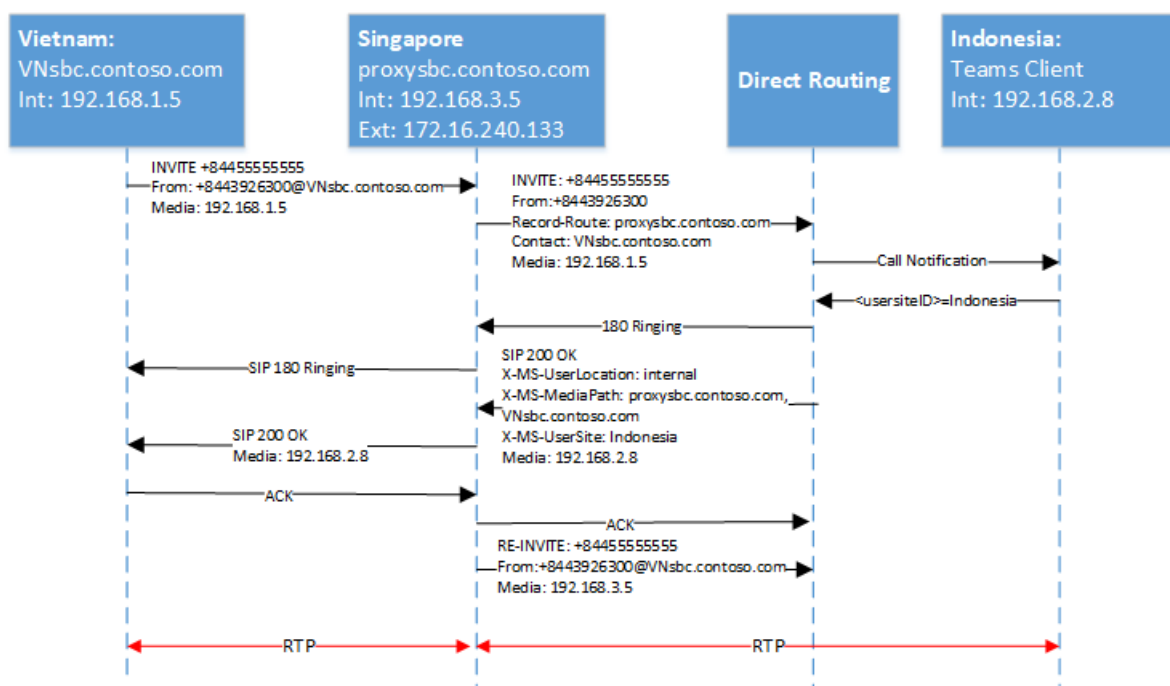

The following diagram shows an outbound call with OnlyForLocalUsers mode, and an internal user who is not at the same location as the SBC.

Inbound call and the user is internal but is not at the same location as the SBC with Only for local users

MODE	USER	SITE	CALL DIRECTION
OnlyForLocalUsers	Internal	Different from SBC	Inbound

The following diagram shows an inbound call with OnlyForLocalUsers mode, and an internal user who is not at the same location as the SBC.

User accounts in a hybrid environment with PSTN connectivity

12/7/2021 • 2 minutes to read • [Edit Online](#)

About the environment

This article applies to environments in which you have all of the following:

- Skype for Business Server or Lync Server 2013
- An Microsoft 365 or Office 365 organization
- Hybrid connectivity configured between the Skype for Business Server and Skype for Business Online or Microsoft Teams tenant
- Users who are enabled to make and receive Public Switched Telephone Network (PSTN) calls to and from the client

If you have a different environment (such as Skype for Business Cloud Connector Edition), hybrid is not configured, or your users are not enabled for PSTN calls, the supportability matrix will be different.

About the combinations and the supportability statement

A Skype for Business hybrid environment with PSTN connectivity provides flexibility regarding where user services are provided and how user accounts are provisioned and managed. But the abundance of options might create some unsupported combinations. This section explains different combinations of user creation, followed by a supportability statement.

Definitions:

- **Enterprise Voice:** Option to provide access to PSTN for users with on-premises Skype for Business user account. On-premises Skype for Business Mediation server provides interconnectivity to PSTN.
- **Hybrid Voice Connectivity:** Option to provide access to PSTN for users with Skype for Business Online account. On-premises Skype for Business Mediation server provides interconnectivity to PSTN.
- **Direct routing:** Option to provide access to PSTN for users with online Skype for Business account, Microsoft Teams license, using Microsoft Teams client. The SBC is connected to the SIP Proxy in Microsoft 365 or Office 365 without need for any on-premises software from Microsoft.

The environment supports the following combinations:

- **Scenario 1:** User account in Skype for Business on-premises and will use the Skype for Business client with Enterprise Voice
- **Scenario 2:** User account in Skype for business online and will use the Skype for Business client with Hybrid Voice Connectivity
- **Scenario 3:** User account in Skype for Business online with Microsoft Teams license and will use Teams client

Supportability matrix

USER OBJECT CREATED IN	USER'S SKYPE FOR BUSINESS SERVICE PROVIDER	USER'S CLIENT	VOICE OPTION	SUPPORTED
On premises AD	On premises	Skype for Business	Enterprise Voice	Yes

USER OBJECT CREATED IN	USER'S SKYPE FOR BUSINESS SERVICE PROVIDER	USER'S CLIENT	VOICE OPTION	SUPPORTED
On premises AD	Online	Skype for Business	Hybrid Voice Connectivity	Yes
On premises AD	Online	Microsoft Teams	Direct Routing	Yes
Unsupported combinations				
Azure AD	On premises/online	Skype for Business/Microsoft Teams	Enterprise Voice/Hybrid Voice Connectivity/Direct Routing	No, user object MUST be created in on-premises AD first
On premises AD	On premises	Microsoft Teams	Enterprise Voice/Hybrid Voice Connectivity/Direct Routing	No, Microsoft Teams client is not supported with on-premises Skype for Business
On premises AD	Online	Skype for Business	Direct Routing	No, Direct Routing is not supported with Skype for Business client

Supportability statement for the hybrid environment with PSTN

For all users, the user object **must** be created in the on-premises AD and synchronized to the Azure AD using the Azure AD Connect tool. Enabling users for Teams/Skype for Business **is not supported** if the user object is created directly in the Azure AD in a hybrid configuration. For new users, such as a new hire, who will be enabled directly for Teams, the user must be enabled for Skype for Business using on premises Skype for Business management tools. Creating users in online Skype for Business or Teams without first enabling them in on-premises pool with Enterprise Voice **is not supported**. For more information on this, look into [Plan Phone System with on-premises PSTN connectivity in Skype for Business Server](#).

Migrate to Direct Routing

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes what is needed to migrate to Direct Routing from a Skype for Business Online and Microsoft Teams configuration perspective. This article covers migrating from the following:

- Phone System with Calling Plans (for Teams and Skype for Business Online)
- Phone System with on-premises PSTN Connectivity in Skype for Business Server (for Skype for Business Online)
- Phone System with on-premises PSTN Connectivity by using the Cloud Connector Edition (for Skype for Business Online)

In addition to these configuration steps, configuration is also required on the Session Border Controller (SBC) to route the calls to the new route. That is outside the scope of this document. For more information, see your SBC vendor documentation.

User provisioning end-state for various PSTN connectivity options

The following table shows the end-state for a user provisioned for the selected PSTN connectivity options with Phone System. Only attributes relevant for voice are shown.

USER OBJECT ATTRIBUTES	PHONE SYSTEM WITH CALLING PLANS	PHONE SYSTEM WITH ON-PREMISES PSTN CONNECTIVITY VIA SKYPE FOR BUSINESS SERVER	PHONE SYSTEM WITH ON-PREMISES PSTN CONNECTIVITY VIA CLOUD CONNECTOR	PHONE SYSTEM WITH ON-PREMISES PSTN CONNECTIVITY VIA DIRECT ROUTING
Client	Skype for Business or Teams	Skype for Business	Skype for Business	Teams
Licenses	Skype Business Online Plan 2 MCOProfessional or MCOSTANDARD) Phone System (MCOEV) Calling Plans Teams	Skype Business Online Plan 2 (MCOProfessional or MCOSTANDARD) Phone System (MCOEV)	Skype Business Online Plan 2 (MCOProfessional or MCOSTANDARD) Phone System (MCOEV)	Skype Business Online Plan 2 (MCOProfessional or MCOSTANDARD) Phone System (MCOEV) Teams

USER OBJECT ATTRIBUTES	PHONE SYSTEM WITH CALLING PLANS	PHONE SYSTEM WITH ON-PREMISES PSTN CONNECTIVITY VIA SKYPE FOR BUSINESS SERVER	PHONE SYSTEM WITH ON-PREMISES PSTN CONNECTIVITY VIA CLOUD CONNECTOR	PHONE SYSTEM WITH ON-PREMISES PSTN CONNECTIVITY VIA DIRECT ROUTING
OnPremLineURI	N/A	The phone number must be synced from the on-premises AD.	The phone number can be managed either in on-premises Active Directory or in Azure Active Directory.	The phone number can be managed either in on-premises Active Directory or in Azure Active Directory. However, if the organization has on-premises Skype for Business, the number must be synced from the on-premises Active Directory.
LineURI	PSTN Calling phone number	Set automatically from the OnPremLineURI parameter	Set automatically from the OnPremLineURI parameter	Set automatically from the OnPremLineURI parameter
EnterpriseVoiceEnabled	True	True	True	True
HostedVoiceMail	True	True	True	True
VoicePolicy	BusinessVoice	HybridVoice	HybridVoice	HybridVoice
HostedVoiceMailPolicy	BusinessVoice	BusinessVoice	BusinessVoice	BusinessVoice
VoiceRoutingPolicy	Has a value	Has a value	Has a value	N/A
OnlineVoiceRoutingPolicy	\$Null	\$Null	\$Null	Has a value
TeamsUpgradePolicy ¹	TeamsOnly, SfBOnly	\$Null	\$Null	TeamsOnly
TeamsCallingPolicy AllowPrivateCalling	True	N/A	N/A	True
TeamsCallingPolicy AllowGroupCalling	True	N/A	N/A	True

¹ Choosing the right mode of the TeamsUpgradePolicy depends on the scenario. Please read about the voice experience in different modes in [Migration and interoperability Guidance for organizations using Teams together with Skype for Business](#).

As part of this effort, Microsoft recently updated the “Microsoft Teams admin center” (also known as Modern Portal) to reflect the new management model based on coexistence modes. In Modern Portal, configuring TeamsUpgradePolicy will now automatically also set TeamsInteropPolicy to consistent value, so TeamsInteropPolicy is no longer exposed in the user interface. However, admins using PowerShell must still set both TeamsUpgradePolicy and TeamsInteropPolicy together to ensure proper routing. After the transition to

TeamsUpgradePolicy is complete, it will no longer be necessary to also set TeamsInteropPolicy.

For more information, please refer to [Migration and interoperability Guidance for organizations using Teams together with Skype for Business](#).

Migrating from Calling Plans

For more information about migrating from Calling Plans, see:

- [Set up Calling Plans](#)
- [Set-CsOnlineVoice User](#)
- [Get-CsOnlineLisLocation](#)

It is recommended that you remove previously configured licensing plan information as follows:

```
$companyname = "contoso"
$lic1 = $companyname + "MCOPSTN1"
$lic2 = $companyname + "MCOPSTN2"
Set-MsolUserLicense -UserPrincipalName <UPN> -RemoveLicenses $lic1
Set-MsolUserLicense -UserPrincipalName <UPN> -RemoveLicenses $lic2
```

Migrating from Office 365 Phone System with on-premises PSTN connectivity in Skype for Business Server

For more information about migrating from Phone System with on-premises PSTN connectivity in Skype for Business Server, see the following:

- [Planning](#)
- [Deploying](#)

It is recommended that you remove previously configured voice routing information as follows:

```
Grant-CsVoiceRoutingPolicy -PolicyName $NULL -Identity <UPN>
```

NOTE

If a global CsVoiceRoutingPolicy is configured, it is recommended that you remove any PSTN usages associated with this global policy.

Migrating from Office 365 Phone System with on-premises PSTN connectivity via Cloud Connector Edition

IMPORTANT

Cloud Connector Edition will retire July 31, 2021 along with Skype for Business Online. Once your organization has upgraded to Teams, learn how to connect your on-premises telephony network to Teams using [Direct Routing](#).

For more information about migrating from Phone System with on-premises PSTN connectivity via Cloud Connector, see the following:

- [Planning](#)
- [Deploying](#)

- [User configuration](#)

It is recommended that you remove previously configured voice routing information as follows:

```
Grant-CsVoiceRoutingPolicy -PolicyName $NULL -Identity <UPN>  
Set-CsUserPstnSettings -Identity <UPN> -AllowInternationalCalls $false -HybridPSTNSite $null
```

Monitor and troubleshoot Direct Routing

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes how to monitor and troubleshoot your Direct Routing configuration.

The ability to make and receive calls by using Direct Routing involves the following components:

- Session Border Controllers (SBCs)
- Direct Routing components in the Microsoft Cloud
- Telecom trunks

If you have difficulties troubleshooting issues, you can open a support case with your SBC vendor or Microsoft.

Microsoft is working on providing more tools for troubleshooting and monitoring. Please check the documentation periodically for updates.

Direct Routing Diagnostic Tool

If you're an administrator, you can use the following diagnostic tool to validate that a user is correctly configured for Direct Routing:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.

[Run Tests: Direct Routing](#)

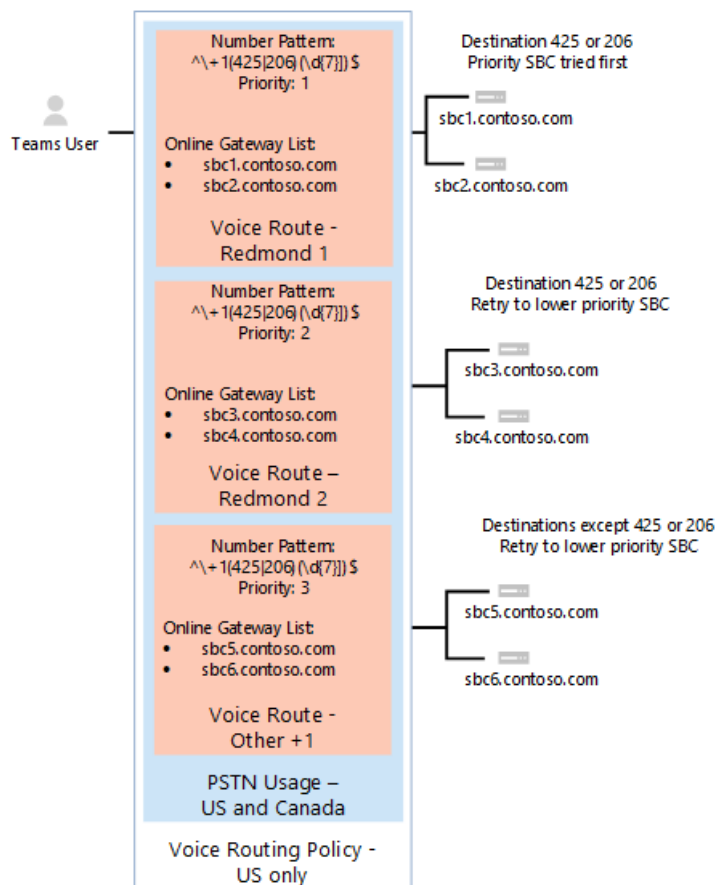

2. In the Run diagnostic pane, enter the email of the user you want to test in the **Username or Email** field, and then select **Run Tests**.
3. The tests will return the best next steps to address any tenant, user, or policy configurations to validate that the user is properly configured for Direct Routing in Microsoft Teams.

Monitoring availability of Session Border Controllers using Session Initiation Protocol (SIP) options messages

Direct Routing uses SIP options sent by the Session Border Controllers to monitor SBC health. There are no actions required from the tenant administrator to enable the SIP options monitoring. The collected information is taken into consideration when routing decisions are made.

For example, if, for a specific user, there are several SBCs available to route a call, Direct Routing considers the SIP options information received from each SBC to determine routing.

The following diagram shows an example of the configuration:

When a user makes a call to number +1 425 <any seven digits>, Direct Routing evaluates the route. There are two SBCs in the route: sbc1.contoso.com and sbc2.contoso.com. Both SBCs have equal priority in the route. Before picking an SBC, the routing mechanism evaluates the health of the SBCs based on when the SBC sent the SIP options last time.

An SBC is considered healthy if statistics at the moment of sending the call shows that the SBC sends options every minute.

When a call is made, the following logic applies:

- The SBC was paired at 11:00 AM.
- The SBC sends options at 11:01 AM, 11:02 AM, and so on.
- At 11:15, a user makes a call and the routing mechanism selects this SBC.

Direct Routing takes the regular interval options three times (the regular interval is one minute). If options were sent during the last three minutes, the SBC is considered healthy.

If the SBC in the example sent options at any period between 11:12 AM and 11:15 AM (the time the call was made), it is considered healthy. If not, the SBC will be demoted from the route.

Demotion means that the SBC will not be tried first. For example, we have sbc1.contoso.com and sbc2.contoso.com with equal priority.

If sbc1.contoso.com does not send SIP options on a regular interval as previously described, it is demoted. Next, sbc2.contoso.com tries for the call. If sbc2.contoso.com cannot deliver the call, the sbc1.contoso.com (demoted) is tried again before a failure is generated.

If two (or more) SBCs in one route are considered healthy and equal, Fisher-Yates shuffle is applied to distribute the calls between the SBCs.

Monitor Call Quality Analytics dashboard and SBC logs

In some cases, especially during the initial pairing, there might be issues related to misconfiguration of the SBCs or the Direct Routing service.

You can use the following tools to monitor your configuration:

- Call Quality Dashboard
- SBC logs

The Direct Routing service has very descriptive error codes reported to either Call Analytics or the SBC logs.

The Call Quality Dashboard provides information about call quality and reliability. To learn more about how to troubleshoot issues using Call Analytics, see [Turning on and using Call Quality Dashboard for Microsoft Teams and Skype for Business Online](#) and [Use Call Analytics to troubleshoot poor call quality](#).

In case of call failures, Call Analytics provides standard SIP codes to help you with troubleshooting.

FAILED - RESPONSE CODE: 480

0:00:00

Audio quality
UNAVAILABLE

However, Call Analytics can only help when calls reach the internal components of Direct Routing and fail. In case of issues with SBC pairing or issues where SIP "Invite" was rejected (for example, the name of the trunk FQDN is misconfigured), Call Analytics will not help. In this case, refer to the SBC logs. Direct Routing sends a detailed description of issues to the SBCs; these issues can be read from the SBC logs.

Health Dashboard for Direct Routing

12/7/2021 • 6 minutes to read • [Edit Online](#)

Health Dashboard for Direct Routing lets you monitor the connection between your Session Border Controller (SBC) and the Direct Routing interface. With Health Dashboard, you can monitor information about your SBC, the telephony service, and the network parameters between your SBC and the Direct Routing interface. This information can help you identify issues, including the reason for dropped calls. For example, the SBC might stop sending calls if a certificate on the SBC has expired or if there are network issues. See the [admin roles](#) to learn who has access to the health dashboard.

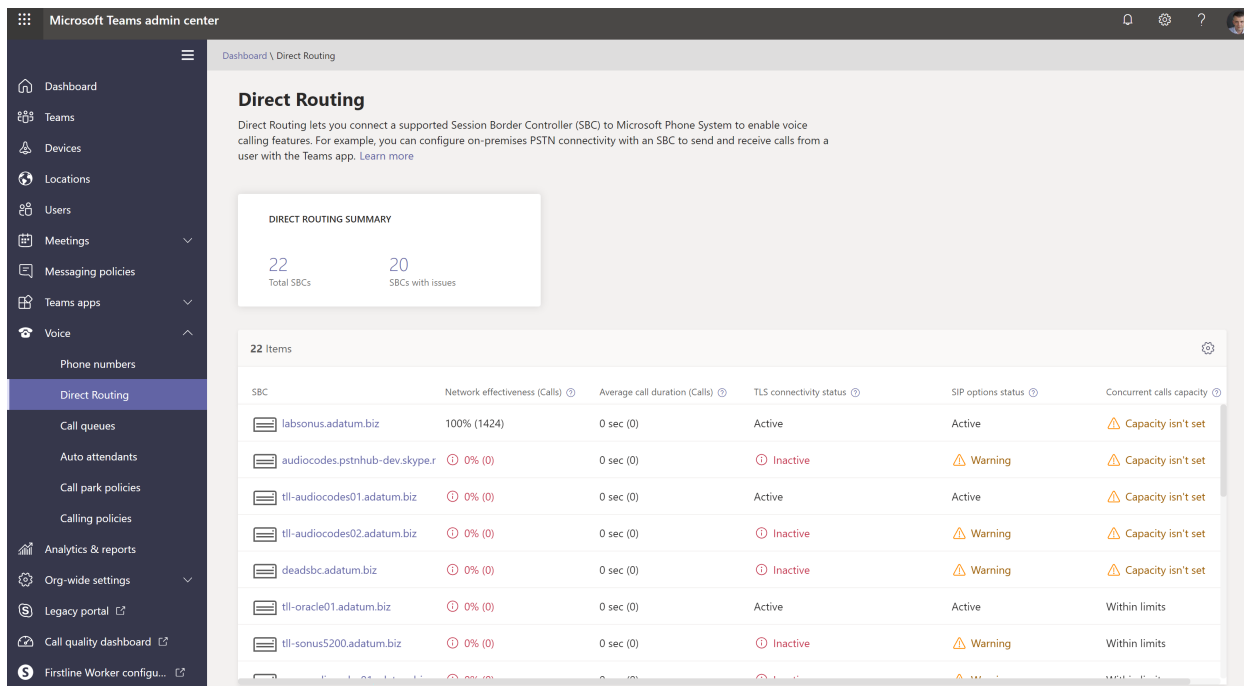

Health Dashboard monitors two levels of information:

- Overall health of the connected SBCs
- Detailed information about the connected SBCs

You can view Health Dashboard in the Microsoft Teams and Skype for Business Admin Center.

Overall health

Health Dashboard provides the following information related to overall health of the connected SBCs:

- **Direct Routing summary** - Shows the total number of SBCs registered in the system. Registration means that the tenant administrator added an SBC by using the New-CsOnlinePSTNGateway command. If the SBC was added in PowerShell, but never connected, the Health Dashboard shows it in an unhealthy status.
- **SBC** - The FQDN of the paired SBC.
- **Network Effectiveness Ratio (NER)** - The NER measures the ability of a network to deliver calls by measuring the number of calls sent versus the number of calls delivered to a recipient.

The NER measures the ability of networks to deliver calls to the far-end terminal--excluding user actions resulting in call rejections. If the recipient rejected a call or sent the call to voicemail, the call is counted as a successful delivery. This means that an answer message, a busy signal, or a ring with no answer are all

considered successful calls.

For example, assume Direct Routing sent a call to the SBC and the SBC returns SIP code "504 Server Time-out - The server attempted to access another server in attempting to process the request and did not receive a prompt response". This response indicates there is an issue on the SBC side, and this will decrease the NER on the Health Dashboard for this SBC.

Because the action you take might depend on the number of calls affected, Health Dashboard shows how many calls were analyzed to calculate a parameter. If the number of calls is less than 100, the NER might be quite low, but still be normal.

The formula used to calculate NER is:

$$\text{NER} = 100 \times (\text{Answered calls} + \text{User Busy} + \text{Ring no Answer} + \text{Terminal Reject Seizures}) / \text{Total Calls}$$

- **Average call duration** - Information about average call duration can help you monitor the quality of calls. The average duration of a 1:1 PSTN call is four to five minutes. However, for each company, this average can differ. Microsoft recommends establishing a baseline for the average call duration for your company. If this parameter goes significantly below the baseline, it might indicate that your users are having issues with call quality or reliability and are hanging up earlier than usual. If you start seeing extremely low average call duration, for example 15 seconds, callers might be hanging up because your service is not performing reliably.

Because the action you take might depend on the number of calls affected, Health Dashboard shows how many calls were analyzed to calculate a parameter.

- **TLS connectivity status** - TLS (Transport Layer Security) connectivity shows the status of the TLS connections between Direct Routing and the SBC. Health Dashboard also analyzes the certificate expiration date and warns if a certificate is set to expire within 30 days so that administrators can renew the certificate before service is disrupted.

By clicking the Warning message, you can see a detailed issue description in a popup window on the right and recommendations for how to fix the issue.

- **SIP options status** – By default, the SBC sends options messages every minute. This configuration can vary for different SBC vendors. Direct Routing warns if the SIP options are not sent or are not configured. For more information about SIP options monitoring, and conditions when an SBC can be marked as not functional, see [Monitor and troubleshoot Direct Routing](#).
- **Detailed SIP options status** - In addition to showing that there is an issue with SIP options flow, the Health Dashboard also provides detailed descriptions of the errors. You can access the description by clicking the "Warning" message. A pop-up window on the right will show the detailed error description.

Possible values for SIP options status messages are as follows:

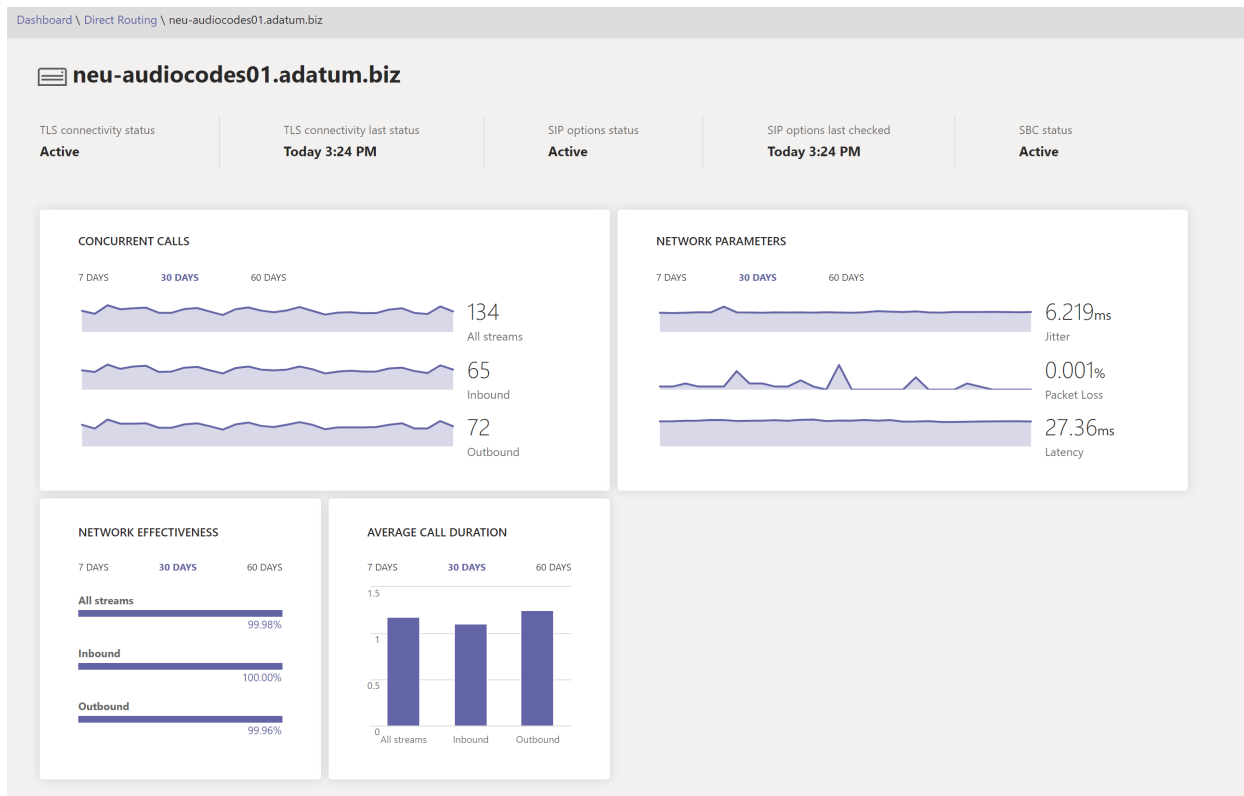

- **Active** – The SBC is active--Microsoft Direct Routing service sees the options flowing on a regular interval.
- **Warning, no SIP options** - The Session Border Controller exists in the database (your administrator created it using the command New-CsOnlinePSTNGateway). It is configured to send SIP options, but the Direct Routing service never saw the SIP options coming back from this SBC.
- **Warning, SIP Messages aren't configured** - Trunk monitoring using SIP options isn't turned on. Microsoft Calling System uses SIP options and Transport Layer Security (TLS) handshake monitoring to detect the health of the connected Session Border Controllers (SBCs) at the application level. You'll have problems if this trunk can be reached at the network level (by ping), but the certificate has expired or the SIP stack doesn't work. To help identify such problems early, Microsoft recommends enabling sending SIP options. Check your SBC manufacturer

documentation to configure sending SIP options.

- **Concurrent calls capacity** - You can specify the limit of concurrent calls that an SBC can handle by using the New- or Set-CsOnlinePSTNGateway command with the -MaxConcurrentSessions parameter. This parameter calculates how many calls were sent or received by Direct Routing using a specific SBC and compares it with the limit set. Note: If the SBC also handles calls to different PBXs, this number will not show the actual concurrent calls.

Detailed information for each SBC

You can also view the detailed information for a specific SBC as shown in the following screenshot:

The detailed view shows the following additional parameters:

- **TLS Connectivity status** – this is the same metric as on the “Overall Health” page;
- **TLS Connectivity last status** – shows time when the SBC made a TLS connection to the Direct Routing service;
- **SIP options status** – the same metric as on the “Overall Health” page.
- **SIP options last checked** – time when the SIP options were received last time.
- **SBC status** – overall status of the SBC, based on all monitored parameters.
- **Concurrent call** - shows how many concurrent calls the SBC handled. This information is useful to predict the number of concurrent channels you need and see the trend. You can slide the data by number of days and call direction (inbound/outbound/All streams).
- **Network parameters** - All network parameters are measured from the Direct Routing interface to the Session Border Controller. For information about the recommended values, see [Prepare your organization's network for Microsoft Teams](#), and look at the Customer Edge to Microsoft Edge recommended values.
 - **Jitter** – Is the millisecond measure of variation in network propagation delay time computed between two endpoints using RTCP (The RTP Control Protocol).

- Packet Loss – Is a measure of packet that failed to arrive; it is computed between two endpoints.
- Latency - (Also known as round trip time) is the length of time it takes for a signal to be sent plus the length of time it takes for the acknowledgment of that signal to be received. This time delay consists of the propagation times between the two points of a signal.

You can slide the data by number of days and call direction (inbound/outbound/All streams).

Network Effectiveness ratio - This is the same parameter that appears on the Overall Health dashboard, but with the option to slice the data by time series or call direction.

Trunk failover on outbound calls

12/7/2021 • 2 minutes to read • [Edit Online](#)

This topic describes how to avoid trunk failovers on outbound calls--from Teams to the Session Border Controller (SBC).

Failover on network errors

If a trunk cannot be connected for any reason, the connection to the same trunk will be tried from a different Microsoft Datacenter. A trunk might not be connected, for example, if a connection is refused, if there is a TLS timeout, or if there are any other network level issues. For example, a connection might fail if an administrator limits access to the SBC only from well-known IP addresses, but forgets to put the IP addresses of all Microsoft Direct Routing datacenters on the Access Control List (ACL) of the SBC.

Failover of specific SIP codes received from the Session Border Controller (SBC)

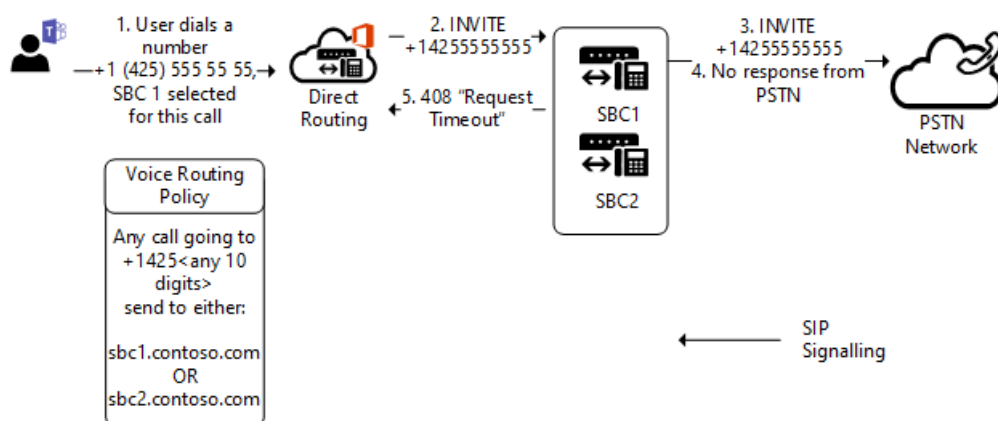

If Direct Routing receives any 4xx or 6xx SIP error codes in response to an outgoing Invite, the call is considered completed by default. Outgoing means a call from a Teams client to the Public Switched Telephone Network (PSTN) with the following traffic flow: Teams Client -> Direct Routing -> SBC -> Telephony network.

The list of SIP Codes can be found in [Session Initiation Protocol \(SIP\) RFC](#).

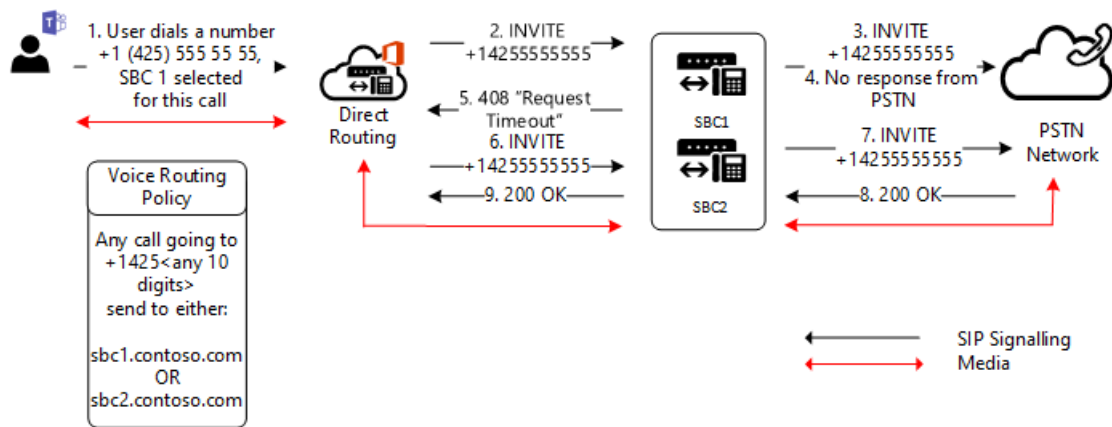

Assume a situation where an SBC replied on an incoming invite with the code "408 Request Timeout: The server could not produce a response within a suitable amount of time, for example, if it could not determine the location of the user in time. The client MAY repeat the request without modifications at any later time."

This particular SBC might be having difficulties connecting to the callee--perhaps because of a network misconfiguration or other error. However, there is one more SBC in the route which might be able to reach the callee.

In the following diagram, when a user makes a call to a phone number, there are two SBCs in the route that can potentially deliver this call. Initially, SBC1.contoso.com is selected for the call, but SBC1.contoso.com isn't able to reach a PSTN network due to a network issue. By default, the call will be completed at this moment.

But there is one more SBC in the route which potentially can deliver the call. If you configure the parameter `Set-CSOnlinePSTNGateway -Identity sbc1.contoso.com -FailoverResponseCodes "408"`, the second SBC will be tried- SBC2.contoso.com in the following diagram:

Setting the parameter `-FailoverResponseCodes` and specifying the codes helps you fine tune your routing and avoid potential issues when an SBC cannot make a call due to network or other issues.

Default values: 408, 503, 504

Direct Routing media path country codes

12/7/2021 • 3 minutes to read • [Edit Online](#)

When choosing a routing path for media, Direct Routing, by default, always assigns a datacenter based on the public IP address of the Session Border Controller (SBC), and always selects the path closest to the SBC datacenter.

However, in some cases the default media path might not be the optimal media path; for example, a public IP from a United States range might be assigned to an SBC located in Europe.

By using the `-MediaRelayRoutingLocationOverride` parameter with the `New-CsOnlinePSTNGateway` and `Set-CsOnlinePSTNGateway` cmdlets, you can specify the preferred region for media traffic. For example, the following command specifies that the preferred region is Germany:

```
Set-CsOnlinePSTNGateway -Identity sbc1.contoso.com -MediaRelayRoutingLocationOverride DE
```

Note that Microsoft only recommends setting this parameter if the call logs clearly indicate that the default assignment of the datacenter for the media path does not use the path closest to the SBC datacenter.

NOTE

`MediaRelayRoutingLocationOverride` parameter is reserved for use with managed carriers.

PowerShell script to test Direct Routing Session Border Controller connections

12/7/2021 • 2 minutes to read • [Edit Online](#)

SIP Tester client is a sample PowerShell script that you can use to test Direct Routing Session Border Controller (SBC) connections in Microsoft Teams. This script tests basic functionality of a customer-paired Session Initiation Protocol (SIP) trunk with Direct Routing.

The script submits an SIP test to the test runner, waits for the result, and then presents it in a human-readable format. You can use this script to test the following scenarios:

- Outbound and inbound calls
- Simultaneous ring
- Media escalation
- Consultative transfer

Download the script and documentation

Download the [SIP Tester client script and documentation](#).

NOTE

SIP Tester client script only supports adal.ps version 3.19.8.1. An error will be returned if a later version of the adal.ps is used.

Direct routing - definitions and RFC standards

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes how Microsoft Phone System Direct Routing implements RFC standard protocols. This article is intended for voice administrators who are responsible for configuring the connection between the on-premises Session Border Controller (SBC) and the Session Initiation Protocol (SIP) proxy service.

The customer SBC interfaces with the following components in the Microsoft Teams backend:

- **The SIP proxy** for signaling. This is the Internet-facing component of Direct Routing that handles SIP (TLS) connections between the SBCs and Direct Routing.
- **The media processors** for media. This is the Internet-facing component of Direct Routing that handles media traffic. This component uses SRTP and SRTCP protocols.

For more information about Direct Routing, see [Phone System Direct Routing](#).

For more information about how Direct Routing implements the SIP protocol, see [Direct Routing - SIP protocol](#).

RFC standards

Direct Routing complies with RFC standards. The SBC connected to Direct Routing must also comply with the following RFCs (or their successors).

Standards applicable to devices that support non-media bypass mode

The following standards are applicable to devices that support only non-media bypass mode:

- [RFC 3261 SIP](#): Session Initiation Protocol
- [RFC 3325](#). Private Extension to the Session Initiation Protocol for asserted identity within Trusted Networks--Sections about handling P-Asserted-Identity header. Direct Routing sends P-Asserted-Identity with Privacy ID headers.
- [RFC 4244](#) An extension to Session Initiation Protocol (SIP) for required History Information. See also: Routing SIP Protocol description for more information.
- [RFC 3892](#) The Session Initiation Protocol Referred-By mechanism
- [RFC 3891](#) The Session Initiation Protocol (SIP) "Replaces" Header
- [RFC 6337](#) Session Initiation Protocol (SIP) Usage of the Offer/Answer Model. See the "Deviations from RFC" section.
- [RFC 3711](#) and [RFC 4771](#). Protect RTP traffic using SRTP. The SBC must be able to establish keys using SDDES.
- [RFC 8035](#) Session Description Protocol (SDP) Offer/Answer Clarifications for RTP/RTCP Multiplexing

Standards applicable to devices that support media bypass mode

In addition to the standards listed as applicable to non-bypass mode, the following standards are used for media bypass mode:

- [RFC 5245 Interactive Connectivity Establishment \(ICE\) for media bypass](#). The SBC must support the following:
 - ICE Lite - the Teams clients are full ICE clients
 - [ICE Restarts](#). See more on ICE restarts use case and examples in ICE Restart: Media bypass call transferred to an endpoint which does not support media bypass
- [RFC RFC 5589 Session Initiation Protocol \(SIP\) Call Control – Transfer](#).
- [RFC 3960 Early Media and Ringing Tone Generation in the Session Initiation Protocol \(SIP\)](#), see sections 3.1,

Forking, and 3.2, Ringing Tone Generation

- [RFC 5389 Session Traversal Utilities for NAT \(STUN\)](#)
- [RFC 5766 Traversal Using Relays around NAT \(TURN\): Relay Extensions to Session Traversal Utilities for NAT \(STUN\)](#)

Standards applicable to support conveying location information to E911 providers

- [RFC 6442, Location Conveyance for the Session Initiation Protocol](#)

Deviations from the RFC's

The following table lists the sections of the RFC(s) in which Microsoft's implementation of the SIP or media stack deviates from the standard:

RFC AND SECTIONS	DESCRIPTION	DEVIATION
RFC 6337, section 5.3 Hold and Resume of Media	RFC allows using "a=inactive", "a=sendonly", a=recvonly" to place a call on hold.	The SIP proxy only supports "a=inactive" and does not understand if the SBC sends "a=sendonly" or "a=recvonly".
RFC 6337, section 5.4 "Behavior on Receiving SDP with c=0.0.0.0	RFC3264 requires that an agent is capable of receiving SDP with a connection address of 0.0.0.0, in which case it means that neither RTP nor RTCP should be sent to the peer.	The SIP proxy does not support this option.

Operational modes

There are two operational modes for Direct Routing:

- **Without media bypass** in which all RTP traffic flows between the Teams client, the media processors, and the SBC.
- **With media bypass** in which all RTP media flows between the Teams endpoints and the SBC.

Note that SIP traffic always flows via the SIP proxy.

DTMF

In-band DTMF is not supported by media stack.

Direct Routing - SIP protocol

12/7/2021 • 18 minutes to read • [Edit Online](#)

This article describes how Direct Routing implements the Session Initiation Protocol (SIP). To properly route traffic between a Session Border Controller (SBC) and the SIP proxy, some SIP parameters must have specific values. This article is intended for voice administrators who are responsible for configuring the connection between the on-premises SBC and the SIP proxy service.

Processing the incoming request: finding the tenant and user

Before an incoming or outbound call can be processed, OPTIONS messages are exchanged between SIP Proxy and the SBC. These OPTIONS messages allow SIP Proxy to provide the allowed capabilities to SBC. It is important for OPTIONS negotiation to be successful (200OK response), allowing for further communication between SBC and SIP Proxy for establishing calls. The SIP headers in an OPTIONS messages to SIP Proxy are provided as an example below:

PARAMETER NAME	EXAMPLE OF THE VALUE
Request-URI	OPTIONS sip:sip.pstnhub.microsoft.com:5061 SIP /2.0
Via Header	Via: SIP/2.0/TLS sbc1.adatum.biz:5058;alias;branch=z9hG4bKac2121518978
Max-Forwards header	Max-Forwards:68
From Header	From Header From: sip:sbc1.adatum.biz:5058
To Header	To: sip:sip.pstnhub.microsoft.com:5061
CSeq header	CSeq: 1 INVITE
Contact Header	Contact: sip:sbc1.adatum.biz:50588;transport=tls

NOTE

The SIP headers do not contain userinfo in the SIP URI in use. As per [RFC 3261, section 19.1.1](#), the userinfo part of a URI is optional and MAY be absent when the destination host does not have a notion of users or when the host itself is the resource being identified. If the @ sign is present in a SIP URI, the user field MUST NOT be empty. Please note, that SIP URI should not be used with Direct Routing as it is not supported. Check your Session Border Controller configuration and make sure that you are not using "Replaces" headers in SIP requests. Direct Routing will reject SIP requests that have Replaces headers defined.

On an incoming call, the SIP proxy needs to find the tenant to which the call is destined and find the specific user within this tenant. The tenant administrator might configure non-DID numbers, for example +1001, in multiple tenants. Therefore, it is important to find the specific tenant on which to perform the number lookup because the non-DID numbers might be the same in multiple Microsoft 365 or Office 365 organizations.

This section describes how the SIP proxy finds the tenant and the user, and performs authentication of the SBC on the incoming connection.

The following is an example of the SIP Invite message on an incoming call:

PARAMETER NAME	EXAMPLE OF THE VALUE
Request-URI	INVITE sip:+18338006777@sip.pstnhub.microsoft.com SIP /2.0
Via Header	Via: SIP/2.0/TLS sbc1.adatum.biz:5058;alias;branch=z9hG4bKac2121518978
Max-Forwards header	Max-Forwards:68
From Header	From Header From: <sip:+17168712781@sbc1.adatum.biz;transport=udp;tag=1c747237679
To Header	To: sip:+18338006777@sbc1.adatum.biz
CSeq header	CSeq: 1 INVITE
Contact Header	Contact: <sip: 68712781@sbc1.adatum.biz:5058;transport=tls>

On receiving the invite, the SIP proxy performs the following steps:

1. Check the certificate. On the initial connection, the Direct Routing service takes the FQDN name presented in the Contact header and matches it to the Common Name or Subject Alternative name of the presented certificate. The SBC name must match one of the following options:
 - Option 1. The full FQDN name presented in the Contact header must match the Common Name/Subject Alternative name of the presented certificate.
 - Option 2. The domain portion of the FQDN name presented in the Contact header (for example adatum.biz of the FQDN name sbc1.adatum.biz) must match the wildcard value in Common Name/Subject Alternative Name (for example *.adatum.biz).
2. Try to find a tenant using the full FQDN name presented in the Contact header.

Check if the FQDN name from the Contact header (sbc1.adatum.biz) is registered as a DNS name in any Microsoft 365 or Office 365 organization. If found, the lookup of the user is performed in the tenant that has the SBC FQDN registered as a Domain name. If not found, Step 3 applies.
3. Step 3 only applies if Step 2 failed.

Remove the host portion from the FQDN, presented in the Contact header (FQDN: sbc12.adatum.biz, after removing the host portion: adatum.biz), and check if this name is registered as a DNS name in any Microsoft 365 or Office 365 organization. If found, the user lookup is performed in this tenant. If not found, the call fails.
4. Using the phone number presented in the Request-URI, perform the reverse number lookup within the tenant found in Step 2 or 3. Match the presented phone number to a user SIP URI within the tenant found on the previous step.
5. Apply trunk settings. Find the parameters set by the tenant admin for this SBC.

Microsoft does not support having a third-party SIP proxy or User Agent Server between the Microsoft SIP proxy and the paired SBC, which might modify the Request URI created by the paired SBC.

The requirements for the two lookups (steps 2 and 3) needed for the scenario where one SBC is interconnected to many tenants (carrier scenario) are covered later in this article.

Detailed requirements for Contact header and Request-URI

Contact header

For all incoming SIP messages (OPTIONS, INVITE) to the Microsoft SIP proxy, the Contact header must have the paired SBC FQDN in the URI hostname as follows:

Syntax: Contact: <sip:phone or sip address@FQDN of the SBC;transport=tls>

As per [RFC 3261, section 11.1](#), a Contact header field MAY be present in an OPTIONS message. In Direct Routing the contact header is required. For INVITE messages in format above, for OPTIONS messages the userinfo can be removed from SIP URI and only FQDN sent in format as follows:

Syntax: Contact: <sip:FQDN of the SBC;transport=tls>

This name (FQDN) must also be in the Common Name or Subject Alternative name field(s) of the presented certificate. Microsoft supports using wildcard values of the name(s) in the Common Name or Subject Alternative Name fields of the certificate.

The support for wildcards is described in [RFC 2818, section 3.1](#). Specifically:

*"Names may contain the wildcard character * which is considered to match any single domain name component or component fragment. E.g., *.a.com matches foo.a.com but not bar.foo.a.com. f*.com matches foo.com but not bar.com."*

If more than one value in the Contact header presented in a SIP message is sent by the SBC, only the FQDN portion of the first value of the Contact header is used.

As rule of thumb for Direct Routing, it is important that FQDN is used to populate SIP URI instead of IP. An incoming INVITE or OPTIONS message to SIP Proxy with Contact header where hostname is represented by IP and not FQDN, the connection will be refused with 403 Forbidden.

Request-URI

For all incoming calls, the Request-URI is used to match the phone number to a user.

Currently The phone number must contain a plus sign (+) as shown in the following example.

```
INVITE sip:+18338006777@sip.pstnhub.microsoft.com SIP /2.0
```

From Header

For all incoming calls, the From Header is used to match the caller's phone number against callee's blocked phone number list.

The phone number must contain a + as shown in the following example.

```
From: <sip:+17168712781@sbcl.adatum.biz;transport=udp;tag=1c747237679
```

Contact and Record-Route headers considerations

The SIP proxy needs to calculate the next hop FQDN for new in-dialog client transactions (for example Bye or Re-Invite), and when replying to SIP Options. Either Contact or Record-Route are used.

According to [RFC 3261, section 8.1.1.8](#), Contact header is required in any request that can result in a new dialog. The Record-Route is only required if a proxy wants to stay on the path of future requests in a dialog. If a proxy SBC is in use with [Local Media Optimization for Direct Routing](#), a record route will need to be configured as the proxy SBC needs to stay in the route.

Microsoft recommends using only Contact header if a proxy SBC is not used:

- Per [RFC 3261, section 20.30](#), Record-Route is used if a proxy wants to stay on the path of future requests in a dialog, which is not essential if no proxy SBC is configured as all traffic goes between the Microsoft SIP proxy and the paired SBC.
- The Microsoft SIP proxy uses only Contact header (not Record-Route) to determine the next hop when sending outbound ping Options. Configuring only one parameter (Contact) instead of two (Contact and Record-Route) simplifies the administration if a proxy SBC is not in use.

To calculate the next hop, the SIP proxy uses:

- Priority 1. Top-level Record-Route. If the top-level Record-Route contains the FQDN name, the FQDN name is used to make the outbound in-dialog connection.
- Priority 2. Contact header. If Record-Route does not exist, the SIP proxy will look up the value of the Contact header to make the outbound connection. (This is the recommended configuration.)

If both Contact and Record-Route are used, the SBC administrator must keep their values identical, which causes administrative overhead.

Use of FQDN name in Contact or Record-Route

Use of an IP address is not supported in either Record-Route or Contact. The only supported option is an FQDN, which must match either the Common Name or Subject Alternative Name of the SBC certificate (wildcard values in the certificate are supported).

- If an IP address is presented in Record-route or Contact, the certificate check fails and the call fails.
- If the FQDN does not match the value of the Common or Subject Alternative Name in the presented certificate, the call fails.

Inbound call: SIP dialog description

The following table below summarizes the call flow differences and similarities between non-bypass and bypass modes:

PARAMETER NAME	NON-BYPASS MODE	BYPASS MODE
Media candidates in 183 and 200 messages coming from	Media processors	Clients
Number of 183 messages SBC can receive	One per session	Multiple
Call can be with provisional answer (183)	Yes	Yes
Call can be without provisional answer (183)	Yes	Yes

Non-media bypass flow

A Teams user might have multiple endpoints at the same time. For example, Teams for Windows client, Teams for iPhone client, and Teams Phone (Teams Android client). Each endpoint might signal an HTTP rest as follows:

- Call progress – converted by the SIP proxy to the SIP message 180. On receiving message 180, the SBC must generate local ringing.

- Media answer – converted by the SIP proxy to message 183 with media candidates in Session Description Protocol (SDP). On receiving message 183, the SBC expects to connect to the media candidates received in the SDP message.

NOTE

In some cases the Media answer might not be generated, and the end point might answer with “Call Accepted” message.

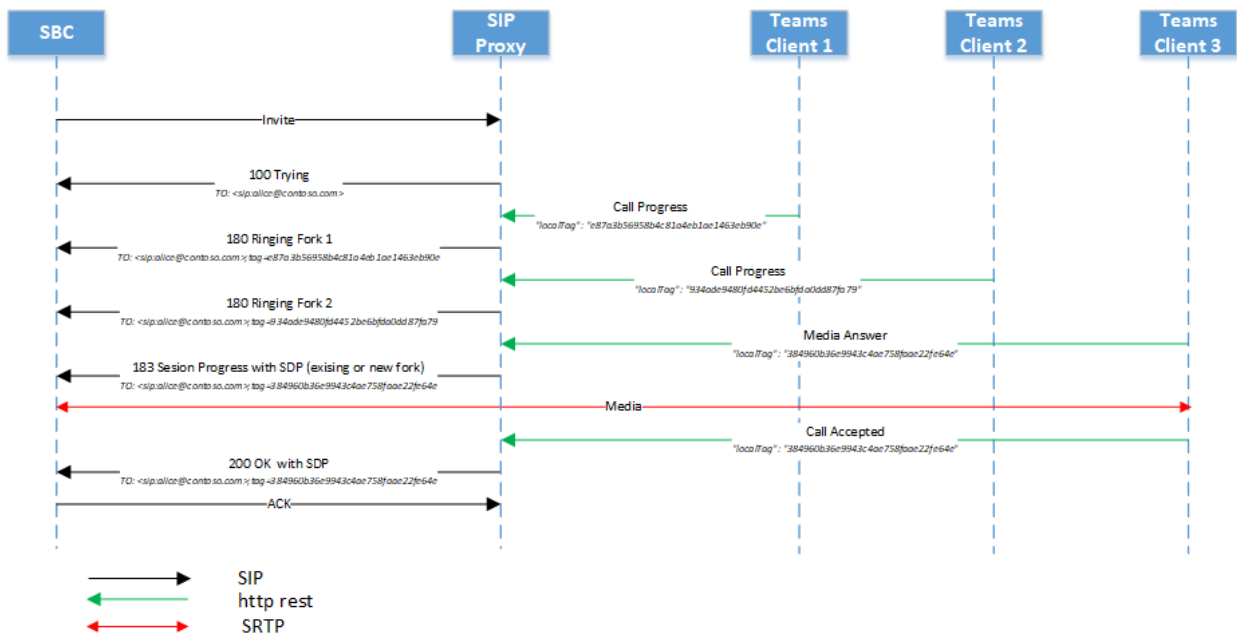

- Call accepted – converted by the SIP proxy to SIP message 200 with SDP. On receiving message 200, the SBC is expected to send and receive media to and from the provided SDP candidates.

NOTE

Direct Routing does not support Delayed Offer Invite (Invite without SDP).

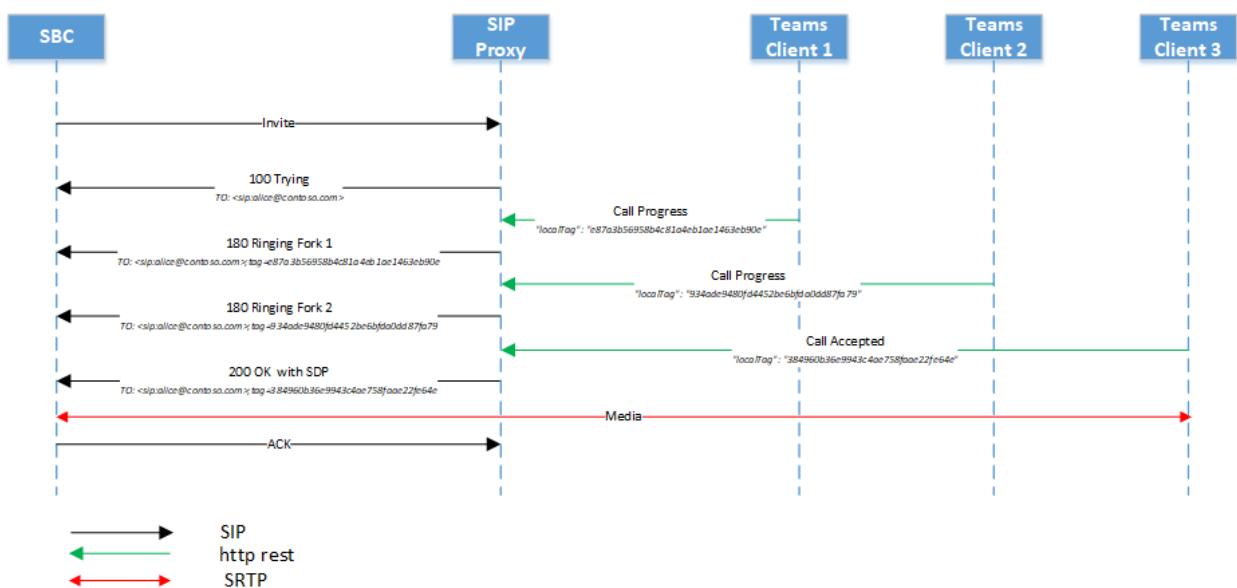

Multiple endpoints ringing with provisional answer

1. On receiving the first Invite from the SBC, the SIP proxy sends the message "SIP SIP/2.0 100 Trying" and notifies all end user endpoints about the incoming call.
2. Upon notification, each endpoint will start ringing and sending "Call progress" messages to the SIP proxy. Because a Teams user can have multiple end points, the SIP proxy might receive multiple Call Progress messages.
3. For every Call Progress message received from the clients, the SIP proxy converts the Call Progress message to the SIP message "SIP SIP/2.0 180 Trying". The interval for sending such messages is defined by the interval of the receiving messages from the Call Controller. In the following diagram, there are two 180 messages generated by the SIP proxy. These messages come from the two Teams endpoints of the user. The clients each have a unique Tag ID. Every message coming from a different endpoint will be a separate session (the parameter "tag" in the "To" field will be different). But an endpoint might not generate message 180 and send message 183 right away as shown in the following diagram.
4. Once an endpoint generates a Media Answer message with the IP addresses of endpoint's media candidates, the SIP proxy converts the message received to a "SIP 183 Session Progress" message with the SDP from the client replaced by the SDP from the Media Processor. In the following diagram, the endpoint from Fork 2 answered the call. If the trunk is non-bypassed, the 183 SIP message is generated only once (either Ring Bot or Client End Point). The 183 might come on an existing fork or start a new one.
5. A Call Acceptance message is sent with the final candidates of the endpoint that accepted the call. The Call Acceptance message is converted to SIP message 200.

Multiple endpoints ringing without provisional answer

1. On receiving the first Invite from the SBC, the SIP proxy sends the message "SIP SIP/2.0 100 Trying" and notifies all end user endpoints about the incoming call.
2. Upon notification, each endpoint will start ringing and sending the message "Call progress" to the SIP proxy. Because a Teams user can have multiple end points, the SIP proxy might receive multiple Call Progress messages.
3. For every Call Progress message received from the clients, the SIP proxy converts the Call Progress message to the SIP message "SIP SIP/2.0 180 Trying". The interval for sending the messages is defined by the interval of receiving the messages from the Call Controller. On the picture below there are two 180 messages generated by the SIP proxy, meaning that user logged into three Teams clients and each client send the call progress. Every message will be a separate session (parameter "tag" in "To" field is different)
4. A Call Acceptance message is sent with the final candidates of the endpoint that accepted the call. The Call Acceptance message is converted to SIP message 200.

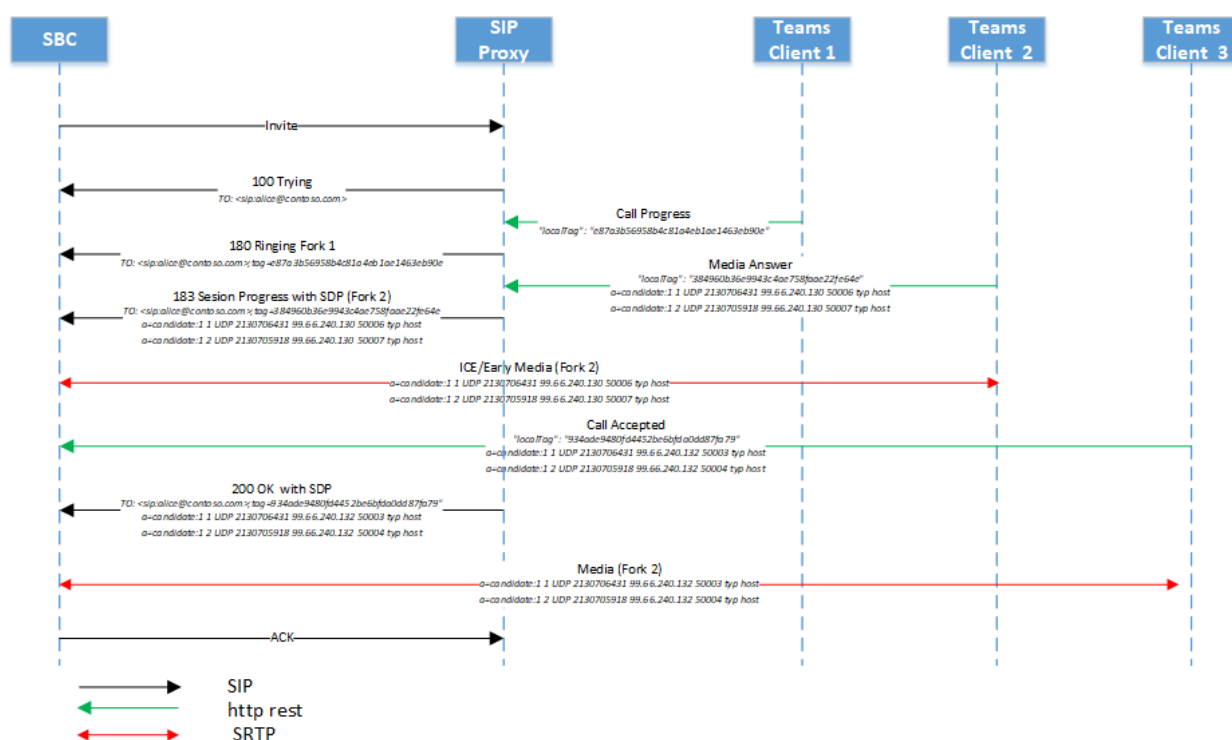

Media bypass flow

The same messages (100 Trying, 180, 183) are used in the media bypass scenario.

The schema below shows an example of the bypass call flow.

NOTE

The media candidates can come from different endpoints.

Replaces option

The SBC must support Invite with Replaces.

Size of SDP considerations

The Direct Routing interface might send a SIP message exceeding 1,500 bytes. The size of SDP primarily causes this. However, if there is a UDP trunk behind the SBC, it might reject the message if it is forwarded from the Microsoft SIP proxy to the trunk unmodified. Microsoft recommends stripping some values in SDP on the SBC when sending the message to the UDP trunks. For example, the ICE candidates or unused codecs can be removed.

Call transfer

Direct Routing supports two methods for call transfer:

- Option 1. SIP proxy processes Refer from the client locally and acts as a Referee as described in section 7.1 of RFC 3892.

With this option, the SIP proxy terminates the transfer and adds a new Invite.

- Option 2. SIP proxy sends the Refer to the SBC and acts as a Transferor as described in Section 6 of RFC 5589.

With this option, the SIP proxy sends a Refer to the SBC and expects the SBC to handle the Transfer fully.

The SIP proxy selects the method based on the capabilities reported by the SBC. If the SBC indicates that it supports the method "Refer", the SIP proxy will use Option 2 for call transfers.

The following is an example of an SBC sending the message that the Refer method is supported:

ALLOW: INVITE, OPTIONS, INFO, BYE, CANCEL, ACK, PRACK, UPDATE, REFER, SUBSCRIBE, NOTIFY

If the SBC doesn't indicate that Refer as a supported method, Direct Routing will use Option 1 (SIP proxy acts as a Referee). The SBC must also signal that it supports the Notify method:

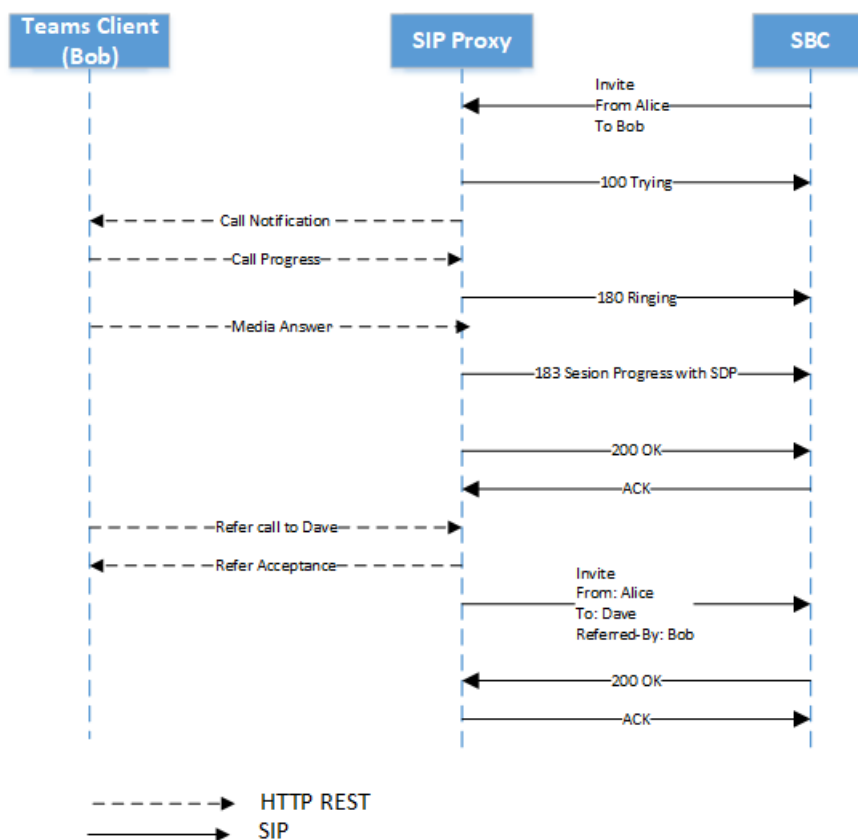

Example of SBC indicating that Refer method is not supported:

ALLOW: INVITE, ACK, CANCEL, BYE, INFO, NOTIFY, PRACK, UPDATE, OPTIONS

SIP proxy processes Refer from the client locally and acts as a Referee

If the SBC indicated that the Refer method is not supported, the SIP proxy acts as a Referee.

The Refer request that comes from the client will be terminated on the SIP proxy. (The Refer request from the client is shown as "Call transfer to Dave" in the following diagram. For more information, see section 7.1 of [RFC 3892](#).

SIP proxy send the Refer to the SBC and acts as a Transferor

This is the preferred method for call transfers, and it is mandatory for devices seeking media bypass certification. Call Transfer without the SBC being able to handle Refer is not supported in media bypass mode.

The standard is explained in Section 6 of RFC 5589. The related RFCs are:

- [Session Initiation Protocol \(SIP\) Call Control - Transfer](#)
- [Session Initiation Protocol \(SIP\) "Replaces" Header](#)
- [Session Initiation Protocol \(SIP\) "Referred-By" mechanism](#)

This option assumes that the SIP proxy acts as a Transferor and sends a Refer message to the SBC. The SBC acts as a Transferee and handles the Refer to generate a new offer for transfer. There are two possible cases:

- The call is transferred to an external PSTN participant.

- The call is transferred from one Teams user to another Teams user in the same tenant via the SBC.

If the call is transferred from one Teams user to another via the SBC, the SBC is expected to issue a new invite (start a new dialog) for the transfer target (the Teams user) using the information received in the Refer message.

To populate the To/Transferor fields for the transaction of the request internally, the SIP proxy needs to convey this information inside the REFER-TO/REFERRED-BY headers.

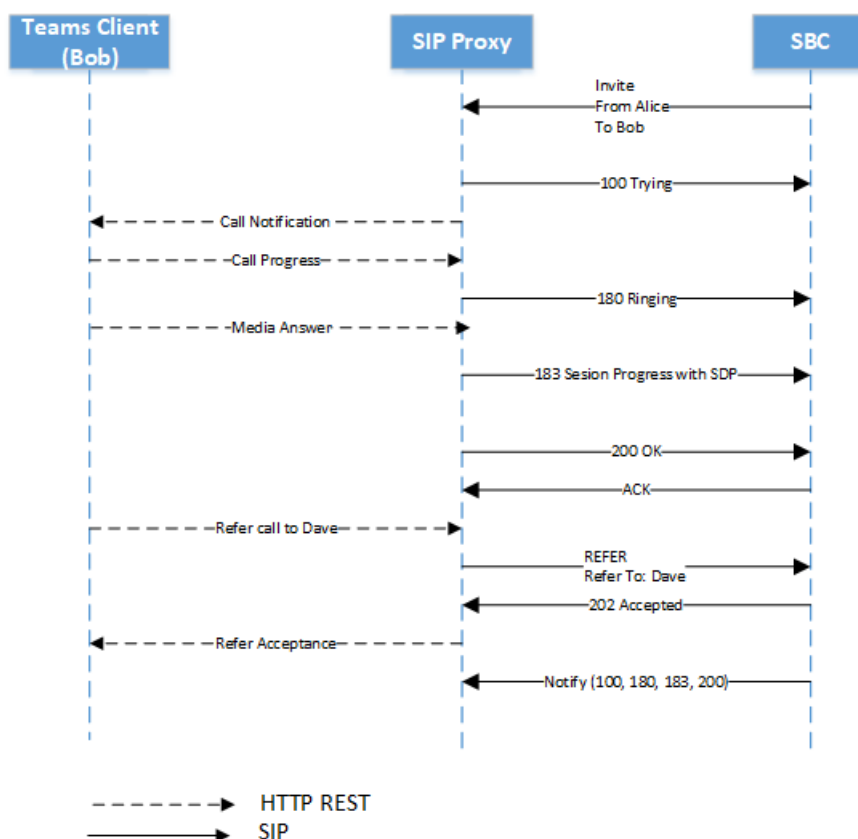

The SIP proxy will form the REFER-TO as a SIP URI comprised of a SIP proxy FQDN in the hostname and either one of the following:

- An E.164 phone number in the username part of the URI in case the transfer target is a phone number, or
- x-m and x-t parameters encoding the full transfer target MRI and tenant ID respectively

The REFERRED-BY header is a SIP URI with transferor MRI encoded in it as well as transferor tenant ID and other transfer context parameters as shown in the following table:

PARAMETER	VALUE	DESCRIPTION
x-m	MRI	Full MRI of transferor/transfer target as populated by CC
x-t	Tenant ID	x-t Tenant ID Optional Tenant ID as populated by CC
x-ti	Transferor Correlation Id	Correlation ID of the call to the transferor
x-tt	Transfer target call URI	Encoded call replacement URI

The size of the Refer Header can be up to 400 symbols in this case. The SBC must support handling Refer messages with size up to 400 symbols.

Session timer

The SIP proxy supports (always offers) the Session Timer on non-bypass calls but does not offer it on bypass calls. Use of the Session Timer by the SBC is not mandatory.

Use of Request-URI parameter user=phone

The SIP proxy analyses the Request-URI and if the parameter user=phone is present, the service will handle the Request-URI as a phone number, matching the number to a user. If parameter is not present the SIP proxy applies heuristics to determine the Request-URI user type (phone number or a SIP address).

Microsoft recommends always applying the user=phone parameter to simplify the call setup process.

History-Info header

The History-Info header is used for retargeting SIP requests and “provide(s) a standard mechanism for capturing the request history information to enable a wide variety of services for networks and end-users.” For more information, see [RFC 4244 – Section 1.1](#). For Microsoft Phone System, this header is used in Simulring and Call Forwarding scenarios.

If sending, the History-Info is enabled as follows:

- The SIP proxy will insert a parameter containing the associated phone number in individual History-Info entries that comprise the History-Info header sent to the PSTN Controller. Using only entries that have the phone number parameter, the PSTN Controller will rebuild a new History-Info header, and pass it on to the SIP trunk provider via SIP proxy.
- History-Info header will be added for simultaneous ring and call forwarding cases.
- History-Info header will not be added for call transfer cases.
- An individual history entry in the reconstructed History-Info header will have the phone number parameter provided combined with the Direct Routing FQDN (sip.pstnhub.microsoft.com) set as the host part of the URI; a parameter of ‘user=phone’ will be added as part of the SIP URI. Any other parameters associated with the original History-Info header, except for phone context parameters, will be passed through in the re-constructed History-Info header.

NOTE

Entries that are private (as determined by the mechanisms defined in Section 3.3 of RFC 4244) will be forwarded as is because the SIP trunk provider is a trusted peer.

- Inbound History-Info is ignored.

Following is the format of the History-info header sent by the SIP proxy:

```
<sip:UserB@sip.pstnhub.microsoft.com?Privacy=history&Reason=SIP%3B\cause%3D486>;index=1.2,
```

If the call was redirected several times, information about every redirect is included with the appropriate reason in chronological order.

Header Example:

History-info:

```
<sip:+14257123456@sip.pstnhub.microsoft.com;user=phone?Reason=SIP;cause=302;text="Move Temporarily">;index=1  
<sip:+14257123457@sip.pstnhub.microsoft.com;user=phone?Reason=SIP;cause=496;text="User Busy">;index=1.1
```

The History-Info is protected by a mandatory TLS mechanism.

SBC connection to Direct Routing and failover mechanism

See the section Failover mechanism for SIP signaling in [Plan for Direct Routing](#).

Retry-After

If a Direct Routing datacenter is busy, the service can send a Retry-After message with a one-second interval to the SBC. When the SBC receives a 503 message with a Retry-After header in response to an INVITE, the SBC must terminate that connection and try the next available Microsoft datacenter.

Handling retries (603 response)

If an end user observes several missed calls for one call after declining the incoming call, it means that the SBC or PSTN trunk provider's retry mechanism is misconfigured. The SBC must be reconfigured to stop the retry efforts on the 603 response.

ICE Restart: Media bypass call transferred to an endpoint that does not support media bypass

The SBC must support ICE restarts as described in [RFC 5245, section 9.1.1.1](#).

The restart in Direct Routing is implemented according to the following paragraphs of the RFC:

To restart ICE, an agent MUST change both the ice-pwd and the ice-ufrag for the media stream in an offer. Note that it is permissible to use a session-level attribute in one offer, but to provide the same ice-pwd or ice-ufrag as a media-level attribute in a subsequent offer. This is not a change in password, just a change in its representation, and does not cause an ICE restart.

An agent sets the rest of the fields in the SDP for this media stream as it would in an initial offer of this media stream (see Section 4.3). Consequently, the set of candidates MAY include some, none, or all of the previous candidates for that stream and MAY include a totally new set of candidates gathered as described in Section 4.1.1.

If the call was initially established with media bypass, and the call is transferred to a Skype for Business client, Direct Routing needs to insert a Media Processor--this is because Direct Routing cannot be used with a Skype for Business client with media bypass. Direct Routing starts the ICE restart process by changing the ice-pwd and ice-ufrag and offering new media candidates in a reinvite.

Overview

12/7/2021 • 6 minutes to read • [Edit Online](#)

This article describes how Direct Routing supports media bypass with a Session Border Controller (SBC) enabled for ICE Lite as described in [RFC 5245](#). This article is intended for voice administrators who are responsible for configuring the connection between the on-premises SBC and the SIP proxy service.

This article provides an overview of the ICE Lite scenarios and requirements for interoperability. The article describes the message formats and the required state machine transitions for ensuring reliable call and media flow.

Terminology

- First Hello – The first words spoken by the caller and callee. It is important that all efforts are made to ensure that the first packets from the endpoints are delivered reliably for most use cases.
- Forking – The offer from the caller might be delivered to multiple callee endpoints if the callee is available on multiple devices (for example, a Teams user might be signed into Teams for Windows and Teams for Android or iPhone).
- Provisional Answer (183) – The callee endpoints for faster call setup send an answer with the candidates and keys required to establish media flow. This is done in anticipation of the user potentially answering the call(200OK) from that specific callee instance. With forking, the caller should be ready to receive multiple provisional answers.
- Re-Invite – Offer with final candidates selected by the ICE controlling endpoint. This will have the a=remote-candidate attribute to resolve any race conditions from handling multiple forks.
- Teams Endpoint – This could either be a server (Media Processor, Transport Relay) or the Teams client.

Message format

The Teams infrastructure follows RFC 5245 for ICE-Lite. This implies that all the STUN messages will be compliant with [RFC 5389](#).

The SBCs as required by RFC 5389 must ignore any STUN attributes that they do not recognize, and continue to process the messages with the known attributes.

If any malformed packets are received, the packets must be discarded without impacting the media session establishment.

ICE Lite requirements

This section briefly captures the requirements for ICE Lite.

Candidate gathering

The SBC must offer only one candidate that is publicly reachable. Currently, only IPV4 candidates are supported.

Connectivity checks

The ICE Lite implementation must respond to any connectivity checks received. The ICE Lite endpoint must not send any connectivity check requests. (If connectivity checks are sent in violation, the full implementation will respond, which can result in unexpected peer-derived candidates being discovered and potentially result in call failures.)

Nominations

The ICE full implementation endpoint will always be the Controlling endpoint, and will follow "Regular" nominations for selecting the final candidates to be used for media flow. The ICE Lite endpoint can use the nominations to conclude the path to be used for media and complete call establishment.

Note: In the case of forking with peer endpoints sending 183 provisional answers, the SBC must be ready to respond to checks from multiple endpoints and also nominations from multiple endpoints if the nominations happen before 200OK. Depending on the convergence of the ICE state machine on the final path and timing of the user answering, the nominations can happen before or after 200OK. The SBC must be able to handle both cases.

Converging for forking

If the offer from the SBC forks to multiple Teams endpoints, the Teams endpoints may respond with a provisional answer and start connectivity checks. The SBC must be prepared to receive connectivity checks and respond to connectivity checks from multiple peer endpoints. For example, the Teams user could be signed on to both a desktop and a cell phone. Both devices will be notified of the inbound call and will attempt connectivity checks with the SBC.

Eventually only one of the endpoints will answer the call (200OK). On receiving the 200OK, the SBC can set up the right context for processing the media packets.

Scenarios

Inbound call from SBC

For this scenario, there are several possible peer endpoints that the SBC must handle:

- Server endpoints will typically respond directly with 200OK. These are full ICE endpoints that are typically involved in Voicemail, Call queue, and Auto attendant scenarios.
- Client endpoints can send multiple provisional answers with different From/To tags (183) followed by a 200OK from the endpoint that answers the call. These are full ICE endpoints typically representing end user clients.
- Other SBC endpoints. These are ICE Lite endpoints typically involved in the scenario of simultaneously ringing client endpoints and another phone number(s).

The SBC must respond to all valid connectivity check requests received from the full ICE endpoints. Per RFC, the full ICE endpoints will become Controlling endpoints. The Teams (client/server) endpoints will perform "Regular" nominations to complete connectivity checks. The final 200Ok can either be from an endpoint that sent early media or from a different endpoint. On receiving the 200Ok, the SBC must set up the right context for media flow.

Early media

If there is early media flow, the SBC must latch to the first endpoint that starts streaming media; media flow can start before candidates are nominated. The SBC should have support for sending DTMF during this phase to enable IVR/voicemail scenarios. The SBC should use the highest priority path on which it has received checks if nominations have not completed.

Outbound call to SBC

The Teams endpoints are the Caller for this scenario and will be the Controlling Endpoint. On receiving either a provisional answer (183) or a final answer(200OK), the Teams endpoint will start connectivity checks and proceed to "Regular" nominations to complete the connectivity checks.

Note: If the SBC sends a provisional answer (183), the SBC must be ready to receive connectivity check requests and potentially complete the nominations before the 200OK is sent by the SBC. If checks and/or nominations are completed before the 200OK is received, checks and/or nominations will not be performed again after

200OK is received. The SBC must not change ICE candidates, password, and ufrag (username fragment) between 183 and 200.

To support early media, the SBC may start streaming the media to the peer ICE candidate, with the highest priority based on received connectivity checks, even before nominations are completed by Teams endpoint. The SBC should expect media from Teams on any candidate until nominations are completed. Once a candidate is nominated, the SBC must reset to the right context to send and receive media packets.

SRTP support requirements

The SBC must support SRTP encryption cipher AES_CM_128_HMAC_SHA1_80 for offer and answer in the following format:

```
"inline:" <key||salt> ["|" lifetime]
```

The following is an example of the crypto attribute in the SDP offer from the SBC:

```
a=crypto:1 AES_CM_128_HMAC_SHA1_80 inline:V/Lr6Lsvhad/crSB9kCQ28jrYDxR2Yfk5bXryH5V|2^31
```

MKI and Length parameters are not required.

For more information, see [RFC 4568, section 6.1](#).

SDES support requirements

The device must be able to offer SDES in the format as described below. Microsoft Media Processors always prefer SDES.

- With non-media bypass, even if a client only supports DTLS, the Media Processors will convert to SDES.
- With media bypass, if a client is DTLS only (future Google Chrome state), Direct Routing will insert an MP in the path, converting the call from media bypass to non-media bypass. Between the SBC and media processor component of Direct Routing, SDES is always used.

Currently, there are no Teams client that offer only DTLS; however Google has announced that at some point in time they will stop supporting SDES.

Format for offer from SBC in bypass mode

Offer must contain SDES and can contain DTLS optional in the following format:

```
m=audio 54056 UDP/TLS/RTP/SAVP 0 8 76 77 18 9 101 13
a=rtcp:54056
a=crypto:1 AES_CM_128_HMAC_SHA1_80 inline:krXco0QRglwErMqtbMs2zSw29tBdmdgXpEYZhQmp|2^31
a=fingerprint:sha-256
AE:24:07:15:5C:B7:45:1A:E4:45:60:C1:1E:68:0E:CC:8D:A6:78:3B:76:65:BB:B0:77:88:07:F8:98:18:62:34
a=setup:actpass
a=rtcp-mux
```

Format for answer containing SDES to SBC

```
m=audio 54056 RTP/SAVP 111 103 104 9 0 8 description 106 13 110 112 113 126
a=rtcp:54056
a=crypto:2 AES_CM_128_HMAC_SHA1_80 inline:fBc61ikv1kMy0sF85Db1NqTzVAbFa7hJQ9GKb6Yj|2^31|1:1
a=crypto:3 AES_CM_128_HMAC_SHA1_80 inline:01qT9tWbs/NwJVwhfrgF5tCrbNOxnVDqkIqTx4rz|2^31
a=rtcp-mux
```

Format for offer from Teams to SBC

Format for SDES only offer to SBC

```
m=audio 52884 RTP/SAVP 111 103 104 9 0 8 106 13 110 112 113 126
a=crypto:0 AES_CM_128_HMAC_SHA1_32 inline:Hr4D2cgUu9+Uza5Igz/JkVx59DAxDbaxJg862ibQ|2^31

a=rtcp-mux
```

Survivable Branch Appliance (SBA) for Direct Routing

12/7/2021 • 5 minutes to read • [Edit Online](#)

Occasionally, a customer site using Direct Routing to connect to Microsoft Phone System may experience an internet outage.

Assume that the customer site--called a branch--temporarily cannot connect to the Microsoft cloud through Direct Routing. However, the intranet inside the branch is still fully functional and users can connect to the Session Border Controller (SBC) that is providing PSTN connectivity.

This article describes how to use a Survivable Branch Appliance (SBA) to enable Microsoft Phone System to continue to make and receive Public Switched Telephone Network (PSTN) calls in the case of an outage.

Prerequisites

The SBA is distributable code provided by Microsoft to SBC vendors who then embed code into their firmware or distribute it separately to have SBA run on a separate VM or hardware.

To get the latest Session Border Controller firmware with the embedded Survivable Branch Appliance, contact your SBC vendor. In addition, the following is required:

- The SBC needs to be configured for Media Bypass to ensure that the Microsoft Teams client in the branch site can have media flowing directly with the SBC.
- TLS1.2 should be enabled on the SBA VM OS.
- Ports 3443, 4444 and 8443 are used by Microsoft SBA Server to communicate with the Teams client and should be allowed on the firewall.
- Port 5061 (or the one configured on the SBC) is used by Microsoft SBA Server to communicate with the SBC and should be allowed on the firewall.
- UDP Port 123 is used by Microsoft SBA Server to communicate with NTP server and should be allowed on the firewall.
- Port 443 is used by Microsoft SBA Server to communicate with Microsoft 365 and should be allowed on the firewall.
- Azure IP Ranges and Service Tags for the Public Cloud should be defined according to the guidelines described at: <https://www.microsoft.com/download/details.aspx?id=56519>

Supported Teams clients

The SBA feature is supported on the following Microsoft Teams clients:

- Microsoft Teams Windows desktop
- Microsoft Teams macOS desktop

How it works

During an internet outage, the Teams client should switch to the SBA automatically, and ongoing calls should

continue with no interruptions. No action is required from the user. As soon as the Teams client detects that the internet is up and any outgoing calls are finished, the client will fall back to normal operation mode and connect to other Teams services. The SBA will upload collected Call Data Records to the cloud and call history will be updated so that this information is available for review by the tenant administrator.

When the Microsoft Teams client is in offline mode, the following calling-related functionality is available:

- Making PSTN calls via local SBA/SBC with media flowing through the SBC.
- Receiving PSTN calls via local SBA/SBC with media flowing through the SBC.
- Hold and Resume of PSTN calls.

Configuration

For the SBA feature to work, the Teams client needs to know which SBAs are available in each branch site, and which SBAs are assigned to the users in that site. The configuration steps are as follows:

1. Create the SBAs.
2. Create the Teams branch survivability policy.
3. Assign the policy to users.
4. Register an application for the SBA with Azure Active Directory.

All configuration is done by using Skype for Business Online PowerShell cmdlets. (The Teams admin center does not yet support the Direct Routing SBA feature.)

(For information on configuring the SBC, with links to SBC vendor documentation, see Session Border Controller configuration at the end of this article.)

Create the SBAs

To create the SBAs, you will use the `New-CsTeamsSurvivableBranchAppliance` cmdlet. This cmdlet has the following parameters:

PARAMETER	DESCRIPTION
Identity	The identity of the SBA
Fqdn	The FQDN of the SBA
Site	The TenantNetworkSite where the SBA is located
Description	Free format text

For example:

```
C:\> New-CsTeamsSurvivableBranchAppliance -Fqdn sba1.contoso.com -Description "SBA 1"
Identity      : sba1.contoso.com
Fqdn          : sba1.contoso.com
Site          :
Description   : SBA 1
```

Create the Teams Branch Survivability Policy

To create a policy, you use the `New-CsTeamsSurvivableBranchAppliancePolicy` cmdlet. This cmdlet has the following parameters. Note that the policy can contain one or more SBAs.

PARAMETER	DESCRIPTION
Identity	The identity of the policy
BranchApplianceFqdns	The FQDN of the SBA(s) in the site

For example:

```
C:\> new-CsTeamsSurvivableBranchAppliancePolicy -Identity CPH -BranchApplianceFqdns
"sba1.contoso.com","sba2.contoso.com"
Identity          : Tag:CPH
BranchApplianceFqdns : {sba1.contoso.com, sba2.contoso.com}
```

You can add or remove SBAs from a policy by using the Set-CsTeamsSurvivableBranchAppliancePolicy cmdlet. For example:

```
Set-CsTeamsSurvivableBranchAppliancePolicy -Identity CPH -BranchApplianceFqdns @{remove="sba1.contoso.com"}
Set-CsTeamsSurvivableBranchAppliancePolicy -Identity CPH -BranchApplianceFqdns @{add="sba1.contoso.com"}
```

Assign a policy to a user

To assign the policy to individual users, you will use the Grant-CsTeamsSurvivableBranchAppliancePolicy cmdlet. This cmdlet has the following parameters:

PARAMETER	DESCRIPTION
Identity	The identity of the user
PolicyName	The identity of the policy

For example:

```
C:\> Grant-CsTeamsSurvivableBranchAppliancePolicy -PolicyName CPH -Identity user@contoso.com
```

You can remove a policy from a user by granting the \$Null policy as shown in the next example:

```
C:\> Grant-CsTeamsSurvivableBranchAppliancePolicy -PolicyName $Null -Identity user@contoso.com
```

Register an application for the SBA with Azure Active Directory

To allow different SBAs used within your tenant to read required data from Microsoft 365, you need to register an application for the SBA with Azure Active Directory.

For more information about application registration, see the following:

- [Develop line-of-business apps for Azure Active Directory](#)
- [Register an application with the Microsoft identity platform.](#)

You only need to register one application for use by all the SBAs in your tenant.

For the SBA registration, you need the following values created by the registration:

- Application (client) ID
- Client secret

For the SBA application, keep the following in mind:

- The name can be whatever you decide.
- Supported account types = Account in this organizational directory only.
- The Web Redirect Uri = <https://login.microsoftonline.com/common/oauth2/nativeclient>.
- Implicit grant tokens = Access tokens and ID tokens.
- API permissions = Skype and Teams Tenant Admin Access -> Application permissions -> application_access_custom_sba_appliance.
- Client secret: you can use any description and expiration.
- Remember to copy the client secret immediately after creating it.
- The Application (client) ID is shown on the Overview tab.

Then follow these steps:

1. Register the application.
2. Set the implicit grant tokens.
3. Set the API permissions.
4. Create the client secret.

Session Border Controller configuration

For step-by-step guidance on how to configure your Session Border Controller with the embedded Survivable Branch Appliance, see the documentation provided by your SBC vendor:

- [AudioCodes](#)
- [Ribbon](#)
- [Oracle](#)
- [TE-Systems](#)

Reporting issues

Report any issues to your SBC vendor's support organization. When reporting the issue, indicate that you have a configured Survivable Branch Appliance.

Known issues

- When you add new Survivable Branch Appliances, it might take some time before you can use them in Survivable Branch Appliance policies.
- When you assign a Survivable Branch Appliance policy to a user, it might take some time before the SBA is shown in the output of Get-CsOnlineUser.
- Reverse number lookup against Azure AD Contacts is not performed.
- The SBA does not support call forwarding settings.
- Making an emergency call to an emergency number configured for dynamic emergency calling (E911) is not supported.

Manage telephone numbers for your organization

12/7/2021 • 2 minutes to read • [Edit Online](#)

Currently, Microsoft supports two telephone number types:

- **User numbers**, also called subscriber numbers, which can be assigned to users in your organization.
- **Service numbers**, which are assigned to services such as [Audio Conferencing](#), [Auto Attendants](#), or [Call Queues](#).

Microsoft is working to simplify number types, but for now you will need to decide:

- Which user locations need new telephone numbers from Microsoft?
- Which type of telephone number (subscriber or service) do I need?
- How do I port existing telephone numbers to Teams?

How you acquire and manage telephone numbers differs depending on your PSTN connectivity option.

- For information about managing telephone numbers for Microsoft Calling Plan, see [Manage telephone numbers for Calling Plans](#).
- For information about managing telephone numbers for Operator Connect, see [Set up telephone numbers with Operator Connect](#).
- For information about managing telephone numbers for Direct Routing, see [Configure the telephone number and enable enterprise voice and voicemail](#).

If you need additional or other number types other than those numbers seen in the Microsoft Teams admin center, you can submit a telephone number request to the [Phone Number Service Center](#).

User telephone numbers

There are two types of user telephone numbers, which can be assigned to users in your organization:

- **Geographic numbers** have a relationship to a geographic area and are the most common. For example, geographic telephone numbers in most cases can only be used within a certain address, city, state, or region of the country.
- **Non-geographic numbers** are known as national numbers or sometimes VoIP numbers. These numbers don't have a relationship to a geographic area within a country/region. For example, non-geographic numbers often have the same cost when calling the number from anywhere within the country/region. Also, some countries, such as Denmark, only have non-geographic numbers available.

Service telephone numbers

This section describes service numbers available from Microsoft that are included in your licensing. For information about service numbers provided by Operator Connect or Direct Routing, contact your provider.

There are two types of service telephone numbers provided by Microsoft--toll and toll-free--which can be assigned to services such as Audio Conferencing, Auto Attendants, or Call Queues. Service numbers have a higher concurrent call capacity than user numbers. Service number availability varies by country/region and the type of number (whether it's a toll or toll-free number). Microsoft's telephony licenses in each country/region dictate what the number can be used for.

- **Toll service numbers** - There are two types of toll service numbers, which may incur a toll cost to the caller:
 - **Geographic numbers** Geographic numbers have a relationship to a geographic area. For example, geographic telephone numbers in most cases can only be used within a certain address, city, state, or region of the country.
 - **Non-geographic numbers** Non-geographic numbers are national numbers that don't have a relationship to a geographic area within a country/region. For example, non-geographic numbers often have the same cost when calling the number from anywhere within the country/region.
- **Toll-free service numbers** - These service numbers don't typically incur a toll cost to the caller. Teams provides national toll-free numbers in over 60 countries/regions.

Caution

Some countries/regions and originating number types, such as calls originating from mobile phones, may in some cases incur a toll cost to the caller.

NOTE

If you need to get more telephone numbers than this, contact the [Phone Number Service Center](#).

How many telephone numbers can you get?

12/7/2021 • 3 minutes to read • [Edit Online](#)

When you are looking for and getting Microsoft-supplied telephone numbers for your organization, you can get more telephone numbers than you have assigned licenses. But this depends on the types of telephone numbers and types of licenses you have bought and assigned.

How you acquire and manage telephone numbers differs depending on your PSTN connectivity option: Microsoft Calling Plans, Operator Connect, or Direct Routing. For more information, see [Manage telephone numbers for your organization](#).

The following table applies to Microsoft Calling Plans, [Audio Conferencing](#), and voice apps, such as [Call Queues and Auto Attendants](#). For information about Operator Connect and Direct Routing, contact your service provider.

You can see the quantity of telephone numbers you can get from Microsoft during the search and acquire process in the Microsoft Teams admin center (**Get phone numbers**).

IMPORTANT

The limits below don't include telephone numbers you have ported to Microsoft.

HERE'S THE TYPE OF PHONE NUMBER	HOW DO YOU GET THE TOTAL PHONE NUMBERS?	HERE'S AN EXAMPLE
User (subscriber) number	The number of phone numbers is equal to the total number of Domestic Calling Plan and/or Domestic and International Calling Plan licenses multiplied by 1.1 + 10 additional phone numbers.	If I have 50 users in total with either a Domestic Calling Plan and/or Domestic and International Calling Plan, you can acquire 65 phone number ($50 \times 1.1 + 10$).

HERE'S THE TYPE OF PHONE NUMBER	HOW DO YOU GET THE TOTAL PHONE NUMBERS?	HERE'S AN EXAMPLE
Toll service number	<p>The number of phone numbers is equal to the total number of Phone System and Audio Conferencing licenses and uses the following:</p> <p>If there are 1-25 licenses then 5 telephone numbers are given.</p> <p>If there are 26-49 licenses then 10 telephone numbers are given.</p> <p>If there are 50-99 licenses then 20 telephone numbers are given.</p> <p>If there are 100-149 licenses then 30 telephone numbers are given.</p> <p>If there are 150-199 licenses then 40 telephone numbers are given.</p> <p>If there are 200-499 licenses then 65 telephone numbers are given.</p> <p>If there are 500-749 licenses then 90 telephone numbers are given.</p> <p>If there are 750-999 licenses then 110 telephone numbers are given.</p> <p>If there are 1,000-1,249 licenses then 125 telephone numbers are given.</p> <p>If there are 1,250-1,499 licenses then 135 telephone numbers are given.</p> <p>If there are 1,500-1,999 licenses then 160 telephone numbers are given.</p> <p>If there are 2,000-2,999 licenses then 210 telephone numbers are given.</p> <p>If there are 3,000-6,999 licenses then 420 telephone numbers are given.</p> <p>If there are 7,000-9,999 licenses then 500 telephone numbers are given.</p> <p>If there are 10,000-14,999 licenses then 600 telephone numbers are given.</p> <p>If there are 15,000-19,999 licenses then 700 telephone numbers are given.</p> <p>If there are 20,000-49,999 licenses then 1000 telephone numbers are given.</p> <p>If there are 50,000+ licenses then 1500 telephone numbers are given.</p>	<p>If you have a total of 51 Phone System and Audio Conferencing licenses, you can get 20 toll service numbers.</p>

HERE'S THE TYPE OF PHONE NUMBER	HOW DO YOU GET THE TOTAL PHONE NUMBERS?	HERE'S AN EXAMPLE
Toll-free service number	<p>The number of phone numbers is equal to the total number of Phone System and Audio Conferencing licenses and uses the following:</p> <p>If there are 1-25 licenses then 5 telephone numbers are given.</p> <p>If there are 26-49 licenses then 10 telephone numbers are given.</p> <p>If there are 50-99 licenses then 20 telephone numbers are given.</p> <p>If there are 100-149 licenses then 30 telephone numbers are given.</p> <p>If there are 150-199 licenses then 40 telephone numbers are given.</p> <p>If there are 200-499 licenses then 65 telephone numbers are given.</p> <p>If there are 500-749 licenses then 90 telephone numbers are given.</p> <p>If there are 750-999 licenses then 110 telephone numbers are given.</p> <p>If there are 1,000-1,249 licenses then 125 telephone numbers are given.</p> <p>If there are 1,250-1,499 licenses then 135 telephone numbers are given.</p> <p>If there are 1,500-1,999 licenses then 160 telephone numbers are given.</p> <p>If there are 2,000-2,999 licenses then 210 telephone numbers are given.</p> <p>If there are 3,000-6,999 licenses then 420 telephone numbers are given.</p> <p>If there are 7,000-9,999 licenses then 500 telephone numbers are given.</p> <p>If there are 10,000-14,999 licenses then 600 telephone numbers are given.</p> <p>If there are 15,000-19,999 licenses then 700 telephone numbers are given.</p> <p>If there are 20,000-49,999 licenses then 1000 telephone numbers are given.</p> <p>If there are 50,000+ licenses then 1500 telephone numbers are given.</p>	<p>If you have a total of 1001 Phone System and Audio Conferencing licenses, you can get 125 toll-free service numbers.</p> <p>Important: Communications Credits billing is required to reserve and use toll-free phone numbers.</p>

NOTE

If you need to get more telephone numbers than this, contact the [Phone Number Service Center](#).

Search for telephone numbers for users

12/7/2021 • 4 minutes to read • [Edit Online](#)

When you are setting up users in your organization to make and receive telephone calls using Microsoft-supplied telephone numbers, you must first use the **Microsoft Teams admin center** and acquire telephone numbers to be assigned to users. The telephone number you assign to a user will be a telephone number that you have previously acquired for your organization; the number will be listed in the drop-down list when you edit the properties of the user and click **Assign**.

Before you can assign Microsoft-supplied telephone numbers to your users, you must use the **Get new numbers** page to search for telephone numbers that are available to you. You can search by **Country (Market)**, **Number type**, and **Location**. You will then see a list of operators that supply numbers in that country.

If you select Microsoft as your operator, you can acquire the numbers from the Teams admin center by entering the quantity of telephone numbers you will need for your users. The page will automatically limit the quantity based on how many you still have available to acquire. If you select an Operator Connect operator, you will be directed to the landing page of your selected operator to complete the number order.

How you acquire and manage telephone numbers differs depending on your PSTN connectivity option: Microsoft Calling Plans, Operator Connect, or Direct Routing.

This article applies to [Microsoft Calling Plans](#) and [Operator Connect](#). For more information about all options, see [Manage telephone numbers for your organization](#).

Search for telephone numbers for Microsoft Calling Plans

To search for telephone numbers for your users:

1. Go to the **Microsoft Teams admin center**.
2. In the left navigation select **Voice > Phone numbers > Get new numbers**.

IMPORTANT

For you to see the **Voice** option in the left navigation in the Teams admin center, you must first buy at least one **Enterprise E5 or E3 license**, one **Phone System** add-on license, or one **Audio Conferencing** add-on license.

3. On the **Select location and quantity** page, select a location from the **Country (Market)** drop-down list.
4. Select **User** from the **Number type** drop-down list.
5. Depending on the Country (Market) you have selected, you will now have different options available for you to use for locating the telephone numbers you require.
6. Under **Quantity**, enter the number of phone numbers that you want for your organization, and then click **Next**. You have 10 minutes to select your phone numbers. If you take more than 10 minutes, the numbers will be returned to the pool of phone numbers.

NOTE

You can see the number of telephone numbers available to you (which is based on the number of licenses), listed next to **Quantity**.

7. On the **Get numbers** page, select the telephone numbers you want, click **Acquire numbers**, and then click **Next**.

IMPORTANT

You can acquire more telephone numbers than you have Microsoft licenses. To determine how many telephone numbers you can acquire, take your number of Microsoft Calling Plan licenses, add 10 percent of the number of licenses, then add 10, and then remove however many you have already acquired. For example, if you have 100 Microsoft **Domestic Calling Plan** and/or Microsoft **International Calling Plan** licenses, you can reserve 120 telephone numbers, assuming that you have not already acquired some telephone numbers for those 100 users. For more details, see [How many telephone numbers can you get?](#)

8. On the **Confirmation** page, verify your choices, and then click **Place order**.
9. When you return to the **Phone numbers** page, select the telephone number or numbers that you want to assign and then click **Edit** to assign it to a user.

Search for telephone numbers for Operator Connect

1. Go to the **Microsoft Teams admin center**.
2. In the left navigation select **Voice > Phone numbers > Get new numbers**.

IMPORTANT

For you to see the **Voice** option in the left navigation in the Teams admin center, you must first buy at least one **Enterprise E5 or E3 license**, one **Phone System** add-on license, or one **Audio Conferencing** add-on license.

3. On the **Select location and quantity** page, select a location from the **Country (Market)** drop-down list.
4. Select **User** from the **Number type** drop-down list.
5. Depending on the Country (Market) you have selected, you will now have different options available for you to use for locating the telephone numbers you require. You can filter to show only operators that you have added by selecting **Show my operators**.
6. If you have already provided consent to the operator, you will be directed to the landing page of the operator to complete the order process.
7. If you have not provided consent to the operator, you will be directed to enable your operator on the chosen operator page in the Teams admin center. For more information, see [Enable an operator](#).
8. After your order is complete, your operator will upload phone numbers to your tenant, and you can assign them to users.

Assign, change, or remove a phone number for a user

12/7/2021 • 3 minutes to read • [Edit Online](#)

When you set up Calling Plans or Operator Connect, you assign phone numbers to your users. In Microsoft Teams, the phone number that you assign is listed when a user clicks **Calls**.

This article applies to Calling Plans and Operator Connect. For information about assigning, changing, or removing a phone number from a user in a Direct Routing scenario, see [Enable users for Direct Routing, voice, and voicemail](#).

Before you assign a number for a Calling Plan or Operator Connect user, you must get numbers for your users. For more information, see [Get numbers for Calling Plan users](#) or [Set up numbers for Operator Connect users](#).

NOTE

One way to see whether a user has a license assigned is by going to the Microsoft Teams admin center > **Users**. If a license is assigned, it will be indicated on the page. You can also use the Microsoft 365 admin center.

NOTE

This note applies to customers who have a hybrid deployment with an on-premises Active Directory. If you want to assign a Calling Plan or Operator Connect phone number to a user or resource account, you must ensure that the phone number in the on-premises Active Directory has been removed, and the change has been synchronized to Microsoft 365.

Assign a phone number to a user

When assigning a phone number to a user, make sure the phone number and the usage location of the user are of the same country.

To assign a number by using the Teams admin center:

1. In the left navigation, click **Voice > Phone numbers**.
2. On the **Phone numbers** page, select an unassigned number in the list, and then click **Edit**.
3. In the **Edit** pane, under **Assigned to**, search for the user by display name or user name, and then click **Assign**.
4. To assign or change the associated emergency location, under **Emergency location**, search for and then select the location.

NOTE

If you are assigning numbers to Operator Connect users, you may or may not be able to assign or change the associated emergency location. This functionality will depend on your Operator. Contact your Operator for more information.

5. Depending on whether you want to send an email to the user with their phone number information, turn off or turn on **Email user with telephone number information**. By default, this is on.

6. Click **Save**.

To assign numbers by using PowerShell, use the [Set-CsOnlineVoiceUser](#) cmdlet as follows:

```
PowerShell Set-CsOnlineVoiceUser -Identity -TelephoneNumber
```

For example:

```
PowerShell  
Set-CsOnlineVoiceUser -Identity john@contoso.com -TelephoneNumber +14255550101
```

NOTE

Because of the latency between Microsoft 365 and Teams, it can take up to 24 hours for users to be enabled. If the phone number isn't assigned correctly after 24 hours, see [Phone Number Service Center](#).

Change a phone number for a user

To change a phone number for a user by using the Teams admin center:

1. In the left navigation, click **Users**, locate and double-click the user you want, click **Account**, and then under **General information**, make a note of the phone number that's assigned to the user.
2. In the left navigation, click **Voice > Phone numbers**.
3. On the **Phone numbers** page, select the number that you identified in step 1, and then click **Edit**.
4. In the **Edit** pane, under **Assigned to**, click the X to remove the user.
5. Click **Save**.
6. On the **Phone numbers** page, select an unassigned number in the list, and then click **Edit**.
7. In the **Edit** pane, under **Assigned to**, search for the user by display name or user name, and then click **Assign**.
8. To assign or change the associated emergency location, under **Emergency location**, search for and then select the location.

NOTE

If you are changing numbers for Operator Connect users, you may or may not be able to assign or change the associated emergency location. This functionality will depend on your Operator. Contact your Operator for more information.

9. Click **Save**.

For a PowerShell example, see [Set-CsOnlineVoiceUser](#).

Remove a phone number from a user

To remove a phone number by using the Teams admin center:

1. In the left navigation, click **Users**, locate and double-click the user you want, click **Account**, and then under **General information**, make a note of the phone number that's assigned to the user.
2. In the left navigation, click **Voice > Phone numbers**.

3. On the **Phone numbers** page, select the number that you identified in step 2, and then click **Edit**.
4. In the **Edit** pane, under **Assigned to**, click the **X** to remove the user.
5. Click **Save**.

For a PowerShell example, see [Set-CsOnlineVoiceUser](#).

See a list of telephone numbers

12/7/2021 • 2 minutes to read • [Edit Online](#)

There are different types of telephone numbers that you can assign to users or voice applications like [Audio Conferencing](#) or [Call Queues](#). For more information, see [Manage telephone numbers for your organization](#).

This article applies to Calling Plans and Operator Connect. For information about Direct Routing, see [Configure the telephone number and enable enterprise voice and voicemail](#).

To see all telephone numbers in your organization

To see a list of all telephone numbers in your organization:

1. Go to the **Microsoft Teams admin center**.
2. In the left navigation, go to **Voice > Phone numbers**.
3. To view the telephone numbers that are assigned, see the **Assignment Status** column, which also shows what type of service the number is assigned to.
4. To filter your view, click the filter icon. On the **Filter** pane, you can use the drop-down list to filter your view by:
 - **Number range** that you set. You can search by lowest number or highest number.
 - Numbers that start with a number that you specify.
 - Number **activation state**.
 - Number **type**.
 - Phone number **status**.

To see all telephone numbers that are assigned to users

When you are setting up users, you might just want to see the list of the telephone numbers that are already assigned to users and which telephone numbers are available to be assigned to them.

1. Go to the **Microsoft Teams admin center**.
2. In the left navigation, go to **Voice > Phone numbers**.

IMPORTANT

For you to see the **Voice** option in the left navigation in the Microsoft Teams admin center, you must first buy at least one **Enterprise E5 license**, one **Phone System** add-on license, or one **Audio Conferencing** add-on license.

3. To quickly sort the numbers so that you can see which are assigned, click the **Assignment Status** column heading. Or, you can click the filter icon and then filter your view to see telephone numbers that are already assigned to users or unassigned numbers that you can assign to a user. You can filter by:
 - **Assigned to user**
 - **Assigned to conference bridge**

- Assigned to Voice app (Auto Attendant/Call Queue)
- Unassigned

To see all telephone numbers that are assigned to voice users

When you are setting up users in your organization to make and receive telephone calls, you must first get the telephone numbers and then assign them to your users. After you've gotten your telephone numbers, you might want to see the activation status of the number assignments.

1. Go to the **Microsoft Teams admin center**.
2. In the left navigation, go to **Voice > Phone numbers**.
3. Click the filter icon to filter your view by **Activation state**. You can filter by:
 - Activated
 - Assignment pending
 - Assignment failed
 - Update pending
 - Update failed

Using the Teams PowerShell module

You can use the Teams PowerShell module to get the same information from the previous sections, but version 1.1.6 or later is required, which includes the integration of the Skype for Business Online connector. For more information about the module, see [Microsoft Teams PowerShell Overview](#).

To see a list of all telephone numbers that you have for your organization, use the [Get-CsOnlineTelephoneNumber](#) cmdlet. For example, to see each telephone number and its state, run the following command:

```
Get-CsOnlineTelephoneNumber | ft Id,ActivationState
```

To see all of the telephone numbers that are assigned to users, use the [Get-CsOnlineUser](#) cmdlet. For example, to see all users with a telephone number assigned, run the following command:

```
Get-CsOnlineUser | Where-Object { $_.LineURI -notlike $null } | ft DisplayName,UserPrincipalName,LineURI
```

Manage phone numbers for Calling Plan

12/7/2021 • 2 minutes to read • [Edit Online](#)

There are four ways to get user (subscriber) and service (toll and toll-free) phone numbers for Calling Plan:

- [Getting new user phone numbers in the Microsoft Teams admin center.](#)
- [Getting new service phone numbers in the Microsoft Teams Admin Center.](#)
- [Transfer or *Port* your existing phone numbers with us.](#)
- Use a request form for new phone numbers that aren't listed in the Microsoft Teams admin center.

IMPORTANT

For new phone numbers in Australia, see [Telstra Voice Services](#). For new phone numbers in Japan, see [SoftBank Voice Services](#).

If you know what kind of forms you are looking for, use the drop-down to select the country/region where you're getting numbers.

Select your country or region to find the downloadable PDF LOA forms you will need

Number request forms

The following sections describe request forms for new numbers and for transferring existing numbers.

Request forms for new phone numbers

Each country or region has different instructions, different types of phone numbers (geographic/non-geographic and service (toll/toll-free)) and rules/regulations for getting phone numbers so they can be used in Microsoft Teams.

Sometimes (depending on your country or region) you won't be able to get new user (subscriber) or service (toll or toll-free) phone numbers using the Microsoft Teams admin center or you might need *specific* phone numbers (vanity requests) or *specific* area codes.

If so, you will need to download the correct PDF LOA form (per country or region and type of phone numbers) and send it back to us. Our service desk will take it from there and start processing your request.

Letters of Authorization (LOAs) to transfer/port existing phone numbers

If you need to transfer/port your existing phone numbers from another service provider to Teams, you will need to download, fill, and send us a Letter of Authorization (LOA). The LOA gives Microsoft permission to request and transfer, on your behalf, those existing numbers from a different service provider into Teams.

Please send us an LOA if you currently have the following with another carrier:

- User (subscriber) numbers.
- Service (toll) numbers for audio conferencing bridges, auto attendants, or call queues.
- Toll-Free phone numbers.
- More than 999 user phone numbers that you need to transfer/port but can't get in the Microsoft Teams admin center using the local number porting wizard.

Once you have your **filled and signed** LOA, please [contact our TNS Service Desk](#) so we can assist you.

Still need assistance?

If you need assistance, please [contact the TNS Service Desk](#).

Additional resources

- To see *if* and which calling plans are available in your country or region, read [Countries and region availability for Audio Conferencing and Calling Plans](#)
- To assist you in choosing the correct type of phone numbers, read [Different kinds of phone numbers used for Calling Plans](#).
- To get assistance with setting up phone numbers for your organization, read: [Support Contact for Business Products - Admin Help](#).

Getting phone numbers for your users

12/7/2021 • 3 minutes to read • [Edit Online](#)

Before you can set up users in your organization to make and receive phone calls, you must get phone numbers for them.

There are three ways to get user numbers:

- **Use the Microsoft Teams admin center.** For some countries and regions, you can get numbers for your users using the Microsoft Teams admin center. See [Get new phone numbers for your users](#).
- **Port your existing numbers.** You can port or transfer existing numbers from your current service provider or phone carrier. See [Transfer phone numbers to Teams](#) or [Manage phone numbers for your organization](#) for more information to help you do this.
- **Use a request form for new numbers.** Sometimes (depending on your country or region) you won't be able to get your new phone numbers using the Microsoft Teams Admin Center or you'll need specific phone numbers or area codes. See [Manage phone numbers for your organization](#) for more information.

NOTE

If you need help setting up phone numbers for your organization, please [contact Support Contact for Business Products - Admin Help](#).

Get new phone numbers for your users

Using the Microsoft Teams admin center

You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. Go to the Microsoft Teams Admin Center.
2. In the left navigation, go to **Voice > Phone numbers**, and then click **Add**.
3. Enter a name for the order and add a description.
4. On the Location and quantity page, do the following:
 - a. Under **Country or region**, select a country or region.
 - b. Under **Number type**, select **User (subscriber)**.
 - c. Under **Location**, select a location. If you need to create a new location, click **Add a location**.
 - d. Under **Area code**, select an area code.
 - e. Under **Quantity**, enter the number of numbers that you want for your organization, and then click **Next** to select your numbers.
5. Select the numbers you want. You have 10 minutes to select your phone numbers and place your order. If you take more than 10 minutes, the phone numbers will be returned to the pool of numbers.
6. When you're ready to place your order, click **Place order**.

IMPORTANT

The number of phone numbers for users (subscribers) is equal to the total number of **Domestic Calling Plan** and/or **Domestic and International Calling Plan** licenses you have assigned multiplied by 1.1, plus 10 additional phone numbers. For example, if you have 50 users in total with a Domestic Calling Plan and/or Domestic and International Calling Plan, you can acquire 65 phone numbers ($50 \times 1.1 + 10$). For details, see [How many phone numbers can you get?](#). If you need to get more phone numbers than this, [contact Support Contact for Business Products - Admin Help](#).

Port or transfer phone numbers from your service provider or phone carrier

- If you need 999 or fewer phone numbers for your users, use the porting wizard in the Microsoft Teams Admin Center. Follow the steps in [Transfer phone numbers to Teams](#). If your country or region isn't listed in the porting wizard, you can [manually submit a port order](#) or see [Manage phone numbers for your organization](#) to download the correct Letter of Authorization (LOA).
- If you need to port more than 999 phone numbers, you can [manually submit a port order](#) or see [Manage phone numbers for your organization](#) to download the correct Letter of Authorization (LOA) and then send it to [the TNS service desk](#) to get all your numbers transferred.

View the phone numbers for your organization

Using the Microsoft Teams admin center

In the left navigation of the admin center, go to **Voice > Phone numbers** to view the numbers for your organization, including location, number type, and status information.

Assign phone numbers to users

After you get your phone numbers, you'll need to assign a number to each of your users. See [Assign, change, or remove a phone number for a user](#) for more information.

NOTE

If you need to get more phone numbers than this, [contact Support Contact for Business Products - Admin Help](#).

Service phone numbers for Calling Plans

12/7/2021 • 3 minutes to read • [Edit Online](#)

In addition to [getting phone numbers for your users](#), you can get toll or toll-free phone numbers for services such as Audio Conferencing (for conference bridges), Auto Attendants, and Call Queues (also called service numbers). Service phone numbers have a higher concurrent calling capacity than user or subscriber phone numbers. For example, a service number can handle hundreds of calls simultaneously, whereas a user's phone number can only handle a few calls simultaneously.

NOTE

You have to first set up Communications Credits before you can get toll-free numbers. To learn more, see [Set up Communications Credits for your organization](#).

There are three ways to get service numbers:

- **Use the Microsoft Teams admin center.** For some countries and regions, you can get service numbers using the Microsoft Teams admin center. See [Get new service numbers](#).
- **Port your existing numbers.** You can port or transfer existing numbers from your current service provider or phone carrier. See [Transfer phone numbers to Teams](#) or [Manage phone numbers for your organization](#) for more information to help you do this.
- **Use a request form for new numbers.** Sometimes (depending on your country or region) you won't be able to get your new phone numbers using the Microsoft Teams admin center, or you'll need specific phone numbers or area codes. If so, you'll need to download a form and send it back to us. See [Manage phone numbers for your organization](#) for more information.

NOTE

Service numbers are needed so you can get a higher concurrent call capacity for a specific number. When you're transferring the number over to us, you can [contact the TNS service desk](#) to make sure the service number you're transferring has a high concurrent call capacity.

Get new service numbers

To get new service numbers, in the Teams admin center:

1. In the left navigation, go to **Voice > Phone numbers**, and then click **Add**.
2. Enter a name for the order and add a description.
3. On the Location and quantity page, do the following:
 - Under **Country or region**, select a country or region.
 - Under **Number type**, select the type of service number that you want.
 - Under **Location**, select a location. If you need to create a new location, click **Add a location**.
 - Under **Area code**, select an area code.
 - Under **Quantity**, enter the number of numbers that you want for your organization, and then click **Next** to select your numbers.
4. Select the numbers you want. You have 10 minutes to select your phone numbers and place your order. If

you take more than 10 minutes, the phone numbers will be returned to the pool of numbers.

5. When you're ready to place your order, click **Place order**.

Port or transfer existing service numbers

To transfer your phone numbers from your current service provider or carrier to Teams, you can use the porting wizard in the Microsoft Teams admin center. Follow the steps in [Transfer phone numbers to Teams](#).

If your country or region isn't listed in the porting wizard, you can [manually submit a port order](#) or go to [Manage phone numbers for your organization](#), select your country or region, and then download a Letter of Authorization (LOA). You'll have to submit separate port orders for each type of service number (for example, toll vs. toll-free) that you'll be transferring by using an LOA. In the LOA, you must select the correct type of service number. Make sure you specify that you're transferring a service number (and not a user or subscriber number), or the concurrent calling capacity may not be enough to handle call volumes.

NOTE

If you need to get more phone numbers than this, [contact the TNS service desk](#).

View the phone numbers for your organization

In the Teams admin center, in the left navigation, go to **Voice > Phone numbers** to view the numbers for your organization, including location, number type, and status information.

Assign service phone numbers

After you get your service numbers, assign each number to an Audio Conferencing bridge. See [Change the toll or toll free numbers on your Audio Conferencing bridge](#).

What's a port order?

12/7/2021 • 7 minutes to read • [Edit Online](#)

If you currently have a phone service provider or carrier and already have phone numbers for your users or services, you need to create a "*port order*" to transfer those phone numbers to Microsoft Teams. When the numbers are ported over, you can assign those phone numbers to your users and services such as audio conferencing (for conference bridges), auto attendants, and call queues.

After you port your phone numbers over to Teams, Microsoft becomes your service provider and you can disconnect your service with your old service provider or carrier.

Review the information in this article to get familiar with number porting. After that, you should be ready to create a port order and transfer your phone numbers. See [Transfer phone numbers to Teams](#) for step-by-step instructions.

What countries or regions support number porting?

You can port or transfer phone numbers in all the supported countries or regions, but how you submit a port order request depend on the country or region where the phone numbers come from. For a list of countries and regions that support number porting, see [Manage phone numbers for your organization](#).

Currently, [the porting wizard](#) in the Microsoft Teams admin center supports getting phone numbers for the United Kingdom, United States, and Canada. To get phone numbers for other countries and regions, you can [manually submit a port order](#).

What numbers can be transferred?

You can transfer

In general, you can transfer any phone number that's from a supported provider, including:

- Land line phone numbers.
- Mobile device phone numbers such as those used for cell phone and tablets.

NOTE

Transferring mobile numbers is only available in the United States and Puerto Rico.

- Toll phone numbers.
- Toll-free phone numbers.

NOTE

Universal International Freephone Number (UIFN) can't be transferred to us.

- Service phone numbers such as those used for conference bridges, auto attendants, etc.
- Fax phone numbers, but they can't be used for faxing. They have to be assigned to a user.
- VoIP phone numbers from a phone provider such as Vonage or RingCentral.

- Skype for Business hybrid phone numbers. If you want to transfer these numbers, email us at ptn@microsoft.com.

You can't transfer:

NOTE

At this time, you can't transfer any phone number or numbers that aren't from a supported country or region, including phone numbers from a VoIP phone provider. For a list of supported countries/regions, see [Country and region availability for Audio Conferencing and Calling Plans](#)

- Phone numbers used for data connections like for DSL lines or broadband Internet connections.
- Phone numbers dedicated to faxing.

If you have existing dedicated phone numbers that are being used for faxing, you *can* transfer these numbers over to Teams but your fax services won't continue to work as expected. Faxing services aren't available to Teams customers, even if you have licenses for Phone System, Domestic Calling Plan, or International Calling Plan.

If you port the phone number to Teams, you can assign this phone number to a user in your organization instead of using it for faxing.

NOTE

At this time in the United Kingdom, we currently don't support transferring UK non-geographic numbers including shared cost numbers for area codes 0843, 0844, 0845, 0870, 0871, 0872.

What information do I need to provide?

You need to have all the account information for your current carrier. The information that you enter in the port order is mostly found on the most recent bill or invoice from your current service provider. You also need to know whose name is on the account and what numbers you want to port.

What are full-port and partial-port transfers?

When you're porting phone numbers to Teams, you have the option to transfer all your numbers or some of them.

- **Full-port** This is when you transfer all of your numbers from your current service provider to Teams. When you're asked for the phone numbers you want to transfer, you *must include* the billing telephone number (BTN) along with all of the other phone numbers on your account.

For example, let's say your BTN is *+1 425-555-1234* and you want to port all of your 25 phone numbers (*+1 425-555-1235 through 1259*). When you follow the instructions below to transfer your numbers, you would enter: **+14255551234 - +14255551259**.

- **Partial-port** This is when you're only transferring some of your phone numbers from your current service provider to Teams. When you want to port some of the phone numbers tied to the same BTN, you *** must not include *** the BTN along with all of the other phone numbers on your account.

For example, let's say your BTN is *+1 425-555-1234* and you want to port only 5 of your 25 phone numbers (*+1 425-555-1235 through 1239*). When you follow the instructions below to transfer your numbers, you would enter: **+1 425 555 1235 - +1 425 555 1239**.

Can I submit a single number porting request for all of my numbers at one time?

A unique request is needed for each carrier and type of number being ported.

For example, you need to submit a unique number porting request for each of the following types of numbers:

- Local toll numbers, also known as subscriber numbers or geographic numbers
- Toll Free numbers with area codes such as: 800, 844, 855, 866, 877 and 888
- Mobile numbers
- Service numbers that can be used for Audio Conferencing in Microsoft 365 or Office 365.

Here's more information about how to submit number porting requests for each of these types of numbers:

- **Phone numbers** provided by different carriers require a unique porting request for numbers with each carrier.
- **Toll-free numbers** with area codes such as: 800, 844, 855, 866, 877 and 888 can't be included in a number porting request with other types of numbers. To port these toll-free numbers, you must [manually submit a port order](#). You can't port these numbers in the Microsoft Teams admin center. For more information, see [Manage phone numbers for your organization](#).

It's important to use the correct Letter of Authorization (LOA) for the country and type of phone numbers that you want to port. You can [download the LOA that you need here](#).

- **Mobile numbers** require a PIN code to authorize the transfer. Therefore, they need separate number porting request.
- **Service number** porting requests need to be submitted by themselves. They can't be submitted with other types of numbers.

How long does it take to port numbers?

After you've completed the port order request, it takes between 7-14 days to be processed. However, depending on your service provider it may take up to 30 days. After the phone numbers are ported over, you'll get an email from us to let you know that you're good to go.

To check the status of your port order, in the left navigation of the Microsoft Teams admin center, go to **Voice > Phone numbers**, and then click **Order history**. Each port order status is listed in the **Status** column.

Can user (subscriber) phone numbers be converted to service numbers?

Yes they can. All you need to do is submit a service request that includes your organization's tenant GUID and the phone numbers you want converted. To do this, see [Manage phone numbers for your organization](#).

Can I port out my numbers from Teams to a different phone service provider or carrier?

To port out your numbers from Teams to a different carrier, you must submit a request with the new carrier. You'll also need to set a porting PIN by opening a support case. For information on how to get support, see [Get support](#).

When your new carrier contacts us with the porting request, we'll ask them to provide the PIN you defined.

Common mistakes to watch out for

Number porting is easy to do. Your order can get messed up, however, if there's a problem with the phone service provider, the order is incomplete and missing information, or there are typos.

Here are the most common mistakes we see customers make when they port numbers. Save yourself a call to customer support and double-check for these errors.

- Make sure the account information you give matches exactly what your phone carrier has on record. Mismatched information is the most common cause of errors and delay your port order. Verify the following is true:
 - Name or person authorized to make changes to the account is correct.
 - Address is correct.
 - Account number is correct.
 - BTN is correct.
- Make sure there are no advanced call control features, for example, Call Hunt, Distinctive Ring, that are enabled on these phone numbers.
- Make sure you haven't placed any new service orders or disconnects with your current service provider.
- Make sure all numbers are from the same carrier and the same account.
- Make sure your service is active. Freezing the account prevents the change of carriers on the account. The person authorized to make changes to the account must submit an order to the current carrier to remove the freeze. This process can take one to three weeks depending on the carrier.

Transfer phone numbers to Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Use the porting wizard in the Microsoft Teams admin center to transfer your phone numbers from your current service provider to Teams. After you port your phone numbers to Teams, Microsoft will become your service provider and will bill you for those phone numbers.

Before you start, we recommend that you review the information in [What's a port order?](#) If you have service numbers for dial-in conferencing bridges, auto attendants or other service numbers, toll-free phone numbers, or have more than 999 user (subscriber) phone numbers that you need to transfer to Teams, see [Manage phone numbers for your organization](#) to download the correct forms and send them to us.

NOTE

We process port orders for transferring phone numbers only on United States business days and not on public holidays or weekends.

Create a port order and transfer your phone numbers to Teams

NOTE

Currently, you can use this wizard to get phone numbers for the United Kingdom, United States, and Canada. To get phone numbers for other countries and regions, you can [manually submit a port order](#). To get the form you need to manually submit a port order, select your country or region in the drop-down list in [Manage phone numbers for your organization](#).

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Phone numbers**. Click **Numbers**, and then click **Port** to start the porting wizard.
2. Review the information on the **Get started** page, and then when you're ready, click **Next**.
3. On the **Select location and number type** page, specify the following, and then click **Next**:
 - **Country or region**: Country or region where you're getting numbers.
 - **Phone number type**: Type of number, such as geographic or toll-free numbers.
 - **Numbers assigned to**: What the numbers are assigned to. For example, users, or conferencing or voice features.
4. On the **Add account information** page, complete the following, and then click **Next**.

IMPORTANT

The information displayed on this page is determined by the country or region and number type. Each country and region have different regulations on the information that's required to port numbers. What you see on this page may be different from what's described here.

- **Order details**:
 - **Order name**: Name of your order
 - **Notification emails**: Email addresses to receive order notifications. If you enter multiple email addresses, separate each with a semicolon.

- **Transferred date:** Transfer date issued by your current service provider.
 - **Phone number details**
 - **Port type:** Whether you're doing a full-port to transfer all your numbers or a partial-port to transfer some of your numbers.
 - **Person requesting details**
 - Your organization name and contact details of the person requesting the transfer.
 - **Current provider's details**
 - **Billing telephone number (BTN):** Your BTN in E.164 format, which requires a + sign to prepend the number. For example, for a North America number, use +1XXXYYYZZZZ format.
 - Other details including the name of your current service provider, your account number, and your service address.
5. On the **Add numbers** page, click **Select a file**, browse to and select the CSV file that contains the phone numbers that you want to transfer, and then click **Next**.

NOTE

The CSV file must have only one column with a header named PhoneNumber. Each phone number must be on a separate row and can be digits only or in E.164 format.

6. On the **Complete your order** page, click **Upload a signed Letter of Authorization** to upload a scanned copy of the signed Letter of Authorization (LOA).

If you haven't already downloaded and signed the LOA, do the following:

- a. Click **Download the template** to download the LOA for your country or region.
- b. Print the LOA.
- c. Have the LOA signed by the person who is authorized to make changes to the account.
- d. Scan the signed LOA, and then click **Upload a signed Letter of Authorization** to upload it.

NOTE

After you upload your LOA, submit your order. Just uploading the LOA isn't sufficient. You have to also submit the order for it be processed.

7. Review your order details, and then click **Submit**.

What happens next?

When we receive your port order, you'll get an email that verifies your request. Your request is checked and updated daily and you'll be notified of its progress and status in email. If your port request is rejected by the losing carrier, contact the [TNS Service Desk](#).

To view the status of your port order, in the left navigation of the Microsoft Teams admin center, go to > **Voice** > **Port orders**, and then click **Order history**. Each port order status is listed in the **Status** column. To learn more, see [What's the status of your port orders?](#)

Related topics

Manually submit a port order

12/7/2021 • 2 minutes to read • [Edit Online](#)

In some countries and regions, you may have to manually submit a service request to get phone numbers, transfer phone numbers, release phone numbers, or change addresses. To see what's required for each country and region or to learn more about number porting, see [Manage phone numbers for your organization](#).

Use the steps in this article to manually submit a port order if your country or region isn't listed in the [porting wizard in the Microsoft](#).

Manually submit a new port order request

To manually submit a new port order, send your completed Letter of Authorization (LOA) form directly to the TNS service desk for your region.

1. Download the [LOA](#) for your country or region.
2. Complete the form.
3. Send it to the [TNS service desk](#) for your region.

What else should you know about number porting

- To use Calling Plans you must purchase and assign licenses to your users. See [Teams add-on licensing](#).
- You must assign the new phone numbers you have to each of your users. See [Assign, change, or remove a phone number for a user](#).

Related topics

- [What's a port order?](#)

What's the status of your port orders?

12/7/2021 • 2 minutes to read • [Edit Online](#)

To see the status of your port order, in the left navigation of the Microsoft Teams admin center, go to > **Voice** > **Port orders**, and then click **Order history**. Each port order status is listed in the **Status** column. See [how long does it take to port numbers](#) to learn about the order process.

The following table lists port order statuses, as well as actions you can take if needed.

STATUS	CAN YOU VIEW THE ORDER?	CAN YOU EDIT THE ORDER?	CAN YOU CANCEL THE ORDER?	CAN YOU DELETE THE ORDER?	DESCRIPTION
Processing	Yes	No	Yes	No	The admin created the order, and it's been received by Microsoft.
Contacting carrier	Yes	No	Yes	No	The order has been received and approved by Microsoft, and we're working with the losing carrier to get it approved.
Transfer approved	Yes	No	Yes	No	The order has been accepted by the losing carrier, and the Firm Order Commitment (FOC) date has been set.
Transfer pending	Yes	No	No	No	The transfer is less than 24 hours away, so the order can no longer be edited or cancelled.
Error	No	Yes	Yes	Yes (at this time, you can't delete the port order if there's an error. The port order needs to be re-created, or you need to contact the TNS Service Desk .)	The losing carrier rejected the order.

STATUS	CAN YOU VIEW THE ORDER?	CAN YOU EDIT THE ORDER?	CAN YOU CANCEL THE ORDER?	CAN YOU DELETE THE ORDER?	DESCRIPTION
Completed	Yes	No	No	No	The numbers have been successfully transferred.
Cancelled	No	Yes	No	No	The admin canceled the order.

For complete step-by-step instructions, see [Transfer phone numbers to Teams](#).

If you need help or if you need to get more phone numbers, contact the [TNS Service Desk](#).

Supported rate centers and coverage for Calling Plans

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article lists the supported rate centers and coverage for Calling Plans in North America. A rate center is the industry term for a geographical area that traditionally defines boundaries for local calling, billing rates, and phone number assignment for the Public Switched Telephone Network (PSTN). In many cases, with the industry moving to all inclusive plans or bundles of minutes, the rate center has become less important for billing but is still used by some.

The [Supported rate centers and coverage matrix for North America](#) spreadsheet lists the rate centers that we support. When you're getting new phone numbers or when you're transferring phone numbers from your existing provider to Teams, download the spreadsheet and use it to look up rate centers. If you don't know your rate center, you can look it up on the internet based on your area codes (NPAs) and prefixes (NXX)s. If you're getting new numbers and we don't have the numbers that you've requested, we'll attempt to offer you numbers from the same rate center.

If you're getting new numbers and we don't have the numbers that you've requested, we'll offer you numbers from the same rate center.

Configure Operator Connect

12/7/2021 • 5 minutes to read • [Edit Online](#)

This article describes how to configure Operator Connect. Before configuring Operator Connect, be sure to read [Plan for Operator Connect](#) for information about prerequisites and licensing.

Enable an operator

You can enable, edit, and remove operators in the Teams admin center. In the left navigation pane, go to **Voice > Operators**.

To enable an operator:

1. **Choose an operator.** In the **All operators** tab, filter available operators by region or service to find the right operator for your voice needs. Then select the operator you want to enable.
2. **Select countries.** Under **Operator settings**, select the countries you want to enable with your selected operator.
3. **Provide contact information** Your contact information, including your full name and email address, will be shared automatically with your operator. You can change this information later. Additionally, you'll need to provide company size, and you'll have the option to provide your phone number. Operators will use this information to contact you with more details about Operator Connect.
4. Accept the data transfer notice.
5. **Add your operator.** Select **Add as my operator** to save.

Set up phone numbers

How you set up phone numbers depends on whether you're setting up numbers for new users, or moving existing numbers from either Microsoft Calling Plans or Direct Routing.

- If you need to acquire phone numbers for new users, see [Acquire numbers for new Teams users](#).
- If you want to move existing numbers from Calling Plans to Operator Connect, see [Move numbers from Calling Plans to Operator Connect](#).
- If you want to move existing numbers from Direct Routing to Operator Connect, see [Move numbers from Direct Routing to Operator Connect](#).

Acquire numbers for new Teams users

To acquire numbers for new Teams users, follow these steps:

1. **Assign a Phone System license.** You can assign a Phone System license to your users from the Microsoft 365 admin center or using PowerShell. For more information, see [Assign Teams add-on licenses to users](#).
2. Users that will be assigned phone numbers acquired with Operator Connect need to be in TeamsOnly mode. If your organization is in TeamsOnly mode, then all your users are in TeamsOnly mode. To check this, in the Teams admin center, go to **Teams > Teams upgrade settings**. If your organization is in Islands mode, check if specific users are in TeamsOnly mode. Go to **Users** and select a user account. In the **Account** tab, under **Teams upgrade**, the coexistence mode should be set to 'TeamsOnly.'

3. **Acquire numbers.** Go to your operator's website to order and acquire phone numbers. For a list of operator websites, go to the [Microsoft 365 Operator Connect directory](#). You'll need to provide your tenant ID. If you don't know your tenant ID, see [Find your Microsoft 365 tenant ID](#) for more information.
4. **Assign numbers.** Once your operator completes the order, they'll upload numbers to your tenant. You can view the numbers and the provider in the Teams admin center by going to **Voice > Phone numbers**. Assign numbers to users from the Teams admin center or by using PowerShell. For more information, see [Assign numbers](#).

NOTE

In addition to [getting phone numbers for your users](#), you can get toll or toll-free phone numbers for services such as Audio Conferencing (for conference bridges), Auto Attendants, and Call Queues (also called service numbers). Service phone numbers have a higher concurrent calling capacity than user or subscriber phone numbers. For example, a service number can handle hundreds of calls simultaneously, whereas a user's phone number can only handle a few calls simultaneously. To get service numbers, contact your operator.

Emergency addresses

The emergency address is a static location associated with a number. Once you create emergency addresses in the Teams admin center, how you assign the addresses, or change them later, will depend on your operator.

To assign numbers to emergency addresses, your operator will implement one of three scenarios:

- The operator assigns emergency addresses to the phone numbers and allows you to change them later in the Teams admin center.
- The operator doesn't assign addresses and allows you to assign emergency addresses to the phone numbers in the Teams admin center.
- The operator assigns emergency addresses to the phone numbers, and doesn't allow you to change them. In this scenario, you'll need to contact your operator to make changes to phone numbers and their assigned emergency address.

For more information on emergency calling, see [Manage emergency calling](#) and [Plan and configure dynamic emergency calling](#).

Move numbers from Calling Plans to Operator Connect

1. Contact your operator to port your numbers to Operator Connect. See [Microsoft 365 Operator Connect directory](#) to find your operator's website.
2. After your operator completes the porting order, you can unassign your users' Calling Plan phone numbers, and remove the Calling Plan License. Then, your operator can upload the numbers to your tenant.
3. Assign Operator Connect numbers to users by using the Teams admin center or by using PowerShell. For more information, see [Assign numbers](#).

Move numbers from Direct Routing to Operator Connect

1. Remove the existing telephone number from the user as follows:

Get the existing On-prem Line URI by running the following PowerShell command:

```
Get-CsOnlineUser -Identity <user> | select OnPremLineURI
```

Remove the On-prem Line URI by running the following PowerShell command:

```
Set-CsUser -Identity <user> -OnPremLineURI $null
```

2. Remove any PSTNUsage associated with your users, otherwise calls will be routed to the gateway specified in the PSTN Usage. To learn how to remove PSTN usage, see [Set-CsOnlinePstnUsage](#).
3. Go to your operator's website to order and acquire phone numbers. To find your operators website, see the [Microsoft 365 Operator Connect directory](#). You'll need to provide your tenant ID. If you don't know your tenant ID, see [Find your Microsoft 365 tenant ID](#) for more information.
4. Once your operator completes the order, they'll upload numbers to your tenant. You can view the numbers and the provider in the Teams admin center by going to **Voice > Phone numbers**. Assign Operator Connect numbers to users by using the Teams admin center or by using PowerShell. For more information, see [Assign numbers](#).

Assign numbers

For information on how to assign phone numbers to your users, see [Assign, change, or remove a phone number for a user](#).

Manage your operators

From the **My operators** tab, you can view your operators and their status and make the following changes to your selections:

- Manage operator services by country
- Suspend an operator
- Remove an operator

NOTE

Before removing an operator from your organization or from a country, you must remove all phone numbers assigned to users in the organization or country and contact the operator to release the numbers.

Release numbers

To release phone numbers from the Teams admin center, go to the **Phone numbers** page and select a number.

- If the phone number isn't assigned to a user, select **Release**.
- If the phone number is assigned to a user, you'll need to unassign the number. Select **Edit**, then **Remove user**. After you save your changes, select **Release**.

Enable users for Direct Routing, voice, and voicemail

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article describes how to enable users for Phone System Direct Routing. This is step 2 of the following steps for configuring Direct Routing:

- Step 1. [Connect the SBC with Microsoft Phone System and validate the connection](#)
- **Step 2. Enable users for Direct Routing, voice, and voicemail** (this article)
- Step 3. [Configure voice routing](#)
- Step 4. [Translate numbers to an alternate format](#)

For information on all the steps required for setting up Direct Routing, see [Configure Direct Routing](#).

When you are ready to enable users for Direct Routing, follow these steps:

1. Create a user in Microsoft 365 or Office 365 and assign a Phone System license.
2. Ensure that the user is homed in Skype for Business Online.
3. Configure the phone number and enable enterprise voice and voicemail.
4. Assign Teams Only mode to users.

Create a user and assign the license

There are two options for creating a new user in Microsoft 365 or Office 365. However, Microsoft recommends that your organization choose one option to avoid routing issues:

- Create the user in on-premises Active Directory and sync the user to the cloud. See [Integrate your on-premises directories with Azure Active Directory](#).
- Create the user directly in the Microsoft 365 admin center. See [Add users individually or in bulk to Microsoft 365 or Office 365 - Admin Help](#).

If your Skype for Business Online deployment coexists with Skype for Business 2015 or Lync 2010 or 2013 on-premises, the only supported option is to create the user in the on-premises Active Directory and sync the user to the cloud (Option 1).

For information about license requirements, see [licensing and other requirements](#) in [Plan Direct Routing](#).

Ensure that the user is homed online

This step is applicable to Skype for Business Server Enterprise Voice enabled users being migrated to Teams Direct Routing.

Direct Routing requires the user to be homed online. You can check by looking at the RegistrarPool parameter, which needs to have a value in the infra.lync.com domain. It's also recommended, but not required, to change management of the LineURI from on-premises to online when migrating users to Teams Direct Routing.

1. Connect a Skype for Business Online PowerShell session.
2. Issue the command:

```
Get-CsOnlineUser -Identity "<User name>" | fl  
RegistrarPool,OnPremLineUriManuallySet,OnPremLineUri,LineUri
```

In case OnPremLineUriManuallySet is set to False and LineUri is populated with a <E.164 phone number>, the phone number was assigned on-premises and synchronized to O365. If you want manage the phone number online, clean the parameter using on-premises Skype for Business Management Shell and synchronize to O365, before configuring the phone number using Skype for Business Online PowerShell.

3. From Skype for Business Management Shell issue the command:

```
Set-CsUser -Identity "<User name>" -LineUri $null
```

NOTE

Do not set EnterpriseVoiceEnabled to False as there is no requirement to do so and this can lead to dial plan normalization issues if legacy Skype for Business phones are in use and the Tenant hybrid configuration is set with UseOnPremDialPlan \$True.

After the changes have synced to Office 365 the expected output of

```
Get-CsOnlineUser -Identity "<User name>" | fl RegistrarPool,OnPremLineUriManuallySet,OnPremLineUri,LineUri
```

would be:

```
RegistrarPool           : pool.infra.lync.com  
OnPremLineUriManuallySet : True  
OnPremLineUri           :  
LineURI                 :
```

NOTE

All user's phone attributes must be managed online before you [decommission your on-premises Skype for Business environment](#).

Configure the phone number and enable enterprise voice and voicemail online

After you have created the user and assigned a license, the next step is to configure the user's online phone settings.

1. Connect a Skype for Business Online PowerShell session.
2. If managing the user's phone number on-premises, issue the command:

```
Set-CsUser -Identity "<User name>" -EnterpriseVoiceEnabled $true -HostedVoiceMail $true
```

3. If managing the user's phone number online, issue the command:

```
Set-CsUser -Identity "<User name>" -EnterpriseVoiceEnabled $true -HostedVoiceMail $true -  
OnPremLineUri tel:<phone number>
```

For example, to add a phone number for user "Spencer Low," enter the following:

```
Set-CsUser -Identity "spencer.low@contoso.com" -OnPremLineURI tel:+14255388797 -  
EnterpriseVoiceEnabled $true -HostedVoiceMail $true
```

If the users "Spencer Low" and "Stacy Quinn" share the same base number with unique extensions, enter the following

```
Set-CsUser -Identity "spencer.low@contoso.com" -OnPremLineURI "tel:+14255388701;ext=1001" -  
EnterpriseVoiceEnabled $true -HostedVoiceMail $true  
Set-CsUser -Identity "stacy.quinn@contoso.com" -OnPremLineURI "tel:+14255388701;ext=1002" -  
EnterpriseVoiceEnabled $true -HostedVoiceMail $true
```

It's recommended, but not required, that the phone number used is configured as a full E.164 phone number with country code. It is supported to configure phone numbers with extensions which will be used to lookup users when the lookup against the base number returns more than one result. This allows companies to configure phone numbers with the same base number and unique extensions. For lookup to be successful, the invite must include the full number with extension as follows:

```
To: <sip:+14255388701;ext=1001@sbc1.adatum.biz
```

NOTE

If the user's phone number is managed on premises, use on-premises Skype for Business Management Shell or Control Panel to configure the user's phone number.

Configure sending calls directly to voicemail

Direct Routing allows you to end the call to a user and send it directly to the user's voicemail. If you want to send the call directly to voicemail, attach `opaque=app:voicemail` to the Request URI header. For example, "sip:user@yourdomain.com;opaque=app:voicemail". In this case, the Teams user will not receive the calling notification, the call will be connected to the voicemail of the user directly.

Assign Teams Only mode to users to ensure calls land in Microsoft Teams

Direct Routing requires that users be in Teams Only mode to ensure incoming calls land in the Teams client. To put users in Teams Only mode, assign them the "UpgradeToTeams" instance of TeamsUpgradePolicy. For more information, see [Upgrade strategies for IT administrators](#). If your organization uses Skype for Business Server or Skype for Business Online, see the following article for information about interoperability between Skype and Teams: [Migration and interoperability with Skype for Business](#).

[Configure Direct Routing](#)

What are dial plans?

12/7/2021 • 8 minutes to read • [Edit Online](#)

A dial plan is a named set of normalization rules that translate dialed phone numbers by an individual user into an alternate format (typically E.164) for purposes of call authorization and voice routing.

A dial plan consists of one or more normalization rules that define how phone numbers expressed in various formats are translated to an alternate format. The same dial string may be interpreted and translated differently in different dial plans, so depending on which dial plan is assigned to a given user, the same dialed number may be translated and routed differently. There can be a maximum of 1,000 tenant dial plans.

See [Create and manage dial plans](#) to create and manage tenant dial plans.

Tenant dial plan scope

A dial plan's scope determines the hierarchical level at which the dial plan can be applied. Clients get the appropriate dial plan through provisioning settings that are automatically provided when users sign in to Teams. As an admin, you can manage and assign dial plan scope levels by using the Microsoft Teams admin center or Remote PowerShell.

In Teams, there are two types of dial plans: service-scoped and tenant-scoped (which is for your organization). A service-scoped dial plan is defined for every country or region where Phone System is available. Each user is automatically assigned the service country dial plan that matches the usage location assigned to the user. You can't change the service country dial plan, but you can create tenant scoped dial plans, which augment the service country dial plan. As clients are provisioned, they obtain an "effective dial plan," which is a combination of the service country dial plan and the appropriately scoped tenant dial plan. Therefore, it's not necessary to define all normalization rules in tenant dial plans as they might already exist in the service country dial plan.

Tenant dial plans can be further broken into two scopes - tenant-scope or user-scope. If a tenant defines and assigns a user-scoped dial plan, that user will be provisioned with an effective dial plan of the user's service country dial plan and the assigned user dial plan. If a tenant defines a tenant-scoped dial plan but doesn't assign a user-scoped dial plan, then that user will be provisioned with an effective dial plan of the user's service country dial plan and the tenant dial plan.

The following is the inheritance model of dial plans in Teams.

The following are the possible effective dial plans:

Service Country If no tenant scoped dial plan is defined and no tenant user scoped dial plan is assigned to the provisioned user, the user will receive an effective dial plan mapped to the service country associated with their usage location.

Tenant Global - Service Country If a tenant user dial plan is defined but not assigned to a user, the provisioned user will receive an effective dial plan consisting of a merged tenant dial plan and the service country dial plan associated with their usage location.

Tenant User - Service Country If a tenant user dial plan is defined and assigned to a user, the provisioned user will receive an effective dial plan consisting of the merged tenant user dial plan and the service country dial

plan associated with their usage location.

See [Create and manage dial plans](#) to create your tenant dial plans.

NOTE

In the scenario where no dial plan normalization rules apply to a dialed number, the dialed string is still normalized to prepend "+CC" where CC is the country code of the dialing user's usage location. This applies to Calling Plans, Direct Routing and PSTN Conference dial-out scenarios. Additionally, if a tenant dial plan normalization rule results in a number that does not start with "+", the calling service will attempt to normalize the number received from the Teams client based on the tenant dial plan, and if not matched, on the region dial plan. To avoid double normalization, it's recommended that Direct Routing customers normalize numbers to include a + and then remove the + using Trunk Translation rules.

Planning for tenant dial plans

To plan custom dial plans, follow these steps:

- **Step 1** Decide whether a custom dial plan is needed to enhance the user dialing experience. Typically, the need for one would be to support non-E.164 dialing, such as extensions or abbreviated national dialing.
- **Step 2** Determine whether tenant global or tenant user scoped dial plans are needed, or both. User scoped dial plans are needed if users have different local dialing requirements.
- **Step 3** Identify valid number patterns for each required dial plan. Only the number patterns that are not defined in the service level country dial plans are required.
- **Step 4** Develop an organization-wide scheme for naming dial plans. Adopting a standard naming scheme assures consistency across an organization and makes maintenance and updates easier.

Creating your new dial plan

When you create a new dial plan, you must put in the information that is required.

Name and simple name

For user dial plans, you should specify a descriptive name that identifies the users to which the dial plan will be assigned. The dial plan Simple Name is pre-populated with a string that is derived from the dial plan name. The Simple Name field is editable, which enables you to create a more descriptive naming convention for your dial plans. The Simple Name value cannot be empty and must be unique. A best practice is to develop a naming convention for your entire organization and then use this convention consistently across all sites and users.

Description

We recommend that you type the common, recognizable name of the geographic location or group of users to which the corresponding dial plan applies.

External access prefix

You can specify an external access prefix of up to four characters (#, *, and 0-9) if users need to dial one or more additional leading digits (for example, 9) to get an external line.

NOTE

If you specify an external access prefix, you don't need to create an additional normalization rule to accommodate the prefix.

See [Create and manage dial plans](#) to create your tenant dial plans.

Normalization rules

Normalization rules define how phone numbers expressed in various formats are to be translated. The same number string may be interpreted and translated differently, depending on the locale from which it is dialed. Normalization rules may be necessary if users need to be able to dial abbreviated internal or external numbers.

One or more normalization rules must be assigned to the dial plan. Normalization rules are matched from top to bottom, so the order in which they appear in a tenant dial plan is important. For example, if a tenant dial plan has 10 normalization rules, the dialed number matching logic will be tried starting with the first normalization rule, if there isn't a match then the second, and so forth. If a match is made, that rule is used and there is no effort to match any other rules that are defined. There can be a maximum of 50 normalization rules in a given tenant dial plan.

Determining the required normalization rules

Because any tenant dial plan is effectively merged with a given user's service country dial plan, it is likely that the service country dial plan's normalization rules need to be evaluated in order to determine which tenant dial plan normalization rules are needed. The `Get-CsEffectiveTenantDialPlan` cmdlet can be used for this purpose. The cmdlet takes the user's identity as the input parameter and will return all normalization rules that are applicable to the user.

Creating normalization rules

Normalization rules use .NET Framework regular expressions to specify numeric match patterns that the server uses to translate dial strings to E.164 format. Normalization rules can be created by specifying the regular expression for the match and the translation to be done when a match is found. When you finish, you can enter a test number to verify that the normalization rule works as expected.

For details about using .NET Framework regular expressions, see [.NET Framework Regular Expressions](#).

See [Create and manage dial plans](#) to create and manage normalization rules for your tenant dial plans.

NOTE

Normalization rules with the first token as optional are currently not supported on 3pip devices (for example, Polycom VVX 601 model). If you want to apply normalization rules with optionality on 3pip devices, you should create two normalization rules instead of one. For example, the rule `^0?(999)$` should be replaced by the following two rules: `(999)$` (Translation:\$1) and `^0(999)$` (Translation:\$1).

Sample normalization rules

The following table shows sample normalization rules that are written as .NET Framework regular expressions. The samples are examples only and are not meant to be a prescriptive reference for creating your own normalization rules.

Normalization rules using .NET Framework regular expressions

RULE NAME	DESCRIPTION	NUMBER PATTERN	TRANSLATION	EXAMPLE
4digitExtension	Translates 4-digit extensions.	<code>^\d{4}\$</code>	+1425555\$1	0100 is translated to +14255550100
5digitExtension	Translates 5-digit extensions.	<code>^\d{5}\$</code>	+1425555\$1	50100 is translated to +14255550100

RULE NAME	DESCRIPTION	NUMBER PATTERN	TRANSLATION	EXAMPLE
7digitcallingRedmond	Translates 7-digit numbers to Redmond local numbers.	^\d{7})\$	+1425\$1	5550100 is translated to +14255550100
RedmondOperator	Translates 0 to Redmond Operator.	^0\$	+14255550100	0 is translated to +14255550100
RedmondSitePrefix	Translates numbers with on-net prefix (6) and Redmond site code (222).	^6222\d{4})\$	+1425555\$1	62220100 is translated to +14255550100
5digitRange	Translates 5-digit extensions starting with the digit range between 3-7 inclusive.	^([3-7]\d{4})\$	+142555\$1	54567 is translated to +14255554567
PrefixAdded	Adds a country prefix in front of a 9 digit number with restrictions on the first and third digits.	^([2-9]\d\d[2-9]\d{6})\$	1\$1	4255554567 is translated to 14255554567
NoTranslation	Match 5 digits but no translation.	^\d{5})\$	\$1	34567 is translated to 34567

Redmond dial plan based on normalization rules shown above.

The following table illustrates a sample dial plan for Redmond, Washington, United States, based on the normalization rules shown in the previous table.

REDMOND DIAL PLAN
5digitExtension
7digitcallingRedmond
RedmondSitePrefix
RedmondOperator

NOTE

The normalization rules names shown in the preceding table don't include spaces, but this is a matter of choice. The first name in the table, for example, could have been written "5 digit extension" or "5-digit Extension" and still be valid.

Create and manage dial plans

12/7/2021 • 5 minutes to read • [Edit Online](#)

After you plan the dial plans for your organization and figured out all the normalization rules that need to be created for voice routing, you're ready to create the dial plans. With an administrator account that has a valid Teams license, you can use the Microsoft Teams admin center or Windows PowerShell to create and manage dial plans.

Using the Microsoft Teams admin center

Create a dial plan

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Dial plan**.
2. Click **Add**, and then enter a name and description for the dial plan.

The screenshot shows the 'Add' page for creating a new dial plan. At the top, there's a section for 'Description' with a text area. Below this is a paragraph explaining that a dial plan is a set of rules that translate phone numbers into a standard E.164 number for call authorization and routing. The page is divided into two main columns: 'Dial plan details' and 'Test dial plan'. In the 'Dial plan details' column, there's a text box for 'External dialing prefix' with an example of '9', and a toggle switch for 'Optimized device dialing' which is currently turned off. In the 'Test dial plan' column, there's a text box for 'Enter a phone number to test' with an example of '4255551234' and a 'Test' button. A purple message box states 'You need to save this dial plan before testing it.' Below these columns is a section for 'Normalization rules' with a paragraph explaining that these rules define how phone numbers in various formats are translated. At the bottom, there's a message 'You haven't added any normalization rules yet.' and an 'Add' button.

3. Under **Dial plan details**, specify an external dialing prefix if users need to dial one or more additional leading digits (for example, 9) to get an external line. To do this:
 - a. In the **External dialing prefix** box, enter an external dialing prefix. The prefix can be up to four characters (#, *, and 0-9).
 - b. Turn on **Optimized device dialing**. If you specify an external dialing prefix, you must also turn on this setting to apply the prefix so calls can be made outside your organization.
4. Under **Normalization rules**, configure and associate one or more [normalization rules](#) for the dial plan. Each dial plan must have at least one normalization rule associated with it. To do this, do one or more of the following:
 - To create a new normalization rule and associate it with the dial plan, click **Add**, and then define the rule.
 - To edit a normalization rule that's already associated with the dial plan, select the rule by clicking to the left of the rule name, and then click **Edit**. Make the changes you want, and then click **Save**.

- To remove a normalization rule from the dial plan, select the rule by clicking to the left of the rule name, and then click **Remove**.
5. Arrange the normalization rules in the order that you want. Click **Move up** or **Move down** to change the position of rules in the list.

NOTE

Teams traverses the list of normalization rules from the top down and uses the first rule that matches the dialed number. If you set up a dial plan so that a dialed number can match more than one normalization rule, make sure the more restrictive rules are sorted above the less restrictive ones. If you set up a dial plan that normalizes a dialed number without a "+", the calling service will attempt to normalize the number again using Tenant and regional dial plan rules. To avoid double normalization, it's recommended that all normalization rules result in numbers starting with a "+". Direct Routing customers can use [trunk translation](#) rules to remove the "+" if required.

6. Click **Save**.
7. If you want to test the dial plan, under **Test dial plan**, enter a phone number, and then click **Test**.

Edit a dial plan

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Dial plan**.
2. Select the dial plan by clicking to the left of the dial plan name, and then click **Edit**.
3. Make the changes that you want, and then click **Save**.

Assign a dial plan to users

You assign a dial plan in the same way you assign policies. You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type). To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Using PowerShell

Start PowerShell

- Open a Windows PowerShell command prompt and run the following commands:

```
# When using Teams PowerShell Module

Import-Module MicrosoftTeams
$credential = Get-Credential
Connect-MicrosoftTeams -Credential $credential
```

Create and manage your dial plans

You can either use a single cmdlet or a PowerShell script to create and manage tenant dial plans.

Using single cmdlets

- To create a new dial plan, run:

```
New-CsTenantDialPlan -Identity RedmondDialPlan -Description "Dial Plan for Redmond" -
NormalizationRules <pslistmodifier> -ExternalAccessPrefix 9 -SimpleName "Dial-Plan-for-Redmond"
```

For other examples and parameters, see [New-CsTenantDialPlan](#).

- To edit the settings of an existing dial plan, run:

```
Set-CsTenantDialPlan -Identity RedmondDialPlan -NormalizationRules <pslistmodifier> -  
ExternalAccessPrefix 9  
-SimpleName "Dial-Plan-for-Redmond"
```

For other examples and parameters, see [Set-CsTenantDialPlan](#).

- To add users to a dial plan, run:

```
Grant-CsTenantDialPlan -Identity amos.marble@contoso.com -PolicyName RedmondDialPlan
```

For other examples and parameters, see [Grant-CsTenantDialPlan](#).

- To view the settings on a dial plan, run:

```
Get-CsTenantDialPlan -Identity RedmondDialPlan
```

For other examples and parameters, see [Get-CsTenantDialPlan](#).

- To delete a dial plan, run:

```
Remove-CsTenantDialPlan -Identity RedmondDialPlan -force
```

For other examples and parameters, see [Remove-CsTenantDialPlan](#).

- To see the settings of the effective dial plan, run:

```
Get-CsEffectiveTenantDialPlan -Identity amos.marble@contoso.com
```

For other examples and parameters, see [Get-CsEffectiveTenantDialPlan](#).

- To test the effective settings of a dial plan, run:

```
Test-CsEffectiveTenantDialPlan -DialedNumber 14255550199 -Identity amos.marble@contoso.com
```

For other examples and parameters, see [Test-CsEffectiveTenantDialPlan](#).

Using a PowerShell script

Run this to delete a normalization rule that is associated with a tenant dial plan without needing to delete the tenant dial plan first:

```
$b1=New-CsVoiceNormalizationRule -Identity Global/NR4 -InMemory  
Set-CsTenantDialPlan -Identity RedmondDialPlan -NormalizationRules @{add=$b1}  
(Get-CsTenantDialPlan -Identity RedmondDialPlan).NormalizationRules  
$b2=New-CsVoiceNormalizationRule -Identity Global/NR4 -InMemory  
Set-CsTenantDialPlan -Identity RedmondDialPlan -NormalizationRules @{remove=$b2}
```

Run this to add the following normalization rule to the existing tenant dial plan named RedmondDialPlan.

```
$nr1=New-CsVoiceNormalizationRule -Parent Global -Description 'Organization extension dialing' -Pattern  
'^(\d{3})$' -Translation '+14255551$1' -Name NR1 -IsInternalExtension $false -InMemory  
Set-CsTenantDialPlan -Identity RedmondDialPlan -NormalizationRules @{add=$nr1}
```

Run this to remove the following normalization rule from the existing tenant dial plan named RedmondDialPlan.

```
$nr1=New-CsVoiceNormalizationRule -Parent Global/NR1 -InMemory
Set-CsTenantDialPlan -Identity RedmondDialPlan -NormalizationRules @{$remove=$nr1}
```

Run the following when you want to also examine the existing normalization rules, determine which one you want to delete, and then use its index to remove it. The array of normalization rules starts with index 0. We would like to remove the 3-digit normalization rule, so that is index 1.

```
Get-CsTenantDialPlan RedmondDialPlan).NormalizationRules
Description      : 4-digit
Pattern          : ^(\d{4})$
Translation      : +1426666$1
Name             : NR2
IsInternalExtension : False

Description      : 3-digit
Pattern          : ^(\d{3})$
Translation      : +1425555$1
Name             : NR12
IsInternalExtension : False

$nr1=(Get-CsTenantDialPlan RedmondDialPlan).NormalizationRules[1]
Set-CsTenantDialPlan -Identity RedmondDialPlan -NormalizationRules @{$remove=$nr1}
```

Run this to find all users who have been granted the RedmondDialPlan tenant dial plan.

```
Get-CsOnlineUser | Where-Object {$_.TenantDialPlan -eq "RedmondDialPlan"}
```

Run this to remove any assigned TenantDialPlan from all users who have a HostingProvider of sipfed.online.lync.com.

```
Get-CsOnlineUser -Filter {HostingProvider -eq "sipfed.online.lync.com"} | Grant-CsTenantDialPlan -policyname $null
```

Run these to add the existing on-premises dial plan named OPDP1 as a tenant dial plan for your organization. You need to first save the on-premises dial plan to an .xml file, and then use it to create the new tenant dial plan.

Run this to save the on-premises dial plan to the .xml file.

```
$DPName = "OPDP1"
$DPFileName = "dialplan.xml"
Get-CsDialplan $DPName | Export-Clixml $DPFileName
```

Run this to create the new tenant dial plan.

```
$DPFileName = "dialplan.xml"
$dp = Import-Clixml $DPFileName
$NormRules = @()
ForEach($nr in $dp.NormalizationRules)
{
    $id1 = "Global/" + $nr.Name
    $nr2 = New-CsVoiceNormalizationRule -Identity $id1 -Description $nr.Description -Pattern $nr.Pattern -
Translation $nr.Translation -IsInternalExtension $nr.IsInternalExtension -InMemory
    $NormRules += $nr2
}
New-CsTenantDialPlan -Identity $dp.SimpleName -ExternalAccessPrefix $dp.ExternalAccessPrefix -Description
$dp.Description -OptimizeDeviceDialing $dp.OptimizeDeviceDialing -SimpleName $dp.SimpleName -
NormalizationRules $NormRules
```

Routing calls to unassigned numbers

12/7/2021 • 2 minutes to read • [Edit Online](#)

As an administrator, you can route calls to unassigned numbers in your organization. For example, you might want to route calls to unassigned numbers as follows:

- Route all calls to a given unassigned number to a custom announcement.
- Route all calls to a given unassigned number to the the main switchboard.

You can route calls to unassigned numbers to a user, to a resource account associated with an Auto Attendant or a Call Queue, or to an announcement service that will play a custom audio file to the caller.

Configuration

To route calls to an unassigned number, use the `New/Get/Set/Remove-CsTeamsUnassignedNumberTreatment` cmdlet available in Teams PowerShell module 2.5.1 or later.

You need to specify the called number or range of numbers and the associated routing for calls to these numbers. For example, the following command specifies that all calls to the number +1 (555) 222-3333 will be routed to the resource account `aa@contoso.com`:

```
$RAObjectId = (Get-CsOnlineApplicationInstance -Identity aa@contoso.com).ObjectId

New-CsTeamsUnassignedNumberTreatment -Identity MainAA -Pattern "^+15552223333$" -TargetType ResourceAccount
-Target $RAObjectId -TreatmentPriority 1
```

The next example specifies that all calls to the number range +1 (555) 333-0000 to +1 (555) 333-9999 will be routed to the announcement service, which will play the audio file `MainAnnouncement.wav` to the caller.

```
$Content = Get-Content "C:\Media\MainAnnouncement.wav" -Encoding byte -ReadCount 0

$AudioFile = Import-CsOnlineAudioFile -FileName "MainAnnouncement.wav" -Content $Content

$fid = [System.Guid]::Parse($AudioFile.Id)

New-CsTeamsUnassignedNumberTreatment -Identity TR1 -Pattern "^+1555333\d{4}$" -TargetType Announcement -
Target $fid.Guid -TreatmentPriority 2
```

Notes

- If routing to an announcement, the audio file will be played once to the caller.
- To route calls to unassigned Microsoft Calling Plan subscriber numbers, your tenant needs to have available [Communications Credits](#).
- To route calls to unassigned Microsoft Calling Plan service numbers, your tenant needs to have at least one Phone System – Virtual User license.

Add and update reporting labels

12/7/2021 • 2 minutes to read • [Edit Online](#)

Reporting labels are used in your organization to indicate the physical locations of offices, buildings, or organizational sites. The Reporting labels page in the Microsoft Teams admin center lets you provide a text file (.csv or .tsv) containing a list of physical locations and their associated network subnets. This file is used by Call Analytics for generating reports. When you upload your subnet mapping, the reports provided by these services will contain the location names as well, making the reports easier to understand and use for remediating any potential issues.

IMPORTANT

Reporting Labels that you upload will be handled as *Support Data* under your agreement for Office 365, including any information that would otherwise be considered *Customer Data* or *Personal Data*. Please don't include data you do not wish to provide to Microsoft as *Support Data*, as this information will be visible to Microsoft Engineers for support purposes.

The report labels and locations data you provide is a single data structure – there's currently no interface available to make individual edits to the data.

To edit the table of subnets and locations

1. In the left navigation of the Microsoft Teams admin center, click **Analytics & reports** > **Reporting labels**.
2. Click **Upload data**.
3. In the **Upload data** pane, click **Select a file**, and then browse to and upload your edited .csv or .tsv file.
4. Click **Upload**.

You can download a sample template [here](#).

Use the following example to help create your data file.

IMPORTANT

Your data file shouldn't contain column headers (such as Network, Network Name, etc.). These are used here for informational purposes only.

Network settings for cloud voice features in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Learn about network regions, network sites, network subnets, and trusted IP addresses. These terms and concepts are used throughout our cloud voice documentation for [Location-Based Routing for Direct Routing](#) and [dynamic emergency calling](#). If you're deploying these cloud features in your organization, you must configure network settings for use with these features in Microsoft Teams.

This article gives you an overview of the network settings that are common to Location-Based Routing and dynamic emergency calling. Depending on the cloud voice feature and capability that you're deploying, you configure some or all these settings. For steps on how to configure these settings, see [Manage your network topology for cloud features in Teams](#).

NOTE

Any feature-specific requirements for network settings are documented in the configuration topics for that feature.

Network region

A network region contains a collection of network sites. It interconnects various parts of a network across multiple geographic areas. For example, if your organization has many sites located in India, you may choose to designate "India" as a network region. Each network site must be associated with a network region.

The same network regions are shared by Location-Based Routing for Direct Routing and enhanced emergency services. If you already created network regions for one feature, you don't have to create new network regions for the other feature.

Network site

A network site represents a location where your organization has a physical venue, such as an office, a set of buildings, or a campus. Network sites are defined as a collection of IP subnets. Each network site must be associated with a network region.

You can also use network sites to enable and configure emergency calling.

Network subnet

Each subnet must be associated with a specific network site. A client's location is determined based on the network subnet and the associated network site. You can associate multiple subnets with the same network site but you can't associate multiple sites with the same subnet.

Subnet information is used to determine the network site on which an endpoint is located when a new session is initiated. When the location of each party in a session is known, the cloud voice feature can apply that information to determine how to handle call setup or routing.

For each network site, work with your network admin to determine which IP subnets are assigned to each network site. For example, the New York site in the North America region can be assigned the following IP subnets: 172.29.80.0/23, 157.57.216.0/25, 172.29.91.0/23, 172.29.81.0/24. If Bob, who usually works in Detroit, travels to the New York office for training, turns on his computer and connects to the network, his computer will

get an IP address in one of the four ranges that are allocated for New York, for example, 172.29.80.103.

Trusted IP address

Trusted IP addresses are the internet external IP addresses of the enterprise network. They determine whether the user's endpoint is inside the corporate network before checking for a specific site match.

If the user's external IP address matches an IP address that's in the trusted IP address list, the cloud voice feature checks to determine the internal subnet where the user's endpoint is located. A match can be made against either IPv4 or IPv6 IP addresses and is dependent upon the format of the IP packet sent to the network settings. (If a public IP address has both IPv4 and IPv6, you must add both as trusted IP addresses.)

If the user's external IP address doesn't match an IP address that's in the trusted IP address list, the endpoint is classified as being at an unknown location.

IMPORTANT

Network configuration setting lookups are not supported with cloud proxy service deployments that modify the source IP addresses from Teams clients.

Manage your network topology for cloud voice features in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

If your organization is deploying [Location-Based Routing for Direct Routing](#) or [dynamic emergency calling](#), you must configure network settings for use with these cloud voice features in Microsoft Teams. Network settings are used to determine the location of a Teams client and include network regions, network sites, subnets, and trusted IP addresses. Depending on the cloud voice feature and capability that you're deploying, you configure some or all these settings. To learn more about these terms, see [Network settings for cloud voice features](#).

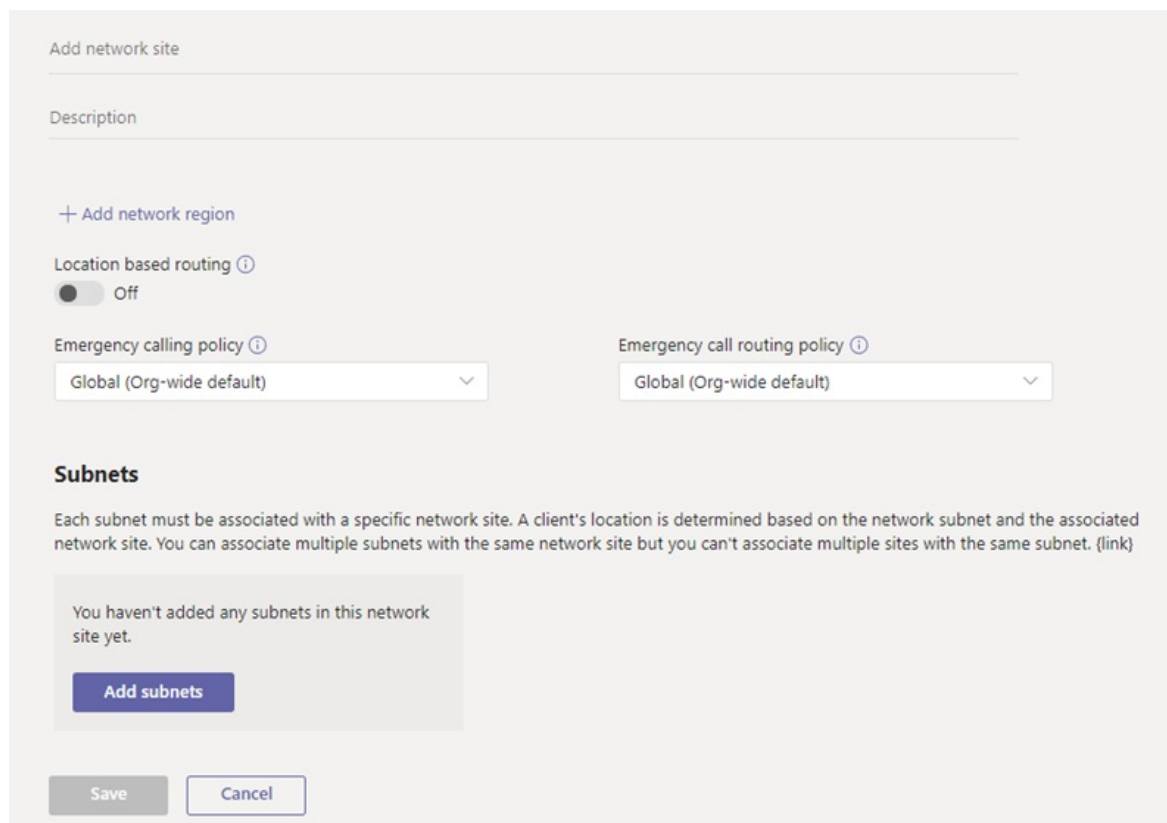

You configure network settings on the **Network topology** page of the Microsoft Teams admin center or by using Windows PowerShell.

Configure network settings in the Microsoft Teams admin center

You define network regions, network sites, and subnets on the **Network sites** tab of the **Network topology** page. Here, you can create or modify a network site, associate a site with a network region, associate a subnet to the site, turn on Location-based Routing, and assign emergency policies to the site. You can also add network regions that can be used globally for all sites.

Add and configure a network site

1. In the left navigation of the Microsoft Teams admin center, go to **Locations > Network topology**, and then click the **Network sites** tab.
2. Click **Add**, and then enter a name and description for the site.

The screenshot shows the 'Add network site' form in the Microsoft Teams admin center. The form has a title bar 'Add network site' and a 'Description' field. Below the description field is a '+ Add network region' link. There are two toggle switches: 'Location based routing' (currently off) and 'Emergency calling policy' (currently set to 'Global (Org-wide default)'). There are also two dropdown menus for 'Emergency call routing policy' (currently set to 'Global (Org-wide default)'). Below these is a section titled 'Subnets' with a message: 'Each subnet must be associated with a specific network site. A client's location is determined based on the network subnet and the associated network site. You can associate multiple subnets with the same network site but you can't associate multiple sites with the same subnet. (link)'. Below this message is a button 'Add subnets'. At the bottom of the form are 'Save' and 'Cancel' buttons.

3. To associate the site with a network region, click **Add network region**, select an existing region or click **Add** to add a region, and then click **Link**.

4. To enable Location-Based Routing for the site, turn on **Location based routing**.
5. To assign emergency services policies to the site, do one or both of the following:
 - If your organization uses Calling Plans, Operator Connect, or Direct Routing, under **Emergency calling policy**, select the policy that you want.
 - If your organization deployed Direct Routing, under **Emergency call routing policy**, select the policy that you want.
6. To associate a subnet to the site, under **Subnets**, click **Add subnets**. Specify the IP version, IP address, network range, add a description, and then click **Apply**. Each subnet must be associated with a specific site.
7. Click **Save**.

Modify a network site

1. In the left navigation of the Microsoft Teams admin center, go to **Locations > Network topology**, and then click the **Network sites** tab.
2. Select the site by clicking to the left of the site name, and then click **Edit**.
3. Make the changes that you want, and then click **Save**.

Manage external trusted IP addresses

You manage external trusted IP addresses on the **Trusted IPs** tab on the **Network topology** page of the Microsoft Teams admin center. You can add an unlimited number of external trusted IP addresses.

Add a trusted IP address

1. In the left navigation of the Microsoft Teams admin center, go to **Locations > Network topology**, and then click the **Trusted IPs** tab.
2. Click **New**.
3. In the **Add trusted IP address** pane, specify the IP version, IP address, network range, add a description, and then click **Apply**.

Edit a trusted IP address

1. In the left navigation of the Microsoft Teams admin center, go to **Locations > Network topology**, and then click the **Trusted IPs** tab.
2. Select the IP address by clicking to the left of it, and then click **Edit**.

3. In the **Edit trusted IP address** pane, make the changes that you want, and then click **Apply**.

Configure network settings using PowerShell

To complete the steps in this section, you'll need some familiarity with PowerShell cmdlets. To learn more, see [Teams PowerShell Overview](#).

Define network regions

Use the [New-CsTenantNetworkRegion](#) cmdlet to define network regions. Note that the RegionID parameter is a logical name that represents the geography of the region and has no dependencies or restrictions and the CentralSite <site ID> parameter is optional.

```
New-CsTenantNetworkRegion -NetworkRegionID <region ID>
```

In this example, we create a network region named India.

```
New-CsTenantNetworkRegion -NetworkRegionID "India"
```

See also [Set-CsTenantNetworkRegion](#).

Define network sites

Use the [New-CsTenantNetworkSite](#) cmdlet to define network sites. Each network site must be associated with a network region.

```
New-CsTenantNetworkSite -NetworkSiteID <site ID> -NetworkRegionID <region ID>
```

In this example, we create two new network sites, Delhi and Hyderabad, in the India region.

```
New-CsTenantNetworkSite -NetworkSiteID "Delhi" -NetworkRegionID "India"  
New-CsTenantNetworkSite -NetworkSiteID "Hyderabad" -NetworkRegionID "India"
```

The following table shows the network sites defined in this example.

	SITE 1	SITE 2
Site ID	Site 1 (Delhi)	Site 2 (Hyderabad)
Region ID	Region 1 (India)	Region 1 (India)

See also [Set-CsTenantNetworkRegion](#).

Define network subnets

Use the [New-CsTenantNetworkSubnet](#) cmdlet to define network subnets and associate them to network sites. Each network subnet can only be associated with one site.

```
New-CsTenantNetworkSubnet -SubnetID <Subnet IP address> -MaskBits <Subnet bitmask> -NetworkSiteID <site ID>
```

In this example, we create an association between subnet 192.168.0.0 and the Delhi network site and between subnet 2001:4898:e8:25:844e:926f:85ad:dd8e and the Hyderabad network site.

```
New-CsTenantNetworkSubnet -SubnetID "192.168.0.0" -MaskBits "24" -NetworkSiteID "Delhi"
New-CsTenantNetworkSubnet -SubnetID "2001:4898:e8:25:844e:926f:85ad:dd8e" -MaskBits "120" -NetworkSiteID
"Hyderabad"
```

The following table shows the subnets defined in this example.

	SITE 1	SITE 2
Subnet ID	192.168.0.0	2001:4898:e8:25:844e:926f:85ad:dd8e
Mask	24	120
Site ID	Site (Delhi)	Site 2 (Hyderabad)

For multiple subnets, you can import a CSV file by using a script such as the following.

```
Import-CSV C:\subnet.csv | foreach {New-CsTenantNetworkSubnet -SubnetID $_.Identity -MaskBits $_.Mask -
NetworkSiteID $_.SiteID}
```

In this example, the CSV file looks something like this:

```
Identity, Mask, SiteID
172.11.12.0, 24, Redmond
172.11.13.0, 24, Chicago
172.11.14.0, 25, Vancouver
172.11.15.0, 28, Paris
```

See also [Set-CsTenantNetworkSubnet](#).

Define external subnets (external trusted IP addresses)

Use the [New-CsTenantTrustedIPAddress](#) cmdlet to define external subnets and assign them to the tenant. You can define an unlimited number of external subnets for a tenant.

```
New-CsTenantTrustedIPAddress -IPAddress <External IP address> -MaskBits <Subnet bitmask> -Description
<description>
```

For example:

```
New-CsTenantTrustedIPAddress -IPAddress 198.51.100.0 -MaskBits 30 -Description "Contoso address"
```

See also [Set-CsTenantTrustedIPAddress](#).

Manage emergency calling

12/7/2021 • 14 minutes to read • [Edit Online](#)

This article describes concepts you'll need to know to manage emergency calling—it includes information about emergency addresses, dynamic emergency addresses, and emergency call routing. This article uses the following terminology:

- **Emergency address** - A civic address—the physical or street address of a place of business for your organization.

For example, the address *12345 North Main Street, Redmond, WA 98052* is used to route emergency calls to the appropriate dispatch authorities and to assist in locating the emergency caller.

- **Place** - Typically a floor, building, wing, or office number. Place is associated with an emergency address to give a more exact location within a building. You can have an unlimited number of places associated with an emergency address. For example, if your organization has multiple buildings, you might want to include place information for each building and every floor within each building.

- **Emergency location** - A location is a civic address—with an optional place. If your business has more than one physical location, it's likely that you'll need more than one emergency location.

When you create an emergency address, a unique location ID is automatically created for this address. If you add a place to an emergency address—for example, if you add a floor to a building address—a location ID is created for the combination of the emergency address and place. In this example, there will be two location IDs: one for the civic address; one for the joined civic address and associated place.

When you assign an emergency location to a user or site, it's this unique location ID that's associated with the user or site.

- **Registered address** - An emergency address that is assigned to each user. A registered address is sometimes referred to as a static emergency address or address of record. (Currently, registered addresses are not supported for Direct Routing. Check back soon for updates.)

NOTE

There are some differences in how you manage emergency calling depending on whether you are using Microsoft Calling Plans, Operator Connect, or Direct Routing for your [PSTN connectivity](#). These considerations are described throughout this article.

Emergency address validation

To assign an emergency address to a user or to a network identifier, you must ensure that the emergency address is marked as "validated." Address validation ensures that the address is legitimate, and that it cannot be modified after it is assigned.

If you define an emergency address by using the address map search feature in the Teams admin center, the address is automatically marked as validated. Because you cannot modify a validated emergency address—if the format or representation of the address changes, you must create a new address with the updated format.

Emergency address geo codes

Each emergency address can have a geo code (latitude and longitude) associated with it. These geo codes are

used in some countries to assist in routing emergency calls with dynamic locations.

If you define an emergency address by using the address map search feature in the Teams admin center, the geo code is automatically associated with an emergency address. You can also associate geo codes with an address if you define the address by using PowerShell.

Microsoft recommends that you create emergency addresses by using the map search feature in Teams admin center, which will ensure that the addresses are formatted, validated, and have the appropriate geo codes.

IMPORTANT

To assign an emergency location to a network identifier for dynamic emergency calling, the emergency address must contain an appropriate geo code.

Considerations for Calling Plans

The following sections describe how to manage emergency calling for Microsoft Calling Plan users. To find out if Microsoft Calling Plans are the right solution for your business, see [PSTN connectivity options](#).

Emergency call enablement for Calling Plans

Each Calling Plan user is automatically enabled for emergency calling and is required to have a registered emergency address associated with their assigned telephone number.

When the location is associated to the telephone number depends on the country/region:

- In the United States and Canada, for example, an emergency location is required when a number is assigned to a user.
- For other countries—such as in Europe, the Middle East, and Africa (EMEA)—an emergency location is required when you get the phone number from Microsoft 365, or when it's transferred from another service provider or carrier.

Dynamic emergency calling for Calling Plans

Dynamic emergency calling for Calling Plans provides the capability to configure and route emergency calls based on the current location of the Teams client. The ability to do automatic routing to the appropriate Public Safety Answering Point (PSAP) or to notify security desk personnel varies depending on the country of usage of the Teams user.

Dynamic location for routing emergency calls is supported in the United States as follows.

- If a Teams client for a United States Calling Plan user dynamically acquires an emergency address within the United States, that address is used for emergency routing instead of the registered address, and the call will be automatically routed to the PSAP in the serving area of the address.
- If a Teams client for a United States Calling Plan user doesn't dynamically acquire an emergency address within the United States, then the registered emergency address is used to help screen and route the call. However, the call will be screened to determine if an updated address is required before connecting the caller to the appropriate PSAP.

Dynamic location for routing emergency calls is supported in Canada the same as in the United States with the following exception: all emergency calls will be screened nationally before being transferred to the PSAP.

For more information, see [Plan and configure dynamic emergency calling](#).

Emergency call routing for Calling Plans

When a Teams Calling Plan user dials an emergency number, how the call is routed to the PSAP depends on the following:

- Whether the emergency address is dynamically determined by the Teams client.
- Whether the emergency address is the registered address associated with the user's phone number.
- The emergency calling network of that country.

For example:

In the United States:

- If a Teams client is located at a tenant-defined dynamic emergency location, emergency calls from that client are automatically routed to the PSAP serving that geographic location.
- If a Teams client is not located at a tenant-defined dynamic emergency location, emergency calls from that client are screened by a national call center to determine the location of the caller before transferring the call to the PSAP serving that geographic location.
- If an emergency caller is unable to update their emergency location to the screening center, the call will be transferred to the PSAP serving the caller's registered address.

In Canada, Ireland, and the United Kingdom, emergency calls are first screened to determine the current location of the user before connecting the call to the appropriate dispatch center.

In France, Germany, and Spain, emergency calls are routed directly to the PSAP serving the emergency address associated with the number regardless of the location of the caller.

In the Netherlands, emergency calls are routed directly to the PSAP for the local area code of the number regardless of the location of the caller.

In Australia, emergency addresses are configured and routed by the carrier partner.

In Japan, emergency calling is not supported.

For more information, see:

- [Calling Plans](#)
- [Set up Calling Plans](#)
- [Different kinds of phone numbers used for Calling Plans](#)
- [Emergency calling terms and conditions](#)

Considerations for Operator Connect

The following sections describe how to manage emergency calling for Operator Connect users. To find out whether Operator Connect is the right solution for your business, see [PSTN connectivity options](#).

Emergency call enablement for Operator Connect

Each Operator Connect user is automatically enabled for emergency calling. Emergency calls are routed automatically to the Operator Connect carrier for a given number.

The ability for a tenant admin to set the registered address for an Operator Connect user will depend upon the capabilities assigned to the number when the carrier uploads them into a customers inventory. Based upon this setting, the tenant administrator may or may not be required—or able—to set, modify, or delete the emergency location of a user.

Dynamic emergency calling for Operator Connect

Dynamic emergency calling for Operator Connect provides the capability to configure and route emergency calls based on the current location of the Teams client. The ability to do automatic routing to the appropriate Public Safety Answering Point (PSAP) or to notify security desk personnel varies depending on the country of usage of the Teams user.

Dynamic location for routing emergency calls is supported in the United States as follows.

- If a Teams client for a United States user dynamically acquires an emergency address within the United States, that address is used for emergency routing instead of the registered address, and the call will be automatically routed to the PSAP in the serving area of the address.
- If a Teams client for a United States user doesn't dynamically acquire an emergency address within the United States, then the registered emergency address is used to help screen and route the call. However, the call will be screened to determine if an updated address is required before connecting the caller to the appropriate PSAP.

Dynamic location for routing emergency calls is supported in Canada the same as in the United States with the following exceptions: all emergency calls will be screened nationally before transferred to the PSAP.

For more information, see [Plan and configure dynamic emergency calling](#).

Emergency call routing for Operator Connect

When a Teams Operator Connect user dials an emergency number, how the call is routed to the PSAP depends on the following:

- Whether the emergency address is dynamically determined by the Teams client.
- Whether the emergency address is the registered address associated with the user's phone number.
- The emergency calling network of that country.
- In the United States and Canada, dynamic routing is part of the carrier's service. You do not need to procure this service from another service provider.

In the United States and Canada:

- If a Teams client is located at a tenant-defined dynamic emergency location, emergency calls from that client are automatically routed to the PSAP serving that geographic location.
- If a Teams client is not located at a tenant-defined dynamic emergency location, emergency calls from that client are screened by a national call center to determine the location of the caller before transferring the call to the PSAP serving that geographic location.
- If an emergency caller is unable to update their emergency location to the screening center, the call will be transferred to the PSAP serving the caller's registered address.

Considerations for Direct Routing

The following sections describe how to manage emergency calling for Direct Routing users. To find out whether Direct Routing is the right solution for your business, see [PSTN connectivity options](#).

Emergency call enablement for Direct Routing

For Direct Routing, you must define emergency calling policies for users by using a [Teams emergency call routing policy](#) to define emergency numbers and their associated routing destination. (Currently, registered emergency locations are not supported for Direct Routing users.)

You can assign an emergency call routing policy to a Direct Routing user account, a network site, or both. When a Teams client starts or changes a network connection, Teams performs a lookup of the network site where the client is located as follows:

- If an emergency call routing policy is associated with the site, then the site policy is used to configure emergency calling.
- If there is no emergency call routing policy associated with the site, if the client is connected at an

undefined site, or if the dialed number does not match any of the emergency numbers defined in the emergency call routing policy associated with the site, then the emergency call routing policy associated with the user account is used to configure emergency calling.

- If the Teams client is unable to obtain an emergency call routing policy, then the user is not enabled for emergency calling.

Dynamic emergency calling for Direct Routing

Dynamic emergency calling for Direct Routing provides the capability to configure and route emergency calls based on the current location of the Teams client. The ability to do automatic routing to the appropriate Public Safety Answering Point (PSAP) or to notify security desk personnel varies depending on the country of usage of the Teams user.

For Direct Routing users, dynamic location for routing emergency calls is only supported in the United States as follows:

- If a Teams client for a United States Direct Routing user dynamically acquires an emergency address within the United States, that address is used for emergency routing, and the call will be automatically routed to the PSAP in the serving area of the address.
- If a Teams client for a United States Direct Routing user doesn't dynamically acquire an emergency address within the United States, the call will be screened to determine if an updated address is required before connecting the caller to the appropriate PSAP.

Dynamic location for routing emergency calls is supported in Canada the same as in the United States with the following exception: all emergency calls will be screened nationally before being transferred to the PSAP.

For more information, see [Configure dynamic emergency calling](#).

Emergency call routing for Direct Routing

The emergency call routing policy for Direct Routing references an online PSTN usage, which must have the appropriate Direct Routing configuration to properly route the emergency calls to the appropriate PSTN gateway(s). In particular, you must ensure that there is an OnlineVoiceRoute for the emergency dial string. For more information, see [Configure Direct Routing](#).

NOTE

Teams clients no longer prepend the "+" sign in front of emergency numbers; that is, +911. Consequently, Teams emergency calls will no longer be sending a "+" preceding the 911 number. Be sure your voice route patterns reflect this change.

The ability to dynamically route emergency calls for Direct Routing users varies depending on the emergency calling network within a given country. There are two solutions available:

- [Emergency Routing Service Providers \(US only\)](#)
- [Emergency Location Identification Number applications](#)

Emergency Routing Service Providers

In the United States, there are numerous certified Emergency Routing Service Providers (ERSPs) that can automatically route emergency calls based upon the location of the caller.

- If an Emergency Routing Service Provider is integrated into a Direct Routing deployment, emergency calls with a dynamically acquired location will be automatically routed to the Public Safety Answering Point (PSAP) serving that location.
- Emergency calls without a dynamically acquired location are first screened to determine the current location of the user before connecting the call to the appropriate dispatch center based upon the updated

location.

For more information, see [Session Border Controllers certified for Direct Routing](#).

Emergency Location Identification Number applications

Session Border Controllers (SBCs) can include Emergency Location Identification Number (ELIN) applications. If an SBC ELIN application is integrated into a Direct Routing deployment, you must configure the emergency addresses and associated telephone numbers in the ELIN application, and then upload the ELIN records to the emergency calling database in the respective PSTN. Teams emergency locations with an ELIN identifier must match those within the ELIN application.

When an emergency call with a dynamically acquired location is routed to the appropriate SBC, the ELIN application:

- Parses the emergency location of the caller.
- Matches the location to an ELIN record.
- Substitutes the emergency caller's number with the ELIN phone number.
- Routes the call to the PSAP serving that location, and then the dispatchers obtain the location from the uploaded ELIN record.

Upon a call back to the emergency number, the ELIN application will do the reverse called number substitution to that of the original emergency caller.

For more information, see [Session Border Controllers certified for Direct Routing](#).

Security desk notification

Security desk notification is available with both Microsoft Calling Plans, Operator Connect, and Direct Routing.

You use a Teams emergency calling policy (TeamsEmergencyCallingPolicy) to configure who should be notified during an emergency call and how they are notified: chat only, conferenced in and muted, or conferenced in and muted but with the ability to unmute. You can also specify an external PSTN number of a user or group to call and join the emergency call. Note that the PSTN party is not allowed to unmute.

An emergency calling policy can be granted to a Teams user account, assigned to a network site, or both. When a Teams client starts or changes a network connection, Teams performs a lookup of the network site where the client is located:

- If an emergency calling policy is associated with a network site, then the site policy is used to configure security desk notification.
- If there is no emergency calling policy associated with the site, or if the client is connected at an undefined site, then the emergency calling policy associated with the user account is used to configure security desk notification.
- If the Teams client is unable to obtain an emergency calling policy, then the user is not enabled for security desk notification.

During an emergency call, a security desk is conferenced into the call and the experience of the security desk user is controlled based upon the Teams emergency calling policy. A group chat is started with each security desk member, and the location of the emergency caller is shared via an important message notification. If a conference option is configured as part of the policy, each security desk user is additionally called as part of the conference.

Plan and configure dynamic emergency calling

12/7/2021 • 10 minutes to read • [Edit Online](#)

Dynamic emergency calling for Microsoft Calling Plans, Operator Connect, and Direct Routing provides the capability to configure and route emergency calls and notify security personnel based on the current location of the Teams client.

Based on the network topology (network elements associated with emergency addresses) that the tenant administrator defines, the Teams client provides network connectivity information in a request to the Location Information Service (LIS). If there's a match, the LIS returns a location to the client.

The Teams client includes location data as part of an emergency call. This data is then used by the emergency service provider to determine the appropriate Public Safety Answering Point (PSAP) and to route the call to that PSAP, which allows the PSAP dispatcher to obtain the caller's location.

For dynamic emergency calling, the following must occur:

1. The network administrator configures network settings and the LIS to create a network/emergency location map.
2. During startup and periodically afterwards, or when a network connection is changed, the Teams client sends a location request that contains its network connectivity information to the network settings and the LIS.
 - If there's a network settings site match – emergency calling policies are returned to the Teams client from that site. (For more information about policies, see [Configure emergency policies](#)).
 - If there's an LIS match – an emergency location from the network element the Teams client is connected to is returned to the Teams client. The match is performed in the following order with the first matched result being returned:
 - WAP
 - Ethernet switch/port
 - Ethernet switch
 - Subnet
3. When the Teams client makes an emergency call, the emergency location is conveyed to the PSTN network.

The ability to do automatic routing to the appropriate Public Safety Answering Point (PSAP) varies depending on the country of usage of the Teams user.

Microsoft Calling Plans and Operator Connect partners include dynamic emergency routing services for users in the United States and Canada.

For Direct Routing, however, additional configuration is required for routing emergency calls and possibly for partner connectivity. The administrator must configure connection to an Emergency Routing Service (ERS) provider (United States and Canada) **OR** configure the Session Border Controller (SBC) for an Emergency Location Identification Number (ELIN) application. For information about ERS providers, see [Session Border Controllers certified for Direct Routing](#).

This article contains the following sections.

- [Assign emergency addresses](#)

- [Configure network settings](#)
- [Configure Location Information Service](#)
- [Configure emergency policies](#)
- [Enable users and sites](#)
- [Test emergency calling](#)

For more information about emergency calling, including information about emergency addresses and emergency call routing, information specific to countries, and information about network settings and network topology, see the following:

- [Manage emergency calling](#)
- [Manage network settings for cloud voice features](#)
- [Manage your network topology for cloud voice features](#)

For more information about which features are available in the government clouds, see [Government support](#) at the end of this article.

Supported clients

The following clients are currently supported. Check back often to see updates to this list.

- Teams desktop client for Microsoft Windows
- Teams desktop client for Apple macOS
- Teams mobile client for Apple iOS client version 1.0.92.2019121004 and App Store version 1.0.92 and greater
- Teams mobile client for Android client and Google Play store version 1416/1.0.0.2019121201 and greater
- Teams phone version 1449/1.0.94.2019110802 and greater
- Teams Rooms version 4.4.25.0 and greater

NOTE

3PIP phones do not support dynamic emergency calling.

NOTE

Dynamic emergency calling, including security desk notification, isn't supported on the Teams web client. To prevent users from using the Teams web client to call PSTN numbers, you can set a Teams calling policy and turn off the **Allow web PSTN calling** setting. To learn more, see [Calling policies in Teams](#) and [Set-CsTeamsCallingPolicy](#).

NOTE

Subnet and WiFi-based locations are supported on all Teams clients.
Ethernet/Switch (LLDP) is supported on:

- Windows versions 8.1 and later at this time.
- Mac OS, which requires [LLDP enablement software](#).
- Teams phone with Teams app version 1449/1.0.94.2021110101 and later.

Assign emergency addresses

You can assign emergency addresses as follows:

- To Calling Plan users.
- To Operator Connect users—depending on the capabilities assigned to the number when the carrier uploads them into a customer's inventory.
- To the network identifiers that are required for dynamically obtaining a location.

To support automated routing of emergency calls within the United States, you must ensure that the emergency locations that are assigned to network identifiers include the associated geo codes. (Emergency addresses without geo codes can't be assigned to the network identifiers that are required for dynamic locations.)

Azure Maps is used for location-based services. When you enter an emergency address by using the Microsoft Teams admin center, Teams checks Azure Maps for the address:

- If a match is found, the geo codes are automatically included.
- If a match isn't found, you will have the opportunity to manually create an emergency address. You can use the PIN drop feature to do this.

NOTE

Emergency addresses that are more than a couple of years old cannot be assigned to network identifiers. You will need to re-create older addresses.

You add and assign emergency addresses in the Microsoft Teams admin center or by using PowerShell. For more information, see [Add an emergency location for your organization](#) and [Assign an emergency location for a user](#).

Configure network settings

Network settings are used to determine the location of a Teams client, and to dynamically obtain emergency calling policies and an emergency location. You can configure network settings according to how your organization wants emergency calling to function.

Network settings include sites that include a collection of subnets and these are used exclusively for dynamic policy assignment to users. For example, an emergency calling policy and an emergency call routing policy might be assigned to the "Redmond site" so that any user that roams from home or another Microsoft location is configured with emergency numbers, routing, and security desk specific to Redmond.

Trusted IP addresses contain a collection of the internet external IP addresses of the enterprise network and are used to determine if the user's endpoint is inside the corporate network. An attempt to obtain a dynamic policy or location will only be made if the user's external IP address matches an IP address in the trusted IP address.

For more information about IP addresses, network regions, sites, and subnet addresses, see [Network settings for cloud voice features](#).

You configure network settings in the Microsoft Teams admin center or by using PowerShell. To learn more, see [Manage your network topology for cloud voice features](#).

Note that it can take some time (up to a couple of hours) for some changes to network settings (such as a new address, network identifier, and so on) to propagate and be available to Teams clients.

NOTE

Subnets can also be defined in LIS and can be associated with an emergency location. LIS subnets must be defined by the Network ID matching the subnet IP range assigned to clients. For example, the network ID for a client IP/mask of 10.10.10.150/25 is 10.10.10.128. For more information, see [Understand TCP/IP addressing and subnetting basics](#).

IMPORTANT

Network configuration setting lookups are not supported with cloud proxy service deployments that modify the source IP addresses from Teams clients.

For Calling Plan and Operator Connect users:

- If dynamic configuration of security desk notification is required, you must configure both trusted IP addresses and network sites.
- If only dynamic locations are required, you must configure only trusted IP addresses; configuring network settings isn't required.
- If neither are required, configuring network settings isn't required.

For Direct Routing users:

- If dynamic enablement of emergency calling or dynamic configuration of security desk notification is required, then you must configure both Trusted IP addresses and network sites.
- If only dynamic locations are required, you must configure only trusted IP addresses; configuring network settings isn't required.
- If neither are required, configuring network settings isn't required.

Configure Location Information Service

A Teams client obtains emergency addresses from the locations associated with different network identifiers.

For a client to obtain a location, you must populate the LIS with network identifiers (subnets, WAPs, switches, ports) and emergency locations. You can do this in the Microsoft Teams admin center or by using PowerShell.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Locations > Networks & locations**.
2. Click the tab that represents the network identifier that you want to add. For example, click **Subnets**, **Wi-Fi access points**, **Switches**, or **Ports**. Then click **Add**.
3. Complete the fields, add an emergency location, and then click **Apply**.

Using PowerShell

Use the following cmdlets to add ports, switches, subnets, and WAPs to the LIS.

- [Get](#), [Set](#), [Remove](#) -CsOnlineLisSubnet
- [Get](#), [Set](#), [Remove](#) -CsOnlineLisPort
- [Get](#), [Set](#), [Remove](#) -CsOnlineLisWirelessAccessPoint
- [Get](#), [Set](#), [Remove](#) -CsOnlineLisSwitch

IMPORTANT

If subnets are being used as part of network sites, they must be redefined in the Location Information Service to render dynamic locations.

Configure emergency policies

Use the following policies to configure emergency calling. You can manage these policies in the Microsoft Teams admin center or by using PowerShell.

- **Emergency call routing policy – Applies only to Direct Routing.** This policy configures the emergency numbers, masks per number if desired, and the PSTN route per number. You can assign this policy to users, to network sites, or to both. To learn more, see [Manage emergency call routing policies for Direct Routing](#).

(Calling Plan and Operator Connect users are automatically enabled for emergency calling with the emergency numbers from the country based upon their Microsoft 365 or Office 365 usage location.)

- **Emergency calling policy - Applies to Calling Plans, Operator Connect, and Direct Routing.** This policy configures the security desk notification experience when an emergency call is made. You can set who to notify and how they are notified. For example, to automatically notify your organization's security desk and have them listen in on emergency calls. This policy can either be assigned to users or network sites or both. To learn more, see [Manage emergency calling policies in Teams](#).

Enable users and sites

You can assign emergency call routing policies and emergency calling policies to users and to sites. Keep in mind that emergency call routing policies apply to Direct Routing only. (Although it's possible to assign this policy to a Calling Plan or Operator Connect user, the policy will have no effect.)

You assign policies in the Microsoft Teams admin center or by using PowerShell. To learn more, see:

- [Manage emergency call routing policies for Direct Routing](#)
- [Manage emergency calling policies in Teams](#)

The following are PowerShell examples:

To enable a specific user for security desk notification, use the following command:

```
Grant-CsTeamsEmergencyCallingPolicy -Identity user1 -PolicyName SecurityDeskNotification
```

To assign a policy called "Contoso Emergency Calling Policy 1" to Site 1, use the following command:

```
Set-CsTenantNetworkSite -identity "site1" -EmergencyCallingPolicy "Contoso Emergency Calling Policy 1"
```

To enable a specific Direct Routing user for emergency calling, use the following command:

```
Grant-CsTeamsEmergencyCallRoutingPolicy -Identity user1 -PolicyName UnitedStates
```

To assign a policy called "Contoso New York Emergency Call Routing" to Site 1, use the following command:

```
Set-CsTenantNetworkSite -identity "site1" -EmergencyCallRoutingPolicy "Contoso New York Emergency Call Routing"
```

If you assigned an emergency calling policy to a network site and to a user, and if that user is at that network site, the policy that's assigned to the network site overrides the policy that's assigned to the user.

Test emergency calling

Some Emergency Routing Service Providers (ERSPs) in the United States offer an emergency calling test bot.

- **Calling Plan and Operator Connect users in the United States or Canada** can use the predefined test emergency number 933 to validate their emergency calling configuration. This number is routed to a bot, which then echoes back the caller phone number (calling line ID), emergency address or location, and whether the call would be automatically routed to the PSAP or screened first.
- **Direct Routing customers in the United States** should coordinate with their ERSP for a test service.

Government support

The following table shows support for dynamic emergency calling in the government clouds:

CLOUD	AVAILABILITY
World Wide Multi Tenant	Available on all Teams clients
GCC	Available on all Teams clients
GCCH	Available on Teams desktop
DoD	Pending

Emergency addresses for remote locations

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes Microsoft's support for 911 emergency calling location information in the United States. This support ensures that the most precise dispatchable location information possible is provided for Teams users making emergency calls. Regardless of the caller's location--onsite or working from home--a caller's location information sent to the Public Safety Answering Point (PSAP) must be accurate.

This article includes information about Microsoft's compliance with the RAY BAUM'S Act for Multi Line Telephone Systems (MLTS). The RAY BAUM'S Act extends the Kari's Law requirements, which went into effect in early 2021. For more information about the RAY BAUM'S Act and Kari's Law, see [Dispatchable Location for 911 Calls](#) and [Multi-line Telephone Systems – Kari's Law and RAY BAUM'S Act 911 Direct Dialing, Notification, and Dispatchable Location Requirements](#).

Users working at home can now set their own emergency addresses if applicable. This article describes how you can configure user policies so that your end users can set their emergency addresses.

Although this information applies to emergency 911 calling in the United States, user-entered locations will be conveyed to the screening center in Canada as well.

This article contains the following sections:

- [Support for emergency calling location information](#)
- [Location precedence](#)
- [Emergency address classification and routing](#)
- [Enable end users to configure their emergency address](#)
- [Notes and restrictions](#)

Support for emergency calling location information

To support these requirements, Teams uses the location services provided by the respective operating system to suggest an address--if granted permission by the administrator or user. The end user can confirm the location of a suggested address, edit it, or manually enter a new one. A confirmed, edited, or manually entered address is then saved on the Teams client so that the user-confirmed address is automatically used when the client is connected to that network. The user-saved addresses are automatically cleared when the Teams client is signed out.

Location precedence

Emergency addresses for Teams can be categorized by different types. The following list shows the location precedence used when an emergency number is dialed:

1. A dynamically acquired address defined by the tenant administrator in the Location Information Service.
2. An address the end user confirmed, edited, or manually entered which is associated to the local network the Teams client is connected to.
3. An address automatically suggested by the operating system.
4. An address the administrator statically assigns to the user.

Emergency address classification and routing

The following table shows the types of emergency addresses and associated routing methods for each type: whether the call is automatically routed to the serving PSAP or screened for accuracy before transferring to the serving PSAP. This routing behavior is supported in the United States for all Calling Plan users, Operator Connect partners, and Direct Routing certified emergency calling service providers.

TYPE OF EMERGENCY ADDRESS	EMERGENCY ROUTING METHOD
Dynamically acquired emergency address defined by administrator.	Direct to PSAP.
Emergency address obtained from the operating system without confirmation for accuracy by the user.	Screened and Transferred to PSAP.
Emergency address obtained from the operating system with confirmation for accuracy by the user.	Direct to PSAP.
Emergency address obtained from the operating system and edited and confirmed by the user.	Screened and Transferred to PSAP.
Emergency address entered and confirmed by the user.	Screened and Transferred to PSAP.
Emergency address statically assigned to the user/number.	Screened and Transferred to PSAP.
Null	Screened and Transferred to PSAP.

Enable end users to configure their emergency address

To enable this feature for your end users, use the `New-CsTeamsEmergencyCallingPolicy` PowerShell cmdlet, and set the `ExternalLocationLookupMode` parameter to `Enabled`. See the following example:

```
New-CsTeamsEmergencyCallingPolicy -Identity E911WFH -ExternalLocationLookupMode Enabled
```

```
Grant-CsTeamsEmergencyCallingPolicy -PolicyName E911WFH -Identity user@contoso.com
```

After enabling this feature for your end users, from the Calls tab, the user can add, edit, or confirm an emergency address and display the address after it is set.

On Windows, you can manage the Windows location service, and whether applications have access to the location, by using group policy or by using [mobile device management \(MDM\)](#).

For more information about Windows location service, see [Windows location service and privacy](#).

Notes and restrictions

Keep the following in mind:

- The work-from-home experience described is for Teams desktop on Windows and Mac.
- Teams phones do not support the work-from-home experience.
- Teams mobile supports automatic location detection but not the user entered experience described.
- Privacy settings can conflict with automatic location detection - Mobile Device Management systems can be used.

Add, change, or remove an emergency location for your organization

12/7/2021 • 2 minutes to read • [Edit Online](#)

Regardless of the [PSTN connectivity option](#) you choose—Microsoft Calling Plans, Operator Connect, or Direct Routing—emergency locations can be associated with a phone number.

However, depending on your PSTN connectivity option, how you manage emergency locations and location requirements may vary. For more information, see [Manage emergency calling](#).

This article describes how to add, change, or remove an emergency location for your organization.

This article applies to Microsoft Calling Plans, Operator Connect, and Direct Routing.

You manage emergency locations for your organization in the Microsoft Teams admin center or by using PowerShell.

To assign an emergency location, users, phone numbers, and emergency locations all need to be in the same country. For more information, see [Assign or change an emergency location for a user](#).

Add an emergency location

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Locations** > **Emergency addresses**.
2. Click **Add**.
3. Enter a name and description for the location.
4. Select the country or region, and then enter the address.

NOTE

In Belgium, France, Germany, Ireland, Netherlands, and Spain, it's important to understand that to successfully activate a phone number in Microsoft 365, the address set up in the emergency location, which is used to acquire the number, must match the phone number's area code.

5. If the address isn't found and you want to manually edit the address, turn on **Edit the address manually**.
6. Click **Save**.

Using PowerShell

See [New-CsOnlineLisCivicAddress](#).

Change an emergency location

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Locations** > **Emergency addresses**.
2. In the list, select the location that you want to change, and then click **Edit**.
3. Make the changes you want.

4. Click **Save**.

NOTE

You can change the address information for a location only if the address isn't validated. If the address is already validated, and you need to change the address, delete the location, and then create a new location with the correct address.

Using PowerShell

See [Set-CsOnlineLisCivicAddress](#).

Remove an emergency location

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Locations** > **Emergency addresses**.
2. In the list, select the location that you want to remove, and then click **Delete**.

Using PowerShell

See [Remove-CsOnlineLisCivicAddress](#).

Add, change, or remove a place for an emergency location in your organization

12/7/2021 • 2 minutes to read • [Edit Online](#)

Depending on the number of physical locations in your organization, you can add *places* for buildings, floors, and offices to create a more specific emergency location.

Depending on your PSTN connectivity option, however, how you manage emergency locations and location requirements may vary. For more information, see [Manage emergency calling](#).

This article describes how to add, change, or remove a *place* for an emergency location for your organization.

This article applies to Microsoft Calling Plans, Operator Connect, and Direct Routing.

You manage emergency locations for your organization in the Microsoft Teams admin center or by using PowerShell.

Add a place to an emergency location

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Locations** > **Emergency addresses**.
2. In the list, click the name of the location for which you want to add a place.
3. On the **Places** tab, click **Add**.
4. Enter a place name, and then click **Apply**.

Using PowerShell

See [New-CsOnlineLisLocation](#).

Change a place for an emergency location

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Locations** > **Emergency addresses**.
2. In the list, click the name of the location for which you want to change a place.
3. On the **Places** tab, select the place you want to change, and then click **Edit**.
4. Update the place information, and then click **Apply**.

Using PowerShell

See [Set-CsOnlineLisLocation](#).

Remove a place from an emergency location

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Locations** > **Emergency addresses**.
2. In the list, click the name of the location for which you want to remove a place.
3. On the **Places** tab, select the place you want to remove, and then click **Delete**.

Using PowerShell

See [Remove-CsOnlineLisLocation](#).

Assign or change an emergency location for a user

12/7/2021 • 2 minutes to read • [Edit Online](#)

Regardless of the [PSTN connectivity option](#) you choose—Microsoft Calling Plans, Operator Connect, or Direct Routing—an emergency location needs to be assigned to each phone number or user.

Depending on your PSTN connectivity option, however, how you manage and assign emergency locations for a user may vary. For more information, see [Manage emergency calling](#).

This article describes how to assign or change an emergency location for a user.

This article applies to Calling Plans and Operator Connect.

You can assign or change an emergency location for a user in the Microsoft Teams admin center or by using PowerShell.

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, click **Voice > Phone numbers**.
2. On the **Phone numbers** page, click the **Numbers** tab, select a user number in the list, and then click **Edit**.
3. On the **Edit** pane, under **Emergency location**, do one of the following:
 - To assign an emergency location, search for, and select an emergency location.
 - To change the emergency location that's already assigned to the user, click **X** to remove the existing location, and then search for and select the location you want to assign.
4. Depending on whether you want to send an email to the user with their phone number information, turn off or turn on **Email user with telephone number information**. By default, this is on.
5. Click **Apply**.

Using PowerShell

See [Set-CsOnlineVoiceUser](#).

Manage emergency calling policies in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

If your organization uses Microsoft Calling Plans, Operator Connect, or Direct Routing as your [PSTN connectivity option](#), you can use emergency calling policies in Microsoft Teams to define what happens when a Teams user in your organization makes an emergency call.

You can set who to notify and how they are notified when a user who is assigned the policy calls emergency services. For example, you can configure policy settings to automatically notify your organization's security desk and have them listen in emergency calls.

You manage emergency calling policies by going to **Voice > Emergency policies** in the Microsoft Teams admin center or by using Windows PowerShell. The policies can be assigned to users and [network sites](#).

For users, you can use the global (Org-wide default) policy or create and assign custom policies. Users will automatically get the global policy unless you create and assign a custom policy. Keep in mind that you can edit the settings in the global policy but you can't rename or delete it. For network sites, you create and assign custom policies.

If you assigned an emergency calling policy to a network site and to a user and if that user is at that network site, the policy that's assigned to the network site overrides the policy that's assigned to the user.

Create a custom emergency calling policy

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Emergency policies**, and then click the **Calling policies** tab.
2. Click **Add**.
3. Enter a name and description for the policy.
4. Set how you want to notify people in your organization, typically the security desk, when an emergency call is made. To do this, under **Notification mode**, select one of the following:
 - **Send notification only:** A Teams chat message is sent to the users and groups that you specify.
 - **Conferenced in muted and unable to unmute:** A Teams chat message is sent to the users and groups that you specify and they can listen (but not participate) in the conversation between the caller and the PSAP operator.
 - **Conferenced in muted but are able to unmute:** A Teams chat message is sent to the users and groups that you specify and they can unmute to listen and participate in the conversation between the caller and the PSAP operator.
5. If you selected either of the **Conference in muted** notification modes, in the **Numbers to dial for emergency calls notifications** box, you can enter a PSTN phone number of a user or group to call and join the emergency call. For example, enter the number of your organization's security desk, who will receive a call when an emergency call is made and can then listen in on the call. The PSTN phone cannot be unmuted even when the mode is set to **Conferenced in muted but are able to unmute**.
6. Search for and select one or more users or groups, such as your organization's security desk, to notify when an emergency call is made. The notification can be sent to email addresses of users, distribution groups, and security groups. A maximum of 50 users can be notified.
7. Click **Apply**.

Using PowerShell

See [New-CsTeamsEmergencyCallingPolicy](#).

Edit an emergency calling policy

Using the Microsoft Teams admin center

You can edit the global policy or any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Emergency policies**, and then click the **Calling policies** tab.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. Make the changes that you want, and then click **Apply**.

Using PowerShell

See [Set-CsTeamsEmergencyCallingPolicy](#).

Assign a custom emergency calling policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

See also [Grant-CsTeamsEmergencyCallingPolicy](#).

Assign a custom emergency calling policy to a network site

Use the [Set-CsTenantNetworkSite](#) cmdlet to assign an emergency calling policy to a network site.

The following example shows how to assign a policy called Contoso Emergency Calling Policy 1 to the Site1 site.

```
Set-CsTenantNetworkSite -identity "site1" -EmergencyCallingPolicy "Contoso Emergency Calling Policy 1"
```

[Assign policies to your users in Teams](#)

Manage emergency call routing policies for Direct Routing

12/7/2021 • 4 minutes to read • [Edit Online](#)

If you've deployed [Direct Routing](#) in your organization, you can use emergency call routing policies in Microsoft Teams to set up emergency numbers and specify how emergency calls are routed. An emergency call routing policy determines whether enhanced emergency services are enabled for users who are assigned the policy, the numbers used to call emergency services (for example, 911 in the United States), and how calls to emergency services are routed.

NOTE

Note that these call routing policies apply only to Direct Routing--they do not apply to Calling Plans or Operator Connect.

You manage emergency call routing policies by going to **Voice > Emergency policies** in the Microsoft Teams admin center or by using Windows PowerShell. The policies can be assigned to users and [network sites](#).

For users, you can use the global (Org-wide default) policy or create and assign custom policies. Users will automatically get the global policy unless you create and assign a custom policy. Keep in mind that you can edit the settings in the global policy but you can't rename or delete it. For network sites, you create and assign custom policies.

If you assigned an emergency call routing policy to a network site and to a user and if that user is at that network site, the policy that's assigned to the network site overrides the policy that's assigned to the user.

Create a custom emergency call routing policy

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Emergency policies**, and then click the **Call routing policies** tab.
2. Click **Add**.
3. Enter a name and description for the policy.
4. To enable dynamic emergency calling, turn on **Dynamic emergency calling**. When dynamic emergency calling is enabled, Teams retrieves policy and location information from the service and includes that information as part of the emergency call.
5. Define one or more emergency numbers. To do this, under **Emergency numbers**, click **Add**, and then do the following:
 - a. **Emergency dial string**: Enter the emergency dial string. This dial string indicates that a call is an emergency call.

NOTE

For Direct Routing, Teams clients no longer send emergency calls with a "+" in front of the emergency dial string. Be sure the voice route pattern to match an emergency dial string reflects this change.

- b. **Emergency dial mask:** For each emergency number, you can specify zero or more emergency dial masks. A dial mask is the number that you want to translate into the value of the emergency dial string. This allows for alternate emergency numbers to be dialed and still have the call reach emergency services.
For example, you add 112 as the emergency dial mask, which is the emergency service number for most of Europe, and 911 as the emergency dial string. A Teams user from Europe who is visiting may not know that 911 is the emergency number in the United States, and when they dial 112, the call is made to 911. To define multiple dial masks, separate each value by a semicolon. For example, 112;212.
- c. **PSTN usage record:** Select the Public Switched Telephone Network (PSTN) usage record. The PSTN usage record is used to determine which route is used to route emergency calls from users who are authorized to use them. The route associated with this usage should point to a Session Initiation Protocol (SIP) trunk dedicated to emergency calls or to an Emergency Location Identification Number (ELIN) gateway that routes emergency calls to the nearest Public Safety Answering Point (PSAP).

NOTE

Dial strings and dial masks must be unique within a policy. This means that for a policy, you can define multiple emergency numbers and you can set multiple dial masks for a dial string, but each dial string and dial mask must only be used one time.

6. Click **Save**.

Using PowerShell

See [New-CsTeamsEmergencyCallRoutingPolicy](#).

Edit an emergency call routing policy

Using the Microsoft Teams admin center

You can edit the global policy or any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Emergency policies**, and then click the **Call routing policies** tab.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. Make the changes that you want, and then click **Save**.

Using PowerShell

See [Set-CsTeamsEmergencyCallRoutingPolicy](#).

Assign a custom emergency call routing policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

See also [Grant-CsTeamsEmergencyCallRoutingPolicy](#).

Assign a custom emergency call routing policy to a network site

Use the [Set-CsTenantNetworkSite](#) cmdlet to assign an emergency calling routing policy to a network site.

This example shows how to assign a policy called Emergency Call Routing Policy 1 to the Site1 site.

```
Set-CsTenantNetworkSite -identity "site1" -EmergencyCallRoutingPolicy "Emergency Call Routing Policy 1"
```

Contoso case study: Teams voice migration overview

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article introduces a case study for how a fictional multi-national corporation, Contoso, implemented a Teams voice solution for their organization.

Contoso has deployed Microsoft 365 Enterprise and addressed major design decisions and implementation details for the following: networking, identity, Windows 10 Enterprise, Office 365 ProPlus, mobile device management, information protection, security, upgrade from Skype for Business to Teams, Phone System, and Audio Conferencing.

This article focuses on how Contoso migrated their on-premises users to Teams for unified communication, collaboration, and voice. For background information about how Contoso accelerated their digital transformation by using Microsoft's cloud services, see all the core articles starting with the [Contoso case study overview](#).

<https://docs.microsoft.com/microsoft-365/enterprise/contoso-case-study>

In the core articles, you'll find information on the following:

- Contoso's IT infrastructure needs
- Networking
- Identity
- Windows 10 Enterprise
- Office 365 Pro Plus
- Mobile device management
- Information protection
- Summary of Microsoft 365 Enterprise security
- Team for a top-secret project
- SharePoint Online site for highly confidential digital assets

For information about planning an upgrade, you'll want to start with [Getting started with your Microsoft Teams upgrade](#).

Contoso business goals for Teams

To migrate their on-premises users to Teams for unified communication, collaboration, and voice, Contoso decided on the following business goals:

- Teams enablement

Contoso's unified communication and collaboration team enabled Teams with the correct policies to govern and enable secure internal and external collaboration.

- Skype for Business to Teams upgrade

Skype for Business was widely deployed within Contoso. With the need to move off legacy systems, Contoso decided to upgrade their Skype for Business users to Teams. For more information, see [Contoso case study: Teams upgrade plan](#).

- Phone System

Skype for Business with enterprise voice was widely deployed within Contoso. With the need to move off legacy systems that were the next hop for their mediation servers, Contoso migrated their Skype for Business enterprise voice users to Phone System. Contoso sites used Microsoft Calling Plan, Phone System Direct Routing, or a combination of both. For more information, see [Contoso case study: Phone System](#).

- Location-Based Routing

With office locations in telephony-regulated countries, Contoso needed to recreate the Location-Based Routing that was present in Skype for Business in their Phone System deployment. For more information, see [Contoso case study: Location-Based Routing](#).

- Emergency Calling

Where Direct Routing was implemented, Contoso set up emergency calling with approved third parties. For more information, see [Contoso case study: Emergency Calling](#).

- Audio Conferencing

Contoso set up Audio Conferencing service numbers that were hosted on their SIP trunk to their PSTN provider. For more information, see [Contoso case study: Audio Conferencing](#).

- Local Media Optimization

Contoso took advantage of Local Media Optimization in locations where they had one direct route trunk to Microsoft Phone System that was leveraged by remote sites. For more information, see [Plan for Local Media Optimization](#) and [Configure Local Media Optimization](#).

- Auto Attendants and Call Queues

As a result of Covid-19, Contoso wanted to provide receptionist support while their staff was working remotely. Contoso used auto attendants and call queues to manage incoming calls to their receptionist's phone number. For more information, see [Contoso case study: Auto Attendants and Call Queues](#).

Contoso case study: Teams upgrade plan

12/7/2021 • 2 minutes to read • [Edit Online](#)

In the decision to migrate from Skype for Business to Teams, Contoso wanted to provide an easy transition experience for end users. Instead of switching everyone to Teams at the same time, they decided to set up hybrid connectivity, and use the overlapping capabilities method to move users to Teams. This allowed users in Teams and Skype for Business on-premises to share presence and communicate. As users entered the pilot for Phone System, they were moved to Teams Only mode.

To understand fundamental concepts about upgrade, methods, and modes, Contoso read the following articles:

- [Getting started with your Microsoft Teams upgrade](#)
- [Upgrade strategies for IT administrators](#)
- [Migration and interoperability guidance](#)

Contoso also attended the Ignite 2019 session [Designing your path from Skype for Business to Teams](#). Contoso learned about:

- Fundamental concepts such as interoperability, federation, and upgrade behavior
- Coexistence modes and management based on TeamsUpgradePolicy
- End user experience for:
 - Chat and Calling
 - Meeting scheduling
 - Availability of collaboration functionality in Teams clients

To plan and configure hybrid connectivity, the first step in moving their on-premises environment to the cloud, Contoso read [Plan hybrid connectivity](#) and [Configure hybrid connectivity](#) to understand how to:

- Configure their on-premises environment service to federate with Office 365.
- Configure their on-premises environment to trust Office 365 and enable shared SIP address space with Office 365
- Enable shared SIP address space in their Office 365 tenant.
- Use Islands mode during the technical pilot.
- Switch users to TeamsOnly mode once the user is enabled for Phone System. TeamsOnly mode is required for Calling Plan and Direct Routing.

Contoso case study: Phone System for a multi-national corporation

12/7/2021 • 7 minutes to read • [Edit Online](#)

Depending on geographic location and other factors, Contoso had offices using the following telephony solutions:

- Site Type A: Skype for Business Enterprise Voice
- Site Type B: Traditional legacy telephony systems
- Site Type C: A combination of Skype for Business Enterprise Voice and traditional legacy telephony systems

To implement a Microsoft Phone System solution for their entire organization, Contoso had to determine—for each site type—which of the following options would be used with Phone System to connect to the Public Switched Telephone Network (PSTN):

- Phone System with Calling Plan
- Phone System with own PSTN carrier through Direct Routing
- Combination of Phone System with Calling Plan and Phone System with own PSTN carrier through Direct Routing

To determine the right solution for their organization, Contoso used [Microsoft telephony solutions](#) and the Ignite 2019 session [Calling in Microsoft Teams](#).

Site Type A: Skype for Business Enterprise Voice

Contoso Skype for Business Enterprise Voice was set up as a hub and spoke. There was a central location that maintained the PSTN gateway in the region that provided the connection to the PSTN for the Skype for Business Enterprise Voice users in country. Often these satellite offices did not have their own Internet egress. The numbers for these users resided on the SIP trunk connecting to an existing SBC.

To determine if the SBC already deployed is certified for Direct Routing and Media Bypass, Contoso checked the [List of Session Border Controllers certified for Direct Routing](#).

The user's dialing habits were to dial a user on the legacy telephony system using an extension, even when the user has a Skype for Business client available for peer-to-peer audio.

Contoso based their decision on the following questions:

- Q. Do we need to retain functionality provided by our on-premises deployment?
A. No
- Q. Do we need to interoperate with third-party PBX systems and other telephony equipment?
A. No
- Q. Do we need to retain our current third-party carrier?
A. Yes (regulated countries) and No
- Q. Do we need to get the ROI on SBCs deployed?
A. Yes and No

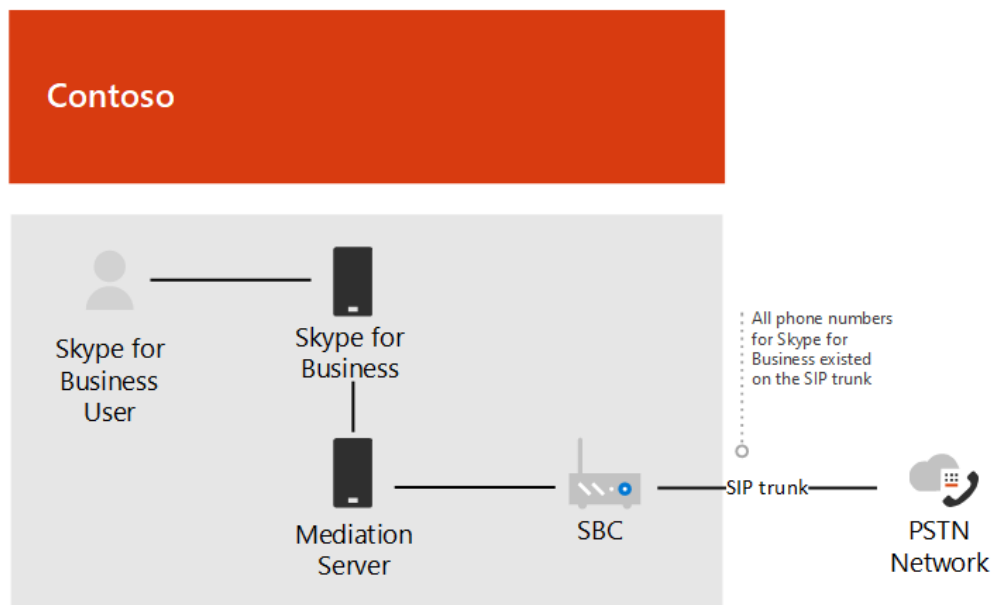

- Q. Is Microsoft PSTN Calling Plans available in this region?
A. Yes and No

Based on the answers to their questions, Contoso decided to:

- Move the users that are located in a region where PSTN calling plans is available to Phone System with Calling Plans.
- Move the users that are not located in a region where PSTN calling plans is available, users located in a site where the ROI on the SBCs have yet to be met, and users that resided in a country that has telephony regulations to Phone System with Direct Routing.

The following diagram shows the initial Skype for Business Enterprise Voice deployment and how this deployment was migrated to both Microsoft Calling Plans and Direct Routing:

Skype for Business Enterprise Voice

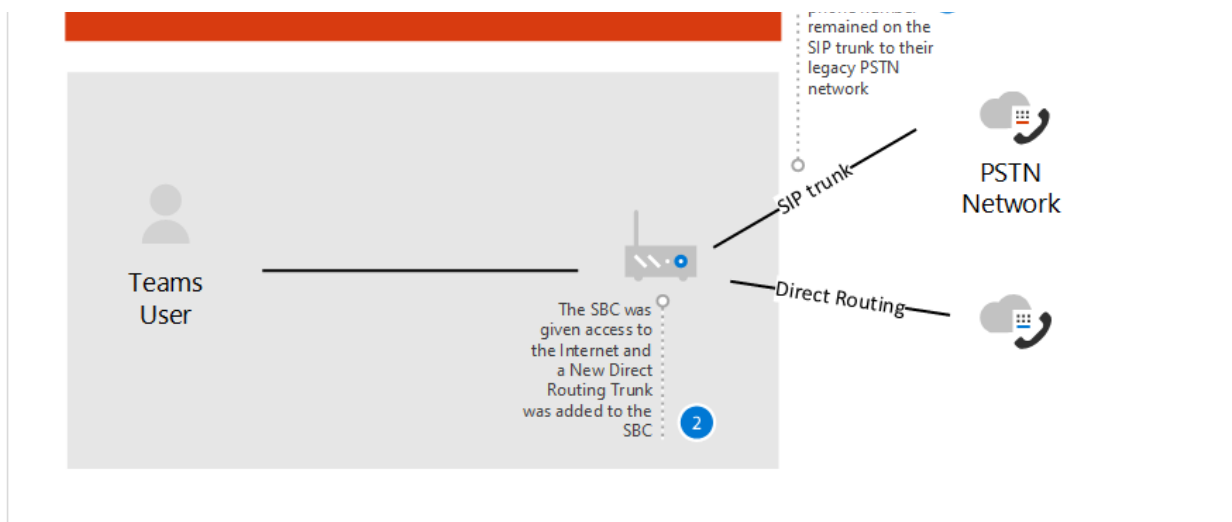

Phone System Calling Plans

Phone System Direct Routing

Site Type B: Traditional legacy telephony systems

Contoso had many offices that leveraged legacy telephony systems. There were a subset of users that had an E1.64 phone number while others only had an extension. These numbers resided on the TDM trunk to the PSTN gateway. Intra-site dialing was configured by leveraging a site code in front of the extension to determine where to route the call. The users' dialing habits were to dial by extension.

Contoso based their decision on the following questions:

- Q. Do we need to retain functionality provided by our on-premises deployment?
A. No
- Q. Do we need to interoperate with third-party PBX systems and other telephony equipment?
A. Yes
- Q. Do we need to retain our current third-party carrier?
A. No
- Q. Is Microsoft PSTN's Calling Plan available in our region?
A. Yes and No

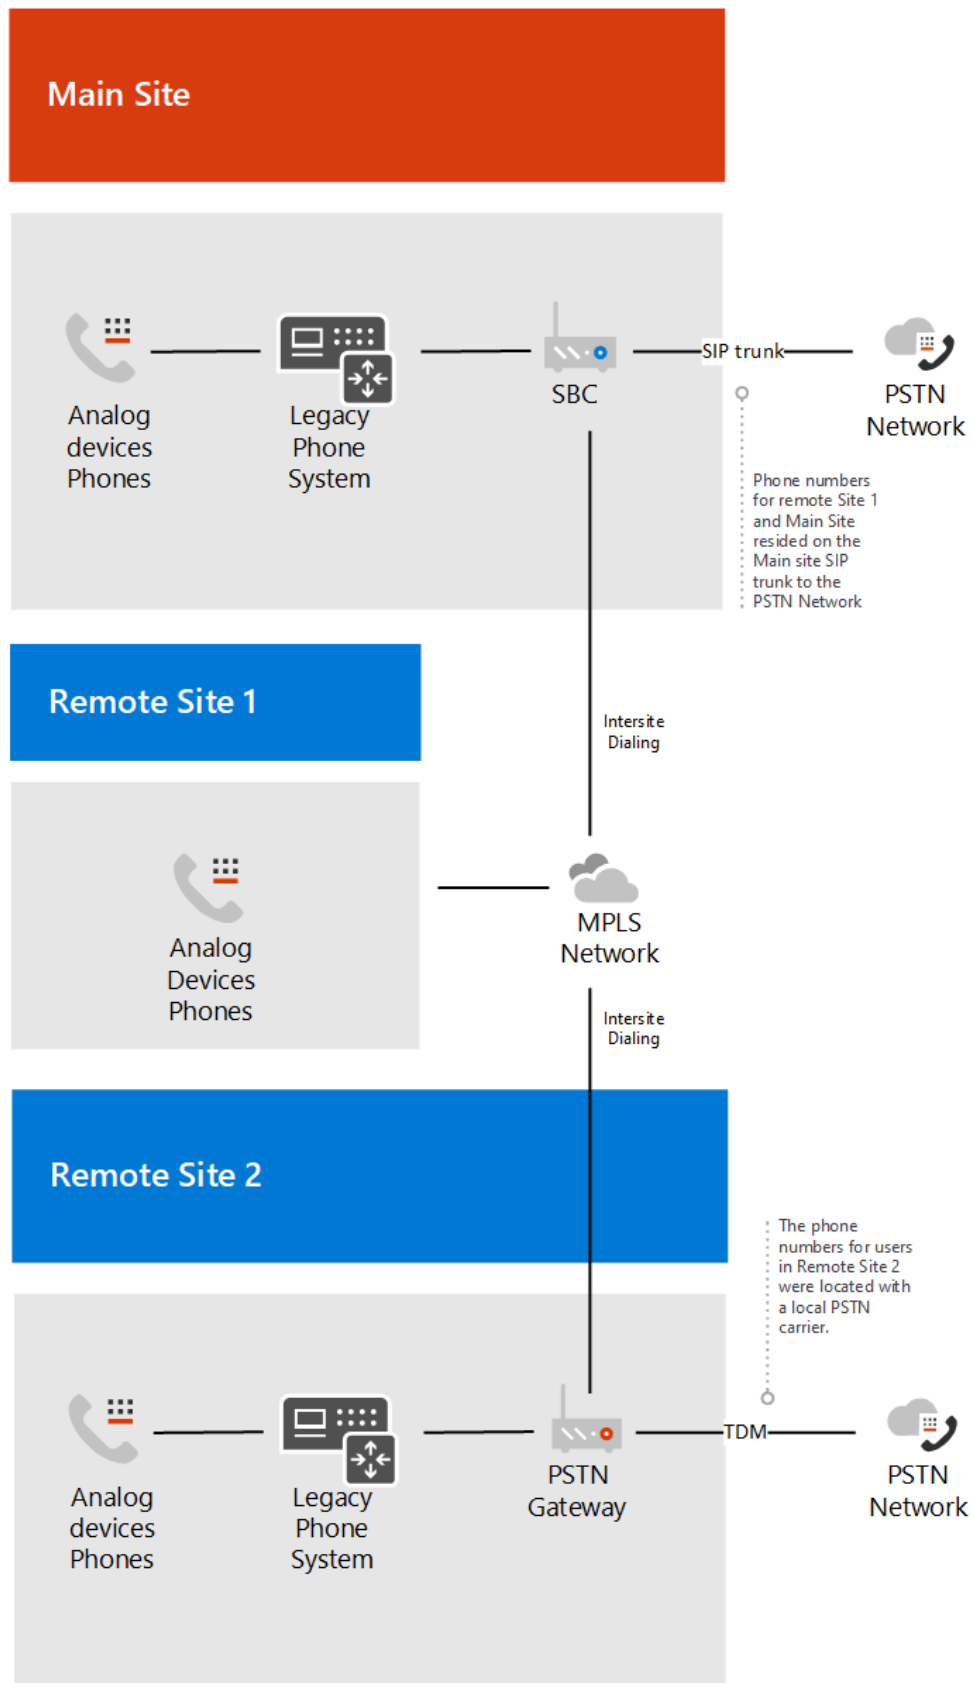

Based on the answers to their questions, Contoso decided to:

- Move the users that are located in a region where PSTN calling plans is available to Phone System with Calling Plans.
- Move the users that are not located in a region where PSTN calling plans is available to Phone System with Direct Routing.
- Maintain a PSTN connection to business critical analog devices.

The following diagrams show the original legacy system deployment with remote sites and the migration to a Direct Routing deployment with Local Media Optimization:

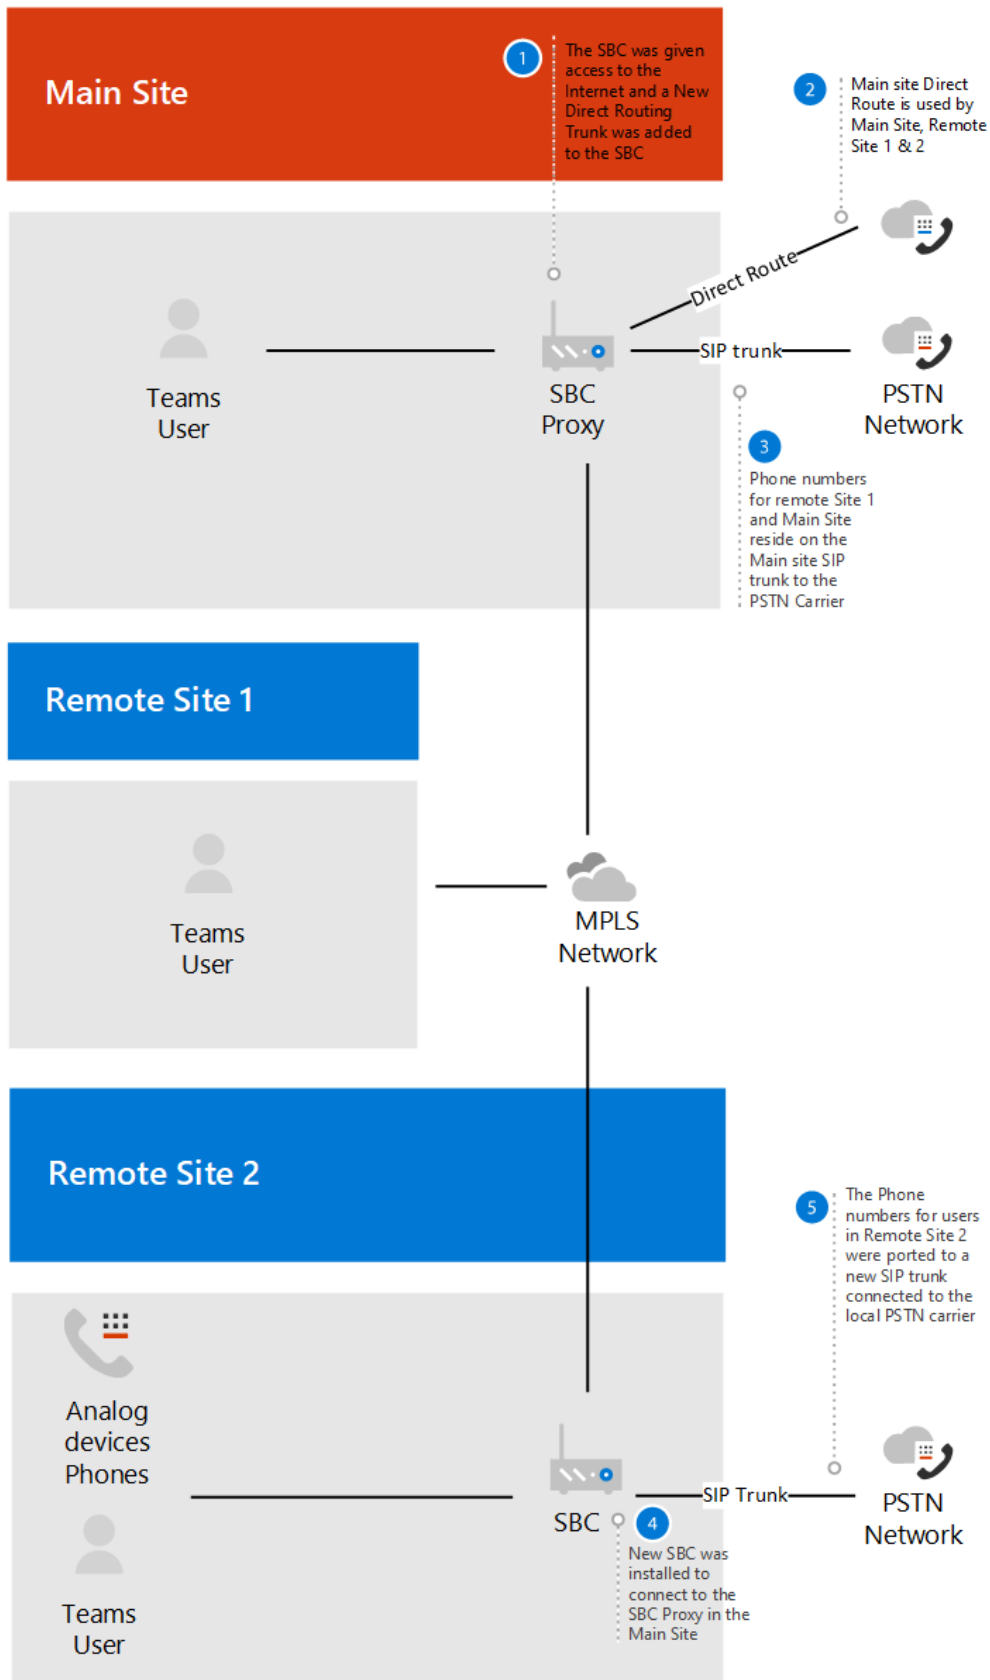

Original legacy deployment

Legacy Site with Remote Sites

Deployment with Direct Routing

Direct Routing with Local Media Optimization

Site Type C: Combination of Skype for Business Enterprise Voice and traditional legacy telephony systems

Contoso Skype for Business Enterprise Voice users' numbers reside on the SIP trunk to the SBC from the carrier. The numbers for the traditional telephony systems resided on the TDM trunk to the PSTN gateway.

Contoso based their decision on the following questions:

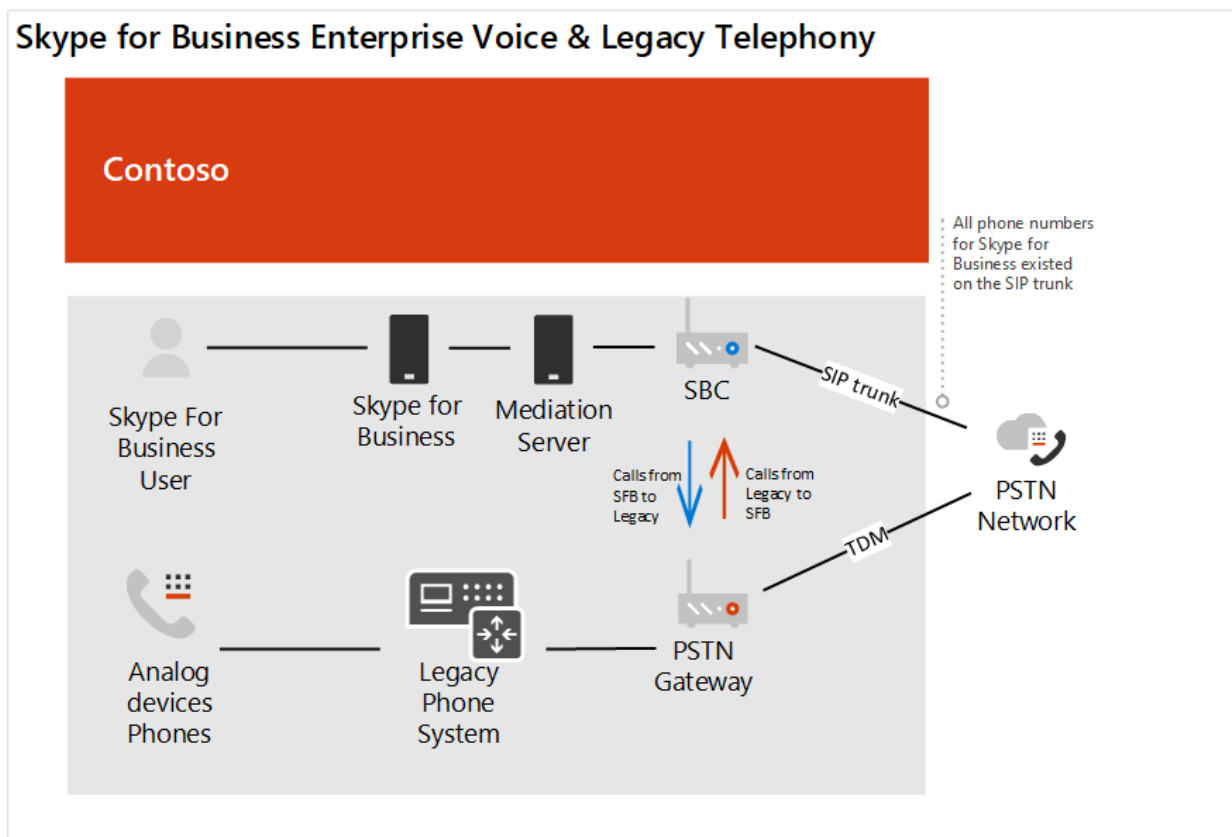

- Q. Do we need to retain functionality provided by our on-premises deployment?
A. No
- Q. Do we need to interoperate with third-party PBX systems and other telephony equipment?
A. No
- Q. Do we need to retain our current third-party carrier?
A. No
- Q. Do we need to get the ROI on SBCs deployed?
A. Yes and No
- Q. Is Microsoft's PSTN Calling Plan available in this region?
A. No

Based on the answers to their questions, Contoso decided on the following:

- For the legacy telephony users that will be enabled for Direct Routing, Contoso ported the numbers from the TDM trunk to the SIP Trunk for the SBC, since the SBC is certified for Direct Routing.
- To support a subset of users moving to Phone System and to allow continued routing through the legacy system, the legacy telephony system was set up as the next hop to the SBC.
- In addition, to encourage user behavior change and remove the dependency on inter- and intra-site extension dialing, Contoso provided guidance to use Teams for all internal calls.

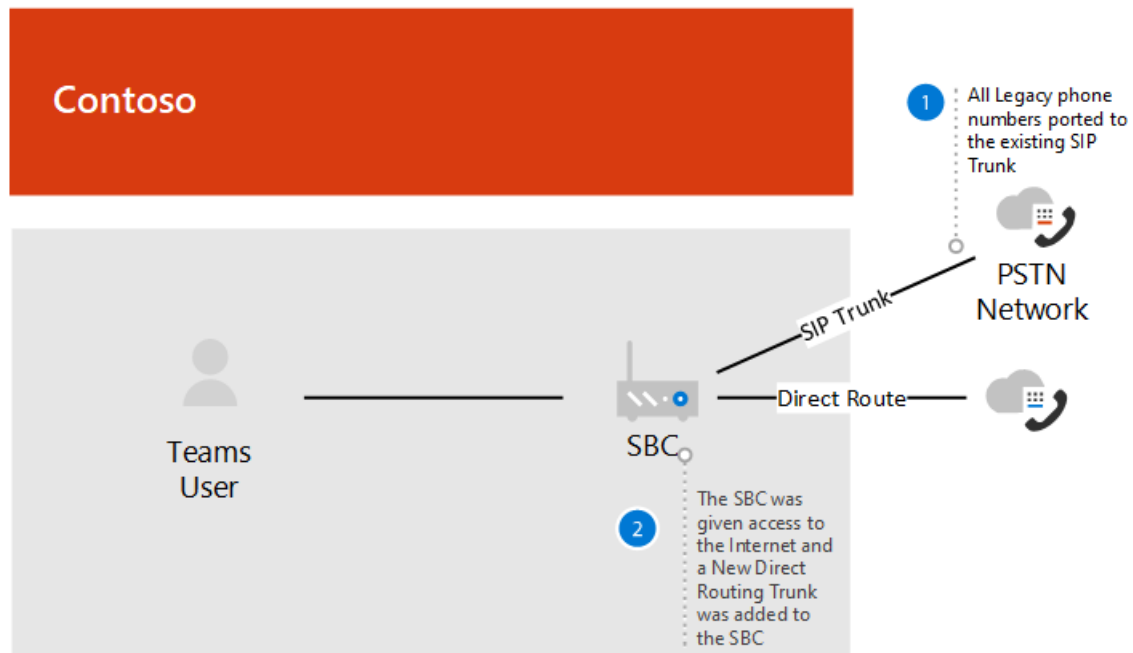

The following diagrams show the original Skype for Business Enterprise Voice and legacy telephony system deployment and the migration to a mixed deployment using Direct Routing:

Original mixed deployment

Mixed deployment with Direct Routing

Mixed Environment End State

Calling Plans

To determine the configuration requirements for Calling Plans, Contoso reviewed the [Calling Plan core deployment decisions](#). The resulting decisions were made:

- Q. Do my users need international calling?
A. Yes
- Q. Do my users each have a direct inward DID phone number?
A. Not today. All users enabled will receive a DID.
- Q. Do I want to mask or disable caller ID?
A. The caller ID for a user will be masked to the local number for Contoso.

Direct Routing

Contoso attended Ignite to stay current on Office 365 features including those available with Phone system and Direct Routing. Technical leadership and architects used the guidance provided during the Ignite 2019 to determine their direction. Key sessions that were used:

- [Plan for success with Microsoft Teams Direct Routing](#)
- [Updates for Direct Routing](#)

Configuration

Calling Plans sites

To obtain licenses and assign phone numbers to users, Contoso followed the steps in [Set up Calling Plans](#).

Due to the number of users that needed to be assigned phone numbers, Contoso decided to use PowerShell to assign the phone numbers. To learn how to assign numbers by using PowerShell—in addition to other settings—Contoso used the [Teams PowerShell Overview](#).

Direct Routing sites

To connect Contoso's on-premises telephony infrastructure to Microsoft Teams, Contoso's administrator followed the steps in [Configure Direct Routing](#) and reviewed the video [Direct Routing in Microsoft Teams](#) for guidance. Contoso also referred to the Direct routing deployment documentation by the certified SBC vendor.

Once Direct Routing was configured between the SBC and Microsoft Phone System, it was necessary for Contoso to test the configuration. To do this, Contoso administrators used the SIP Tester client that was discussed in the [Updates for Direct Routing session at Ignite 2019](#). The SIP Tester client script and documentation was downloaded from the PowerShell script to test Direct Routing Session Border Controller connections.

Local Media Optimization

Contoso saw the opportunity to leverage Local Media Optimization in the different regions across the globe. The supported scenarios for Contoso are described in [Local Media Optimization for Direct Routing](#). The configuration of the local media optimization was completed by following guidance from both the SBC vendor and Microsoft. The configuration steps for Local Media Optimization include:

- Configure the user and SBC sites
- Configure the SBC according to the SBC vendor specification,
- Add external trusted IP addresses to each site used for Local Media Optimization
- Define the network topology
- Define the virtual network topology
- Determine the mode: Always Bypass or Only for local users

Networking considerations

Contoso had a number of users who needed to work remotely for an extended period of time after they were enabled for Phone System. The users used VPN to access certain Line of Business applications. While on VPN, the Phone System users experienced a degradation of call quality.

To resolve the quality issue, Contoso implemented VPN split tunneling, which allowed their Office 365 traffic to traverse the Internet while the connection to the internal apps remained on the VPN. To implement VPN split tunneling, Contoso followed the guidance in [Implementing VPN split tunneling for Office 365](#).

Contoso case study: Location-Based Routing

12/7/2021 • 2 minutes to read • [Edit Online](#)

Location-Based Routing (LBR) is a feature that restricts toll bypass based on policy and the user's physical location at the time of placing or receiving a call.

Overview

Contoso has two offices in a country where it is illegal to bypass the Public Switched Telephone Network (PSTN) provider to decrease long-distance calling costs. The main office has an Internet connection that is used by the main office and by the second office. Each office has their own Session Border Controller (SBC) connected to a PSTN carrier.

In this country, Contoso had LBR configured for their Skype for Business deployment. To determine how to configure LBR for Teams, Contoso read [Plan Location-Based Routing for Direct Routing](#). Contoso determined that Teams and Skype for Business follow the same scenarios on when a call can be placed, when it can be received, when a PSTN call can be transferred to a Teams user, and when you can transfer another Teams user to the PSTN call.

For Skype for Business, LBR was configured with the Session Border Controller (SBC) SIP Trunk connecting to the PSTN carrier. For this SBC, Contoso reviewed the [list of certified SBCs](#) and determined that the SBC deployed is certified for Direct Routing but is not certified for Media Bypass. To support LBR, Direct Routing needs to be configured to the SBC on-site, there needs to be a local Internet egress, and the SBC needs to be configured for Media Bypass. Based on this information, Contoso decided the following:

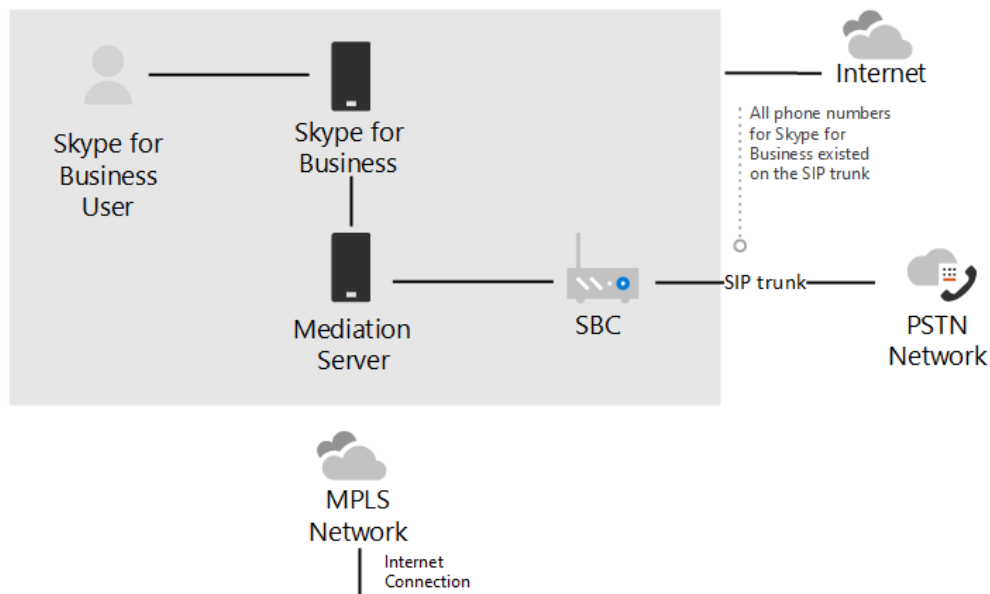

- To delay the enablement of Teams LBR until the existing SBC is certified for Media Bypass.
- Contoso decided to use the main site SBC for the Direct Route to Office 365. The main site SBC will be the proxy SBC for the remote site.
- Contoso used a third-party consultant based in India to assist with certification of the LBR configuration with the telephony company in country.
- To support users working from outside of the office to place PSTN calls, the company issued mobile phone was provided to their employees.

The following diagrams show the before and after deployments for a country with telephony regulations that require Location-Based Routing:

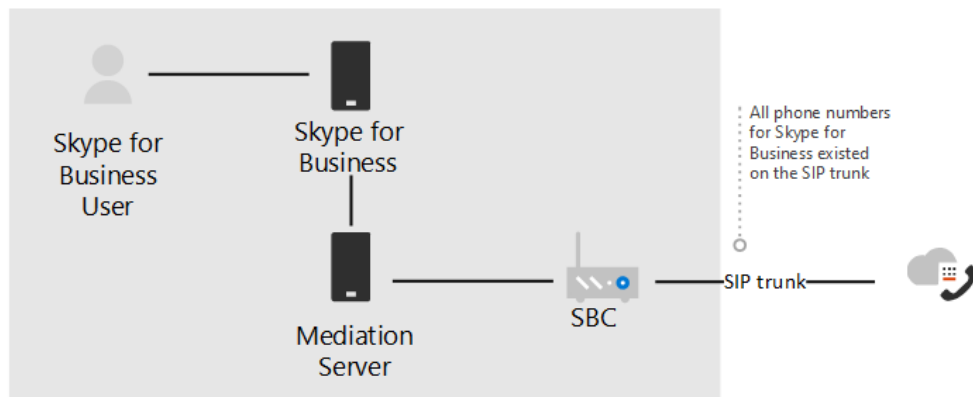

Original deployment

Telephony Regulated Country Requires Location Based Routing

Skype for Business Enterprise Voice Main Site

Skype for Business Enterprise Voice Remote Site

Deployment with Direct Routing

Telephony Regulated Country Local Media Optimization LBR

Main Site

1 The SBC was given access to the Internet and a New Direct Routing Trunk was added to the SBC

2 Main site Direct Route is used by Main Site and Remote Site

3 Phone numbers for remote Site 1 and Main Site reside on the Main site SIP trunk to the PSTN Carrier

PSTN Network

MPLS Network

Remote Site

4 New SBC was installed to connect to the SBC Proxy in the Main Site

5 The Phone numbers for users in Remote Site reside on the SIP Trunk

Teams User

SBC

SIP Trunk

PSTN Network

Configuration:

To configure the network components in Teams, Contoso followed the instructions in [Manage your network topology for cloud voice features](#). Contoso completed the below steps to configure Location-Based Routing:

- Define Network regions - One network region was defined.

- Define Network sites - Two network sites were defined. One site for each office location in the region.
- Define Network subnets - Each floor within an office location has their own subnet for the wired and wireless network. This configuration resulted in 20 subnets for Contoso.
- Define trusted IP addresses - The external facing IP addresses for the SBC were added to the trusted IP address.

Contoso case study: Emergency calling

12/7/2021 • 3 minutes to read • [Edit Online](#)

To understand the availability of emergency calling and terminology related to emergency calling—Emergency Address, Place, Emergency Location, and Registered address—Contoso reviewed [Manage emergency calling](#) and [Plan and configure dynamic emergency calling](#).

In Office 365, a Calling Plan user is automatically enabled for emergency calling. But only Calling Plan users in the United States can use dynamic locations for routing emergency calls.

For Direct Routing, Contoso learned that additional configuration is required for routing emergency calls and possibly for partner connectivity. The administrator must configure connection to an Emergency Routing Service Provider (ERSP) (United States) OR configure the Session Border Controller (SBC) for an Emergency Location Identification Number (ELIN) application.

Contoso has offices in the United States and outside of the United States:

- In the United States, Contoso Calling Plan users can use dynamic locations for routing emergency calls.
- Outside of the United States, Contoso has some sites that use Calling Plans and some sites that are connected to Phone System through Direct Routing.

Emergency calling use cases

After deciding how Contoso will connect to Phone system, Contoso identified the following Emergency calling use cases:

- [Calling Plan user in the United States](#)
- [Calling Plan user outside of the United States](#)
- [User who connects to Phone System through Direct Routing](#)

Calling Plan user in the United States

There are requirements for when the phone number needs to be associated with an emergency location. To understand these requirements, Contoso reviewed [Considerations for Calling Plans](#).

Based on these requirements, Contoso decided to associate the location with the telephone number when a number is assigned to a user in the United States.

Calling Plan user outside of the United States

To understand when a phone number needs to be associated with an emergency location, Contoso reviewed [Considerations for Calling Plans](#). Based on the requirements, Contoso decided the following:

- Contoso will associate the location with the telephone number when a number is assigned to a user in Canada.
- Contoso will assign an emergency location when the phone number is acquired from Office 365 or when a number is transferred from another service provider or carrier.

User who connects to Phone System through Direct Routing

To plan for emergency routing for this use case, Contoso reviewed [Considerations for Direct Routing](#). Because Direct Routing users do not receive emergency calling in the same manner as Calling Plan users, Contoso had to decide on how to provide emergency calling. Direct Routing can be connected to an Emergency Routing Service

Provider (ERSP). Direct Routing can also have an SBC that includes an Emergency Location Identification Number (ELIN).

Emergency Routing Service Provider (ERSP) considerations

The Emergency Routing Service Providers (ERSPs) can automatically route emergency calls based upon the location of the caller.

- If an Emergency Routing Service Provider is integrated into a Direct Routing deployment, emergency calls with a dynamically acquired location will be automatically routed to the Public Safety Answering Point (PSAP) serving that location.
- Emergency calls without a dynamically acquired location are first screened to determine the current location of the user before connecting the call to the appropriate dispatch center based upon the updated location.

ELIN considerations

If an SBC ELIN application is integrated into a Direct Routing deployment, additional configuration steps need to occur to associate the emergency addresses with telephone numbers.

Contoso decided to use Session Border Controllers that include Emergency Location Identification Number (ELIN) applications.

Security desk notification

The ability to notify the security desk when an emergency call is placed is available for both Microsoft Calling Plans and Phone System Direct Routing. Contoso reviewed the details in the Security desk notification to determine if this should be configured at their offices

Contoso decided to use security desk notification.

Configuration

Contoso followed the steps in [Configure dynamic emergency calling](#) to:

- Assign emergency addresses
- Configure network settings
- Configure Location Information Service
- Configure emergency policies
- Enable users and sites
- Test emergency calling

After dynamic emergency calling is configured, Contoso needed to assign the location to the appropriate user.

- To add, change, or remove an emergency location for your organization, Contoso followed the steps in [Add, change, or remove an emergency location for your organization](#)
- To create places for buildings, floors, and offices, Contoso followed the steps in [Add, change, or remove a place for an emergency location](#).
- To assign an emergency location, Contoso followed the steps in [Assign or change an emergency location for a user](#).

Contoso case study: Audio Conferencing

12/7/2021 • 2 minutes to read • [Edit Online](#)

To gain an understanding of audio conferencing—what it is, what it costs, availability, and how it works—Contoso reviewed [Audio Conferencing in Office 365](#).

Overview

For audio conferencing, Contoso used phone numbers that are well known within the organization as well as externally. Because Contoso wanted to maintain these numbers where possible, they reviewed the information on assigning dedicated and shared phone numbers to the audio conferencing bridge.

Based on their research, Contoso made the following decisions:

- Only a segment of the population that regularly host audio conferencing calls would receive Audio Conferencing licenses.
- Contoso would use dedicated phone numbers and port their existing numbers for use with Audio Conferencing.

Because Contoso users were using Skype for Business and all users' mailboxes reside online, many users have existing meetings scheduled. Contoso read [Using the Meeting Migration Service \(MMS\)](#) to learn that existing meetings are updated automatically for Contoso when they change the end user to TeamsOnly mode.

Configuration

Phone numbers that are associated with audio conferencing are referred to as service numbers within Phone System.

- For locations using Calling Plans, to port their existing phone numbers from their phone carrier to Office 365, Contoso followed the steps in [Getting service phone numbers](#).
- To assign the Audio Conferencing license to the end user in the technical pilot, the Contoso administrator followed the steps in [Manage the Audio Conferencing settings for your organization](#).
- For the business pilot and migration, Contoso used group-based licensing by following the steps in [Assign licenses to users by group membership in Azure Active Directory](#).

Contoso case study: Auto attendants and call queues

12/7/2021 • 3 minutes to read • [Edit Online](#)

Contoso was familiar with auto attendants and call queues from their on-premises Skype for Business deployment. To understand how to set up Cloud auto attendants and call queues, they reviewed [Plan for Teams auto attendants and call queues](#).

Requirements depending on site type

Depending on the site type, Contoso had the following needs:

- Site Type A: Traditional legacy telephony systems

Site Type A needed to keep the same phone number associated with the receptionist as the number for their auto attendants. The key departments for each of these sites would have their own call queues that would route to team members. There was a mixture of sites that used Phone System with Direct Routing and Phone System with Calling Plans.

- Site Type B: Skype for Business Enterprise Voice

Site Type B had existing auto attendants and call queues that needed to migrate to Teams. Contoso needed to keep the phone numbers associated with the auto attendants. Contoso moved the majority of these sites to Phone System with Calling Plans. However, in the few locations where Calling Plans was not available, Contoso moved these sites to a Direct Routing configuration.

- Site Type C: Skype for Business Enterprise Voice & traditional legacy telephony system

Site Type C had existing auto attendants that resided in the traditional legacy telephony system. The decisions and configurations for this site were the same as Site Type A.

- For all site types, Contoso asked the following questions:
 - Q: Will we use new or existing numbers? A: Contoso decided to use existing phone numbers to be assigned to the service account for the auto attendant.
 - Q: When will the auto attendant be available to accept incoming calls? A: Contoso decided to set business hours and have calls received after business hours redirected to an "after-hours" auto attendant.
 - Q: How will the calls be routed to members in a call queue: attendant, serial, or round robin routing? A: Contoso decided to use Attendant routing,
 - Q: How will we determine when a user should or should not get a call? A: Contoso decided to use call handling options to determine if the agent is available: presence-based routing.

Configuration

The steps to set up an auto attendant and a call queue include the following outlined in [Manage resource accounts](#):

1. Obtain a service number.
2. Obtain a free Phone System -Virtual User license or a paid Phone System license to use with the resource

account or a Phone System license.

3. Create the resource account. An auto attendant or call queue is required to have an associated resource account.
4. Assign the Phone System or a Phone System - Virtual user license to the resource account. For more information, see [Microsoft 365 Phone System – Virtual User license](#).
5. Assign a service phone number to the resource account you assigned licenses to.
6. Create a Phone System call queue or auto attendant
7. Link the resource account with a call queue or auto attendant.

Sites with Phone System with Direct routing

Contoso had to set up the phone number provided by the local carrier as the service number in Office 365.

- To set up a phone number available through Direct Routing, Contoso followed the instructions located in [Manage Resource Accounts](#). Because Office 365 is not aware of the on-premises phone numbers, Contoso used PowerShell to complete the setup.
- To configure the Cloud auto attendant, Contoso followed the steps outlined in [Set up a Cloud auto attendant](#).
- To set up a Cloud call queue, Contoso followed the steps outlined in [Create a Cloud call queue](#).

Sites with Phone System with Calling plan

Contoso had to port the phone number that was used for Skype for Business Enterprise Voice auto attendants to Office 365 Phone System. This allowed the same number to be assigned as a service number for use as an auto attendant.

- To port the phone number, Contoso followed the instructions in [Transfer phone numbers to Teams](#) and obtained additional guidance at [Manage phone numbers for your organization](#).
- To configure a Cloud auto attendant, Contoso followed the steps outlined in [Set up a Cloud auto attendant](#).
- To set up a Cloud call queue, Contoso followed the steps outlined in [Create a Cloud call queue](#).

Phone number management for Australia

12/7/2021 • 2 minutes to read • [Edit Online](#)

In Australia, we've partnered with Telstra for the purchase and provisioning of Calling Plans for customers with a billing address in Australia. Telstra will sell their Calling Plans and provide Australian user numbers. Telstra provides the support for phone number management for both user and service numbers for auto attendants and call queues. However, service numbers and licenses for Audio Conferencing will still be sold and managed by Microsoft 365 and Office 365.

For more information on the [Telstra Calling](#).

Use this table to find information on getting and managing phone numbers in Australia for Microsoft Teams.

For more information, see [Manage phone numbers for your organization](#).

WHAT YOU WANT TO DO?	DO THESE STEPS AND DOWNLOAD THE CORRECT FORMS
Get new user phone numbers for Calling Plans in Australia.	Contact Telstra Calling for new phone numbers for your users. They'll then add those numbers to your organization so you can assign them to your users.
If you're utilizing Telstra Calling, you might get new service phone numbers that can be used with Cloud auto attendants and call queues for Australia from Telstra.	Contact Telstra Calling for new phone numbers. They'll then add those numbers to your organization so you can assign them to your auto attendants and call queues. If you aren't using Telstra Calling, you might contact our Microsoft Number Management Service desk to obtain service numbers from Microsoft. Contact the TNS Service Desk for instructions and we will assist you as soon as possible.
Get new service phone numbers for Audio Conferencing in Australia.	Contact TNS Service Desk .
Get phone numbers transferred to Microsoft 365 or Office 365 for users, auto attendants, and call queues.	Contact Telstra Calling to transfer phone numbers. They'll then add those numbers to your organization.
Get phone numbers transferred to Microsoft 365 or Office 365 for use with Audio Conferencing.	Contact the TNS Service Desk for instructions
Change emergency addressing assigned to users that have a Call Plan phone number.	Contact Telstra Calling to make emergency address changes. They can update this information for you.
Change a user number to a service number.	Supported when using Telstra Calling.
Make directory service updates to call queue or auto attendant numbers	To add or change call queue or auto attendant numbers, contact the TNS Service Desk for instructions .

Phone number management for the United States

12/7/2021 • 2 minutes to read • [Edit Online](#)

Use this table to find information on getting and managing phone numbers in the United States (including Puerto Rico) for Microsoft Teams.

For more information, see [Manage phone numbers for your organization](#).

WHAT YOU WANT TO DO?	DO THESE STEPS AND DOWNLOAD THE CORRECT FORMS
Get new user or service phone numbers that aren't listed in the Microsoft Teams admin center.	<p>Download this form.</p> <p>New phone number request for the United States (v.5.0) (en-us)</p> <p>Fill it out and contact the TNS Service Desk for instructions.</p>
Get phone numbers transferred to us.	<p>Download one of these forms:</p> <p>Letter of Authorization (LOA) for the United States (user and service numbers) (v.3.3)(en-us)</p> <p>Letter of Authorization (LOA) for the United States (toll free numbers) (v.3.3)(en-us)</p> <p>Note If you are trying to get more than 999 subscriber or user phone numbers, you will need to fill out a Letter of Authorization (LOA) and send it to us. See Transfer phone numbers to Teams for more information.</p> <p>Fill it out and contact the TNS Service Desk for instructions.</p>
Change a user's number to a service number or a service number to a user's number	<p>Log into the Teams Admin Center, go to the "Phone Numbers" page, and select Get phone number support.</p>
Transfer numbers from one Microsoft 365 or Office 365 to another.	<p>Contact the TNS Service Desk for instructions regarding the list of user (subscriber) phone numbers you want to transfer along with the PIN of the source organization where you want to transfer the numbers from. To set up a PIN, see here.</p>
Make directory service updates to call queue or auto attendant numbers	<p>To add or change call queue or auto attendant numbers, contact the TNS Service Desk for instructions.</p>

Toll-free dialing limitations and restrictions

12/7/2021 • 2 minutes to read • [Edit Online](#)

This will help you find out how to dial toll free numbers in each country or region. After you select the country/region, it will take you to a page that contains where toll free service is available including specific details, restrictions, and limits. The dialing format or formats will show you the required access codes within each country/region to dial the toll-free number.

If you're ready, select a country or region:

Select your country or region to see the dialing codes, limitations and restrictions.

Here are some important things for you to remember about toll free numbers:

- **Toll free numbers only operate within each country/region.** For example, your users won't be able to call an Australian toll-free number outside of Australia.
- **Acquiring or porting Universal International Freephone Numbers (UIFN) isn't supported.**
- **In many countries/regions, the regulator/telecommunication agency in the country/region requires each toll free phone number to maintain at least 100 minutes of usage per month in order to retain the number.**

NOTE

In the event you get a toll free number and the usage of the number doesn't meet these minimum requirements, Microsoft may be compelled by the regulator/telecommunication agency to reclaim the number from you.

- **Wireline, fixed line, and mobile network access to toll-free numbers may be fully or partially restricted.** The dialing format describes the required access codes within each country/region to place calls using the toll free number.
- **North America Numbering Plan Toll Free Numbers:** Per-minute rates for North America Numbering Plan toll free numbers are determined by the originating country. The toll free per-minute rate for calls that originate from the United States map to the rate defined as "North America." However, calls that originate from other North American countries such as Canada, Puerto Rico, etc. have specific toll free rates.

NOTE

If you need to get more telephone numbers than this, please [contact support for business products - Admin Help](#)

Island/territory covered	American Samoa, Anguilla, Antigua and Barbuda, Bahamas, Barbados, Bermuda, British Virgin Islands, Canada, Cayman Islands, Dominica, Dominican Republic, Grenada, Guam, Jamaica, Montserrat, Northern Mariana Islands, Puerto Rico, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Sint Maarten, Trinidad and Tobago, Turks and Caicos Islands, United States, United States Virgin Islands
Wired/fixed line availability	Yes
Mobile network availability	Yes
Comments, restrictions, and access issues	None

NOTE

Dialing Formats:

- 800-389 are special and for Bahamas
- 800-534 are special and for Barbados
- 800-623 are special and for Bermuda
- 800-415 or 907 or 751 are for the Dom Republic
- 800-271 are special and for Trinidad
- 800-555 is the deaf line range

IMPORTANT

North America Numbering Plan Toll Free Numbers: Per-minute rates for North America Numbering Plan toll free numbers are determined by the originating country. The toll free per-minute rate for calls that originate from the United States map to the rate defined as "North America." However, calls that originate from other North American countries such as Canada, Puerto Rico, etc. have specific toll free rates.

What are Communications Credits?

12/7/2021 • 5 minutes to read • [Edit Online](#)

Communications Credits are a convenient way to pay for Audio Conferencing and Calling Plan minutes. It helps ensure you and your users are never caught without being able to:

- Add toll-free numbers to use with Audio Conferencing meetings, auto attendants, or call queues. Toll-free calls are billed per minute and require a positive Communications Credits balance.
- Dialing out from an Audio Conference meeting to add someone else from anywhere in the world.
- Dialing out from an Audio Conference meeting to your mobile phone with the Microsoft Teams app or Skype for Business app installed to destinations that aren't already included in your subscription.
- Dial any international phone number when you have **Domestic Calling Plan** subscriptions.
- Dial international phone numbers beyond what is included in a **Domestic and International Calling Plan** subscription.
- Dial out and pay per minute once you have exhausted your monthly minute allotment.

NOTE

Outbound calls to some destinations may be included in your Audio Conferencing subscription. Please check your subscription information for details.

NOTE

If your organization is located in a different region than the billing address of your Enterprise Agreement (EA), you might not be able to purchase Communications Credits. If you are unable to acquire Communications Credits, open a support incident from the portal and we will work with you to mitigate this issue until a permanent solution is in place.

What are the Communications Credits rates?

If you're wondering what the cost of the calls are for Calling Plans, see [Cloud-Based Phone System for Voice Calling](#) (scroll down to "See rates for where you want to call").

What is it?

To use toll-free numbers, Communications Credits are required as these calls are billed per minute. Also, we recommend that you set up Communications Credits for your Calling Plan and Audio Conferencing users who need the ability to dial out to **any PSTN destination**. Many countries/regions are included, but some destinations may not be included in your Calling Plan or Audio Conferencing subscriptions. If you don't set up Communications Credits or assign a license to your users and you run out minutes for your organization (depending on your Calling Plan, Audio Conferencing plan, or your country/region), those users won't be able to make calls or dial out from Online Audio Conferencing meetings.

NOTE

You must set up Communications Credits and then assign a Communications Credits license for each user in the **Microsoft 365 admin center > Users > Active Users**. Communications Credits licenses will appear as unlimited in quantity as they are used to grant access to the Communications Credits balance for any user to which you assign the Communications Credits license.

It's recommended that you carefully evaluate your organization's PSTN Service usage in order to understand the best setup for Communications Credits. You can see more about PSTN services by reading [Phone System and Calling Plans](#) and [Audio Conferencing common questions](#).

You can set up consumption billing using a **one-time funding** of the pre-paid balance **OR** by setting up an **auto-recharge (recommended)** amount with a minimum balance that will trigger a purchase for that recharge amount. Initially, it's suggested that you set up auto recharge amounts that allow you to monitor actual usage and find the right auto recharge thresholds that meet your needs and usage patterns. Communications Credits should be monitored over time and then adjust the minimum balance and recharge amounts as needed to be tailored for each organization's needs.

NOTE

You can see the plans and pricing by [signing in to the Microsoft 365 admin center](#) and going to **Billing > Subscriptions > Add subscriptions**.

In the **Microsoft 365 admin center > Billing > Purchase Services > Add Ons** you can select Communication Credits to add the credits, and you can add credit manually at any time. You can also enable the **Auto-recharge** option, which will allow automatic account refills when the balance falls below the threshold that you set. If you choose to fund your Communications Credits balance with a one-time amount and then the balance falls to zero, the additional calling scenarios above will no longer work, including toll-free phone numbers. As such, it's recommended that you use the **Auto-recharge** setting to avoid any disruption of service should your Communications Credits balance reach 0 (zero). You may view your current Communication Credits balance by going to **Billing > Your products > Communications Credits**.

NOTE

You will be sent emails to **all users** with Lync Service Administrator, Company Administrator, Billing Administrator, Company Administrator, User Account Administrator, Helpdesk Administrator, Service Support Administrator, Billing Administrator, Lync Service Administrator, Device Administrators, Application Administrator, License Administrator, Cloud Device Administrator, Authentication Administrator, Privileged Authentication Administrator, Teams Communications Administrator, Teams Communications Support Engineer, Teams Communications Support Specialist, Teams Administrator admin roles, when recharge transactions succeed, recharge transactions fail (such as an expired credit card), and or your Communications Credits balance reaches 0 (zero).

Communications Credits

Each organization will have a different usage of Calling Plans volume and rates to consider. You will need to get this type of usage data from your current service provider. For organizations using Teams already as their service provider, you can get usage data by reviewing it in the Microsoft Teams admin center > **Analytics & reports > Usage reports**, and then select **PSTN and SMS (preview)usage**.

When you are setting up Communications Credits, you will need to investigate call usage for your organization to determine the amounts that you will need to put in. You can get call usage information by reviewing the PSTN usage report. This report lets you export the call data records to Excel and create custom reports.

Important notifications related to the Communication Credits balance of your organization will be sent to the following admins:

- Billing Administrator
- Skype for Business Administrator
- Company Administrator
- User Account Administrator
- Helpdesk Administrator
- Service Support Administrator
- Device Administrators
- Application Administrator
- License Administrator
- Cloud Device Administrator
- Authentication Administrator
- Privileged Authentication Administrator
- Teams Communications Administrator
- Teams Communications Support Engineer
- Teams Communications Support Specialist
- Teams Administrator

NOTE

Communications Credits are also used for premium rate numbers. The caller pays the charges.

Recommended funding amounts

We recommended that you begin by using a small funding amount, which for smaller organizations could be even the minimum of \$50. After you gather a month or two of PSTN usage using the PSTN usage details report, you'll be able to adjust the amounts to meet the normal usage in your organization.

If you're ready to set this all up, see [Set up Communications Credits for your organization](#).

Want to know about plans and pricing?

You can see the plans and pricing by visiting one of the following links:

- [Calling Plans](#)
- [Audio Conferencing](#)
- [Phone System](#)

You can also see information about pricing by [signing in to the Microsoft 365 admin center](#) and going to **Billing > Purchase Services**.

To see a table with the license or licenses you will need for each feature, see [Microsoft Teams add-on licensing](#).

Related topics

[Teams PSTN usage report](#)

Set up Communications Credits for your organization

12/7/2021 • 5 minutes to read • [Edit Online](#)

You will need to set up Communications Credits if you would like to use toll-free numbers with Skype for Business and Microsoft Teams. Also, we recommend that you set up Communications Credits for your Calling Plans (Domestic or International) and Audio Conferencing users who need the ability to dial out to **any destination**. Many countries/regions are included, but some destinations may not be included in your Calling Plan or Audio Conferencing subscriptions. If you don't set up Communications Credits billing and assign a **Communications Credits** license to your users and you run out minutes for your organization (depending on your Calling Plan or Audio Conferencing plan in your country/region), those users won't be able to make calls or dial out from Audio Conferencing meetings. You can get more information, including recommended funding amounts, by reading [What are Communications Credits?](#)

NOTE

To find out how much it costs, [see the rates here](#).

Step 1: Assign an Audio Conferencing or Calling Plan license to your users

When you sign up, you get a certain number of minutes depending on your country/region. You can search for your country or region in the [Country or region availability list for Audio Conferencing and Calling Plans](#) to see the number of minutes you will get. After you use those minutes, calls will be disconnected. To prevent this from happening, you need to set up Communications Credits.

To do so, you need to assign an **Audio Conferencing** or **Phone System** license to your users.

- Assign an **Audio Conferencing** license to your users. See [Assign Microsoft Teams add-on licenses](#).

After you assign this license, you will need to set up audio conferencing. For step-by-step instructions, see [Try or purchase Audio Conferencing in Microsoft 365 or Office 365](#).

- Assign **Phone System** and a **Domestic or Domestic and International** Calling Plan license to your users. See [Assign Microsoft Teams add-on licenses](#).

NOTE

Although it's not required for Communications Credits, you still need to also assign a **Domestic Calling Plan** or a **Domestic and International Calling Plan** license.

After you assign these licenses, you will need to get your phone numbers for your organization, and then assign those numbers to the people in your organization. For step-by-step instructions, see [Set up Calling Plans](#).

For more information, see [Microsoft Teams add-on licensing](#)

Step 2: Set up Communications Credits for your organization

1. Sign in to the [Microsoft 365 admin center](#) with your work or school account.
2. In the left navigation of the Microsoft 365 admin center, go to **Billing > Purchase Services**. Scroll down and select **Add-Ons**.
3. Select **Communications Credits**.
4. On the **Communications Credits** subscription page, fill in your information, and then click **Next**:

- **Add funds** Enter the amount that you want to add to your account. If you don't enable auto-recharge, once these funds are depleted, calling capabilities that are enabled using Communications Credits will be disrupted (such as inbound toll-free service). To avoid having to manually replenish your Communications Credits balance each time your balance reaches 0 (zero), we recommend you enable the auto-recharge feature.
- **Auto-recharge** Enabling auto-recharge will automatically refill your account when the balance falls below the threshold that you set.

It's recommended that you use the **Auto-recharge** setting to avoid any disruption of service should your Communications Credits balance reach 0 (zero). You will be sent an email when recharge transactions succeed, when recharge transactions fail (such as an expired credit card), and when your Communications Credits balance reaches 0 (zero).

- **Recharge amount** Enter the amount in the **Recharge with** box that you want added to your account once it reaches the trigger amount below.
- **Trigger amount** Enter the amount in **When the balance falls below** box that will be used to 'trigger' the auto-recharge. Once your balance falls below this amount, the recharge amount will be added automatically to your account.

NOTE

Funds will be applied only to Communications Credits at Microsoft published rates when the services are used. Any funds not used within 12 months of the purchase date will expire and be forfeited.

When using the auto-recharge function, invoicing for Communication Credits is generated when the trigger amount is reached and a recharge transaction is processed. Communication credit amounts are used in a first in first out manner. To learn how to check your monthly usage, read [Microsoft Teams PSTN usage report](#).

5. Enter your payment information and click **Place order**.

IMPORTANT

If you are a volume licensing customer, you may choose your enterprise agreement number for payment. If you have multiple enterprise agreement numbers, you will be able to select which enterprise agreement you would like to use for payment. You will also be given an opportunity to specify a purchase order number to associate with the enterprise agreement number (if applicable).

Each organization will have a different usage of Calling Plan volume and rates to consider. You will need to get this type of usage data from your current service provider. Organizations already using Skype for Business Online or Microsoft Teams as their service provider can get usage data by reviewing it in the **Microsoft Teams admin center > Analytics & reports > Usage reports > PSTN and SMS (preview) usage report**.

When you are setting up Communications Credits, you will need to investigate call usage for your organization to determine the amounts you need. You can get call usage information by reviewing the **PSTN and SMS (preview) usage report**. This report lets you export the call data records to Excel if you need to store the data

or create custom reports. To learn how to see usage, read [Microsoft Teams PSTN usage report](#).

Step 3: Assign a Communications Credits license to users

1. Sign in to the [Microsoft 365 admin center](#) with your work or school account.
2. In the left navigation of the Microsoft 365 admin center, go to **Users > Active users**, and then select a user from the list.
3. Choose **Licenses and Apps**.
4. Toggle **Communications Credits** to **On** to assign this license, and then select **Save**.

NOTE

Even if you have users who are assigned an **Enterprise E5** license, it's still recommended that you do this.

TIP

You can use [Powershell](#) to assign licenses and apps to multiple users with one command.

Want to know about plans and pricing?

You can see the plans and pricing by visiting one of the following links:

- [Calling Plans](#)
- [Audio Conferencing Plans](#)
- [Phone System Plans](#)

You can also see information by [signing in to the Microsoft 365 admin center](#) and going to **Billing > Subscriptions > Add subscriptions**.

To see a table with the license or licenses you will need for each feature, see [Microsoft Teams add-on licensing](#).

Related topics

Add funds and manage Communications Credits

12/7/2021 • 2 minutes to read • [Edit Online](#)

Communications Credits are a convenient way to pay for Phone System and Calling Plans in Microsoft 365 or Office 365. Communication Credits helps ensure that you and your users are never caught without being able to:

- Dial in to Audio Conferencing meetings using toll-free dial-in phone numbers.
- Dial out from an Audio Conferencing meeting to add someone else from anywhere in the world.
- Dial out from an Audio Conferencing meeting to your mobile phone with the Skype for Business or Microsoft Teams app installed.
- Dial any international phone number when you have a **Domestic Calling Plan**.
- Dial out and pay per minute once you have exhausted your monthly minute allotment.

NOTE

If you're wondering how much it is and the rates, see the rates table on the [Calling Plans](#) page.

As admin, you can add funds manually or you can set up auto-recharge, which we **recommend**.

Auto-recharge automatically tops off your balance when it falls below the trigger amount you set. We recommend using auto-recharge so you don't have to remember to add funds manually. When your balance hits the trigger amount, funds are added automatically. If you don't choose auto-recharge, you run the risk of your balance falling below zero. At that point, you and your users won't be able to make toll-free calls or international calls.

You can update your payment options at any time. On the **Subscriptions** page, select **Communications Credits**, and make your updates.

Funds will be applied only to Communications Credits at Microsoft's published rates when the services are used. Any funds not used within 12 months of the purchase date will expire and be forfeited.

TIP

We'll send you email notifications when funds are added via auto-recharge, when auto-recharge fails (for example, when a credit card expires), and when your balance reaches zero.

For more information, see [What are Communications Credits?](#)

Want to know about plans and pricing

You can see the plans and pricing by visiting one of the following links:

- [Calling Plans](#)
- [Audio Conferencing plans](#)
- [Phone System plans](#)

You can also see information by signing in to the Microsoft 365 admin center and going to **Billing > Subscriptions > Add subscriptions**.

To see a table with the license or licenses you'll need for each feature, see [Microsoft Teams add-on licensing](#).

Microsoft Teams call flows

12/7/2021 • 24 minutes to read • [Edit Online](#)

TIP

Watch this session to learn how Teams leverages your network and how to plan for optimal network connectivity: [Teams Network Planning](#).

Overview

This article describes how Teams uses Microsoft 365 or Office 365 call flows in various topologies. In addition, it describes unique Teams flows that are used for peer-to-peer media communication. The document describes these flows, their purpose, and their origin and termination on the network. For purposes of this article, assume the following:

- Flow X is used by the on-premises client to communicate with the Microsoft 365 or Office 365 service in the cloud. It originates from the customer network, and it terminates as an endpoint in Microsoft 365 or Office 365.
- Flow Y is used by the on-premises client to communicate with a service on the Internet that Microsoft 365 or Office 365 has a dependency on. It originates from the customer network, and it terminates as an endpoint on the Internet.

This article covers the following information:

- **Background.** Provides background information such as networks that the flows may traverse, types of traffic, connectivity guidance from the customer network to Microsoft 365 or Office 365 service endpoints, interoperability with third-party components, and principles that are used by Teams to select media flows.
- **Call flows in various topologies.** Illustrates the use of call flows in various topologies. For each topology, the section enumerates all supported flows and illustrates how these flows are used in several use cases. For each use case, it describes the sequence and selection of flows using a flow diagram.
- **Teams with Express Route optimization.** Describes how these flows are used when Express Route is deployed for optimization, illustrated using a simple topology.

Background

Network segments

Customer network. This is the network segment that you control and manage. This includes all customer connections within customer offices, whether wired or wireless, connections between office buildings, connections to on-premises datacenters, and your connections to Internet providers, Express Route, or any other private peering.

Typically, a customer network has several network perimeters with firewalls and/or proxy servers, which enforce your organization's security policies, and that only allow certain network traffic that you have set up and configured. Because you manage this network, you have direct control over the performance of the network, and we recommend that you complete network assessments to validate performance both within sites in your network and from your network to the Microsoft 365 or Office 365 network.

Internet. This is the network segment that is part of your overall network that will be used by users who are connecting to Microsoft 365 or Office 365 from outside of the customer network. It is also used by some traffic from the customer network to Microsoft 365 or Office 365.

Visited or guest private network. This is the network segment outside your customer network, but not in the public Internet, that your users and their guests may visit (for example, a home private network or an enterprise private network, that does not deploy Teams, where your users and their customers that interact with Teams services may reside).

NOTE

Connectivity to Microsoft 365 or Office 365 is also applicable to these networks.

Microsoft 365 or Office 365. This is the network segment that supports Microsoft 365 or Office 365 services. It is distributed worldwide with edges in proximity to the customer network in most locations. Functions include Transport Relay, conferencing server, and Media Processor.

Express Route (optional). This is the network segment that is part of your overall network that will give you a dedicated, private connection to the Microsoft 365 or Office 365 network.

Types of traffic

Real-time media. Data encapsulated within Real-time Transport Protocol (RTP) that supports audio, video, and screen sharing workloads. In general, media traffic is highly latency sensitive, so you would want this traffic to take the most direct path possible, and to use UDP versus TCP as the transport layer protocol, which is the best transport for interactive real-time media from a quality perspective. (Note that as a last resort, media can use TCP/IP and also be tunneled within the HTTP protocol, but it is not recommended due to bad quality implications.) RTP flow is secured using SRTP, in which only the payload is encrypted.

Signaling. The communication link between the client and server, or other clients that are used to control activities (for example, when a call is initiated), and deliver instant messages. Most signaling traffic uses the HTTPS-based REST interfaces, though in some scenarios (for example, connection between Microsoft 365 or Office 365 and a Session Border Controller) it uses SIP protocol. It's important to understand that this traffic is much less sensitive to latency but may cause service outages or call timeouts if latency between the endpoints exceeds several seconds.

Connectivity to Microsoft 365 or Office 365

Teams requires [connectivity to the Internet](#). Teams endpoint URLs and IP address ranges are listed in [Office 365 URLs and IP address ranges](#). (Note that open connectivity to TCP ports 80 and 443, and to UDP ports 3478 through 3481, is required.) Furthermore, Teams has a dependency on Skype for Business Online, which must also be connected to the Internet.

Teams media flows connectivity is implemented using standard IETF Interactive Connectivity Establishment (ICE) procedures.

Interoperability restrictions

Third-party media relays. A Teams media flow (that is, where one of the media endpoints is Teams) may traverse only Teams or Skype for Business native media relays. Interoperability with a third-party media relay is not supported. (Note that a third-party SBC on the boundary with PSTN must terminate RTP/RTCP stream, secured using SRTP, and not relay it to the next hop.)

Third-party SIP proxy servers. A Teams signaling SIP dialog with a third-party SBC and/or gateway may traverse Teams or Skype for Business native SIP proxies. Interoperability with a third-party SIP proxy is not supported.

Third-party B2BUA (or SBC). A Teams media flow to and from the PSTN is terminated by a third-party SBC.

However, interoperability with a third-party SBC within the Teams network (where a third-party SBC mediates two Teams or Skype for Business endpoints) is not supported.

Technologies that are not recommended with Microsoft Teams

VPN network. It is not recommended for media traffic (or flow 2'). The VPN client should use split tunneling and route Teams media traffic like any external non-VPN user, as specified in [Enabling Lync media to bypass a VPN tunnel](#).

NOTE

Although the title indicates Lync, it is applicable to Teams as well.

Packet shapers. Any kind of packet sniffer, packet inspection, or packet shaper devices are not recommended for Teams media traffic and may degrade quality significantly.

Principles

There are four general principles that help you understand call flows for Microsoft Teams:

- A Microsoft Teams conference is hosted by Microsoft 365 or Office 365 in the same region where the first participant joined. (Note that if there are exceptions to this rule in some topologies, they will be described in this document and illustrated by an appropriate call flow.)
- A Teams media endpoint in Microsoft 365 or Office 365 is used based on media processing needs and not based on call type. (For example, a point-to-point call may use a media endpoint in the cloud to process media for transcription or recording, while a conference with two participants may not use any media endpoint in the cloud.) However, most conferences will use a media endpoint for mixing and routing purposes, allocated where the conference is hosted. The media traffic sent from a client to the media endpoint may be routed directly or use a Transport Relay in Microsoft 365 or Office 365 if required due to customer network firewall restrictions.
- Media traffic for peer-to-peer calls takes the most direct route that is available, assuming that the call doesn't mandate a media endpoint in the cloud (see previous principle). The preferred route is direct to the remote peer (client), but if that route isn't available, then one or more Transport Relays will relay traffic. It is recommended that media traffic shall not transverse servers such as packet shapers, VPN servers, and so on, since this will impact the media quality.
- Signaling traffic always goes to the closest server to the user.

To learn more about the details on the media path that is chosen, see [Understanding Media Flows in Microsoft Teams - BRK4016](#).

Call flows in various topologies

Teams topology

This topology is used by customers that leverage Teams services from the cloud without any on-premises deployment, such as Skype for Business Server or Phone System Direct Routing. In addition, the interface to Microsoft 365 or Office 365 is done over the Internet without Azure Express Route.

paths work, and the best working path is selected. Media (that is, RTP/RTCP packets secured using SRTP) are then sent using the selected candidate pair. The Transport relay is deployed as part of Microsoft 365 and Office 365.

If the local IP address/port candidates or the reflexive candidates have connectivity, then the direct path between the clients (or using a NAT) will be selected for media. If the clients are both on the customer network, then the direct path should be selected. This requires direct UDP connectivity within the customer network. If the clients are both nomadic cloud users, then depending on the NAT/firewall, media may use direct connectivity.

If one client is internal on the customer network and one client is external (for example, a mobile cloud user), then it is unlikely that direct connectivity between the local or reflexive candidates is working. In this case, an option is to use one of the Transport Relay candidates from either client (for example, the internal client obtained a relay candidate from the Transport relay in Microsoft 365 or Office 365; the external client needs to be able to send STUN/RTP/RTCP packets to the transport relay). Another option is the internal client sends to the relay candidate obtained by the mobile cloud client. Note that, although UDP connectivity for media is highly recommended, TCP is supported.

High-level steps:

1. Teams User A resolves URL domain name (DNS) using flow 2.
2. Teams User A allocates a media Relay port on Teams Transport Relay using flow 4.
3. Teams User A sends "invite" with ICE candidates using flow 4 to Microsoft 365 or Office 365.
4. Microsoft 365 or Office 365 sends notification to Teams User B using flow 4.
5. Teams User B allocates a media Relay port on Teams Transport Relay using flow 4.
6. Teams User B sends "answer" with ICE candidates using flow 4, which is forwarded back to Teams User A using Flow 4.
7. Teams User A and Teams User B invoke ICE connectivity tests and the best available media path is selected (see diagrams below for various use cases).
8. Teams Users send telemetry to Microsoft 365 or Office 365 using flow 4.

Within customer network:

Figure 2 - Within customer network

In step 7, peer-to-peer media flow 5 is selected.

Media is bidirectional. The direction of flow 5 indicates that one side initiates the communication from a connectivity perspective, consistent with all the flows in this document. In this case, it doesn't matter which direction is used because both endpoints are within the customer network.

Customer network to external user (media relayed by Teams Transport Relay):

Figure 3 - Customer network to external user (media relayed by Teams Transport Relay)

In step 7, flow 4, from customer network to Microsoft 365 or Office 365, and flow 3, from remote mobile Teams user to Microsoft 365 or Office 365, are selected. These flows are relayed by Teams Transport Relay within Microsoft 365 or Office 365.

Media is bidirectional, where direction indicates which side initiates the communication from a connectivity perspective. In this case, these flows are used for signaling and media, using different transport protocols and addresses.

Customer network to external user (direct media):

Figure 4 - Customer network to external user (direct media)

In step 7, flow 2, from customer network to the Internet (client's peer), is selected.

- Direct media with remote mobile user (not relayed through Microsoft 365 or Office 365) is optional. In other words, customer may block this path to enforce a media path through Transport Relay in Microsoft 365 or Office 365.
- Media is bidirectional. The direction of flow 2 to remote mobile user indicates that one side initiates the communication from a connectivity perspective.

VPN user to internal user (media relayed by Teams Transport Relay)

Figure 5 - VPN user to internal user (media relayed by Teams Transport Relay)

Signaling between the VPN to the customer network is using flow 2'. Signaling between the customer network and Microsoft 365 or Office 365 is using flow 4. However, media bypasses the VPN and is routed using flows 3 and 4 through Teams media relay in Microsoft 365 or Office 365.

VPN user to internal user (direct media)

Figure 6 - VPN user to internal user (direct media)

Signaling between the VPN to the customer network is using flow 2'. Signaling between the customer network and Microsoft 365 or Office 365 is using flow 4. However, media bypasses the VPN and is routed using flow 2 from the customer network to the Internet.

Media is bidirectional. The direction of flow 2 to the remote mobile user indicates that one side initiates the communication from a connectivity perspective.

VPN user to external user (direct media)

Figure 7 - VPN user to external user (direct media)

Signaling between the VPN user to the customer network is using flow 2' and using flow 4 to Microsoft 365 or Office 365. However, media bypasses VPN and is routed using flow 6.

Media is bidirectional. The direction of flow 6 to the remote mobile user indicates that one side initiates the communication from a connectivity perspective.

Use Case: Teams to PSTN through Microsoft 365 or Office 365 Trunk

Microsoft 365 and Office 365 have a Phone System that allows placing and receiving calls from the Public Switched Telephone Network (PSTN). If the PSTN trunk is connected using the Phone System Calling Plan, then there are no special connectivity requirements for this use case. (If you want to connect your own on-premises PSTN trunk to Microsoft 365 or Office 365, you can use Phone System Direct Routing.)

Figure 8 - Teams to PSTN through Office 365 Trunk

Use case: Teams meeting

The audio/video/screen sharing (VBSS) conferencing server is part of Microsoft 365 and Office 365. It has a public IP address that must be reachable from the customer network and must be reachable from a Nomadic Cloud client. Each client/endpoint needs to be able to connect to the conferencing server.

Internal clients will obtain local, reflexive, and relay candidates in the same manner as described for one-to-one calls. The clients will send these candidates to the conferencing server in an invite. The conferencing server does not use a relay since it has a publicly reachable IP address, so it responds with its local IP address candidate. The client and conferencing server will check connectivity in the same manner described for one-to-one calls.

Note that:

Business client using flow 4.

Media relayed by Skype for Business Media Relay in federated tenant

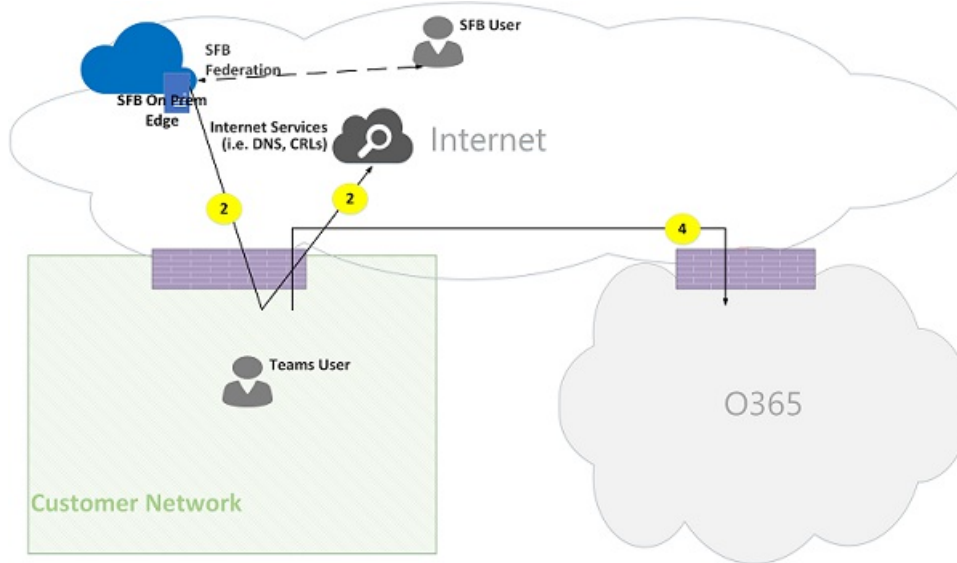

Figure 11 - Media relayed by Skype for Business Media Relay in federated tenant

Note that:

- Signaling and media from the federated Skype for Business client to an on-premises Skype for Business Server is out of scope of this document. However, it is illustrated here for clarity.
- Signaling between Teams and Skype for Business is bridged by a Gateway.
- Media in this case is relayed by Skype for Business on-premises Media Relay to the customer network using flow 2. (Note that traffic from Teams user to the remote Media Relay in the federated customer network will be initially blocked by the Media Relay until traffic in the reverse direction starts to flow. However, the bidirectional flow will open connectivity in both directions.)

Direct (peer-to-peer)

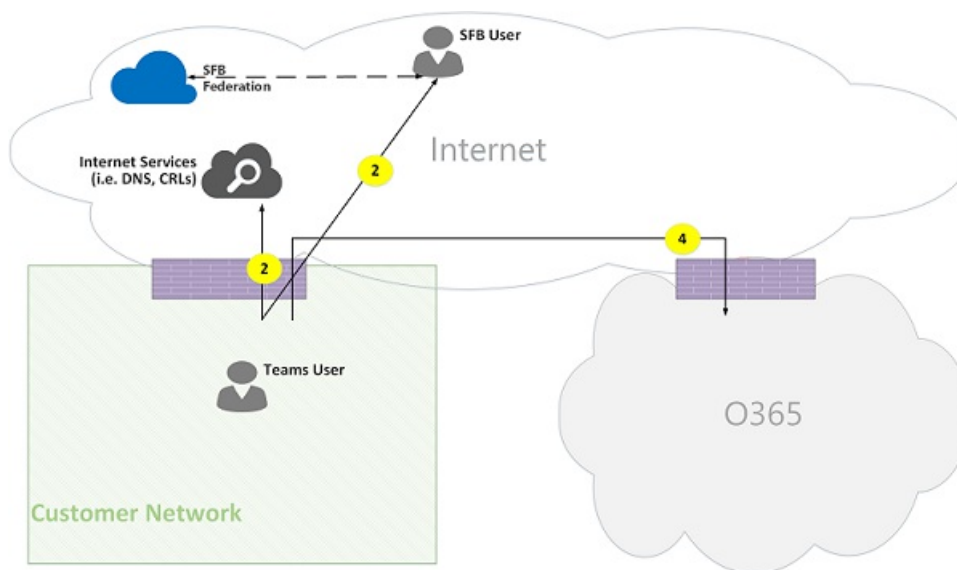

Figure 12 - Direct (peer-to-peer)

Teams hybrid topology

This topology includes Teams with a Skype for Business on-premises deployment.

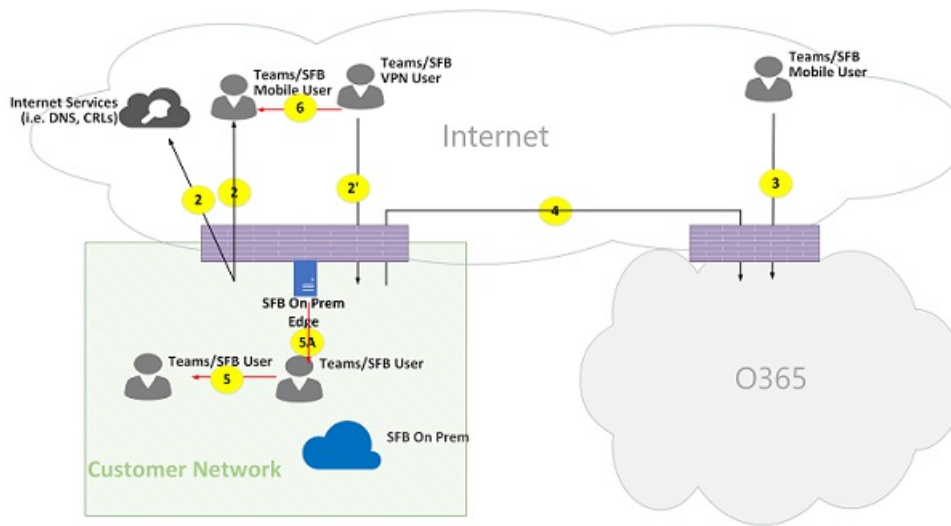

Figure 13 - Teams hybrid topology

- The direction of the arrows on the diagram above reflect the initiation direction of the communication that affects connectivity at the enterprise perimeters. In the case of UDP for media, the first packet(s) may flow in the reverse direction, but these packets may be blocked until packets in the other direction will flow.
- Teams is deployed side by side with Skype for Business Online, hence clients are displayed as "Teams/SFB user."

Additional flow (on top of Teams topology):

- **Flow 5A** – Represents a peer-to-peer media flow between a Teams user within the customer network and a Skype for Business on-premises media relay at the customer network edge.

Use case: Teams to Skype for Business one-to-one

Hybrid within the customer network

Figure 14 - Hybrid within customer network

Signaling between Teams and Skype for Business is bridged by a gateway. However, media is routed directly peer-to-peer within the customer network using flow 5.

Hybrid customer network with external Skype for Business user – relayed by Microsoft 365 or Office 365

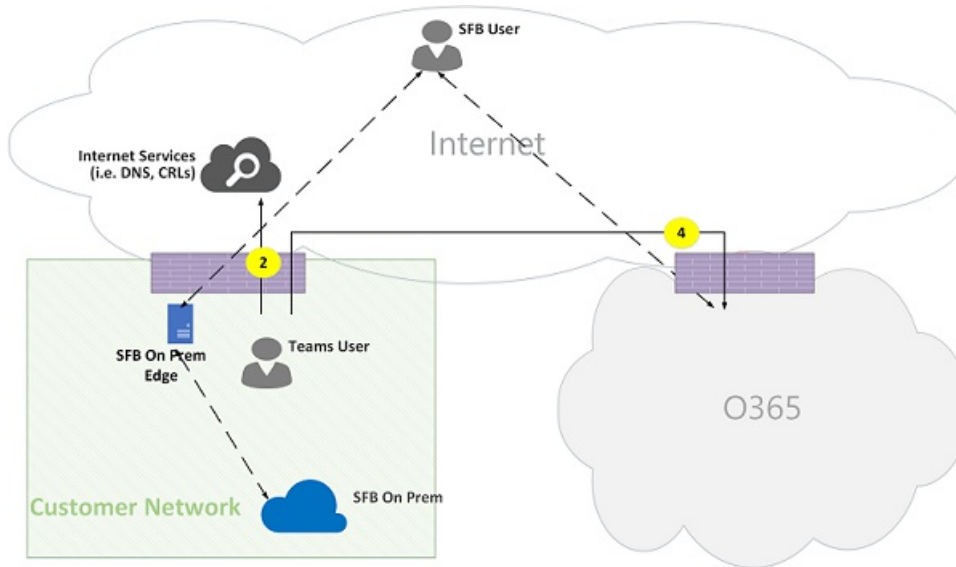

Figure 15 - Hybrid customer network with external Skype for Business user - relayed by Office 365

Note that:

- Signaling and media from the Skype for Business client to an on-premises Skype for Business Server is out of scope of this document. However, it is illustrated here for clarity.
- Signaling between Teams and Skype for Business is bridged by a gateway.
- Media is relayed through Teams Transport Relay to the customer network through flow 4.

Hybrid customer network with external Skype for Business user – relayed by on-premises Edge

Figure 16 - Hybrid customer network with external Skype for Business user - relayed by on-premises Edge

Note that:

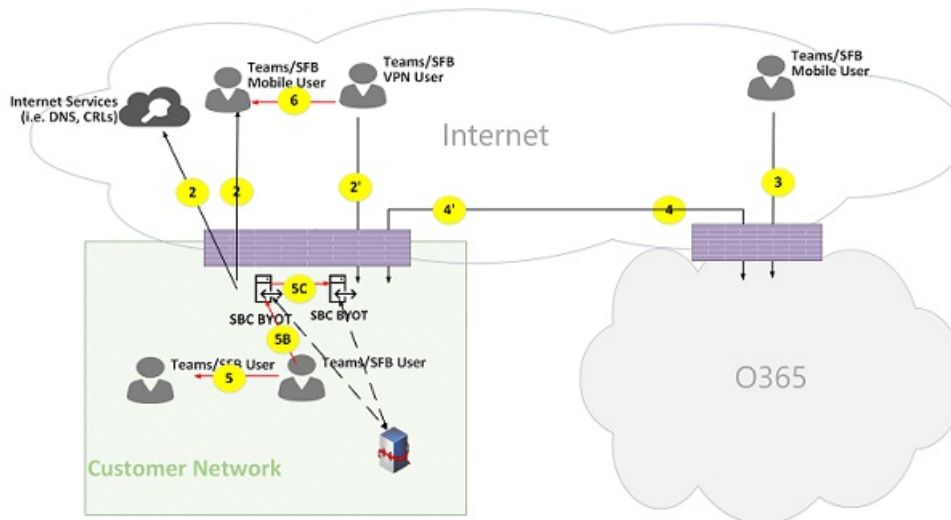

- Signaling and media from Skype for Business client to an on-premises Skype for Business Server is out of scope of this document. However, it is illustrated here for clarity.
- Signaling is bridged by a gateway.
- Media is relayed by Skype for Business Media Relay within Skype for Business on-premises Edge to Teams user within the customer network using media flow 5A.

Teams with Phone System Direct Routing topology

This topology includes Teams with Phone System Direct Routing.

Direct Routing enables you to use a third-party Public Switched Telephone Network (PSTN) service provider by pairing a supported on-premises customer-owned Session Border Controller (SBC) hardware device to Microsoft 365 or Office 365, and then connecting the telephony trunk to that device.

To support this scenario, the customer must deploy a certified SBC for Direct Routing from one of Microsoft's certified partners. The SBC must be configured as recommended by the vendor, and be routable from Microsoft 365 or Office 365 for direct UDP traffic. The media may flow directly from Teams and/or the Skype for Business client to the SBC (bypassing the Teams gateway) or traverse through the Teams gateway. The connectivity with the SBC, when the trunk is configured to bypass the Teams gateway, is based on ICE, where SBC supports ICE-Lite, while the Teams/Skype for Business media endpoint supports ICE Full Form.

*Figure 17 - Teams with Phone System Direct Routing topology

Note that:

- The direction of the arrows on the diagram above reflect the initiation direction of the communication that affects connectivity at the enterprise perimeters. In the case of UDP for media, the first packet(s) may flow in the reverse direction, but these packets may be blocked until packets in the other direction will flow.
- Teams is deployed side by side with Skype for Business Online, hence clients are displayed as "Teams/SFB user."

Additional flows (on top of Teams online topology):

- **Flow 4'** - Represents a flow from Microsoft 365 or Office 365 to the customer network, used to establish a connection between the Teams media server in the cloud with the SBC on premises.
- **Flow 5B** – Represents a media flow between the Teams user within the customer network with the Direct Routing SBC in bypass mode.
- **Flow 5C** – Represents a media flow between the Direct Routing SBC to another Direct Routing SBC in a PSTN hairpin call bypass mode.

Internal user with Direct Routing (media relayed by Teams Transport Relay)

Figure 18 - Internal user with Direct Routing (media relayed by Teams Transport Relay)

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365.
- Signaling and media from the SBC to Microsoft 365 or Office 365 and vice versa use flow 4 and/or flow 4'.
- Signaling and media from the client within the customer network to Microsoft 365 or Office 365 use flow 4.

Remote user with Direct Routing (media is routed through a media server (MP))

Figure 19 - Remote user with Direct Routing (media is routed through a media server (MP))

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365.
- Signaling and media from the SBC to Microsoft 365 or Office 365 and vice versa use flow 4 and/or flow 4'.
- Signaling and media from the client on the Internet to Microsoft 365 or Office 365 use flow 3.

Internal user Direct Routing (media bypass)

Figure 20 - Internal user Direct Routing (media bypass)

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365.
- Signaling from SBC to Microsoft 365 or Office 365 and vice versa use flow 4 and/or flow 4'.
- Signaling from client within the customer network to Microsoft 365 or Office 365 use flow 4.
- Media from client within the customer network to SBC within the customer network use flow 5B.

Remote user with Direct Routing (media bypass relayed by Teams Transport Relay)

Figure 21 - Remote user with Direct Routing (media bypass relayed by Teams Transport Relay)

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365 and Internet.
- Signaling from the SBC to Microsoft 365 or Office 365 and vice versa uses flow 4 and/or flow 4'.
- Signaling from the client on the Internet to Microsoft 365 or Office 365 uses flow 3.
- Media from the client on the Internet to the SBC within the customer network uses flows 3 and 4, relayed by Teams Transport Relay.

Remote user Direct Routing (media bypass direct)

Figure 22 - Remote user Direct Routing (media bypass direct)

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365 and the Internet.
- Signaling from the SBC to Microsoft 365 or Office 365 and vice versa uses flow 4 and/or flow 4'.
- Signaling from the client on the Internet to Microsoft 365 or Office 365 uses flow 3.
- Media from the client on the Internet to the SBC within the customer network uses flow 2.

Direct Routing (media bypass) – PSTN hairpin call (due to call forward/transfer)

Figure 23 - Direct Routing (media bypass) - PSTN hairpin call (due to call forward/transfer)

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365.
- Signaling from the SBC to Microsoft 365 or Office 365 and vice versa uses flow 4 and/or flow 4'.
- The client is out of the signaling and media loop after the call is hairpinned from PSTN to PSTN.
- Media from SBC instance A within the customer network to SBC instance B within the customer network (where, A and B can be the same instance) uses flow 5C.

Direct Routing (media through Microsoft 365 or Office 365) – PSTN hairpin call across two tenants

Figure 24 - Direct Routing (media through Microsoft 365 or Office 365) – PSTN hairpin call across two tenants

Note that:

- The SBC must have a public IP address that is routable from Microsoft 365 or Office 365.
- Signaling from the SBC to Microsoft 365 or Office 365 and vice versa uses flow 4 and/or flow 4'.
- The client is out of the signaling and media loop after the call is hairpinned from PSTN to PSTN.
- Media from SBC instance A within the customer network X to SBC instance B must be relayed through the Microsoft 365 or Office 365 Media Server and can't use bypass mode.

Teams with Express Route optimization

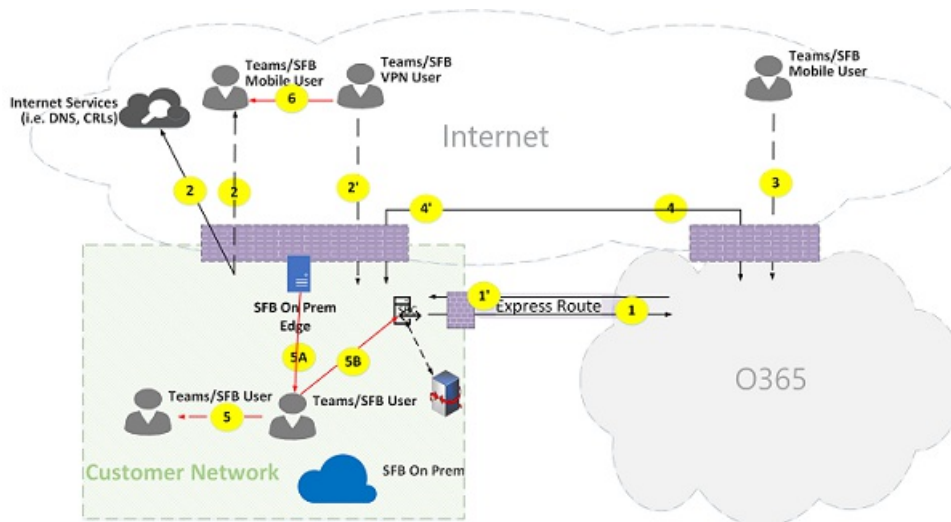

Figure 25 - Teams with Express Route optimization

In the case that Express Route is justified and deployed, then Teams flows could be re-routed from flow 4 to flow 1 and from flow 4' to flow 1'. However, the Teams application has a hard dependency on other Microsoft 365 or Office 365 flows over the Internet using flows 4 and 4'; hence these flows must not be blocked.

Note that Skype for Business hybrid Edge traffic is routed to the Internet and not to Express Route to communicate with external users and federate with other tenants.

To prevent asymmetrical flows, re-routing must be in both directions. In other words, an address within the customer network is routable either through Internet or Express Route, based on optimization, but not through both.

Customer network to external user (media relayed by Teams Transport Relay):

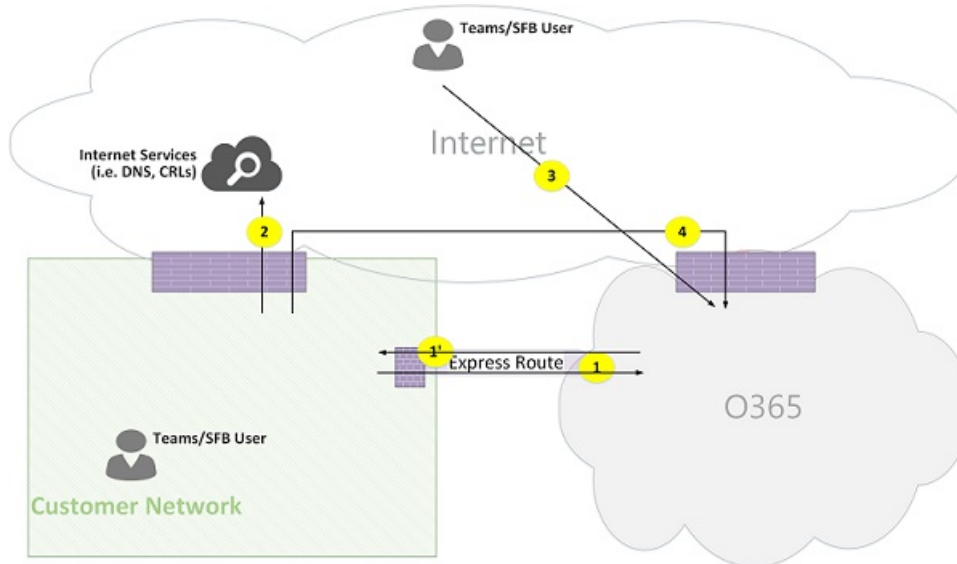

Figure 26 - Customer network to external user (media relayed by Teams Transport Relay)

High-Level Steps:

1. Teams User within customer network resolves URL domain name (DNS) using flow 2.
2. Teams User within customer network allocates a media Relay port on Teams Transport Relay using flow 1.
3. Teams User within customer network sends "invite" with ICE candidates using flow 1 to Microsoft 365 or Office 365.
4. Microsoft 365 or Office 365 sends notification to external Teams user using flow 3.
5. Teams external user allocates a media Relay port on Teams Transport Relay using flow 3.
6. Teams external user sends "answer" with ICE candidates using flow 3, which is forwarded back to Teams user A using Flow 1.
7. Teams User A and Teams User B invoke ICE connectivity tests and selects flows 1 and 3, which are relayed by Teams Transport Relay.
8. Teams Users send telemetry to Microsoft 365 or Office 365 using flows 1 and 3.

NOTE

Flow 4 must be enabled to support dependencies of Teams application on other micro-services that mandates flow 4.

What is Microsoft 365 Business Voice?

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft 365 Business Voice makes it easy for small and medium organizations to turn Microsoft Teams into a powerful and flexible telephone system. It's a replacement for traditional telephony providers and in-house phone systems that can be difficult and costly to manage. You can set up both toll and toll-free numbers, call menus to help callers get to the right department, audio conferencing so you can host meetings with anyone, and more. You can even give people their own phone numbers so they can get calls directly.

Business Voice does all of this by wrapping Microsoft 365 Phone System features into an easy-to-manage bundle. You don't need to worry about choosing the right plan or feature; they're all there and set up for you. Because Phone System is a part of Teams, you can turn any PC, Mac, or mobile device into a phone that can use your Business Voice phone number.

Here's a short video that gives you an overview of Business Voice (2:13 minutes):

Business Voice is right for you if your organization has 300 or fewer people and you have one the following Microsoft 365 subscriptions:

- Microsoft 365 Business Basic
- Microsoft 365 Business Standard
- Microsoft 365 Business Premium
- Microsoft 365 F1
- Microsoft 365 F3
- Office 365 F3
- Microsoft and Office 365 Enterprise E1 or E3
- Microsoft 365 and Office 365 Education A1 or A3
- Microsoft 365 and Office 365 Government G1 or G3
- Microsoft 365 Nonprofit Business Basic
- Microsoft 365 Nonprofit Business Standard
- Microsoft 365 and Office 365 Nonprofit E1 or E3

Business Voice is available in over 70 countries and regions. Whether you can set up Business Voice on your own, transfer phone numbers to Microsoft 365, and manage your phone numbers in Microsoft 365, depends on the country or region in which your Microsoft 365 tenant is located. For more information, check out [Country and region availability for Business Voice](#).

IMPORTANT

Microsoft Teams and Business Voice only work when your users' mailboxes are located in Microsoft 365. They don't support mailboxes located on on-premises Exchange Server.

When you buy Business Voice, you get the following features and more:

Phone System

Standard phone features include Voice Mail, Caller ID, call menus, shared phone lines, and emergency calling.

Domestic Calling	Calls within your country or region are free. International plans and toll-free dialing are also available.
Audio Conferencing	Lets you host conference calls with people who don't have Teams or don't have an internet connection.

You can see everything that's included with Business Voice by visiting [Microsoft 365 Business Voice service description](#).

Country and region availability for Business Voice

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft 365 Business Voice is available in over 70 countries and regions. All of the countries and regions in which Business Voice is available are listed in the table later in this article.

Some Business Voice features, specifically Calling Plans, are available only in certain countries and regions. Whether these features are available in your tenant's location determines whether you can set up Business Voice on your own, or if you need help from a Microsoft partner or reseller.

In countries and regions **with** support for Calling Plans, you can buy Business Voice from Microsoft and then set up or transfer your existing phone numbers to Microsoft. Doing this will let you manage all of your phone numbers in Microsoft 365. After your move to Business Voice is finished:

- Microsoft 365 becomes your telephone provider and domestic local and long distance calls are included in Business Voice. Toll free and international long distance charges are billed directly by Microsoft.
- You no longer need to subscribe to a third-party telephone provider to manage your phone numbers.
- You no longer need any on-premises telephony equipment (other than end-user devices such as desk phones).

If your tenant is located in a country or region that supports Calling Plans, check out [What do I need to buy to use Microsoft 365 Business Voice with Calling Plan?](#)

In countries and regions **without** support for Calling Plans, you need to purchase Business Voice from a Microsoft partner or reseller. They will work with your third-party telephone provider to set up Direct Routing between your on-premises telephony hardware and Microsoft 365.

- Your telephone provider doesn't change. All local, long distance, and toll-free charges are billed by your existing third-party telephone provider.
- Your telephone provider continues to manage your phone numbers. If you want to add or remove phone numbers, you need to coordinate that change with your telephone provider.
- You need to maintain some on-premises telephone equipment to enable your on-premises telephony equipment (such as desk phones) to communicate with Microsoft 365.

If your tenant is located in a country or region that doesn't support Calling Plans, check out [Get help from a Microsoft reseller or partner](#).

To see what's included in Business Voice with Calling Plan and without Calling Plan, see [Microsoft 365 Business Voice Service Description](#).

¹ Unless you have specific needs that prevent you from transferring (porting) your phone numbers to Microsoft 365, we recommend that you choose Business Voice with Calling Plan. Business Voice without Calling Plan requires the use of [Phone System Direct Routing](#). Direct Routing has many requirements that may increase the complexity of your deployment and may require the use of a Microsoft partner or consultant.

² Business Voice includes the licenses for Phone System and Audio Conferencing. Even though you can't get a Calling Plan through us, you can contact us to purchase your licenses and get your phone numbers.

What do I need to buy to use Microsoft 365 Business Voice?

12/7/2021 • 6 minutes to read • [Edit Online](#)

Microsoft 365 Business Voice licenses

To make or receive phone calls to or from *external* phone numbers in Microsoft Teams, users need a Microsoft 365 Business Voice license. The license gives them access to all the features that they need to make or receive phone calls, host audio conferences, and more.

Users who don't need to make or receive phone calls to or from external phone numbers just need Teams. They don't need a Microsoft 365 Business Voice license.

For example, you might have 10 factory employees and 5 office employees. The factory employees may only need to call other employees within your company. In addition to calling other employees, office workers also need to make and receive phone calls to and from suppliers, partners, and customers. In this case, only the 5 office workers would need a Microsoft 365 Business Voice license.

Business Voice license types

There are two types of Business Voice licenses: Business Voice **with** Calling Plan and Business Voice **without** Calling Plan. The type of Business Voice license available to you depends on the location of your Microsoft 365 tenant. The license type determines whether you can set up Business Voice on your own, if you need help from a Microsoft partner or reseller, who manages your phone numbers, and so on.

- **Business Voice with Calling Plan** You can buy Business Voice from Microsoft, set it up on your own, and then set up or transfer your existing phone numbers to Microsoft. The article [Set up Microsoft 365 Business Voice](#) shows you how to set up Business Voice for your tenant.

See [Business Voice with Calling Plan](#) later in this article for more information about buying Business Voice with Calling Plan licenses.

- **Business Voice without Calling Plan** You need to buy Business Voice from a Microsoft partner or reseller who will help you set up Business Voice. Your existing phone numbers remain with your current third-party telephone provider. The article [Get help from a Microsoft reseller or partner](#) gives you an overview of process needed to set up Business Voice in your tenant.

To see whether your country or region supports Calling Plan, check out [Country and region availability for Business Voice](#).

To learn about Business Voice features, see [Microsoft 365 Business Voice service description](#).

Business Voice with Calling Plan

Business Voice with Calling Plan includes a Domestic Calling Plan, which gives you a certain number of minutes per month to make calls within your country or region. You can purchase an International Calling Plan if you want to make calls to other countries or regions. You use *Communications Credits* to pay for an International Calling Plan, extra minutes per month for a Domestic Calling Plan, and toll-free numbers. You'll learn more about Calling Plans and Communications Credits later in this article.

To buy Microsoft 365 Business Voice with Calling Plan licenses, sign in to the [admin center](#), and then go to **Billing > Purchase services**.

Calling Plans

Calling Plans let your users call phone numbers that are outside your organization. Calling Plans include a monthly pool of minutes that's based on the number of assigned Business Voice licenses in a given country or region. When a user makes a phone call, the number of minutes used for that call is deducted from the monthly pool. At the beginning of each month, the balance of minutes in the pool is reset.

Calling Plan pools are specific to the country or region in which the users are located. Users in a country or region can only use minutes from the Calling Plan pool in their country or region. Minutes in a Calling Plan pool in one country or region can't be transferred to a pool in another country or region.

What happens when all the minutes in a Calling Plan pool are used up depends on whether you have Communications Credits available. (We talk about Communications Credits later in this article.) If you have Communications Credits, Business Voice will start using them. If you don't have Credits, users won't be able to make phone call outside your organization until the Calling Plan pool is reset at the beginning of the next month.

IMPORTANT

The number of minutes in a pool depends on the country or region and the number of Business Voice licenses that are assigned to your users, not the number of Business Voice licenses that you purchased. For example, if you purchased 10 Business Voice licenses in Canada but are only using three licenses, you'll have a total of 9,000 minutes in your pool (3 licenses multiplied by 3,000 minutes per user).

There are two types of Calling Plans:

Domestic Calling Plan

The Domestic Calling Plan lets users call phone numbers in their country or region. Business Voice includes a Domestic Calling Plan for each user who's assigned a Business Voice license. The number of minutes that are available for each user each month depends on country or region the user is located. This table shows the number of minutes for each country or region where Calling Plan is included with Business Voice:

WHERE THE USER IS LOCATED	MONTHLY ALLOTMENT FOR DOMESTIC CALLS
Canada	3,000
United Kingdom	1,200
United States	3,000

Calling Plan isn't included with Business Voice in countries or regions not listed in the preceding table. For a list of all countries and regions in which Business Voice is available, see [Business Voice availability](#).

Calls between the United States and Canada are considered domestic calls. You don't need to add the International Calling Plan to place calls between these two countries.

International Calling Plan

The International Calling Plan lets users call phone numbers outside their country or region. The International Calling Plan is purchased as an add-on.

When you consider whether to buy the International Calling Plan for a user, determine how often they make international calls and how long the calls are. This is important because when you purchase an International Calling Plan, you pay for a certain number of minutes up front. If a user doesn't use up all of the minutes in a month, the remaining minutes are discarded at the beginning of the next month. If it's likely that a user won't use up all the minutes in the International Calling Plan, don't buy one. Instead use Communications Credits (see the following section).

Communications Credits

Communications Credits are like a digital wallet that's used to pay for calls to or from phone numbers outside your phone system. Communications Credits are used in a few situations.

- **A user has run out of minutes in their Domestic or International Calling Plan:** If a user doesn't have an International Calling Plan, Business Voice automatically starts using your Communications Credits balance.
- **A user who doesn't have an International Calling Plan makes international calls:** Business Voice automatically starts using your Communications Credits balance.
- **You have toll-free numbers:** When someone calls your toll-free number, the cost of the call is deducted from your Communications Credit balance.

If you still have Communication Credits left over at the end of the month, they're carried over to the next month.

Buy Communication Credits

We strongly recommend that you always have a minimum balance of Communication Credits so that your users can always make phone calls. The easiest way to make sure you always have an available balance is to set up automatic recharging. With automatic recharging, Microsoft 365 automatically refills your balance when it falls below a minimum. You can choose the minimum and the amount to buy each time. If you'd rather refill your Communication Credits balance manually, you can do that too.

IMPORTANT

Remember that you need Communications Credits if you run out of minutes in your Calling Plans or if you receive toll-free calls. If your Communications Credits balance is empty, you won't be able to receive phone calls on toll-free phone numbers or make calls after the Calling Plan balances are used up.

To learn more about Communication Credits, take a look at [What are Communications Credits?](#)

To see rates for toll-free and international calling, scroll down to "Add time with Communication Credits" in [Cloud-based Phone System](#).

Get help from a Microsoft reseller or partner

12/7/2021 • 2 minutes to read • [Edit Online](#)

IMPORTANT

The information in this article is applicable to Business Voice **without** Calling Plan only. Before reading this article, check [Country and region availability for Business Voice](#) to see whether your country or region supports Business Voice with Calling Plan.

If your tenant is located in a country or region that supports Business Voice with Calling Plan, check out [Set up Microsoft 365 Business Voice](#).

Setting up Business Voice without Calling Plan requires the configuration of Phone System Direct Routing. Direct Routing enables interoperability between your on-premises telephone hardware; Microsoft Phone System, which is the core feature of Business Voice; and your third-party Public Switched Telephone Network (PSTN) provider. Because Direct Routing requires a deep understanding of Microsoft Phone System, PSTN connectivity, networking, and other technical skills, we recommend that you use a Microsoft partner or seller to set it up. Additionally, Business Voice without Calling Plan licenses are only available from Microsoft partners and resellers.

A Microsoft partner or reseller can:

- Obtain the correct Business Voice licenses for your tenant and phone users
- Help you understand the technical requirements for setting up Business Voice
- Coordinate with your telephone provider to make sure your phone numbers are properly set up for use with Business Voice
- Set up communication between your on-premises telephony hardware and Microsoft 365
- Help you set up Business Voice features like Call Queues, Auto Attendant, Voice Mail, and more

When contacting a Microsoft partner or reseller about setting up Business Voice without Calling Plan, you'll need to provide them with information such as:

- How many users, phones, and other devices, will need to make and receive calls to and from external phone numbers
- Details about your existing phone system
- Details about your connection between your phone system and your PSTN provider
- Your Internet connection
- Unique design considerations about your organization such as the need to support call centers, phone system call menus (for example, press 1 for Sales, press 2 for Technical Support), conference rooms, phone kiosks, and so on.
- How many locations your existing phone system supports and how connectivity is set up between them

Check your Internet connection for Business Voice

12/7/2021 • 4 minutes to read • [Edit Online](#)

Business Voice is located in the cloud with Microsoft 365. Every device that uses Microsoft Teams and Business Voice needs a connection to the Internet.

To get the best Business Voice experience, you need a broadband Internet connection that can support the maximum number of phone calls that your organization might make at any one time. You also need to make sure that the computers on your network can reach Microsoft 365 servers.

To follow these steps, you need to have a tenant with one of the following subscriptions:

- Microsoft 365 Business Basic
- Microsoft 365 Business Standard
- Office 365 E1
- Office 365 E3
- Office 365 F1
- Microsoft 365 A1
- Microsoft 365 A3
- Microsoft 365 E3
- Microsoft 365 Business

You don't need a Business Voice license to follow these steps.

Check your Internet connection speed

This article helps determine whether your Internet connection is fast enough for the number of people who need to make phone calls and host video conferences. You'll provide information about your organization and get back a report that shows how much of your Internet connection will be used by Teams and Business Voice.

Gather information about your Internet connection and users

Before you start, you need the following information:

- The speed of your Internet connection
- How many people will use Business Voice mainly from your office
- How many people will use Business Voice mainly from a remote location, such as a home office

Enter your information into the network planner

Follow these steps:

1. In a browser, go to <https://admin.teams.microsoft.com>. Sign in by using an account that has Global Administrator permissions. The account that you used to sign up for Microsoft 365 or Office 365 has these permissions.
2. Open **Planning** and select **Network planner**.
3. Under **Network plans**, select **Add**. Enter a name for your plan, and then select **Apply**. Your network plan should look like this:

Network planner

Network planner helps you to determine and organize network requirements for connecting people to your organization in a few steps. By providing your networking details and Teams usage, you get calculated requirements you need when deploying Teams and cloud voice across organizational physical locations.

	Remote Worker	24

0 remaining

+ Add persona

Generate report Cancel 3 Select Generate report

Find your minimum Internet connection speed

When you select **Generate report**, Microsoft 365 or Office 365 creates a report that looks like this:

Calculation Report

Allowed bandwidth 30 % Run report

Projected impact of Microsoft Teams
Sep 17, 2019 3:25:59 PM PDT

Network site	Type	Impact	Audio	Video	Screenshare	Office 365 server tr...	PSTN
Main office network	WAN	0 Mbps	0 Mbps	0 Mbps	0 Mbps	0 Mbps	0 Mbps
120 network users	Office 365	4.6875 Mbps	0.273 Mbps	2.648 Mbps	1.515 Mbps	0.2515 Mbps	0 Mbps

The highlighted number shows how much of your Internet connection Teams and Business Voice will use. We recommend that this number is no more than 30 percent of your total Internet connection speed. For example, if your Internet connection is 60 Mbps, Teams and Business Voice should use no more than 18 Mbps.

Use this equation to determine your minimum Internet connection speed: $\text{<highlighted number>} / 0.3$. With the number that's highlighted in the preceding image, the calculation is $4.6875 / 0.3 = 15.6$. In this case, the Internet connection speed should be at least 15.6 Mbps.

If Teams and Business Voice will use more than 30 percent of your total Internet connection speed, the highlighted number will appear red. In that case, you may need to upgrade your Internet connection.

Network site	Type	Impact
Main office network	WAN	0 Mbps
120 network users	Office 365	4.6875 Mbps

Make sure the computers and devices on your network can reach Microsoft 365

Computers and devices that use Business Voice must use specific network ports to communicate with Microsoft 365 servers. These ports are essentially doors through which devices talk to each other over a network or the Internet. Your firewall needs to allow devices on your network to reach Microsoft 365 through the following *outbound* network ports:

- TCP ports 80 and 443

- **UDP ports** 3478, 3479, 3480, and 3481

The easiest way to check whether your firewall allows communication on these network ports is to make a test call in Teams:

1. Go to <https://aka.ms/getteams> on a computer on your network and install Teams. Make sure that the computer has speakers and a microphone.
2. Open Teams and sign in by using a Microsoft 365 account.
3. In Teams, select your profile picture, and then go to **Settings > Devices**.
4. Under **Audio devices**, select **Make a test call**.
5. Follow the steps to leave a message and have it played back to you.
 - If the call connects and you hear your message, your firewall is set up correctly.
 - If the call connects, but you can't hear the instructions or your message, make sure that your speakers and microphone are set up correctly, and then try again.
 - If the call doesn't connect or it connects but you can't hear your message, you might need to update your firewall to allow access to the required network ports. Check your firewall's documentation, or contact an IT specialist for help.

If you're an IT professional and want more information about how to prepare larger or more complex networks to support Business Voice, see [Evaluate my environment](#). This article provides information about bandwidth, proxy and firewall requirements, and how to use the [Network Assessment Tool](#) to test your network.

How do I get my users ready for Microsoft 365 Business Voice?

12/7/2021 • 3 minutes to read • [Edit Online](#)

It's a good idea to get your users ready before you set up Business Voice:

- Make sure that they have Microsoft Teams and Microsoft Office installed.
- Set up any necessary devices on their computers.
- Show them how to set up voicemail greetings and other Business Voice features.
- Encourage them to learn more about Teams so that they get the most out of it.

Install Microsoft Teams on computers and phones

If you haven't already, install Teams on any computers and phones that will be used for Business Voice. Teams is available for PCs and Macs, and for Android and iPhone phones. There's also a web version, at <https://teams.microsoft.com>. For PCs, Macs, and the web, you need a headset or a microphone and speakers. The next section provides more detail.

For PCs and Macs, you can download Teams at <https://teams.microsoft.com/downloads>. If a user is running Windows 10 in S mode, they can install Teams from the Windows Store.

For Android and iPhone phones, search for Microsoft Teams in Google Play or Apple App Store. Phones must be running Android 4.4 or later or iOS 10.0 or later. To use Teams on the web, you need to use a [supported browser](#).

Choose devices for Teams and Business Voice

Business Voice users need a microphone and speakers to make and receive phone calls. There are lots of options, depending on the needs of each user or environment. Here are some ideas to think about when you decide what to get:

- **Mobile users or users in noisy environments:** Consider USB or wireless headsets with microphones. Paired with Microsoft Teams, any computer can work as a phone as long as it has an Internet connection.
- **Receptionists and executives:** Full, multi-function desktop handsets can be used, just like with regular phones. Autodial, conferencing, speakerphone, and support for headsets make these devices extremely flexible.
- **Conference rooms:** Audio conferencing devices let you set up conference rooms with speakerphone functionality that can be used with Teams conference bridges to host even large meetings.

If you're using a USB or wireless device, plug the device into a computer that's running Teams. You might need to go into device settings in Teams: Select your profile picture at the top of Teams, and then go to **Settings** > **Devices**. Choose your device from **Audio devices**. If you don't see your device in Teams, follow the manufacturer's instructions to set it up on your computer.

NOTE

To test that Teams, your speakers, and your microphone all work correctly, follow the steps in [Make sure your networked devices can reach Microsoft 365](#).

To see all the devices that Teams supports, visit the [Teams Devices store](#). To purchase devices, contact your local

reseller. Most major online stores also carry most Teams devices.

Set up voicemail greetings and other Business Voice features

Just like regular phones, you can set up voicemail greetings and call forwarding, choose ringtones, and more. Everything that can be set up by users can be found in the Teams app by selecting their profile picture in the upper-right corner of Teams and then selecting **Settings** > **Calls**. They can get help with setting up these features by taking a look at [Manage your call settings in Teams](#).

Learn what Microsoft Teams and Business Voice can do

Business Voice can do a lot more than regular phones, too. You can set up simultaneous ring and call groups, share a phone line with a delegate, park calls, make multiple calls at once, and more. Users can see what Teams with Business Voice can do, and learn how to set it up, by taking a look at [Meetings and calls](#).

If users want to know even more about Teams, they can take a look the [Microsoft Teams help center](#).

Set up Microsoft 365 Business Voice

12/7/2021 • 2 minutes to read • [Edit Online](#)

Business Voice is a complete phone system that can replace your existing telephony provider. Whether you're a new business setting up phone numbers for the first time, or an established business moving from a legacy on-premises telephony provider, the steps in these articles can help you get up and running with Business Voice. When you're finished setting up Business Voice:

- You'll be able to receive toll or toll-free phone calls on a main company phone line. You can even set up a call menu if you want.
- Users set up with Business Voice will have their own direct-dial phone numbers that they can use to make and receive phone calls from any device with Teams installed.
- Meeting participants will be able to call in to meetings using a regular phone if they're unable to join from a Teams client.
- If you have existing phone numbers, you'll be able to continue using them after they're moved to Business Voice.

If you want to learn more about Business Voice, check out [What is Microsoft 365 Business Voice?](#).

IMPORTANT

The information in these articles is applicable to Business Voice **with** Calling Plan only. Business Voice with Calling Plan is available only in select countries and regions. Before you start setting up Business Voice, check [Country and region availability for Business Voice](#) to see whether your country or region supports Business Voice with Calling Plan.

If your tenant is located in a country or region that doesn't support Business Voice with Calling Plan, check out [Get help from a Microsoft reseller or partner](#).

Microsoft Teams and Business Voice only work when your users' mailboxes are located in Microsoft 365. They don't support mailboxes on on-premises Exchange Server.

This setup process doesn't support Skype for Business hybrid deployments. If you have a Skype for Business hybrid deployment and want to set up Business Voice, check out [Set up Phone System in your organization](#).

Before you begin

Before you set up Business Voice, there are a few things you need to do. The following tasks will make sure your organization is ready for Business Voice.

- **Buy Business Voice licenses** and, if you want to get a toll-free number or make long-distance phone calls, Communication Credits. For more information, see [What do I need to buy to use Microsoft 365 Business Voice?](#).
- **Make sure your Internet connection can support Business Voice.** For more information, see [Check your Internet connection for Business Voice](#).
- **Set up Teams on your users' devices**, set up voicemail greetings, and help your users learn about Teams. For more information, see [How do I get my users ready for Microsoft 365 Business Voice?](#).

After you've prepare your organization for Business Voice, select **Next step: Start setting up Business Voice**.

Next step: Start setting up Business Voice

Step 1: Set up a Business Voice emergency location

12/7/2021 • 2 minutes to read • [Edit Online](#)

An emergency location is used when someone in your organization calls emergency services such as fire, police, or ambulance. When a person calls an emergency service, the address that's configured as your organization's emergency address is sent to the service. This step sets up the primary emergency location for your organization. This location will be associated with your company's main phone number in a later step.

If you have users in multiple locations, such as home offices or offices in other cities, you can configure additional emergency locations. You can even configure specific places within a location. Places can be different buildings, floors, offices, or other places where users may be at a location. Additional locations and places can be added after you complete your initial setup of Business Voice.

The following video shows you how to complete these steps in the Teams admin center.

Add an emergency location

1. Open the Microsoft Teams admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation pane, go to [Locations > Emergency addresses](#).
3. Click **Add**.
4. Enter a name and description for the location.
5. Select the country or region, and then enter the address.

NOTE

In Belgium, France, Germany, Ireland, Netherlands, and Spain, it's important to understand that to successfully activate a phone number in Microsoft 365 or Office 365, the address set up in the emergency location, which is used to acquire the number, must match the phone number's area code.

6. If the address isn't found and you want to manually edit the address, turn on **Edit the address manually**.
7. Click **Save**.

[Next step: Set up phone numbers](#)

Step 2: Set up Business Voice phone numbers

12/7/2021 • 4 minutes to read • [Edit Online](#)

Before you can set up users or auto attendants in your organization, you need to get phone numbers for them. There are several different types of phone numbers, however the following are the two types of numbers that you need to add in this step:

- **Service numbers** These numbers are used for auto attendants, audio conferencing, and call queues. They can be toll or toll-free numbers and can handle large amounts of calls at the same time. Your company phone number needs to be a service number because it'll be assigned to an auto attendant in a later step.
- **Subscriber numbers** These numbers are used for regular users so they can make and receive phone calls.

IMPORTANT

Even if you want to use your existing phone numbers, you need to create and assign temporary phone numbers to your company's main phone line and your users. You'll be able to replace these temporary numbers with your existing phone numbers in a later step.

NOTE

It may take several hours for your new phone numbers to become available in Teams.

The following video shows you how to complete these steps in the Teams admin center.

Set up a service number

The service number you set up now will be used in a later step for your company's main phone number.

1. Open the Microsoft Teams admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation, go to **Voice > Phone numbers**, and then click **Add**.
3. Enter a name for the order and add a description.
4. On the Location and quantity page, do the following:
 - a. Under **Country or region**, select a country or region.
 - b. Under **Number type**, select one of the following options:
 - **Auto attendant (Toll)** Regular, non-toll-free, phone number. Long distance fees are charged to the caller.
 - **Auto attendant (Toll Free)** Toll-free (US and Canada) or freephone (UK) phone number. Long distances fees are charged to your company. Before you can select this option, you need to purchase Communication Credits. For more information, see [What do I need to buy to use Microsoft 365 Business Voice?](#)
 - c. Under **Quantity**, select **1**.

NOTE

If you get the message **You don't have enough licenses to request more numbers of this type**, make sure you've purchased Business Voice licenses. For more information, see [What do I need to buy to use Microsoft 365 Business Voice?](#).

- d. Choose either **Location** or **Area code**, depending on whether you want to search for phone numbers using a location's city, or if you want to search for numbers in a specific area code.
- e. If you select **Location**:
 - a. Type the city in which your emergency address is located in the [Set up emergency locations](#) step, or if you need to create a new location for another office or a home office, click **Add a location**.
 - b. Under **Area code**, select an area code, and then select **Next** to reserve your number.
- f. If you select **Area code**, type the area code you want to search, and then select **Next** to reserve your number.
5. Select the number you want. You have 10 minutes to select your phone number and place your order. If you take more than 10 minutes, the phone number will be returned to the pool of numbers.
6. When you're ready to place your order, click **Place order**, and then **Finish**

Set up phone numbers for your users

1. Open the Microsoft Teams admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation, go to [Voice > Phone numbers](#), and then click **Add**.
3. Enter a name for the order and add a description.
4. On the Location and quantity page, do the following:
 - a. Under **Country or region**, select a country or region.
 - b. Under **Number type**, select **User (subscriber)**.
 - c. Under **Quantity**, enter the number of numbers that you want for your organization.
 - d. Choose either **Location** or **Area code**, depending on whether you want to search for phone numbers using a location's city, or if you want to search for numbers in a specific area code.
 - e. If you select **Location**:
 - a. Type the city in which your emergency address is located in the [Set up emergency locations](#) step, or if you need to create a new location for another office or a home office, click **Add a location**.
 - b. Under **Area code**, select an area code, and then select **Next** to reserve your number.
 - f. If you select **Area code**, type the area code you want to search, and then select **Next** to reserve your number.
5. Select the numbers you want. You have 10 minutes to select your phone numbers and place your order. If you take more than 10 minutes, the phone numbers will be returned to the pool of numbers.
6. When you're ready to place your order, click **Place order**, and then **Finish**.

[Next step: Assign licenses to Teams users](#)

Step 3: Assign Business Voice licenses

12/7/2021 • 2 minutes to read • [Edit Online](#)

Each user that needs to use Microsoft 365 Business Voice needs to be assigned licenses for Business Voice.

The following video shows you how to complete these steps in the Microsoft 365 admin center.

1. Open the Microsoft 365 admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation pane, go to [Billing > Licenses](#).
3. Select **Microsoft 365 Business Voice**.
4. On the product details page, select **Assign licenses**.
5. In the **Assign licenses to users** pane, begin typing a name, and then choose it from the results to add it to the list. You can add up to 20 users at a time.
6. When you're finished, select **Assign**, then select **Close**.

[Next step: Set up Teams resource account](#)

Step 4: Set up a Business Voice resource account

12/7/2021 • 3 minutes to read • [Edit Online](#)

Resource accounts aren't assigned to any specific user. Instead, resource accounts, which use a free virtual user license, are used by devices and services in Microsoft 365. In Microsoft Teams, resource accounts are assigned phone numbers and are then associated with auto attendants and call queues.

By associating resource accounts to auto attendants and call queues, you can add one or more toll or toll-free phone numbers to them. For example, you could associate one resource account with a toll number to an auto attendant for local callers. For long distance calls, you could associate another resource account with a toll-free number to the same auto attendant.

The sections in this article show you how to set up a resource account and then assign a phone number to it. Later on, you'll associate the resource account with an auto attendant.

The following video shows you how to complete these steps in the Teams admin center.

Obtain virtual user licenses

Resource accounts require a license in order to work with auto attendants and call queues. You can use a free *Microsoft 365 Phone System - Virtual User* license.

NOTE

You should only need to perform the following steps if you've signed up for a Business Voice trial period. If you purchased Business Voice licenses, virtual licenses should already be applied to your account.

To see if you already have virtual licenses, log into Microsoft 365 using an account with Global admin permissions. Then go to **Billing > Your products**. If you have virtual licenses, they'll appear as **Microsoft 365 Phone System - Virtual User**.

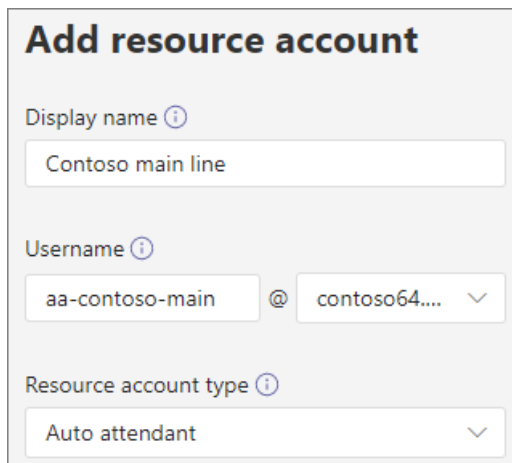

1. Open the Microsoft 365 admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation pane, go to **Billing > Purchase services > Add-ons > See all Add-ons products**.
3. Scroll to the end to find the **Microsoft 365 Phone System – Virtual User** license. Select **Details**, then **Buy**.
4. On the license purchase page, select the number of virtual user licenses you want. You need one virtual license for each auto attendant and call queue you plan to set up. We recommend selecting at least five licenses so you can easily set up more auto attendants and call queues in the future without having to purchase more licenses right away.
5. Uncheck **Automatically assign to all of your users with no licenses**.
6. Select **Check out now**.
7. Confirm your order, select **Next**, and then **Place order**.

NOTE

Keep in mind you must still **Buy** the license even though it has a cost of zero.

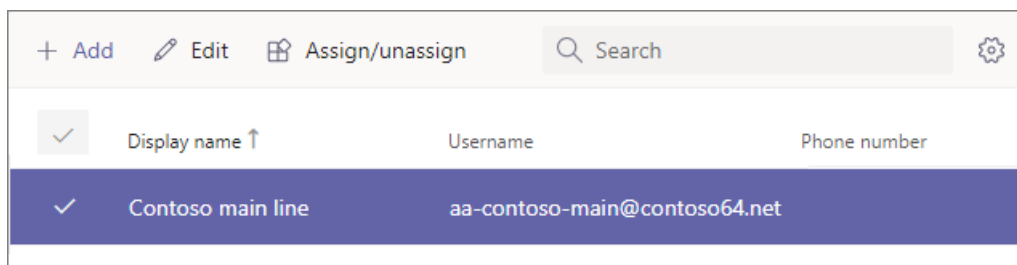

Create a resource account

After you've received your *Microsoft 365 Phone System - Virtual User* license, you can create your resource account.

The screenshot shows the 'Add resource account' form. It has three sections: 'Display name' with a text box containing 'Contoso main line'; 'Username' with a text box containing 'aa-contoso-main' and a dropdown menu showing 'contoso64....'; and 'Resource account type' with a dropdown menu showing 'Auto attendant'.

1. Open the Microsoft Teams admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation pane, go to [Org-wide settings > Resource accounts](#).
3. Select **Add**.
4. In the **Add resource account** pane, fill out **Display name**, and then **Username**. Choose a descriptive display name such as "Main line auto attendant" to describe the purpose of the resource account.
5. In **Resource account type**, select **Auto attendant**.
6. Select **Save**.

	Display name ↑	Username	Phone number
✓	Contoso main line	aa-contoso-main@contoso64.net	

Assign a license

After you've created your resource account, you need to assign a *Microsoft 365 Phone System - Virtual User* license or *Phone System* license.

6. Click **Save**.

[Next step: Assign phone numbers to your users](#)

Step 5: Assign Business Voice phone numbers to your users

12/7/2021 • 2 minutes to read • [Edit Online](#)

Before users can use Teams to make or receive phone calls to or from regular phone lines, you need to assign phone numbers to them. In Microsoft Teams clients, the phone number that you assign to a user is listed in the dial pad when the user clicks **Calls**. Do the following for each user that needs a phone number.

NOTE

If you don't see any phone numbers, please wait. It may take several hours for your new phone numbers to become available in Teams.

The following video shows you how to complete these steps in the Teams admin center.

1. Open the Microsoft Teams admin center and log in with a user that is a Global admin (this is usually the account you used to sign up for Microsoft 365).
2. In the left navigation pane, go to **Voice > Phone numbers**.
3. On the **Phone numbers** page, select an unassigned number in the list, and then click **Edit**.
4. In the **Edit** pane, under **Assigned to**, search for the user by display name or user name, and then click **Assign**.
5. Under **Emergency location**, you can select either the emergency location you added in the [Set up emergency locations](#) step, or if you need to create a new location for another office or a home office, click **Add a location**.
6. Decide whether to send a welcome email with phone number information to the user. If you want to:
 - **Bring your existing phone numbers** to Business Voice (called phone number porting), *unselect* **Email user with telephone number information**.
 - **Use the new phone numbers** selected by Business Voice, *select* **Email user with telephone number information**.
7. Click **Save**.
8. Repeat the above steps for each user to which you want to assign a phone number.

NOTE

Because of the latency between Microsoft 365 or Office 365 and Teams, it can take up to 24 hours for users to be enabled. If the phone number isn't assigned correctly after 24 hours, [contact support for business products - Admin Help](#). We're here to help!

Next step: [Set up an auto attendant](#)

Step 6: Set up an auto attendant for your company's main phone number

12/7/2021 • 9 minutes to read • [Edit Online](#)

An auto attendant lets you set up a call menu so that callers to your main phone number can choose from a list of options. For example, you could have options to connect to a sales or support department, specific individual, the switchboard, and even another auto attendant.

The following video shows you how to complete these steps in the Teams admin center.

Video demonstration

This video shows a basic example of how to create an auto attendant in Teams.

Before you begin

Get the service numbers (service numbers are a special type of phone number that are used by auto attendants) that you need for the auto attendants that you want to be accessible by direct dialing from outside your organization. This might include [transferring numbers from another provider](#) or [requesting new service numbers](#).

Each auto attendant needs to be assigned a Phone System - Virtual User license. When you purchased Business Voice, you also received a number of Phone System - Virtual User licenses, so you probably don't need to request more. However, if you need more in the future, you can get them by following the instructions in [Phone System - Virtual User license](#).

If you want to have your auto attendant route calls differently on holidays, then [create the holidays that you want to use](#) before you create the auto attendant.

Follow these steps to set up your auto attendant

- [Step 1](#)
[Phone number](#)
- [Step 2](#)
[Attendant general info](#)
- [Step 3](#)
[Call flow](#)
- [Step 4](#)
[After hours](#)
- [Step 5](#)
[Holidays](#)
- [Step 6](#)
[Directory members](#)
- [Step 7](#)
[Resource accounts](#)

NOTE

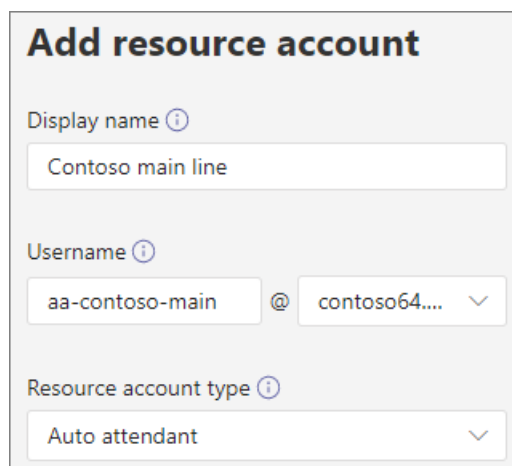

If you're following the steps to set up Business Voice for the first time and you're on **Step 6: Set up an auto attendant for your company's main phone number**, you've already finished the steps on this tab. Move to the next tab: [Auto attendant general info](#).

Each auto attendant that you create requires a resource account. This is similar to a user account, except the account is associated with an auto attendant or call queue instead of a person. In this step, we'll create the account, assign it a *Microsoft 365 Phone System - Virtual User* license, and then assign a service number.

Create a resource account

You can create a resource account in the Teams admin center.

1. In the Teams admin center, expand **Org-wide settings**, and then click **Resource accounts**.
2. Click **Add**.
3. In the **Add resource account** pane, fill out **Display name**, **Username**, and choose **Auto attendant** for the **Resource account type**

Add resource account

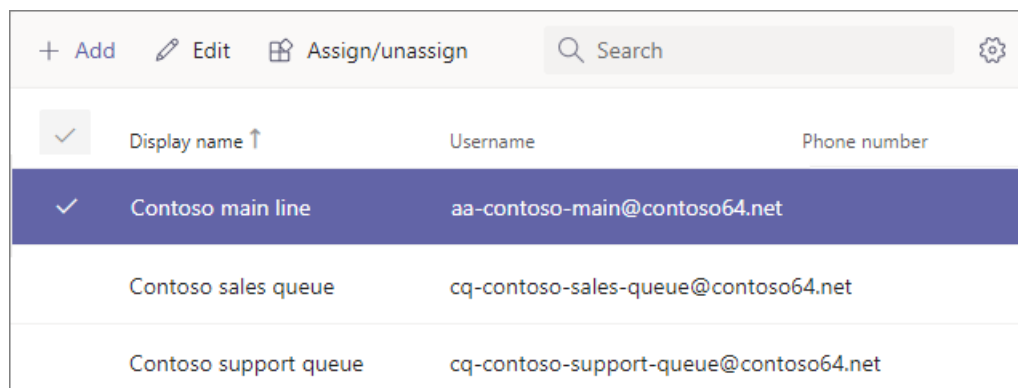

Display name ⓘ
Contoso main line

Username ⓘ
aa-contoso-main @ contoso64.... ▼

Resource account type ⓘ
Auto attendant ▼

4. Click **Save**.

The new account will appear in the list of accounts.

✓	Display name ↑	Username	Phone number
✓	Contoso main line	aa-contoso-main@contoso64.net	
	Contoso sales queue	cq-contoso-sales-queue@contoso64.net	
	Contoso support queue	cq-contoso-support-queue@contoso64.net	

Assign a license

You must assign a *Microsoft 365 Phone System - Virtual User* license to the resource account.

1. In the Microsoft 365 admin center, click the resource account to which you want to assign a license.
2. On the **Licenses and Apps** tab, under **Licenses**, select **Microsoft 365 Phone System - Virtual User**.
3. Click **Save changes**.

[Next step: Port phone numbers to Business Voice](#)

Step 7: Port phone numbers to Business Voice (optional)

12/7/2021 • 2 minutes to read • [Edit Online](#)

IMPORTANT

The information in this article is applicable to Business Voice **with** Calling Plan only. Business Voice with Calling Plan is available only in select countries and regions. Before reading this article, check [Country and region availability for Business Voice](#) to see whether your country or region supports Business Voice with Calling Plan.

If your tenant is located in a country or region that doesn't support Business Voice with Calling Plan, check out [Get help from a Microsoft reseller or partner](#).

Earlier in this setup guide, you acquired phone numbers for the main company line and for any users that you've assigned a Business Voice license to. **If you're a new business and don't have any existing phone numbers that you want to bring to Business Voice, you can skip this step.**

If you already have phone numbers that you want to keep when you move to Business Voice, you can bring them with you by using a process called phone number porting to bring them over to Business Voice. After you port your phone numbers to Business Voice, you assign them to users and services. The old numbers replace the temporary numbers that you acquired earlier in this setup guide.

Before you move numbers to Business Voice, take a look at [Transferring phone numbers common questions](#). This article includes answers to questions including what countries and regions are supported, what numbers can and can't be transferred, and what information you'll need.

When you're ready to move your phone numbers to Business Voice, follow the steps in [Transfer phone numbers to Office 365](#) to create a port order. The order includes the information that's needed to move your numbers from your current phone service carrier to Business Voice.

After your phone numbers have been moved to Business Voice, you need to assign them to people. To do that, follow the steps in [Change a phone number for a user](#). When you follow these steps, you'll replace the phone number that was temporarily assigned to the user with their original phone number that you ported over.

If you need help, let us know! We're here to help you get your phone numbers moved to Business Voice as easy as possible. Be sure to include the following information:

- Your organization ID (such as *contoso.onmicrosoft.com*)
- What types and how many numbers you need help with
- The authorizing person on your account
- A description of the issue or question that you have

For help with phone numbers in Canada and the United States, send your request to ptn@microsoft.com.

For help with phone numbers in Europe, send your request to ptneu@microsoft.com.

[Next step: Finish Business Voice setup](#)

Finished Business Voice setup

12/7/2021 • 2 minutes to read • [Edit Online](#)

Congratulations! You've completed the setup of Microsoft 365 Business Voice. The following are some helpful resources for managing Business Voice and helping your users get the most of their new phone, meeting, and audio conferencing experience.

The following tables list resources that'll help you make the most out of Teams and Business Voice.

Training

Use the following training resources to get you and your users up to speed with Teams and Business Voice.

RESOURCE	DESCRIPTION
Microsoft Teams training	Training for admins and end users who are new to Teams.
Microsoft Teams quickstart guide	A printable PDF file explaining the Teams client and how to perform common activities.
How to use Teams as a phone	Training on how to make and receive calls, set up and check voicemail, transfer and merge calls, and so on.

Customize Business Voice

Use the following resources to customize Business Voice for your specific requirements.

RESOURCE	DESCRIPTION
Calling policies in Microsoft Teams	Control whether users can make private calls, forward calls or set up simultaneous ring, route calls to voicemail, and so on.
Manage policy packages in Microsoft Teams	Create groups of policies that can be assigned to users of similar roles.
Create and license Business Voice users and assign them phone numbers	Add more users to Business Voice and set them up with phone numbers.
Create a call queue - small business tutorial	Create a call queue to support call center environments like sales, customer service, technical support, and so on.
Set up an auto attendant - small business tutorial	Create additional auto attendant (call menus) for more flexible call routing.
Set up Call Quality Dashboard (CQD)	Set up call usage and quality monitoring to ensure users have the best Business Voice experience.

Manage Business Voice

Use the following resources to manage Teams and Business Voice as part of your daily activities.

RESOURCE	DESCRIPTION
Create and license Business Voice users and assign them phone numbers	Add more users to Business Voice and set them up with phone numbers.
Manage your devices in Microsoft Teams	Create policies for, and monitor, devices that are connected to Teams.
Monitor and improve call quality for Microsoft Teams	Monitor who makes or receives phone calls or participates in online meetings, monitor and troubleshoot call quality, and so on.

Customize Microsoft 365 Business Voice

12/7/2021 • 2 minutes to read • [Edit Online](#)

The [Business Voice setup guide](#) sets up Business Voice with basic options so you can use it right away. Those options might be enough if you're a small business just starting out or if you're running a pilot in your larger organization. You get the basics with new phone numbers and a call menu.

But you'll likely want to customize Business Voice to better meet your business needs. For example, you'll probably want to move your existing phone numbers (called number porting) to Business Voice.

TASK	DESCRIPTION
Move phone numbers to Business Voice	Bring your existing phone numbers to Business Voice.
Set up auto attendants	Add more call menus to expand the options for callers who reach your main phone number.
Set up calling policies	Control whether users can do things like make private calls, use call forwarding, and delegate calls.
Create additional users	Add more users and assign new or existing phone numbers to them.
Set up call queues	Create a queue where callers can wait for the next available agent.

Calling and call-forwarding in Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

In Microsoft Teams, calling policies control which calling and call forwarding features are available to users. Calling policies determine whether a user can make private calls, use call forwarding or simultaneous ringing to other users or external phone numbers, route calls to voicemail, send calls to call groups, use delegation for inbound and outbound calls, and so on.

You can use the global (Org-wide default) policy that's created automatically or create and assign custom policies.

Create a custom calling policy

Follow these steps to create a custom calling policy.

1. In the left navigation of the Microsoft Teams admin center, go to **Voice > Calling policies**.
2. Select **Add**.
3. Turn on or turn off the features that you want to use in your calling policy.
4. To control whether users can route inbound calls to voicemail, select **Enabled** or **User controlled**. To prevent routing to voicemail, select **Disabled**.
5. Select **Save**.

Edit a calling policy

Follow these steps to edit an existing calling policy.

1. In the left navigation of the Microsoft Teams admin center, select **Voice > Calling policies**.
2. Click next to the policy that you want to modify, and then select **Edit**.
3. Make the changes that you want, and then click **Save**.

Assign a custom calling policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Calling policy settings

Here are the settings that you can configure for calling policies.

Make private calls

This setting controls all calling capabilities in Teams. Turn this off to turn off all calling functionality in Teams.

Call forwarding and simultaneous ringing to people in your organization

This setting controls whether incoming calls can be forwarded to other users or can ring another person at the same time.

Call forwarding and simultaneous ringing to external phone numbers

This setting controls whether incoming calls can be forwarded to an external number or can ring an external

number at the same time.

Voicemail is available for routing inbound calls

This setting enables inbound calls to be sent to voicemail. Valid options are:

- **Enabled** Voicemail is always available for inbound calls.
- **Disabled** Voicemail is not available for inbound calls.
- **User controlled** Users can determine whether they want voicemail to be available.

Inbound calls can be routed to call groups

This setting controls whether incoming calls can be forwarded to a call group.

Delegation for inbound and outbound calls

This setting enables inbound calls to be routed to delegates, allowing delegates to make outbound calls on behalf of the users for whom they have delegated permissions. For more information, see [Share a phone line with a delegate](#).

Prevent toll bypass and send calls through the PSTN

Setting this to **On** will send calls through the PSTN and incur charges rather than sending them through the network and bypassing the tolls.

Busy on busy is available when in a call

Busy on Busy (Busy Options) lets you configure how incoming calls are handled when a user is already in a call or conference or has a call placed on hold. New or incoming calls can be rejected with a busy signal or can be routed accordingly to the user's unanswered settings. You can enable busy options at the tenant level or at the user level. Regardless of how their busy options are configured, users in a call or conference or those with a call on hold are not prevented from initiating new calls or conferences. This setting is disabled by default.

Web PSTN calling

This setting enables users to call PSTN numbers using the Teams web client.

Incoming meeting invites are automatically answered

This setting controls whether incoming meeting invites are automatically answered. It's turned off by default. Keep in mind that this setting applies only to incoming meeting invites. It doesn't apply to other types of calls.

Allow music on hold

This setting allows you to turn on or turn off music on hold when a PSTN caller is placed on hold. It's turned on by default. This setting doesn't apply to call park and boss delegate features, and is currently only available via PowerShell.

[Assign policies to your users in Teams](#)

Manage policy packages in Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

A policy package in Microsoft Teams is a collection of predefined policies and policy settings that you can assign to users who have similar roles in your organization. We built policy packages to simplify, streamline, and help provide consistency when managing policies for groups of users across your organization.

You can use the [policy packages included in Teams](#) or [create your own custom policy packages](#).

You can customize the settings of the policies in a policy package to suit the needs of your users. When you change the settings of policies in a package, all users who are assigned to that package get the updated settings. You manage policy packages by using the Microsoft Teams admin center or PowerShell.

NOTE

Each user will require the Advanced Communications add-on in order to receive a custom policy package assignment. For more information, see [Advanced Communications add-on for Microsoft Teams](#).

What is a policy package?

Policy packages let you control Teams features that you want to allow or restrict for specific sets of people across your organization. Each policy package in Teams is designed around a user role and includes predefined policies and policy settings that support the collaboration and communication activities that are typical for that role.

Policy packages support the following Teams policy types:

- Messaging policy
- Meeting policy
- App setup policy
- Calling policy
- Live events policy

Policy packages included in Teams

Teams currently includes the following policy packages.

PACKAGE NAME	DESCRIPTION
Education (Higher education student)	Creates a set of policies and policy settings that apply to higher education students.
Education (Primary school student)	Creates a set of policies and policy settings that apply to primary students.
Education (Secondary school student)	Creates a set of policies and policy settings that apply to secondary students.
Education (Teacher)	Creates a set of policies and policy settings that apply to teachers.
Education (Primary school teacher using remote learning)	Creates a set of policies that apply to primary teachers to maximize student safety and collaboration when using remote learning.
Education (Primary school student using remote learning)	Creates a set of policies that apply to primary students to maximize student safety and collaboration when using remote learning.
Frontline manager	Creates a set of policies and applies those settings to Frontline managers in your organization.
Frontline worker	Creates a set of policies and applies those settings to Frontline workers in your organization.
Healthcare clinical worker	Creates a set of policies and policy settings that give clinical workers such as registered nurses, charge nurses, physicians, and social workers full access to chat, calling, shift management, and meetings.
Healthcare information worker	Creates a set of policies and policy settings that give information workers such as IT personnel, informatics staff, finance personnel, and compliance officers, full access to chat, calling, and meetings.
Healthcare patient room	Creates a set of policies and policy settings that apply to patient rooms in your healthcare organization.
Small and medium business user (Business Voice)	Creates an app setup policy that includes the apps for a business voice experience.
Small and medium business user (without Business Voice)	Creates an app setup policy relevant for a small and medium sized business Teams users (non-Business Voice experience).
Public safety officer	Creates a set of policies and policy settings that apply to public safety officers in your organization.

NOTE

We'll be adding more policy packages in future releases of Teams, so check back for the most up-to-date information.

Each individual policy is given the name of the policy package so you can easily identify the policies that are linked to a policy package. For example, when you assign the Education (Teacher) policy package to teachers in your school, a policy that's named Education_Teacher is created for each policy in the package.

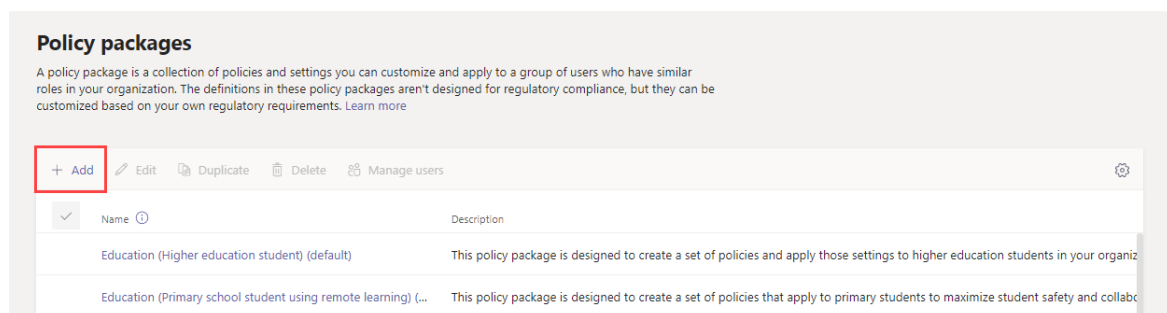

Custom policy packages

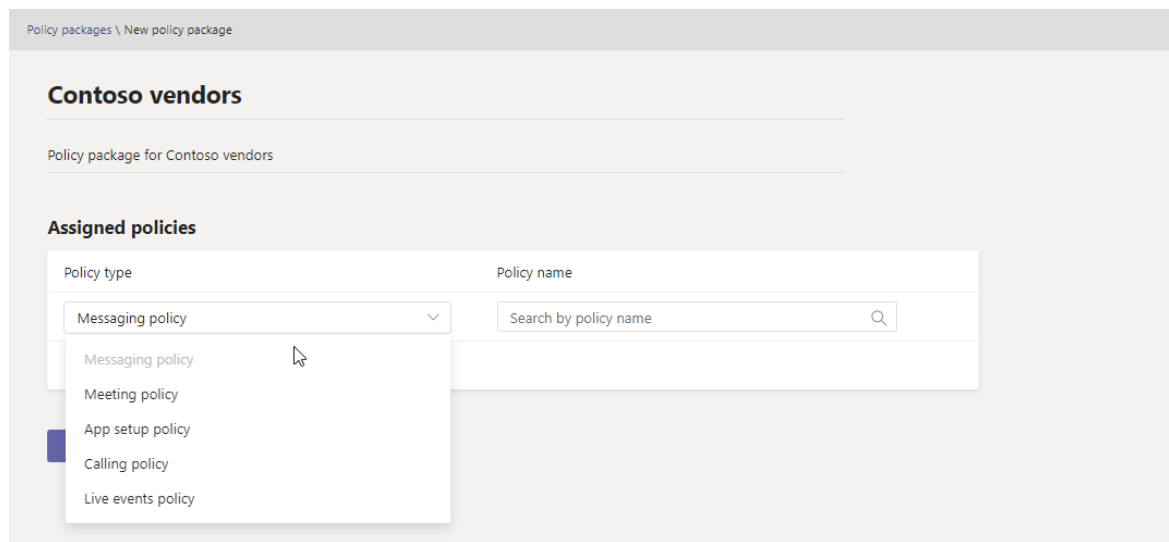

Custom policy packages let you bundle your own set of policies for users with similar roles in your organization. Create your own policy packages by adding the policy types and policies that you need.

To create a new custom policy package:

1. In the left navigation of the Microsoft Teams admin center, select **Policy packages**, and then click **Add**.

2. Enter a name and description for your package.

3. Select the policy types and policy names to include in the package.
4. Click **Save**.

How to use policy packages

The following outlines how to use policy packages in your organization.

- **View:** View the policies in a policy package. Then, view the settings of each policy in a package before you assign the package. Make sure that you understand each setting. Decide whether the predefined values are appropriate for your organization or whether you need to change them to be more restrictive or lenient based on your organization's needs.

If a policy is deleted, you can still view the settings but you won't be able to change any settings. A deleted policy is re-created with the predefined settings when you assign the policy package.

- **Customize:** Customize the settings of policies in the policy package to fit the needs of your organization.
- **Assign:** Assign the policy package to users.

NOTE

You can also change the settings of policies in a policy package after you assign a package. Any changes you make to policy settings are automatically applied to users who are assigned the package.

Here are the steps for how to view, assign, and customize policy packages in the Microsoft Teams admin center.

View the settings of a policy in a policy package

1. In the left navigation of the Microsoft Teams admin center, select **Policy packages**, and then select a policy package by clicking to the left of the package name.
2. Click the policy you want to view.

Customize policies in a policy package

You can edit the settings of a policy through the **Policy packages** page or by going directly to the policy page

in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, do one of the following:
 - Click **Policy packages**, and then select the policy package by clicking to the left of the package name.
 - Click the policy type. For example, click **Messaging policies**.
2. Select the policy you want to edit. Policies that are linked to a policy package have the same name as the policy package.
3. Make the changes that you want, and then click **Save**.

Assign a policy package

You can assign a policy package to an individual user, a group, or a batch of users. For more information on how to assign policy packages, see [Assign policy packages to users and groups](#).

Create and license Business Voice users and assign them phone numbers

12/7/2021 • 2 minutes to read • [Edit Online](#)

To use Microsoft 365 Business Voice, you need a Microsoft 365 account that has a Microsoft 365 Business Voice license. When you have an account and license, you can assign a phone number to it.

Create and license users

Follow the steps in [Add users individually or in bulk](#) and [Assign licenses to users](#).

NOTE

In the **Assign product licenses** pane, select **Microsoft 365 Business Voice**.

Assign phone numbers to users

After you create users and assigned them a Microsoft 365 Business Voice license, you can assign phone numbers to them. You need one unassigned phone number for each user that needs to make or receive calls to or from external phone numbers. If you don't have enough unassigned phone numbers, see [Get more phone numbers](#) later in this article.

1. Go to <https://admin.teams.microsoft.com>.
2. Enter a name and description for the phone number request.
3. Select **Voice > Phone numbers**.
4. Select a phone number that you want to assign to a user, and then select **Edit**.
5. In the **Edit** panel, enter the name of the user that you want to assign the number to in **Assigned to**. Then select **Assign**.
6. For **Emergency location**, enter the location where the user is located, and then select **Apply**.

Get more phone numbers

If you don't have enough phone numbers to assign to new users, you can get more. It may take up to 24 hours for numbers that you order to become available.

1. Go to <https://admin.teams.microsoft.com>.
2. Enter a name and description for the phone number request.
3. Select **Voice > Phone numbers > Add**.
4. Choose the country or region for the phone number.
5. For **Number type**, select **User (subscriber)**.
6. For **Location**, search for the location of the user and select it. You can also choose to **Add a location**.
7. Choose an area code, enter the number of phone numbers that you need, and then select **Next**.
8. Wait for the phone numbers to be reserved, and then view the numbers that you get. If everything looks ok, select **Place order** and then **Finish**.

Create a call queue - small business tutorial

12/7/2021 • 7 minutes to read • [Edit Online](#)

Call queues provide a method of routing callers to people in your organization who can help with a particular issue or question. Calls are distributed one at a time to the people in the queue (who are known as *agents*).

Call queues provide:

- A greeting message.
- Music while people are waiting on hold in a queue.
- Call routing - in *First In, First Out* (FIFO) order - to agents.
- Handling options for queue overflow and timeout.

Video demonstration

This video demonstrates how to create a call queue in Teams.

Before you begin

Get some [Phone System - Virtual User licenses](#) if you don't already have them. Get one for each call queue and auto attendant that you plan to set up. These licenses are free, so we suggest getting a few extra in case you decide to make changes to your setup in the future.

Since agents in a call queue may dial out to return a customer call, consider setting the caller ID for your call agents to your main phone number or the number of an appropriate auto attendant. See [Manage caller ID policies in Microsoft Teams](#) for more information.

Follow these steps to set up your call queue

- [Step 1](#)
[Create a team](#)
- [Step 2](#)
[Resource accounts](#)
- [Step 3](#)
[Call agents](#)
- [Step 4](#)
[Call routing](#)
- [Step 5](#)
[Call overflow](#)
- [Step 6](#)
[Call timeout](#)

When creating a call queue, you can add individual users to the queue, or you can use an existing security group, Microsoft 365 group, or Microsoft Teams team. We recommend [using a team channel](#). This allows members of the queue to chat with each other, share ideas, and create documents or other resources to help them help your customers. A team also provides a voice mailbox for callers to leave a message after hours or if the queue reaches its maximum capacity.

To create a team

1. First, click **Teams** on the left side of the app, then click **Join or create a team** at the bottom of your

teams list.

2. Then click **Create team** (first card, top left corner).
3. Choose **Build a team from scratch**.
4. Next, choose whether you want a public or private team. We recommend **Private** for your call queue to avoid people unintentionally becoming part of the queue by joining the team.
5. Name your team and add an optional description.
6. When you're done, click **Create**.
7. Type the names of the people that you want to have in your call queue, and then click **Add**.
8. Click **Close**. People you add to a team will receive an email letting them know they are now a member of your team and the team will show up in their teams list.

Next, we'll add a channel to use with the call queue.

To add a channel

1. In Teams, find the team you just created, click **More options (...)**, and then click **Add channel**.
2. Type a name and description for the channel.
3. Under **Privacy**, choose **Standard - Accessible to everyone on the team** and then click **Add**.

[Step 2 - Resource accounts >](#)

Set up an auto attendant - small business tutorial

12/7/2021 • 8 minutes to read • [Edit Online](#)

Auto attendants let people call your organization and navigate a menu system to speak to the right department, call queue, person, or an operator. You can create auto attendants for your organization with the Microsoft Teams admin center.

Video demonstration

This video shows a basic example of how to create an auto attendant in Teams.

Before you begin

Get the service numbers (service numbers are a special type of phone number that are used by auto attendants) that you need for the auto attendants that you want to be accessible by direct dialing from outside your organization. This might include [transferring numbers from another provider](#) or [requesting new service numbers](#).

Each auto attendant needs to be assigned a Phone System - Virtual User license. When you purchased Business Voice, you also received a number of Phone System - Virtual User licenses, so you probably don't need to request more. However, if you need more in the future, you can get them by following the instructions in [Phone System - Virtual User license](#).

If you want to have your auto attendant route calls differently on holidays, then [create the holidays that you want to use](#) before you create the auto attendant.

Follow these steps to set up your auto attendant

- [Step 1](#)
[Phone number](#)
- [Step 2](#)
[Attendant general info](#)
- [Step 3](#)
[Call flow](#)
- [Step 4](#)
[After hours](#)
- [Step 5](#)
[Holidays](#)
- [Step 6](#)
[Directory members](#)
- [Step 7](#)
[Resource accounts](#)

NOTE

If you're following the steps to set up Business Voice for the first time and you're on **Step 6: Set up an auto attendant for your company's main phone number**, you've already finished the steps on this tab. Move to the next tab: [Auto attendant general info](#).

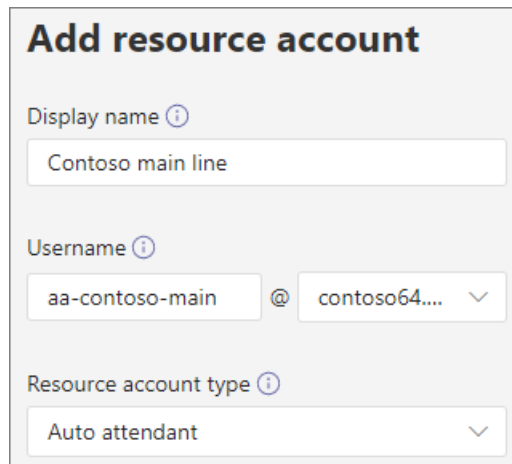

Each auto attendant that you create requires a resource account. This is similar to a user account, except the account is associated with an auto attendant or call queue instead of a person. In this step, we'll create the

account, assign it a *Microsoft 365 Phone System - Virtual User* license, and then assign a service number.

Create a resource account

You can create a resource account in the Teams admin center.

1. In the Teams admin center, expand **Org-wide settings**, and then click **Resource accounts**.
2. Click **Add**.
3. In the **Add resource account** pane, fill out **Display name**, **Username**, and choose **Auto attendant** for the **Resource account type**

Add resource account

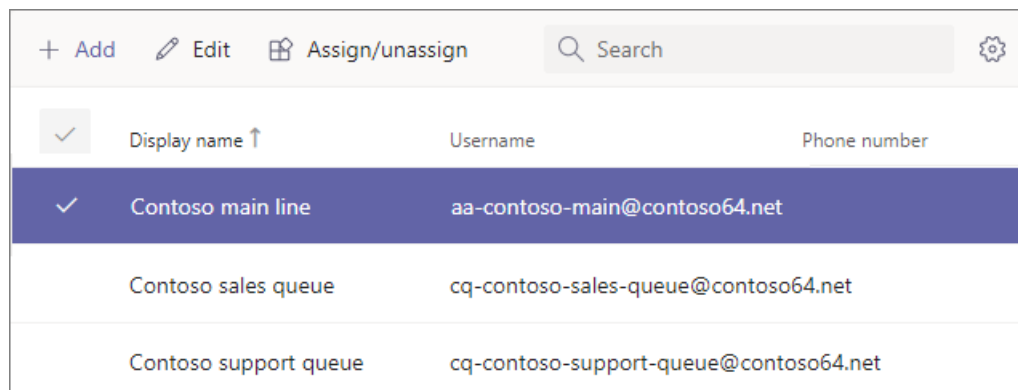

Display name ⓘ
Contoso main line

Username ⓘ
aa-contoso-main @ contoso64.... ▼

Resource account type ⓘ
Auto attendant ▼

4. Click **Save**.

The new account will appear in the list of accounts.

✓	Display name ↑	Username	Phone number
✓	Contoso main line	aa-contoso-main@contoso64.net	
	Contoso sales queue	cq-contoso-sales-queue@contoso64.net	
	Contoso support queue	cq-contoso-support-queue@contoso64.net	

Assign a license

You must assign a *Microsoft 365 Phone System - Virtual User* license to the resource account.

1. In the Microsoft 365 admin center, click the resource account to which you want to assign a license.
2. On the **Licenses and Apps** tab, under **Licenses**, select **Microsoft 365 Phone System - Virtual User**.
3. Click **Save changes**.

Create and license Business Voice users and assign them phone numbers

12/7/2021 • 2 minutes to read • [Edit Online](#)

To use Microsoft 365 Business Voice, you need a Microsoft 365 account that has a Microsoft 365 Business Voice license. When you have an account and license, you can assign a phone number to it.

Create and license users

Follow the steps in [Add users individually or in bulk](#) and [Assign licenses to users](#).

NOTE

In the **Assign product licenses** pane, select **Microsoft 365 Business Voice**.

Assign phone numbers to users

After you create users and assigned them a Microsoft 365 Business Voice license, you can assign phone numbers to them. You need one unassigned phone number for each user that needs to make or receive calls to or from external phone numbers. If you don't have enough unassigned phone numbers, see [Get more phone numbers](#) later in this article.

1. Go to <https://admin.teams.microsoft.com>.
2. Enter a name and description for the phone number request.
3. Select **Voice > Phone numbers**.
4. Select a phone number that you want to assign to a user, and then select **Edit**.
5. In the **Edit** panel, enter the name of the user that you want to assign the number to in **Assigned to**. Then select **Assign**.
6. For **Emergency location**, enter the location where the user is located, and then select **Apply**.

Get more phone numbers

If you don't have enough phone numbers to assign to new users, you can get more. It may take up to 24 hours for numbers that you order to become available.

1. Go to <https://admin.teams.microsoft.com>.
2. Enter a name and description for the phone number request.
3. Select **Voice > Phone numbers > Add**.
4. Choose the country or region for the phone number.
5. For **Number type**, select **User (subscriber)**.
6. For **Location**, search for the location of the user and select it. You can also choose to **Add a location**.
7. Choose an area code, enter the number of phone numbers that you need, and then select **Next**.
8. Wait for the phone numbers to be reserved, and then view the numbers that you get. If everything looks ok, select **Place order** and then **Finish**.

Microsoft Teams: Managing your devices

12/7/2021 • 5 minutes to read • [Edit Online](#)

You can manage devices used with Microsoft Teams in your organization from the Microsoft Teams admin center. You can view and manage the device inventory for your organization and do tasks such as update, restart, and monitor diagnostics for devices. You can also create and assign configuration profiles to a device or groups of devices.

To manage devices, such as change device configuration, restart devices, manage updates, or view device and peripheral health, you need to be assigned one of the following Microsoft 365 admin roles:

- Microsoft 365 Global admin
- Teams Service admin
- Teams Device admin

For more information about admin roles in Teams, see [Use Teams administrator roles to manage Teams](#).

What devices can you manage?

You can manage any device that's certified for, and enrolled in, Teams. A device is automatically enrolled the first time a user signs in to Teams on the device. For a list of certified devices that can be managed, see:

- [Collaboration bars](#)
- [Conference phones](#)
- [Desk phones](#)
- [Microsoft Teams Rooms](#)
- [Teams displays](#)
- [Teams panels](#)

To manage devices, in the left navigation of the [Microsoft Teams admin center](#), go to **Teams Devices**, and then select the device type. Each type of device has its own respective section, which lets you manage them separately.

Manage Teams Rooms devices

You can use the Teams admin center to view and remotely manage your Teams Rooms devices across your organization. The Teams admin center makes it easy to see, at a glance, which devices are healthy and which need attention, and lets you focus on specific devices to see detailed information about device health, meeting performance, call quality, and peripherals.

Here are some things you can do to manage your Teams Rooms devices. Teams Rooms devices can be found in the [Microsoft Teams admin center](#) under **Teams Devices > Teams Rooms**.

For details about how to manage your Teams Rooms devices, see [Manage Microsoft Teams Rooms](#).

TO DO THIS...	DO THIS
Change settings on one or more devices	Select one or more devices > Edit settings . If you select multiple devices, the values you change will replace the values on all the selected devices.

TO DO THIS...	DO THIS
Restart devices	Select one or more devices > Restart . When you restart a device, you can choose whether to restart the device immediately or select Schedule restart to restart the device at a specific date and time. The date and time you select are local to the device being restarted.
View meeting activity	Select a device name to open device details > Activity . When you open the Activity tab, you can see all the meetings that the device has participated in. This summary view shows the meeting start time, the number of participants, its duration, and the overall call quality.
View meeting details	Select a device name to open device details > Activity > select a meeting. When you open a meeting's details, you can see all of the participants in the meeting, how long they were in the call, the Teams session types, and their individual call quality. If you want to see technical information about a participant's call, select the participant's call start time.

Manage phones, collaboration bars, Teams displays, and Teams panels

In the Teams admin center, you can view and manage phones, collaboration bars, Teams displays, and Teams panels enrolled in Teams in your organization. Information that you'll see for each device includes device name, manufacturer, model, user, status, action, last seen, and history. You can customize the view to show the information that fits your needs.

Phones, collaboration bars, Teams displays, and Teams panels are automatically enrolled in Microsoft Intune if you've signed up for it. After a device is enrolled, device compliance is confirmed and conditional access policies are applied to the device.

Here are some examples of how you can manage phones, collaboration bars, Teams displays, and Teams panels in your organization.

TO DO THIS...	DO THIS
Change device information	Select a device > Edit . You can edit details such as device name, asset tag, and add notes.
Manage software updates	Select a device > Update . You can view the list of software and firmware updates available for the device and choose the updates to install. For more information about updating devices, see Update Teams devices remotely
Upgrade Teams phones to Teams displays	On the IP phones page, select one or more Teams phones > Upgrade . This option is available only to phones that support upgrading to Teams displays. To learn more, see Upgrade Teams phones to Teams displays .
Assign or change configuration policies	Select one or more devices > Assign configuration .
Add or remove device tags	Select one or more devices > Manage tags . For more information about device tags, see Manage Teams device tags .
Restart devices	Select one or more devices > Restart .

TO DO THIS...	DO THIS
Filter devices using device tags	Select the filter icon, select the Tag field, specify a device tag to filter on, and select Apply . For more information about filtering devices using device tags, see Use filters to return devices with a specific tag .
View device history and diagnostics	Under the History column, click the View link for a device to view its update history and diagnostic details.

Use configuration profiles in Teams

Use configuration profiles to manage settings and features for different Teams devices in your organization, including collaboration bars, Teams displays, Teams phone, and Teams panels. You can create or upload configuration profiles to include settings and features you want to enable or disable, and then assign a profile to a device or set of devices.

Create a configuration profile

To create a configuration profile for a Teams device type:

1. In the left navigation, go to **Teams Devices** > select the Teams device type > **Configuration profiles**. For example, select **Teams Devices** > **Teams panels** > **Configuration profiles** to create a new configuration profile for Teams panels.
2. Click **Add**.
3. Enter a name for the profile and optionally add a friendly description.
4. Specify the settings you want for the profile, and then click **Save**. The newly created configuration profile is displayed in the list of profiles.

Assign a configuration profile

After creating a configuration profile for a Teams device type, assign it to one or more devices.

1. In the left navigation, go to **Teams Devices** > select the Teams device type. For example, to assign a configuration profile to a Teams panels device, select **Teams Devices** > **Teams panels**.
2. Select one or more devices, and then click **Assign configuration**.
3. In the **Assign a configuration** pane, search for configuration profile to assign to the selected devices.
4. Click **Apply**. For the devices to which you applied the configuration policy, the **Action** column displays **Config Update** and the **Configuration profile** column displays the configuration profile name.

Monitor and improve call quality for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article introduces three key tools you can use to monitor, troubleshoot, manage, and improve call quality in Microsoft Teams.

- **Call Quality Dashboard (CQD)**: To analyze org-wide trends or problems, drive improvements to performance
- **Call analytics**: To analyze call and meeting quality for individual users
- **Quality of Service (QoS)**: To prioritize important network traffic

Monitor and troubleshoot call quality

You'll use per-user **Call analytics** and **Call Quality Dashboard** to find and troubleshoot call-quality problems that come up during ongoing operation. This lets you drive performance improvements across your network. Both of these tools are in the Teams admin center.

- **Call analytics** shows detailed information about the devices, networks, and connectivity related to *specific calls and meetings* for each user in Teams. Teams admin and helpdesk agents will use this information to troubleshoot call quality and connection problems in a specific call. To learn more, read [Set up call analytics](#) and [Use Call Analytics to troubleshoot poor call quality](#).
- **Call Quality Dashboard (CQD)** gives you a *network-wide view* of call quality across your organization. Use CQD information to help you identify and fix problems. First, [Set up CQD](#). Then read [Manage call and meeting quality in Teams](#).

Call analytics and CQD run in parallel and can be used independently or together. For example, if a communications support specialist determines that they need more help troubleshooting a user's call problem, they escalate the call to a communications support engineer, who has access to additional information about the call. In turn, the communications support engineer alerts a network engineer to a possible site-related issue they noticed in the call analytics. The network engineer checks CQD to see if an overall site-related issue could be a contributing cause of the user's call problem.

Prioritize important network traffic using QoS

As your users start using Teams for calls and meetings, they may experience a caller's voice breaking up or cutting in and out of a call or meeting. Shared video may freeze or pixelate, or fail altogether. This is due to the IP packets that represent voice and video traffic encountering network congestion and arriving out of sequence or not at all. If this happens (or to prevent it from happening in the first place), use **Quality of Service (QoS)**.

With QoS, you prioritize delay-sensitive network traffic (for example, voice or video streams), allowing it to "cut in line" in front of traffic that is less sensitive (like downloading a new app, where an extra second to download isn't a big deal). QoS identifies and marks all packets in real-time streams using Windows Group Policy Objects and a routing feature called Port-based Access Control Lists, which instructs your network to give voice, video, and screen sharing their own dedicated network bandwidth.

Ideally, you'll implement QoS on your internal network while getting ready to roll out Teams, but you can do it anytime. If you're small enough, you might not need QoS.

When you're ready, read [Implement Quality of Service \(QoS\) in Microsoft Teams](#).

To use QoS to manage meeting traffic, read [Set how you want to handle real-time media traffic for Teams meetings](#).

Set up Call Quality Dashboard

12/7/2021 • 2 minutes to read • [Edit Online](#)

Open the Microsoft Call Quality Dashboard (CQD) at <https://cqd.teams.microsoft.com> (sign in with your admin credentials). Or go to the Teams admin center and select **Analytics & reports** > **Call Quality Dashboard**.

On the page that opens, click **Sign in** and enter your Global Administrator account or Microsoft Teams Administrator account information. After the first time you sign in, CQD will begin collecting and processing data. Keep in mind that it may take one or more hours to process enough data to display meaningful results in the reports.

CQD shows call and meeting quality, at an org-wide level, for Microsoft Teams, Skype for Business Online, and Skype for Business Server 2019.

IMPORTANT

To use CQD with Skype for Business Server 2019, you'll have to [Configure Call Data Connector](#). See [Plan Call Data Connector](#) before you start.

Assign admin roles for access to CQD

Assign [roles](#) for accessing CQD to the people who need to use it.

If you want non-admin users (such as support engineers and helpdesk agents) to use Call Quality Dashboard, you can assign those users one of the following roles, which gives access to CQD.

	VIEW REPORTS	VIEW EUUI FIELDS	CREATE REPORTS	UPLOAD BUILDING DATA
Global Administrator	Yes	Yes	Yes	Yes
Teams Administrator	Yes	Yes	Yes	Yes
Teams Communications Administrator	Yes	Yes	Yes	Yes
Teams Communications Support Engineer	Yes	Yes	Yes	No
Teams Communications Support Specialist	Yes	No	Yes	No
Skype for Business Administrator	Yes	Yes	Yes	Yes
Global Reader	Yes	Yes	Yes	No
Reports Reader ¹	Yes	No	Yes	No

¹ In addition to reading CQD reports, the Reports Reader can view all the [activity reports](#) in the admin center and any reports from the [Microsoft 365 Adoption content pack](#).

NOTE

If you're not seeing [EUUI \(end-user identifiable information\)](#) and you have one of the roles that's permitted to see this information, keep in mind that CQD only keeps EUUI for 28 days. Anything older than 28 days is deleted.

For more information about these roles, see [About Office 365 admin roles](#).

After the first time you sign in, CQD will begin collecting and processing data.

Use Power BI to analyze CQD data

New in January 2020: [Download Power BI query templates for CQD](#). Customizable Power BI templates you can use to analyze and report your CQD data.

Read [Use Power BI to analyze CQD data](#) to learn more.

Microsoft Teams Rooms

12/7/2021 • 2 minutes to read • [Edit Online](#)

Transform meeting spaces ranging from small huddle areas to large conference rooms with a rich, collaborative Teams experience that's simple to use, deploy, and manage.

Start meetings on time with one-touch join, then instantly project to the display in the room and share to remote participants.

Select the right system and audio video peripherals from one of our partners: Yealink, Logitech, Crestron, Polycom, Lenovo, and HP.

For a quick introduction to Teams Rooms, click on the video to the right.

<input type="text"/>	<input type="text"/>	<input type="text"/>
Plan	Deploy	Manage

NOTE

Microsoft Teams Rooms is intended for use with Microsoft Teams, Skype for Business Online, Skype for Business Server 2019, or Skype for Business Server 2015.

Earlier platforms like Lync Server 2013 aren't expected to work with Microsoft Teams Rooms.

These articles are intended for people tasked with planning, deploying, and managing these devices, and not for the users of the system. Users will be more interested in the Microsoft Teams Rooms [online help](#).

NOTE

[Skype Room System](#) (formerly Lync Room System) and Microsoft Teams Rooms are different products with different dependencies and deployment procedures.

Meeting room guidance for Teams

12/7/2021 • 22 minutes to read • [Edit Online](#)

This article is intended to guide users on how to optimize meeting spaces with Microsoft Teams Rooms solutions and devices. It includes information on Teams Rooms device and solution uses, layouts, and specifications.

The [Example spaces](#) section of this article includes specifications and rendered room layouts and is a great way to visualize and plan a Teams device and/or Teams Rooms solution deployment.

Meeting room uses and layouts

Microsoft Teams Rooms solutions offer flexibility of purpose and even flexibility of movement throughout a space that traditional meeting rooms do not. For example, with Teams Rooms devices, users can enhance their collaboration with a digital whiteboard, and intelligent people-tracking cameras make sure every local participant can be seen no matter where they are in the room. Any type of space and any type of meeting can be optimized with Teams Rooms devices or Teams Rooms solutions.

Presentation-focused meetings

Meet and present meetings are the first bucket, and this meeting is generally more formal. Audio-visual is a priority, and there is a focus on presenting content. The device is typically fixed, allowing users to remain seated while interacting with the device from a center-of-table console.

Meet and present spaces prioritize presentation and discussion, which means the layout and technology must be optimized for content sharing and remote co-creation. Everyone needs to be involved in the discussion and must be able to see and interact with shared content.

Meet and present space layouts: Tables should be fixed and located in front-of-room displays. In smaller rooms, the tables may be attached to the wall, but in larger spaces, they must be separated to accommodate camera considerations.

Co-creation-focused meetings

Meet and co-create meetings are generally less formal with a priority on co-creation, inking, and whiteboard. Access to personal files is also a focus for this bucket. The device can be mobile, encouraging users to stand up, gather, and interact with the device.

The right space bridges users and the technology seamlessly and eliminates friction for even the most novice users. Teams devices are designed to be user-friendly enough for young students or new users to navigate adeptly, and for educators or admin to control and customize from first use.

Meet and co-create space layouts: Tables and co-creation equipment can have flexible positions and should accommodate groups of people working at either the tables or the equipment.

Presentation and co-creation-focused meetings

Remember, both types of rooms can handle both types of experiences when needed. Rooms can also be designed to accommodate both easily by having technology for each use. The important thing to remember is that no matter what space you are equipping, from a private office to a lecture hall, it needs to be Teams enabled.

Combination presentation and co-creation space layouts: A combination of use cases from other meeting scenarios can be combined to form multi-purpose rooms where presentation-focused meetings, as well as co-creation work, can be achieved with equal efficiency, often simultaneously.

Optimizing the meeting experience

A great meeting experience is the result of using the best possible technology for a meeting space in ways that facilitate the exchange of ideas without being intrusive.

Native Teams Rooms experiences versus other devices

Teams Rooms go beyond what can be done with Teams on personal devices by providing unique in-room capabilities, like one-touch join, content cameras to share physical whiteboards into the meeting in an intelligent way, and proximity features like seamlessly transferring a Teams meeting from your personal device to the room.

Non-native and self-built systems that rely on external services, or a bring-your-own-device connection, will never truly match the ease of use or immersive quality of a native Teams Room.

It's understood that over the course of a deployment, there may need to be intermediate steps (such as quickly deploying bring-your-own-device meeting rooms) implemented on your path to a fully native Teams experience in your meeting spaces.

Using Teams to create the best possible meeting experience

By having both Teams on all your personal devices and properly deployed Microsoft Teams Rooms in all your spaces, you will be able to facilitate the best possible meeting experience for every one of your users. As you plan to achieve the best possible experience, you will need to address all your spaces in terms of both technological deployment and end-user guidance and training.

It's normal when planning for a large-scale, company-wide rollout for it to happen in stages with some rooms seeing technology added at different times, or even certain components being installed earlier than others (such as deploying Teams panels for scheduling in every room in a particular building while installing Teams Rooms solutions one floor or even room at a time).

Prepare your users to do this in stages to maximize your Teams meeting experience at every point along the way.

Good experience – Personal devices alone in a meeting space

You can start with this plan by addressing all your non-AV or non-collaboration-equipped meeting spaces. You can still take advantage of Teams in your meeting rooms, even if those meeting rooms have not yet had Teams devices installed.

Audio: A great bridge to a complete Teams Room is to plan for meeting technology by either providing your individual users with Teams-certified audio devices for smaller rooms and groups, or by deploying them in rooms ahead of a full Teams Rooms solution for larger spaces meant for larger groups where a small device won't cut it.

Video: When these rooms are used, individual users can bring their own devices to share in the Teams meeting content and capture their expressions with their individual cameras. Users can then designate someone to be the single source of audio for the local group, connecting that personal device to the certified audio device, so that everyone (both local and remote) has a positive experience with meeting audio.

Engagement: Enabling your meeting rooms for a better Teams meeting experience, even when it requires the use of personal devices and peripherals, will still allow your users to expand on what they can do with Teams. When your users are situated in private offices and at individual workstations, Teams facilitates in-person discussions in addition to engaging with remote participants.

Better experience – Teams Rooms solutions and no personal devices

If you install Teams Rooms solutions or if you already have rooms that have already been deployed with appropriate Teams Rooms devices for their respective spaces, then you are well on your way to having great meeting experiences.

Audio: Audio for these meeting spaces will be handled by the Teams Rooms solution and its Microsoft-certified audio devices.

Video: Video in these spaces will be handled by the Teams Rooms solution and its Microsoft-certified cameras.

Engagement: Your end users will be able to take advantage of the complete Teams Rooms experience for their meetings, ensuring that everyone can join meetings easily and have great audio and video.

Best experience – Teams Rooms solutions used in conjunction with personal devices

Training your users to use technology in coordination leads to the most efficient and streamlined outcome. The best possible scenario is a combination of installed technology and personal devices.

Audio: Most meeting-room connectivity and audio-video work will be handled by the Teams Rooms solution, while individual users can join the same meeting with cameras on and audio off for a completely immersive experience.

Video: Remote users will be able to see everyone take part in the meeting beyond just speaking and content sharing. A remote user can turn on personal video to gain a view from anywhere in the room with the ability to focus in on any participant.

Engagement: Chat can remain dynamic with all participants, local and remote, involved and engaged. Video sharing from both Teams Rooms and via individual cameras allows remote participants to feel engaged with everyone.

Using Teams on all devices ensures that local room users and remote users feel equally engaged in meetings.

Technology considerations

The right audio and video technology choices will help users get the most out of their Microsoft Teams meetings.

Audio

Audio considerations are critical to ensure both remote and in-room participants can be clearly heard and understood. Microphone and speaker coverage must include every seat in the room without leaving gaps.

The right audio devices for each space

A single source of audio for a space is required to ensure that there are no audio issues in a meeting room.

Pairing the right microphone and speakers for each space will give the best possible results for being heard clearly without distraction.

- In shared spaces, the options expand, but the same principles remain: meeting participants need to be heard and hear others clearly.
 - All-in-one audio devices are easy-to-deploy, high-quality options for **smaller spaces** with a limited number of participants seated relatively close to the audio device.
 - In **larger spaces**, the microphones and speakers separate to ensure maximum coverage across all participants in the space. Many solutions for medium- to large-sized rooms are available as part of a kit that requires no configuration, only physical installation of microphones and speakers.
 - In **the very largest and most complex spaces**, solutions are available that allow for a variety of microphone and speaker types to be used together, such as capturing a lecturer and audience voice from a large hall while simultaneously bringing the call to everyone. These solutions are best achieved when deployed with a Microsoft partner who has expertise in the design and deployment of more technically involved solutions.

Video

Video is equally important as audio. Capturing physical, non-verbal communication like facial expressions or gestures is as important as the classroom or meeting content to ensure maximum engagement and understanding. Rooms need to be equipped with the appropriate size of display so that everyone can experience the meeting properly, whether in the room or remote. This is why rooms also need to have the right camera coverage and field of view (FOV) to effectively capture all the in-room meeting participants for those joining remotely.

The right cameras for each space

As important as good audio, high-quality video is a necessity for modern Teams collaboration. Technology for cameras has advanced significantly with high-quality cameras now available for all spaces.

- Included cameras in devices like laptops and tablets should be used in all meetings to ensure that everyone is seen and heard. For users looking to bring a richer video experience to a **personal space**, external cameras represent a step up from embedded devices and can be used in a greater number of scenarios and configurations, ensuring that call participants share the best quality view of themselves. These devices easily install with simple USB connection found on every PC.
- In shared spaces, the options and features expand. **Smaller rooms** may be covered by cameras included within all-in-one audio devices, such as soundbars. These cameras typically feature a wide field of view, ensuring that they capture every participant in the space in a single shot. Many of these cameras also feature things like intelligent framing of the image, so that the camera only shows the people in the meeting and not empty chairs, or people counting, to track and understand space utilization.
- In **larger rooms**, cameras feature the technology needed to capture participants in a variety of locations at varying distances away. These cameras can capture groups or focus on specific individuals while maintaining great visual clarity. Devices that can track and feature only active speakers are regularly used in larger spaces so that many participants may be featured individually throughout a meeting as they contribute their thoughts.

Example spaces

This section explores some examples of how to tackle the various spaces found throughout most organizations. There are many ways to achieve a great meeting experience, and these example spaces can act as great guides when building for your own organization.

Smaller meeting spaces

Private office with meeting space

USAGE	LAYOUT	AUDIO	VIDEO
Meet and Present	Typical capacity: 3-4 people	Recommended audio: Single front-of-room or tabletop device	Recommended camera: Short distance with ultra-wide field of view
	Typical dimensions: 10 ft x 10 ft		Minimum display size: 46in
	Single or dual primary display recommended: Single		

Private offices are often designed with meeting spaces separate from the working area so that small meetings can be held with a mix of local and remote participants.

The solution shown is:

A huddle or focus room area inside of a larger private working space.

Why this layout and device type?

The layout of the space is designed to facilitate meetings with both local and remote participants.

The meeting table is physically separate from the private working space and the meeting-room technology to facilitate both meetings with local and remote participants.

The room features a single display sized so that all participants can clearly see all presented content and remote video participants clearly. It also features a soundbar-based Room solution with an integrated intelligent camera. This solution is easy to install and operate and provides great audio and video coverage for meetings in this type of space.

Pictured here:

- Single display
- All-in-one soundbar-based Teams Rooms solution

Open spaces

USAGE	LAYOUT	AUDIO	VIDEO
Meet and Co-create	Typical capacity: 3-13 people	Recommended audio: Depends on the space	Recommended camera: Depends on the space
	Typical dimensions: Depends on the space		Minimum display size: Depends on the space

Open spaces, such as lounges and common areas, often feature collaboration technology for non-traditional meetings.

The solution shown is:

Two areas with Surface Hub devices positioned for interactive collaboration and creation options in a large, open space.

Why this layout and device type?

The counter-height table is positioned with a large Surface Hub device for use of a content-creation display as well as a Teams Rooms solution for small meetings. Another Surface Hub device is set up on a cart to be moved around to casual seating areas for content creation. The furniture is laid out to be mixed use for both informal office conversation as well as impromptu co-working, giving options for all space types.

Pictured here:

- Large wall-mounted Surface Hub
- Cart-mounted mobile Surface Hub

Focus/huddle room

USAGE	LAYOUT	AUDIO	VIDEO
Meet and Present	Typical capacity: 3-5 people	Recommended audio: Single front-of-room or tabletop device	Recommended camera: Short distance with ultra-wide field of view
	Typical dimensions: 10 ft x 10 ft		Minimum display size: 46in
	Single or dual primary display recommended: Single		

These spaces are ideal for small-group collaboration and discussion.

The solution shown is:

A huddle or focus room with the Microsoft Teams Rooms solution for small-group collaboration.

Why this layout and device type?

The table is attached to the wall, which maximizes the flexibility of the space for various layouts. It ensures the Teams Rooms solution is the focus of the space. A mounted display sized for the room ensures everyone physically present can see remote meeting participants and/or a collaborative document. A room camera captures the room for remote participants. Because the room is a dedicated meeting space, a tabletop audio device makes sure all parties are heard.

Pictured here:

- A Teams Rooms solution for small rooms, easily installed
- Single front-of-room display for remote participants and content to be shared

Small traditional meeting rooms

USAGE	LAYOUT	AUDIO	VIDEO
Meet and Present	Typical capacity: 5-7 people	Recommended audio: Single front-of-room or tabletop device	Recommended camera: Short distance with ultra-wide field of view
	Typical dimensions: 10 ft x 15 ft		Minimum display size: 50in
	Single or dual primary display recommended: Single		

These spaces are ideal for small-group collaboration and discussion.

The solution shown is:

A small, traditionally laid-out meeting room with the Microsoft Teams Rooms solution.

Why this layout and device type?

A more traditional meeting-room layout can be designed just as much for purely in-person meetings as for meetings with remote participants and content. The table is separated from the display wall and Teams Rooms solution. A mounted display sized for the room ensures everyone physically present can see remote meeting participants and/or a collaborative document. A room camera captures the room for remote participants. Because the room is a dedicated meeting space, a tabletop audio device makes sure all parties are heard.

Pictured here:

- A Teams Rooms solution for small rooms, easily installed
- Single front-of-room display for remote participants and content to be shared

Larger meeting spaces

Medium traditional meeting rooms

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: 10-12 people	Recommended audio: Installed audio with discrete tabletop or ceiling microphones and wall-mounted or ceiling-mounted speakers	Recommended camera: Medium-long distance camera with Pan Tilt Zoom function and/or intelligent people-tracking capabilities
	Typical dimensions: 15 ft x 20 ft		Minimum display size: 55in for dual, larger for single

USAGE	LAYOUT	AUDIO	VIDEO
	Single or dual primary display recommended: Single or dual		

This medium room is ideal for conferences and group collaboration, especially in existing spaces that already feature a classic meeting-room layout.

The solution shown is:

A medium-sized meeting room with dual front-of-room displays for various layouts of people and content with annotation and collaboration for the Surface Hub 2.

Why this layout and device type?

A more traditional meeting-room layout can be designed just as much for purely in-person meetings as for meetings with remote participants and content. The table is separated from the display wall and Teams Rooms solution. Multiple displays ensure that remote participants have a prominent space in the physical room and that any collaborative documents are visible. Mounted speakers give remote attendees an “in-the-room” voice. A mounted camera ensures all the physical meeting participants are captured.

Pictured here:

- Microsoft Teams Rooms solution with dual front-of-room displays for high visibility of remote participants and shared content
- An optional Surface Hub 2 for annotation and whiteboarding
- A larger, separated audio and camera solution installed for maximum coverage of participants in the larger space. Table microphones and wall-mounted speakers ensure that everyone is heard in Teams calls

Large traditional meeting rooms

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: 12-20 people	Recommended audio: Installed audio with discrete tabletop or ceiling microphones and wall-mounted or ceiling-mounted speakers	Recommended camera: Medium-long distance camera with Pan Tilt Zoom function and/or intelligent people-tracking capabilities
	Typical dimensions: 15 ft x 30 ft		Minimum display size: 65in for dual, larger for single
	Single or dual primary display recommended: Single or dual		

A large-sized room is ideal for conferences and group collaboration, especially in existing spaces that already feature a classic meeting-room layout.

The solution shown is:

A large-sized meeting room with dual front-of-room displays for various layouts of people and content with annotation and collaboration for the Surface Hub 2.

Why this layout and device type?

A more traditional meeting-room layout can be designed just as much for purely in-person meetings as for meetings with remote participants and content. The table is separated from the display wall and Teams Rooms solution. Multiple displays ensure that remote participants have a prominent space in the physical room and that any collaborative documents are visible. Mounted speakers give remote attendees an “in-the-room” voice. A mounted camera ensures all the physical meeting participants are captured.

Pictured here:

- Microsoft Teams Rooms solution with dual front-of-room displays for high visibility of remote participants and shared content
- Optional Surface Hub 2 for annotation and whiteboarding
- A larger, separated audio and camera solution installed to get maximum coverage of participants in the larger space. Table microphones and wall-mounted speakers ensure that everyone is heard in Teams calls

Extra-large traditional meeting rooms/boardrooms

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: 25-40 people	Recommended audio: Installed ceiling or table microphones and speakers with a Digital Signal Processor (DSP)	Recommended camera: Long-distance camera with Pan Tilt Zoom function and/or intelligent people-tracking capabilities
	Typical dimensions: 28 ft x 33 ft		Minimum display size: 75in for dual, larger for single
	Single or dual primary display recommended: Single or dual		

This type of space typically includes an extra-large-sized layout featuring a meeting-room table as well as an audience seating area with dual front-of-room displays.

The solution shown is:

An extra-large-sized meeting room with dual front-of-room displays for various layouts of people and content with annotation and collaboration for the Surface Hub 2.

Why this layout and device type?

This space features a principal meeting-room table for many meeting participants as well as an audience seating area for extra capacity for local meeting attendees. A dual large display gives remote participants a physical presence within the room. Installed audio in the ceiling means audio coverage for all participants in every part of the room, even those seated away from the main meeting table. A collaborative white-board screen is dedicated to content for both in-room and remote participants to be part of any creative ideation.

Pictured here:

- Microsoft Teams Rooms solution with separated dual displays
- Optional Surface Hub 2 for annotation and whiteboarding
- Installed audio-visual components featuring ceiling-mounted audio devices and a camera solution installed to get maximum coverage of participants throughout the space

Panoramic meeting rooms

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: 6-12 people	Recommended audio: Installed ceiling or table microphones and speakers that can support directional audio	Recommended camera: Long-distance camera with ultra-wide field of view and intelligent people tracking
	Typical dimensions: Depends on the space		Minimum display size: Depends on the space
	Single or dual primary display recommended: Dual traditional displays or dual-edged blended projectors		

This space is dedicated to the most immersive Teams meeting experience.

The solution shown is:

A meeting room, oriented with the table facing a panorama of blended displays, ensuring that all users get the best possible view of meeting participants and content.

Why this layout and device type?

A panoramic table layout is designed for maximum visibility and engagement with remote participants and content. Large, blended displays allow for an immersive feeling, with all chairs facing the displays and able to follow along. Spatial audio means it feels like remote participants are in the room with local participants based on their position on the front-of-room screen.

Pictured here:

- Microsoft Teams Rooms solution with two edge-blended projected displays, creating an immersive front-of-room experience designed specifically for Teams meetings
- Surface Hub 2 for annotation and whiteboarding
- Installed audio-visual components featuring ceiling-mounted and front-of-room audio devices for maximum coverage of participants throughout the space with consideration for spatial audio
- An intelligent, ultrawide-angle front-of-room camera to capture every participant in the space

Non-traditional meeting spaces

Multi-purpose spaces

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: Custom	Recommended audio: Installed ceiling or table microphones and speakers that can support directional audio	Recommended camera: Long-distance camera with ultra-wide field of view and intelligent people tracking
	Typical dimensions: Custom		Minimum display size: Custom
	Single or dual primary display recommended: Custom		

Teams can be implemented in almost any educational or multi-purpose space you can think of. Libraries, mixed-use presentation and collaboration spaces, café spaces, and open-air spaces can all be outfitted with a Teams solution or Teams devices.

An example multi-purpose space is:

A Teams Rooms solution with a large, projector-based front-of-room display, multiple touch consoles for operation, and multiple Surface Hub 2 devices for a wide range of uses.

Devices include:

- Microsoft Teams Rooms solution featuring multiple touch consoles, with a single, large front-of-room projector and screen for high visibility of remote participants and shared content
- Optional Surface Hub 2 for annotation and whiteboarding
- Installed audio-visual components featuring ceiling-mounted audio devices and a camera solution installed for maximum coverage of participants throughout the space

Classrooms

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: Custom	Recommended audio: Installed audio with discrete tabletop or ceiling microphones and wall-mounted or ceiling-mounted speakers	Recommended camera: Medium-long distance camera with Pan Tilt Zoom function and/or intelligent people-tracking capabilities
	Typical dimensions: Custom		Minimum display size: Custom
	Single or dual primary display recommended: Custom		

Classrooms, including traditional and reverse classrooms, require active engagement from everyone present. Effective instruction, discussion, and collaboration among many parties is key.

The solution shown is:

A classroom designed for both in-person and remote student participants with a layout that accommodates a single educator addressing both groups simultaneously.

Why this layout and device type?

A large display gives remote participants a physical presence within the room, along with front-of-the-room speakers that allow their voices to be heard by all, even by those at desks furthest from the source. Microphones are situated at the front of the room and throughout the space, so teachers and students can move around the room and still be heard. A presentation screen is dedicated to content for both in-room and remote participants.

Pictured here:

- Microsoft Teams Rooms solution with separated dual displays, a single cart or stand-based display showing the remote participants for the educator to see clearly, and a separate presentation screen for the educational content shared for both local and remote students to observe
- Kit with speakers and camera at the front of the room as well as microphones at the front and distributed throughout the classroom

Lecture halls and auditoriums

USAGE	LAYOUT	AUDIO	VIDEO
Meet and present + co-create	Typical capacity: Custom	Recommended audio: Installed audio with discrete tabletop or ceiling microphones and wall-mounted or ceiling-mounted speakers	Recommended camera: Medium-long distance camera with Pan Tilt Zoom function and/or intelligent people-tracking abilities
	Typical dimensions: Custom		Minimum display size: Custom
	Single or dual primary display recommended: Custom		

Much like classrooms, lecture halls contain numerous students who must focus on an educator and any information they're presenting. However, lecture halls generally don't require the same amount of interaction among students. The focus is on information, not collaboration.

The solution shown is:

A lecture hall designed for both in-person and remote student participants with a layout that accommodates a single educator addressing both groups simultaneously, as well as creating and annotating content from a touch surface.

Why this layout and device type?

Remote participants can see the same field of view that in-person participants have via the mounted camera. The lecturer can see the remote students via their cameras on a display screen. A dedicated presentation screen

and a touch-surface screen for whiteboarding display the lecturer's educational material for all. A ceiling-tile microphone and a powerful speaker make sure the lecturer and any student questions are heard clearly.

Pictured here:

- Microsoft Teams Rooms solution with separated dual displays, a single cart- or stand-based display showing the remote participants for the educator to see clearly, and a separate presentation screen for the educational content shared into the call for both local and remote students to observe
- Optional Surface Hub 2 for annotation and whiteboarding
- Installed audio-visual components featuring ceiling-mounted audio devices and a camera solution installed for maximum coverage of participants throughout the space

Plan Microsoft Teams Rooms

12/7/2021 • 7 minutes to read • [Edit Online](#)

This article introduces an end-to-end approach to planning, delivering, and operating Microsoft Teams Rooms as part of your overall meeting and conference room strategy.

You'll find planning information below covering the recommended approach and key decisions that you need to make, with links to supporting technical information. We recommend that you review the Plan, Deploy, and Manage sections even if you're already fully deployed.

Overview of Microsoft Teams Rooms

Microsoft Teams Rooms provides a complete meeting experience that brings HD video, audio, and content sharing to meetings of all sizes, from small huddle areas to large conference rooms.

[Microsoft Teams Rooms help](#) is a great resource to find out more about Microsoft Teams Rooms and how it can add value as part of your deployment. In addition, we recommend watching this [overview video](#).

Microsoft Teams Rooms components

Microsoft Teams Rooms includes the following key components to deliver a great user experience:

- Touchscreen control panel
- Compute
- Microsoft Teams Rooms application
- Dock/extender
- Peripheral devices (camera, microphone, speaker)
- External screens (maximum of two)
- HDMI input

You can procure these components as preinstalled bundles from a number of vendors, or you can purchase the supported components individually by following the [requirements documented in this article](#).

In addition to the Surface Pro/dock combination, you can also purchase Microsoft Teams Rooms with the

touchscreen control panel, compute, dock, and key peripheral devices integrated.

Typically, the bundles and integrated units include preinstalled software, whereas if you buy supported components individually for the Surface Pro systems, you'll need to install the software. For instructions, see [this article about installing software on devices](#).

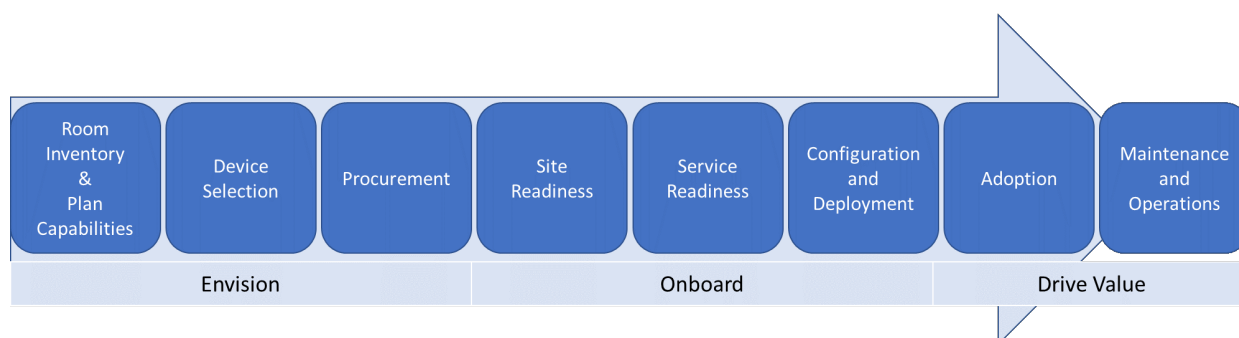

You can deploy Microsoft Teams Rooms with Microsoft Teams, Skype for Business Online, or Skype for Business hybrid or on-premises deployments. See the [Teams Meeting Room Licensing Update](#) for information on the needed licenses.

 Decision points	<ul style="list-style-type: none">• Will you deploy Microsoft Teams Rooms in your organization?• How will you procure your Microsoft Teams Rooms systems—bundled, as separate components, or as an integrated unit?
 Next steps	<ul style="list-style-type: none">• Identify who will undertake the key activities throughout your deployment.• Review the meeting rooms you have (and plan to set up) to understand where you want to deploy Microsoft Teams Rooms and the peripheral devices that would be appropriate for the room size.

Identify who will undertake the key activities throughout your deployment

Use the approach illustrated below to guide you through your deployment, and customize the sample outputs provided throughout these articles as needed for your organization.

Begin with understanding what conference rooms you have and envisioning what would work best for you in the future, then move through selecting and procuring the equipment you need, readying your sites, configuring and deploying your service, managing change and user adoption, and developing operations and maintenance procedures.

You might need to coordinate these activities across several teams. We provide a high-level view of the main activities that you should cover, and also suggestions for the teams who are typically involved in deploying and managing conference room systems, to help you decide who you need to work with.

TASK	WHO MIGHT UNDERTAKE THE TASK	ASSIGNED TO	LINKS TO THIS CONTENT
------	------------------------------	-------------	-----------------------

TASK	WHO MIGHT UNDERTAKE THE TASK	ASSIGNED TO	LINKS TO THIS CONTENT
Inventory rooms	Facilities / AV team / IT Project Team		Room inventory and capability planning
Plan capabilities	IT Project Team		Room inventory and capability planning
Device selection	IT Project Team / AV Team		Device selection
Procurement	IT Project Team / AV Team		Procurement
Site readiness	Facilities / AV team / IT Project Team		Site readiness
Service readiness	IT Project Team		Service readiness
Configuration	IT Project Team		Configuration and deployment
Deployment	Facilities / AV team / IT Project Team		Deployment checklist
Adoption	Facilities / AV team / IT Project Team		Adoption
Maintenance and operations	AV team / IT Project Team		Management overview

Room inventory and capability planning

The first step is to inventory your organization's existing meeting and conference rooms to understand their environment, room size, layout, and purpose, and to identify the capabilities you want each room in scope to have in the future such as which richer collaboration capabilities will be enabled in the room.

After you create an inventory of the equipment and capabilities in each existing room, your requirements for that room feed into your device selection planning to create a rich conferencing solution. The modalities (audio, video) needed for each room—in addition to room size and purpose—all play an important role in deciding which solution is most appropriate for each room.

As part of your discovery, it's key to consider room acoustics and layout. For example, check that the chairs in the room won't block the camera view. Verify that the room doesn't have excessive echo or noisy air conditioning, and that it does have sufficient power for the screens and Microsoft Teams Rooms. There are many factors to consider that your audio-visual (AV) team or partner will be able to advise on.

 Next steps	<ul style="list-style-type: none"> Review the rooms in scope, and define Microsoft Teams Rooms configurations for them.

Sample meeting/conference room inventory

SITE	ROOM NAME	ROOM TYPE	NUMBER OF PEOPLE	IN SCOPE?	CURRENT ROOM CAPABILITIES	FUTURE ROOM CAPABILITIES
London HQ	Curie	Medium	6–12	Yes	Speakerphone	1 screen, audio and video plus presentation PSTN Access
Sydney HQ	Hill	Large	12–16	Yes	Legacy AV unit, 1 screen and camera	2 screens, audio and video plus presentation PSTN Access

Device selection

Evaluate which Microsoft Teams Rooms solution is the most suitable for each room based on the future capabilities you want for the room. Decide which AV peripheral devices are the best fit, depending on room size and layout.

For guidance for the type of system and peripheral devices by room type and size, see the [Microsoft Teams Rooms requirements](#) article.

Based on the vendor you prefer, use the information provided in the requirements article to define your Microsoft Teams Rooms and supported peripheral device configuration per room type, and use this as a template for your deployment.

Pro Tip – Some room types might not be applicable for your deployment.

 <p>Decision points</p>	<ul style="list-style-type: none"> From your inventory, which types of rooms are in scope for your deployment? Which systems will you deploy for each room type?
 <p>Next steps</p>	<ul style="list-style-type: none"> Start to gather key operational material for your chosen systems, and engage your procurement team.

Sample Microsoft Teams Rooms deployment template for your organization

ROOM TYPE/SIZE	NUMBER OF PEOPLE	MICROSOFT TEAMS ROOMS SYSTEM	PERIPHERAL DEVICES	DISPLAY(S)
Focus 10' by 9'	2–4			
Small 16' by 16'	4–6			
Medium 18' by 20'	6–12			
Large 15' by 32'	12–16			

Pro Tip – Now is a great time to start gathering information about the Microsoft Teams Rooms solution you've chosen.

Procurement

You can procure your chosen system as a bundle or an integrated solution via device partners. You can also acquire a partner device dock and prepare your own Microsoft Teams Rooms solution by using a Surface Pro device and existing, *supported* AV peripheral devices.

You can acquire Microsoft Teams Rooms from a number of partners who are listed in the [requirements article](#). Please visit the partners' websites to learn more about these solutions and procurement options.

Depending on your deployment scale and approach, you might decide to have the Microsoft Teams Rooms and supported peripheral devices shipped to a central location for initial configuration and assignment. This might be a good approach for a staged rollout across many sites. Or, you might choose to ship the bundles directly to your sites.

 Decision points	<ul style="list-style-type: none">• Will you ship the components directly to a site or to a staging facility?• Who will manage the staging facility (if you decide to use one)?
 Next steps	<ul style="list-style-type: none">• Plan for operations.• Plan for adoption and change management.

Plan for operations

Your organization must execute monitoring, administration, and management tasks on an ongoing basis, and it's key to agree who will undertake these tasks early in your deployment.

Many organizations have an AV team or partner who manages their conference rooms and devices. This team should be involved in agreeing who will manage the Microsoft Teams Rooms devices going forward to monitor performance, and deploy software updates and hotfixes.

Consider which helpdesk queue you'll route Microsoft Teams Rooms-related calls to, and provide an FAQ to the helpdesk team so they can better understand how to use Microsoft Teams Rooms and the key troubleshooting steps they can take. A good starting point for this FAQ is the [user help](#) and [Known issues](#).

 Decision points	<ul style="list-style-type: none">• Decide who will manage Microsoft Teams Rooms.• Decide which helpdesk queue to route Microsoft Teams Rooms-related calls to.
 Next steps	<ul style="list-style-type: none">• Prepare to host accounts.

Plan for adoption and change management

Microsoft Teams Rooms systems introduce new capabilities to your users. It's important that you recognize that this will be a change for your users, and you should ensure your campaign identifies the benefits the new system will have for your users and the key talking points leads can use to discuss with their teams.

Consider scheduling show-and-tell events and poster drops at each site to inform your users of the new capabilities. You might also create in-room "quick start guides." Consider finding a meetings champion on each site who can help others get up to speed and start using the devices.

Teams devices for shared spaces feature comparison between Windows and Android

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams Rooms experiences are designed with customers in mind. Every customer has unique needs, which is why Microsoft offers a breadth of options, including Teams Rooms on Windows and on Android.

Core functionality is available on both platforms so end users can always have great audio and video experiences, use one-touch join to join meetings, and access inclusive features such as live captions and raise hand.

As Microsoft brings new features to Teams and to Teams Rooms, we strive to bring them to all platforms, but features may roll out at different times due to a number of factors, including things like technical feasibility and customer feedback for each platform. This means you may see some features rolling out on Windows before they come to the Android platform.

To help guide you as to what features are available on different platforms, you can refer to the chart below, which will be updated periodically. Not all Teams Rooms features will be included on this list, so please continue to consult the [Microsoft 365 roadmap](#) and Microsoft sales representatives for additional details.

Teams devices for shared spaces

Feature comparison between Windows and Android

(September 2021)

● Available ◐ Coming soon ○ Not available

	FEATURES	WINDOWS	ANDROID
Meeting join	One-touch-join	●	●
	Proximity join	●	●
	Meet now	●	●
	Direct guest join	●	◐
Meeting engagement and collaboration	Intuitive, purpose-built app experience	●	●
	Video and content layouts (for example, Together Mode, large gallery, gallery only, and gallery and content)	●	●

Microsoft Teams Rooms app version support

12/7/2021 • 3 minutes to read • [Edit Online](#)

The Microsoft Teams Rooms app gets updates through the Windows store. Microsoft Teams Room app uses an evergreen product lifecycle and only the current and the next most recent version of the app are supported at any given time. The Microsoft Teams Room app bundles a specific version of the Teams desktop app that is modified for room use. The Teams desktop app updates every two weeks. Learn more about the [Teams update process](#). This means Teams Rooms app current-1 version can be up to six Teams desktop app updates behind, so it's recommended to keep the Teams Room application updated to the latest version of the Teams Rooms app at all times.

The support structure for Teams Rooms is dynamic and depends on the availability of the latest version. When you encounter a code defect in a version of the application that's not the latest, you must install the latest version to receive a fix.

All releases are listed in the [Microsoft Teams Rooms release notes](#).

IMPORTANT

When installing a new device that came with an older version of the Teams room application, it is recommended to [manually update the application](#) after setting the account, before downloading any Windows updates. This ensures correct OS version and Windows updates are installed on your device.

Windows 10 release support

Microsoft Teams Rooms requires the Windows 10 IoT Enterprise or Windows 10 Enterprise SKUs under Semi-Annual Channel servicing options. These other Windows 10 editions aren't supported:

- Windows 10 Enterprise Long-term Servicing Branch (LTSB) / Long Term Servicing Channel (LTSC) editions
- Windows 10 Internet of Things (IoT) Enterprise LTSB / LTSC editions
- any other edition of Windows such as Windows 10 Pro or Home edition

New Windows 10 feature updates aren't offered on Microsoft Teams Rooms devices immediately. There's an intentional delay of up to six months or more after the general availability date published on the [Windows 10 release information](#) page. This time is used to validate Windows 10 release compatibility for the Microsoft Teams Rooms app, device hardware, and certified audio video peripherals. Validation begins and continues during active development of each major release of Windows 10. Extra time is needed to validate that all device manufacturers have built updated images for their devices, and for Microsoft to certify and test those images. During the validation period, the Microsoft Teams Room app uses [Windows Update for Business group policies](#) to delay Windows 10 feature updates. After any compatibility issues are found and resolved, the block is lifted via updating group policies through a new app release in Windows store. Devices that run the Microsoft Teams Rooms app automatically update to an appropriate Windows 10 release during the nightly maintenance reboot. An MSI version is made available for customers that need to manually manage updates.

IMPORTANT

During the validation period, Microsoft Teams Rooms devices should **not** be updated to the next release of Windows 10 by any means. This includes overriding the group policies in place, or using System Center or other third-party device management services. Any of these may cause issues for the Microsoft Teams Room app or may leave devices unusable.

The following table shows recommended and supported versions of Windows 10 that are verified to support Microsoft Teams Rooms. All dates are listed in ISO 8601 format: YYYY-MM-DD.

VERSION	AVAILABILITY DATE	MICROSOFT TEAMS ROOMS SUPPORT STATUS	MICROSOFT TEAMS ROOMS MINIMUM APPLICATION VERSION	RECOMMENDED OS BUILD
20H2	2020-10-20	Supported, Recommended	4.10.10.0	19042.631
2004	2020-05-27	Skipped, Not recommended ①	—	—
1909	2019-11-12	Supported	4.5.33.0	18363.418
1903	2019-05-21	Not Supported	—	—
1809	2019-03-28	Not Supported, Known compatibility issues ②	—	—
1803	2018-07-10	Not Supported	—	—
1709	2018-01-18	Not supported	—	—
1703	2017-07-11	Not Supported	—	—

① Windows 10 version 2004 is not recommended due to compatibility issues found with the Microsoft Teams Rooms application. This specific issue causes the Microsoft Teams Rooms application to fail to start after the nightly reboot.

② Windows 10 version 1809 is not recommended due to compatibility issues found with the Microsoft Teams Rooms application. This specific issue causes the Microsoft Teams Rooms application to fail to start after the nightly reboot. This issue was addressed in Windows 10 version 1903.

When you use a supported version of Windows 10, you will always get the latest application updates for the Microsoft Teams Rooms app.

Microsoft Teams Rooms feature introduction and issue resolution

Teams Rooms Web client update (October 2021)

Introduced in this update:

- Unified roster control with Teams desktop client with structured meetings grouping, meeting options and controls for presenters/ attendees, raise hand sort order and ability to invite users from Chat or meeting invite directly from roster
- Universal bar call controls alignment with desktop client in meeting call controls, Layout button and meeting status information
- Dynamic gallery support for single and dual front of room displays
- Unified layout picker for front of room layout option consolidated
- Spotlight or Pin multiple participants in Teams meetings
- Large meetings support with presenter/ attendees controls accessible by tapping participant from roster
- Ability to lock a meeting for meetings where room is organizer, as well as awareness of meeting that is locked
- Presenter mode (weatherman) consumption support when a remote user shares content with presenter view option
- Reaction support in Teams meetings

NOTE

Web client updates are available to all Teams Rooms with application versions 4.10 and 4.9. Admins will be able to enroll in Teams Rooms public preview program to get sneak peak of the web client features soon.

4.10.10.0 (10/1/2021)

Introduced in this update:

- Room remote allows users to control basic functionality of the room using Teams on their mobile *
- Logitech scribe content camera support for BLE button for sharing into meeting
- Chat bubbles provide notifications for in meeting chat to bring attention to what's being said using meeting chat *
- Large gallery and Together mode support is now available in GCC High
- New Skills added to Cortana, Add person by name to the meeting and Call by name
- Cortana Push to Talk is enabled by default on all devices. To learn more, see [Cortana voice assistance in Teams](#).

NOTE

Deprecated 19H1 support. Min OS version supported by 4.10 is 19H2.

NOTE

*These features are rolled out using Teams service and will work with all application versions greater than 4.9.

NOTE

To join the scheduled meeting both from Teams Mobile app and MTR-W find the room account in roster on the Teams Mobile app and press "Control this room" menu and you can control Call controls from the app.

4.9.12.0 (7/28/2021)

Introduced in this update:

- Microsoft Teams only mode is now available in application settings, so you don't need to set up a Skype for Business account anymore. In this mode, devices signed in to Teams only mode join Skype for Business meetings as a guest user.
- Fix for HDMI audio causing lower call volume. HDMI audio feature is automatically enabled for all devices with application build 4.9.12.0.

NOTE

With Skype for Business reaching end of life it is recommended to update to Teams only mode.

4.8.31.0 (05/12/2021)

Introduced in this update:

- Windows 10 20H2 support

NOTE

Crestron UC-Engine (BIOS version date containing "KYSKLi") Teams Rooms have compatibility issues and updated drivers will be provided by system OEMs in the near future. Windows 10 20H2 won't be offered to these devices. For more information about Windows version support, see [Windows 10 release support](#).

4.8.25.0 (04/22/2021)

Introduced in this update:

- Fix for an issue where room information on Teams Rooms consoles doesn't show up for room accounts that are hidden from the global address list (GAL)

NOTE

GCCH customers can download the upgrade package from [Manually update a Microsoft Teams Rooms device](#)

4.8.19.0 (04/06/2021)

Introduced in this update:

- Government Community Cloud High (GCCH) support for Teams Rooms. GCCH customers with existing Teams Rooms devices can download version 4.8.19.0 from [Manually update a Microsoft Teams Rooms device](#)
- Join Zoom meetings with better video quality (720p support) and receive the video gallery of participants
- Skype for Business sign-in failure banner removed for Teams default mode. This change supports organizations removing Skype for Business infrastructure
- Teams meetings join link parsing now handles Microsoft Defender Advanced Threat Protection Safe Links to allow joining external Teams seamlessly
- Fix for shared content scaling issue in Skype for Business meetings when the sharer's PC has a custom DPI set in Windows
- Quality and reliability fixes

4.7.19.0 (02/03/2021)

Introduced in this update:

- Quality and reliability fixes

4.7.15.0 (12/11/2020)

Introduced in this update:

- Share HDMI audio to meeting participants in Teams meeting
- Cortana voice skills (Preview)
- Prevent unmuting based on audio permissions when Teams Room joins as attendee. For more information, see [Manage attendee audio permissions in Teams Meetings](#).
- Spotlight someone's video from Teams Room console and consume spotlighted video on room displays

NOTE

Cortana voice skills are available for select audio peripherals for tenants located in the United States. Additional countries or regions will be added in the future. For more information, see [Cortana voice assistance in Teams](#)

4.6.23.0 (10/19/2020)

Introduced in this update:

- Fix for white half-screen when invoking On-screen keyboard in Teams meeting

4.6.20.0 (09/30/2020)

Introduced in this update:

- See more videos with 3x3 video gallery on front of room displays
- Start local live closed captions from MTR
- Join Zoom meetings from Teams Rooms with direct guest join (Preview)

NOTE

3x3 video gallery and local live closed captions are delivered through the Microsoft Teams service. These features are available to all Teams Rooms devices with application version 4.5.37.0 and above.

4.5.37.0 (08/14/2020)

Introduced in this update:

- Coordinated Meetings between Microsoft Teams and Surface Hub 2S
- Fix for Skype For Business sign-in failure when [Windows 10 update KB4565351](#) or [Windows 10 update KB4571709](#) is installed

4.5.35.0 (07/23/2020)

Introduced in this update:

- Join Cisco WebEx meetings from Teams Rooms with direct guest join
- Teams Admin Center enablement and auto-enrollment
- Windows 10 1909 release support
- Switch to video gallery layout even when content is present
- Virtual raise hands support for attendee and controls for presenter
- Adjustable default volume setting for conferencing and default speaker
- Search and call federated users (tenant) from Teams Room

IMPORTANT

Version 4.5 is last release to support Windows 10 version 1803; future releases will not be offered to systems on Windows 10 version 1803. For more information about Windows version support, see [Windows 10 release support](#).

4.4.63.0 (06/25/2020)

Introduced in this update:

- Quality and reliability fixes
- Fix for "application won't launch after update to 4.4.41.0" issue

NOTE

If your device doesn't automatically update to version 4.4.63.0, follow the steps in [Microsoft Teams Rooms application does not start after updating to version 4.4.41.0](#) to resolve the issue.

4.4.41.0 (05/06/2020)

Introduced in this update:

- Reliability fixes for application start in Windows 10 Kiosk

4.4.25.0 (03/31/2020)

Introduced in this update:

- Modern authentication support for Exchange and Skype for Business
- Support for dynamic emergency calling for Teams (Service components required and released using Teams client rings)
- Ability to disable duplicate content out of meeting for dual displays rooms using XML
- Application splash screen
- Open Source Software (OSS) notices in device settings

4.3.42.0 (03/02/2020)

Introduced in this update:

- Policy updates for "Windows Updates for Business"
- Fix for device events reporting showing error in Azure Monitor

4.3.33.0 (1/10/2020)

Introduced in this update:

- A fix for a Window resizing/flickering issue that's seen in certain configurations
- Calendar processing for third-party meetings removed
- Cortana status setting removed

4.3.23.0 (12/13/2019)

Introduced in this update:

- Auto-answer proximity-based calls and admin setting to control this
- Device Admin Settings UI refresh with addition of device configuration under About tab
- Room control back to main screen
- Meeting Room SKU available in GCC
- Content camera support for Surface Pro-based system (Minimum required app build: 4.2.4.0)

4.2.4.0 (10/07/2019)

Introduced in this update:

- Windows 10 1903 support. Windows 10 1903 update is offered in a few days after app update
- Fixes for On-screen keyboard not showing up reliably

4.1.22.0 (08/15/2019)

Introduced in this update:

- A new content camera feature that enables users to intelligently include a traditional whiteboard into their Teams meeting
- Additional improvements to the Console UI to reduce clutter and moved Settings into a new side bar that is accessed via More on the console
- Disabled share tray button if local content cable is not connected or a content camera is not connected
- Fixed an issue with the touch keyboard where it failed to appear the first time only after an MTR system restart
- Quality and reliability fixes

4.0.105.0 (07/10/2019)

Introduced in this update:

- Skype Room System store app rebrand to "Microsoft Teams Rooms"
- Microsoft Teams Rooms console user interface realigned to Microsoft Teams
- Theme update: only keep custom background image on front of room displays, while making console background a neutral color to ensure console UI controls meet color contrast—accessibility requirements
- Universal bar for in-meeting call controls for Teams calls/ meetings to provide consistent experience with Microsoft Teams PC/ Web/ Mobile clients¹
- Call quality feedback rating after Teams calls/ meetings¹
- Receive/render Microsoft Whiteboard on Microsoft Teams Rooms front of room display when shared from PC/ Web/ Mobile Teams client^{1 2}
- Removed support for Windows 10 Version 1809 upgrades due to compatibility issues with Microsoft Teams Rooms client. Windows 10 Version 19H1 support will be added in future releases

¹ Microsoft Teams service rollout using Teams rings. This feature may be available earlier or later than 4.0.105.0 client update

² Requires IT admins to turn on Microsoft Whiteboard. Also, if you have a touch-enabled front of room display, you must calibrate multiple touch displays using Windows settings with device administrator login to start using Microsoft Whiteboard for collaboration from a room display shared into a Teams meeting

4.0.85.0 (04/8/2019)

Introduced in this update:

- Fixes an issue with the "give feedback" feature
- Optimizations in preparation for the forthcoming Microsoft Teams Rooms device upgrade to Windows 10 Version 1809

4.0.78.0 (03/14/2019)

Introduced in this update:

- Fix for "hang at app start-up" bug that affected devices on legacy Windows 10 RS2 build.

4.0.76.0 (03/04/2019)

Introduced in this update:

- DTMF keypad for Microsoft Teams P2P meetings and PSTN calls. To make Microsoft Teams your default

calling client, admins must set IsTeamsDefaultClient to true

- Pin a remote participant's incoming video to full screen on front of room display. Use "Pin" command from participant roster on the console
- Improvements to Lobby notifications with addition of Front of Room notification
- Front of Room display casting icon removed when Bluetooth beacon is not enabled on Microsoft Teams Rooms device
- Fix for volume control issue in Teams meetings

4.0.64.0 (12/14/2018)

Introduced in this update:

- Display content on both Front of Room (FoR) displays on dual screen room systems
- Theming and Front of Room user interface improvements
- TLS 1.2 client-side support. For on-premise customers, enabling communication over TLS 1.2 for Microsoft Teams Rooms requires Skype for Business Server 2015 Cumulative Update 9 (CU9) or Skype for Business Server 2019 Cumulative Update 1 (CU1).

4.0.51.0 (11/17/2018)

Introduced in this update:

- Dual display (Front of Room) support for Teams Meetings

4.0.31.0 (10/16/2018)

Introduced in this update:

- Quality and reliability fixes

4.0.27.0 (10/1/2018)

Introduced in this update:

- Code changes necessary to prepare the Microsoft Teams Rooms app for later Windows 10 Version 1803 upgrade
- Fix formatting issue with localized EULAs (specifically Norwegian) which prevents advancing beyond EULA OOBE setup window
- Code changes required to make Microsoft Teams Rooms application run on legacy Lync Room Systems. See more [here](#).

4.0.19.0 (8/31/2018)

Introduced in this update:

- Hotfix for Crestron application not launching which would normally be accessible when the app button on a Crestron SR device is pressed. Microsoft Teams Rooms app restart required after installation of 4.0.19.0.

4.0.18.0 (08/27/2018)

Introduced in this update:

- "Report a Problem" feature improvements in Teams mode (equivalent of "Give Feedback" in Skype for Business mode)
- Enable ability to fall back from Teams to Skype for Business mode for SIP calls
- Accessibility improvements (Narrator, Magnifier)
- Automatically restart app when required after XML provisioning changes have been applied
- Miscellaneous fixes

4.0.8.0 (07/06/2018)

Introduced in this update:

- This update enables both Skype for Business *and* Teams meetings support on Room Systems devices. Teams is turned off by default once the update is applied. Admins can enable Teams locally in device settings or via a remote xml push.

3.1.115.0 (06/18/2018)

Introduced in this update:

- Fix to address error observed on some systems during app launch.

3.1.113.0 (06/13/2018)

Introduced in this update:

- Changes enabling Microsoft to more flexibly manage Windows Updates.
- No change to end-user experience.

3.1.112.0 (06/05/2018)

Introduced in this update:

- Fix to address console responsiveness issues observed on Surface Pro 2017-based devices connected to two front-of-room displays and video ingest
- Automated check to ensure that system is running latest provisioning script

3.1.104.0 (04/16/2018)

Introduced in this update:

- Fix to improve OSK (on-screen keyboard) behavior in Window 10 Version 1709-based systems
- Improvements to prepare for future operating system updates

3.1.100.0 (03/16/2018)

Introduced in this update:

- Application updated to improve telemetry

3.1.99.0 (03/14/2018)

Introduced in this update:

- Fixes an issue where intermittent meeting join issues may occur
- Fixes an issue known to result in a device "hang" experience

3.1.98.0 (3/8/2018)

Introduced in this update:

- Bug/Crash fixes to improve stability
- Support for variable-sized console
- Peripheral audio processing offloading (additional media allowlist)
- Optimizations that enable IT Pros to build do-it-yourself images with Windows 10 Version 1709 January Update and later.

3.0.16.0 (11/27/2017)

Introduced in this update:

- Fixes an issue with the "Give Feedback" feature.

3.0.15.0 (10/3/2017)

Introduced in this update:

- Support for [Polycom MSR Series](#) dock hardware

- Support for the [Logitech Brio](#)
- Resolves an issue where displays (console and front-of-room) fail to enter sleep mode when there is no activity in the room

3.0.12.0 (9/1/2017)

Introduced in this update:

- Runs on a Surface Pro (2017) tablet
- Supports Windows 10 Enterprise Creator's Update (English language, build 1703)
- Support for [Crestron SR](#) dock hardware
- OEM Support for Environment Controls (Crestron)

The 64-bit version of Windows 10 Enterprise Anniversary edition (English language, version 1607) is no longer supported as of Microsoft Teams Rooms release 3.0.12.0 (update 3).

3.0.8.0 (8/4/2017)

Introduced in this update:

- Resolves issues observed when searching for federated users through the Participants search field. Previous to this fix, search results for external federated users may not have resolved correctly and instead returned incorrect results.

3.0.6.0 (7/7/2017)

Introduced in this update:

- Dual-Screen support (for legacy system parity)
- Themes (built-in themes and the ability to set custom theme)
- Ability to Give Feedback for public builds
- Improved Telemetry around meeting join reliability
- Improved OMS reporting
- Ability for IT Admin to configure devices remotely

2.0.2.0 (03/15/2017)

Introduced in this update:

- In-app user selection of meeting room audio and video USB devices
- Integrated room console status reporting for customers using Microsoft Operations Management Suite, now Azure Monitor

Release to Market (12/7/2016)

Feature(s):

Built for Skype for Business

- One-touch join of Skype Meetings
- Skype Meeting experience optimized for rooms with screen-filling HD video and HD wide-band audio
- All participants can connect to the Skype Meeting using their device of choice from wherever they may be located
- Invite people from your directory where you can instantly see their availability or via a phone call
- Supports Skype for Business PSTN Conferencing and PSTN Calling to replace the stand-alone conference phone in your room

Transform Any Meeting Room

- Dedicated Skype Meeting app optimized for center of table touch controller and large front of room display

- Reuse existing investments in your front of room display or projectors
- Works in all types of meeting spaces from huddle spaces to large conference rooms
- Certified Skype for Business audio and video devices are available for various room sizes
- Built-in wired ingest to project desktop sharing to the room and to the Skype Meeting

Easy to Deploy, Simple to Manage

- Always-on appliance that automatically wakes up the displays when it detects people in the room
- Simple deployment and updating of the UWP (Universal Windows Platform) Skype Meeting App
- Windows AppLocker locks down the device to the Skype Meeting app
- Monitored and managed as a Windows 10 Enterprise device via Intune and Configuration Manager (MDM)
- Enterprise-grade reliability
- Low training effort of end-users due to familiar Skype user interface
- Runs on Surface Pro 4 tablet

Prepare your environment

12/7/2021 • 6 minutes to read • [Edit Online](#)

This section contains an overview of the steps required to prepare your environment so that you can use all of the features of Microsoft Teams Rooms.

1. Prepare a device account for each Microsoft Teams Rooms console. See [Deploy Microsoft Teams Rooms](#) for details.
2. Ensure that there is a working network/Internet connection for the device to use.

It must be able to receive an IP address by using DHCP. (Microsoft Teams Rooms cannot be configured with a static IP address at the first unit startup, but afterwards, a static IP address for the device could be configured on the device or on the upstream switch or router.)

It must have these ports open (in addition to opening the normal ports for media):

- HTTPS: 443
- HTTP: 80

If your network runs through a proxy, you'll need the proxy address or script information as well.

IMPORTANT

Microsoft Teams Rooms does not support proxy authentication as it may interfere with regular operations of the room. Ensure that Microsoft Teams Rooms have been exempted from proxy authentication before going into production.

3. In order to improve your experience, Microsoft collects data. To allow Microsoft to collect data, allow these sites:
 - Telemetry client endpoint: <https://vortex.data.microsoft.com/>
 - Telemetry settings endpoint: <https://settings.data.microsoft.com/>

Create and test a device account

A *device account* is an account that the Microsoft Teams Rooms client uses to access features from Exchange, like calendar, and to enable Skype for Business. See [Deploy Microsoft Teams Rooms](#) for details.

Check network availability

In order to function properly, the Microsoft Teams Rooms device must have access to a wired network that meets these requirements:

- Access to your Active Directory or Azure Active Directory (Azure AD) instance, as well as your Microsoft Exchange and Skype for Business servers.
- Access to a server that can provide an IP address using DHCP. Microsoft Teams Rooms cannot be configured with a static IP address at the first unit startup.
- Access to HTTP ports 80 and 443.
- TCP and UDP ports configured as described in [Port and protocol requirements for servers](#) for on-premise Skype for Business Server implementations, or [Microsoft 365 and Office 365 URLs and IP address ranges](#) for Microsoft Teams or Skype for Business online implementations.

IMPORTANT

Be sure to use a wired 1 Gbps network connection to assure you will have the needed bandwidth.

NOTE

Software updates for Microsoft Teams Rooms are automatically downloaded from the Microsoft Store for Business. See [Prerequisites for Microsoft Store for Business and Education](#) to verify that the room console will be able to access the store and self-update.

Certificates

Your Microsoft Teams Rooms device uses certificates for Exchange Web Services, Microsoft Teams or Skype for Business, network usage, and authentication. If the related servers use public certificates, which is the case for Online and some On-Premises deployments, there should be no further action required on the part of the admin to install certificates. If, on the other hand, the certificate authority is a private CA (typical for On-Premises deployments) then the device needs to trust that CA which means having the CA + CA chain certificates installed on the device. Adding the device to the domain may perform this task automatically.

You will install certificates the same way you would for any other Windows client.

NOTE

Certificates may be required in order to have Microsoft Teams Rooms use Skype for Business Server.

Proxy

Microsoft Teams Rooms is designed to inherit Proxy settings from the Windows OS. Access the Windows OS in the following manner:

1. In the Microsoft Teams Rooms UI, click on the Settings gear icon where you'll be prompted for the local Administrator password on the device (the default password is **sfb**).
2. Tap on **Settings** followed by tapping on the **Go to Windows** button and then tapping on the **go to Admin Sign In** button and then clicking the **Administrator** button (if the computer is domain joined choose **Other User**, then use **.\admin** as the user name).
3. In the **Search Windows** box bottom left type in **regedit** (either long press the screen or right click and choose **Run as administrator**).
4. Click on the **HKEY_USERS** folder (you'll see a list of machine user SIDs) ensure the root folder **HKEY_USERS** is selected.
5. Click on **File** and then choose **Load Hive**.
6. Browse to the **C:\Users\Skype** folder and type in the File name box **NTUSER.dat** and press the open button
7. You'll be prompted for a Key Name for your newly loaded Hive; type in **Skype** (you should now see the registry settings for the Skype User).
8. Open the **Skype** key and browse to **HKEY_USERS\Skype\SOFTWARE\Microsoft\Windows\CurrentVersion\Internet Settings** then ensure these settings are entered:

```
[HKEY_USERS\Skype\SOFTWARE\Microsoft\Windows\CurrentVersion\Internet Settings]
"MigrateProxy"=dword:00000001
"ProxyEnable"=dword:00000001
"ProxyServer"="xx.xx.xx.xx:8080"
```

If ProxyServer doesn't exist you may have to add this key as a string, change the xx.xx.xx.xx:8080 to the ip/host and port of your Proxy server.

If the customer is using a PAC file the configuration would look like the example below:

```
[HKEY_USERS\Skype\SOFTWARE\Microsoft\Windows\CurrentVersion\Internet Settings]
"MigrateProxy"=dword:00000001
"ProxyEnable"=dword:00000001
"AutoConfigURL"=http://contosoproxy.corp.net/proxy.pac
```

9. Once you are finished making your changes highlight the Skype User key (root folder for Skype) and choose unload Hive from the Registry file menu (you'll be prompted for confirmation - select **Yes**).
10. You can now close the registry editor and type logoff into the Windows search box.
11. Back at the sign-in screen, choose the **Skype** user. If all the previous steps were successful, the Microsoft Teams Rooms device will sign-in successfully.

See the [Network Security](#) article for full details on FQDNs, ports, and IP address ranges required for Microsoft Teams Rooms.

Create provisioning packages

You will use provisioning packages to authenticate to Exchange Server, Microsoft 365, or Office 365.

Admin group management

After domain joining, you can use Group Policy or the Local Computer Management to set a Security Group as local administrator just like you would for a Windows PC in your domain. Anyone who is a member of that security group can enter their credentials and unlock Settings.

NOTE

If your Microsoft Teams Rooms device loses trust with the domain (for example, if you remove the Microsoft Teams Rooms from the domain after it is domain joined), you won't be able to authenticate into the device and open up Settings. The workaround is to log in with the local Admin account.

Local accounts

Microsoft Teams Rooms Local User Account

The Device Account does not typically use a password. It is possible to give it a password, but there are consequences, including a possibility that users might get locked out of the console application when that password expires. Consequently, the administrator should take care to ensure that the password is not allowed to expire.

"Admin" - Local Administrator Account

Microsoft Teams Rooms default password is set to "sfb". The Password can be changed locally by going to Windows Settings > Go to Windows or in the AutoUnattend.xml file (use the Windows System Image manager from ADK to make the change to the xml file).

Caution

Be sure to change the Microsoft Teams Rooms password as soon as possible.

You can also manage the Local Administrator password by setting up a group policy where domain admins are made local admins.

The Local admin password is not included as a choice during Setup.

Machine Account

Much like any Windows device, the Machine Name can be renamed by right-clicking in **Settings > About > Rename PC**.

If you would like to rename the computer after joining it to a domain, use **Rename-Computer**, a PowerShell command, followed by the computer's new name.

Microsoft Teams Rooms requirements

12/7/2021 • 10 minutes to read • [Edit Online](#)

Microsoft Teams Rooms scale to different room sizes. Teams Rooms use a wide variety of certified audio and video peripherals based on the size and use of the room. By selecting the right core device and console, combined with microphones, speakers, cameras, and displays appropriate for the space, you can deploy Microsoft Teams Rooms into spaces of any size from small huddle spaces up through large conference spaces and boardrooms. The full set of all available certified audio and video peripherals that may be used to configure your room is available in the [Device Showcase](#).

This article summarizes the device deployment and configuration requirements for supporting Microsoft Teams Rooms.

Your deployment involves resource account creation and setup of Teams Rooms as described in [Deploy Microsoft Teams Rooms](#).

Refer to:

- [License options based on your plan: Microsoft Teams Rooms](#)

NOTE

Microsoft Teams Rooms sign in to Microsoft Teams, Skype for Business Server 2019, or Skype for Business Server 2015 and may join meetings hosted by any of these services.

Earlier platforms like Lync Server 2013 are not supported by Microsoft Teams Rooms. Microsoft Teams Rooms is not supported in Microsoft 365 or Office 365 operated by 21Vianet, or DoD environments.

If you have an on-prem Exchange server, Microsoft Teams Rooms requires the use of Exchange Server 2013 SP1 or later.

Hardware requirements

A hardware deployment includes a selection of a Microsoft Teams Room system, combined with certified audio and video peripherals, and a cabling solution to integrate these devices together. These options are described here.

Supported Microsoft Teams Room systems

All current Microsoft Teams Room devices and bundles are available in the [Room Systems product showcase](#).

‡ Customers may choose either the Dante interface or the network switch recommended by Biamp/Sennheiser for this bundle.

USB extenders

- USB ports on tablet docks are USB 3.0 compatible. You can use a USB 2.x extender but you'll be limited to USB 2.x speeds on the far end. Extenders are not recommended for USB 3.0 peripherals.
- An extender must meet USB 2.0 or newer specifications.
 - Tablet docks support at least two stages of external USB hub extension. If you connect more than two USB hubs in series, check with the dock manufacturer to confirm whether they support series connection.
 - Wired GbE connection in the room. Ethernet cable of appropriate length.
 - Up to two 1080p displays with HDMI connections. HDMI cables of appropriate length.

NOTE

A consumer TV used as a front of room display needs to support/enable the Consumer Electronics Control (CEC) feature of HDMI so that it can switch automatically to an active video source from standby mode. This feature is not supported on all TVs.

Microsoft Teams Rooms does not use a keyboard. If needed, the Admin should use the on-screen keyboard. A USB keyboard or mouse will be required when imaging the Microsoft Teams Rooms device.

The following tables provide recommendations for peripherals based on room size:

Microsoft Teams Rooms Certified Audio Peripherals

ROOM TYPE	NUMBER OF PEOPLE	RECOMMENDED MAXIMUM DISTANCE FROM MICROPHONE TO SPEAKER
Focus 10' x 9'	2–4	1.5 m
Small 16' x 16'	4–6	2.0 m
Medium 18' x 20'	6–12	2.4 m
Large 15' x 32'	12–16	3 m This distance also applies to the area covered by each connected satellite microphone.

Microsoft Teams Rooms Certified Video Peripherals

ROOM TYPE	NUMBER OF PEOPLE
Focus 10' x 9'	2–4
Small 16' x 16'	4–6
Medium 18' x 20'	6–12
Large 15' x 32'	12–16

NOTE

Front of room display resolution should be set to no greater than 1920x1080p.

Microsoft Teams Rooms Security

12/7/2021 • 10 minutes to read • [Edit Online](#)

Microsoft works with our partners to deliver a solution that is secure and doesn't require additional actions to secure Microsoft Teams Rooms. This article discusses many of the security features found in Teams Rooms.

NOTE

Microsoft Teams Rooms should not be treated like a typical end-user workstation. Not only are the use cases vastly different, but the default security profiles are also much different. This article applies to Microsoft Teams Rooms devices running on Windows.

Limited end-user data is stored on Teams Rooms. End-user data may be stored in the log files for troubleshooting and support only. At no point can an attendee of a meeting using Teams Rooms copy files to the hard drive or sign in as themselves. No end-user data is transferred to, or accessible by, the Microsoft Teams Rooms device.

Even though end users can't put files on a Teams Rooms hard drive, Microsoft Defender is still enabled. Teams Rooms performance is tested with Microsoft Defender. Disabling this or adding endpoint security software can lead to unpredictable results and potential system degradation.

Hardware security

In a Teams Rooms environment, there's a central compute module that runs Windows 10 IoT Enterprise edition. Every certified compute module must have a secure mounting solution, a security lock slot (for example, Kensington lock), and I/O port access security measures to prevent the connection of unauthorized devices. You can also disable specific ports via Unified Extensible Firmware Interface (UEFI) configuration.

Every certified compute module must ship with Trusted Platform Module (TPM) 2.0 compliant technology enabled by default. TPM is used to encrypt the login information for the Teams Rooms resource account.

Secure boot is enabled by default. Secure boot is a security standard developed by members of the PC industry to help make sure that a device boots using only software that is trusted by the Original Equipment Manufacturer (OEM). When the PC starts, the firmware checks the signature of each piece of boot software, including UEFI firmware drivers (also known as Option ROMs), EFI applications, and the operating system. If the signatures are valid, the PC boots, and the firmware gives control to the operating system. For more information, see [Secure boot](#).

Access to UEFI settings is only possible by attaching a physical keyboard and mouse. This prevents being able to access UEFI via the Teams Rooms touch-enabled console as well as any other touch-enabled displays attached to Teams Rooms.

Kernel Direct Memory Access (DMA) Protection is a Windows 10 setting that is enabled on Teams Rooms. With this feature, the OS and the system firmware protect the system against malicious and unintended DMA attacks for all DMA-capable devices:

- During the boot process.
- Against malicious DMA by devices connected to easily accessible internal/external DMA-capable ports, such as M.2 PCIe slots and Thunderbolt 3, during OS runtime.

Teams Rooms also enables Hypervisor-protected code integrity (HVCI). One of the features provided by HVCI is

Credential Guard. Credential Guard provides the following benefits:

- **Hardware security** NTLM, Kerberos, and Credential Manager take advantage of platform security features, including Secure Boot and virtualization, to protect credentials.
- **Virtualization-based security** Windows NTLM and Kerberos derived credentials and other secrets run in a protected environment that is isolated from the running operating system.
- **Better protection against advanced persistent threats** When Credential Manager domain credentials, NTLM, and Kerberos derived credentials are protected using virtualization-based security, the credential theft attack techniques and tools used in many targeted attacks are blocked. Malware running in the operating system with administrative privileges can't extract secrets that are protected by virtualization-based security.

Software Security

After Microsoft Windows boots, Teams Rooms automatically signs into a local Windows user account named Skype. The Skype account has no password. To make the Skype account session secure, the following steps are taken.

IMPORTANT

Don't change the password or edit the local Skype user account. Doing so can prevent Teams Rooms from automatically signing in.

The Microsoft Teams Rooms app runs using the Assigned Access feature found in Windows 10 1903 and later. Assigned Access is a feature in Windows 10 that limits the application entry points exposed to the user. This is what enables single-app kiosk mode. Using Shell Launcher, Teams Rooms is configured as a kiosk device that runs a Windows desktop application as the user interface. The Microsoft Teams Rooms app replaces the default shell (explorer.exe) that usually runs when a user logs on. In other words, the traditional Explorer shell does not get launched at all. This greatly reduces the Microsoft Teams Rooms vulnerability surface within Windows. For more information, see [Configure kiosks and digital signs on Windows desktop editions](#).

If you decide to run a security scan or a Center for Internet Security (CIS) benchmark on Teams Rooms, the scan can only run under the context of a local administrator account as the Skype user account doesn't support running applications other than the Teams Rooms app. Many of the security features applied to the Skype user context don't apply to other local users and, as a result, these security scans won't surface the full security lockdown applied to the Skype account. Therefore, it is not recommended to run a local scan on Teams Rooms. However, you can run external penetration tests if so desired. Because of this, we recommend that you run external penetration tests against Teams Rooms devices instead of running local scans.

Additionally, lock down policies are applied to limit non-administrative features from being used. A keyboard filter is enabled to intercept and block potentially insecure keyboard combinations that aren't covered by Assigned Access policies. Only users with local or domain administrative rights are permitted to sign into Windows to manage Teams Rooms. These and other policies applied to Windows on Microsoft Teams Rooms devices are continually assessed and tested during the product lifecycle.

Account Security

Teams Rooms devices include an administrative account named "Admin" with a default password. We strongly recommend that you change the default password as soon as possible after you complete setup.

The Admin account isn't required for proper operation of Teams Rooms devices and can be renamed or even deleted. However, before you delete the Admin account, make sure that you set up an alternate local administrator account configured before removing the one that ships with Teams Rooms devices. For more

information on how to change a password for a local Windows account using built-in Windows tools or PowerShell, see the following:

- [Change or reset your Windows password](#)
- [Set-LocalUser](#)

You can also import domain accounts into the local Windows Administrator group. You can do this for Azure AD accounts by using Intune. For more information, see [Policy CSP – RestrictedGroups..](#)

NOTE

If you are using Crestron consoles, be sure to also update the Admin password on the console as well as on the compute module. For more information, contact Crestron.

Caution

If you delete or disable the Admin account before granting local Administrator permissions to another local or domain account, you may lose the ability to administer the Teams Rooms device. If this happens, you'll need to reset the device back to its original settings and complete the setup process again.

Don't grant local Administrator permissions to the Skype user account.

Windows Configuration Designer can be used to create Windows 10 provisioning packages. Along with changing the local Admin password, you can also do things like changing the machine name and enrolling into Azure Active Directory. For more information on creating a Windows Configuration Designer provisioning package, see [Provisioning packages for Windows 10](#).

You need to create a resource account for each Teams Rooms device so that it can sign into Teams. You can't use two-factor or multi-factor authentication with this account. Requiring a second factor would prevent the account from being able to automatically sign into the Teams Rooms app after a reboot. However, you can enable Modern Authentication for additional security for this account. In addition, location based Conditional Access policies can be deployed for the resource account to prevent signing into the account from an unapproved location. For more information, see [Using the location condition in a Conditional Access policy](#)

We recommend that you create the resource account in Azure AD, if possible. While a synced account can work with Teams Rooms in hybrid deployments, these synced accounts often have difficulty signing into Teams Rooms and can be difficult to troubleshoot. If you choose to use a third-party federation service to authenticate the credentials for the resource account, ensure the third-party IDP responds with the `wsTrustResponse` attribute set to `urn:oasis:names:tc:SAML:1.0:assertion`.

Network Security

Generally, Teams Rooms has the same network requirements as any Microsoft Teams client. Access through firewalls and other security devices is the same for Teams Rooms as for any other Microsoft Teams client. Specific to Teams Rooms, the categories listed as "required" for Teams must be open on your firewall. Teams Rooms also needs access to Windows Update, Microsoft Store, and Microsoft Intune (if you use Microsoft Intune to manage your devices). For the full list of IPs and URLs required for Microsoft Teams Rooms, see:

- **Microsoft Teams** [Office 365 URLs and IP address ranges](#)
- **Windows Update** [Configure WSUS](#)
- **Microsoft Store** [Prerequisites for Microsoft Store for Business and Education](#)
- **Microsoft Intune** [Network Endpoints for Microsoft Intune](#)

If you're using the Microsoft Teams Rooms managed services component of Microsoft Teams Rooms Premium, you also need to make sure that Teams Rooms can access the following URLs:

- `agent.rooms.microsoft.com`

- global.azure-devices-provisioning.net
- gj3ftstorage.blob.core.windows.net
- iothubsgagwt5wgvwg6.azure-devices.net
- blobssgagwt5wgvwg6.blob.core.windows.net
- mmrstgnoamiot.azure-devices.net
- mmrstgnoamstor.blob.core.windows.net
- mmrprodapaciot.azure-devices.net
- mmrprodapacstor.blob.core.windows.net
- mmrprodemeaiot.azure-devices.net
- mmrprodemeastor.blob.core.windows.net
- mmrprodnoamiot.azure-devices.net
- mmrprodnoamstor.blob.core.windows.net

Teams Rooms is configured to automatically keep itself patched with the latest Windows updates, including security updates. Teams Rooms installs any pending updates every day beginning at 2:00am using a pre-set local policy. There is no need to use additional tools to deploy and apply Windows Updates. Using additional tools to deploy and apply updates can delay the installation of Windows patches and thus lead to a less secure deployment. The Teams Rooms app is deployed using the Microsoft Store. If your devices are licensed with Microsoft Teams Rooms Standard, any new versions of the app are automatically installed during the nightly patching process. If your devices are licensed with Microsoft Teams Rooms Premium and enrolled in the Microsoft Managed Service, new versions of the Teams Rooms app are installed per your defined rollout plan.

Teams Rooms devices work with most 802.1X or other network-based security protocols. However, we're not able to test Teams Rooms against all possible network security configurations. Therefore, if performance issues arise that can be traced to network performance issues, you may need to disable these protocols if they're configured in your organization.

For optimum performance of real time media, we strongly recommend that you configure Teams media traffic to bypass proxy servers and other network security devices. Real time media is very latency sensitive and proxy servers and network security devices can significantly degrade users' video and audio quality. Also, because Teams media is already encrypted, there's no tangible benefit from passing the traffic through a proxy server. For more information, see [Networking up \(to the cloud\) — One architect's viewpoint](#) which discusses network recommendations to improve the performance of media with Microsoft Teams and Microsoft Teams Rooms.

IMPORTANT

Teams Rooms doesn't support authenticated proxy servers.

Teams Rooms devices don't need to connect to an internal LAN. Consider placing Teams Rooms in a secure network segment with direct Internet access. If your internal LAN becomes compromised, the attack vector opportunities towards Teams Rooms will be reduced.

We strongly recommend that you connect your Teams Rooms devices to a wired network. The use of wireless networks on Teams Rooms devices isn't recommended or certified. Some connectivity features, such as Wi-Fi Sense, are disabled by default.

Proximity Join and other Teams Rooms features rely on Bluetooth. However, the Bluetooth implementation on Teams Rooms devices doesn't allow for an external device connection to a Teams Rooms device. Bluetooth technology use on Teams Rooms devices is currently limited to advertising beacons and prompted proximal connections. The `ADV_NONCONN_INT` protocol data unit (PDU) type is used in the advertising beacon. This PDU type is for non-connectable devices advertising information to the listening device. There is no Bluetooth device pairing as part of these features. Additional details on Bluetooth protocols can be found on the [Bluetooth SIG](#)

website.

Teams Meeting Room Licensing Update

12/7/2021 • 2 minutes to read • [Edit Online](#)

Licensing Solutions for Shared Communication Devices

Microsoft has two dedicated SKUs for licensing meetings and calling on a per-device basis for meeting room devices (such as Microsoft Teams Rooms, Microsoft Surface Hub, and collaboration bars for Microsoft Teams).

	MICROSOFT TEAMS ROOMS STANDARD	MICROSOFT TEAMS ROOMS PREMIUM
Microsoft Teams	✓	✓
Phone System	✓	✓
Audio Conferencing	✓ ¹	✓ ¹
Microsoft Intune	✓	✓
Azure Active Directory P1	✓	✓
Worldwide Availability	✓ ²	✓ ²
Channel Availability	EA, EAS, CSP, Web Direct	EA, EAS, CSP, Web Direct
Managed Services		✓ ³

¹ Availability and included minutes may vary by region. To verify service availability, refer to [Country and region availability for Audio Conferencing and Calling Plans](#). Consumption charges may apply for additional services, such as toll-free, international minutes for domestic plans, etc. Customers can disable these features to avoid additional billing.

² Not available in sovereign clouds

³ For more information and availability, see [Microsoft Teams Rooms managed service](#).

Both licenses contain entitlements for Skype for Business Online, which was retired on July 31, 2021.

The following table lists the features that are available in Microsoft Teams Rooms and what licenses you need to buy to get them.

NOTE

The room that is being set up needs to be a user object and have these licenses assigned to it.

	YOU HAVE MICROSOFT TEAMS. HERE'S WHAT YOU NEED TO BUY:	YOU HAVE SKYPE FOR BUSINESS SERVER 2015/2019 (ON-PREMISES). HERE'S WHAT YOU NEED TO BUY:
--	---	--

	YOU HAVE MICROSOFT TEAMS. HERE'S WHAT YOU NEED TO BUY:	YOU HAVE SKYPE FOR BUSINESS SERVER 2015/2019 (ON-PREMISES). HERE'S WHAT YOU NEED TO BUY:
Join a scheduled meeting	Microsoft Teams Rooms Standard or Premium	Skype for Business Server Standard CAL
Initiate an ad hoc meeting	Microsoft Teams Rooms Standard or Premium	Skype for Business Server Standard CAL Skype for Business Server Enterprise CAL
Initiate an ad hoc meeting and dial out from a meeting to phone numbers	Microsoft Teams Rooms Standard or Premium	Skype for Business Standard CAL Skype for Business Server Enterprise CAL
Give the room a phone number and make or receive a call from the room or join an audio conference using a phone number	With Direct Routing and/or Operator Connect: Microsoft Teams Rooms Standard or Premium Without Direct Routing or Operator Connect: Domestic or International Calling Plan Microsoft 365 Business Voice	Skype for Business Server Standard CAL Skype for Business Server Plus CAL
Manage your room device with Microsoft Intune	Microsoft Teams Rooms Standard or Premium	Microsoft Intune subscription with on-premises MDM
Microsoft Teams Rooms Managed Services	Microsoft Teams Rooms Premium	

NOTE

If you have existing licenses assigned for room systems, these will continue to work without any interruption. You should move to use the Meeting Room SKU when existing licenses expire.

See also [Great meeting room experiences: Meet the new Microsoft Teams Rooms Standard and Premium](#).

Plan Microsoft Teams Rooms management with Azure Monitor

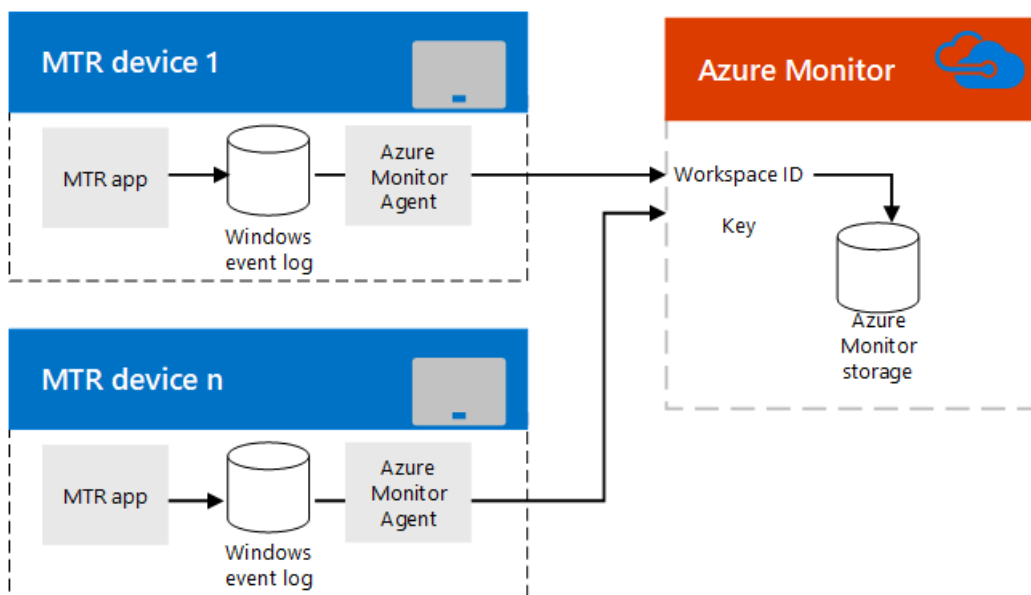

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article discusses planning considerations for using Azure Monitor to administer Microsoft Teams Rooms devices in your Microsoft Teams or Skype for Business implementation.

[Azure Monitor](#) is a collection of management services that were designed in the cloud from the start. Rather than deploying and managing on-premise resources, Azure Monitor components are entirely hosted in Azure. Configuration is minimal, and you can be up and running literally in a matter of minutes. With some customization work, it can aid in managing Microsoft Teams Rooms conferencing systems by providing real-time notifications of system health or faults for individual room systems, and it can potentially scale up to managing thousands of Microsoft Teams Rooms conference rooms.

This article provides a discussion of the requirements, design/architecture, and implementation best practices needed to implement Azure Monitor based management of Microsoft Teams Rooms conference devices, and provides links to detailed articles on implementing Azure Monitor for Microsoft Teams Rooms and critical reference information for ongoing monitoring of Microsoft Teams Rooms rooms.

Functional overview

The Microsoft Teams Rooms app on the console device writes events to its Windows Event Log. A Microsoft Monitoring agent, once installed, passes the information to Azure Monitor service.

Once properly configured, Log Analytics parses the JSON payload embedded in the event descriptions to describe how each Microsoft Teams Rooms system is functioning and what faults are detected.

An administrator using Azure Monitor can get notifications of Microsoft Teams Rooms systems that are offline or are experiencing app, connectivity, or hardware failures as well as knowing if a system needs to be restarted. Each system status is updated frequently, so these notifications are close to real-time updates.

Azure Monitor requirements

You must have a valid Azure subscription for Azure Monitor to use Log Analytics feature. See [Get started with a](#)

[Log Analytics workspace](#) to create a subscription for your organization.

You should familiarize yourself as necessary on how to use the Log Analytics View Designer. See [Views in Log Analytics](#) for those details.

Related Tasks

1. Once subscribed to Azure Monitor Log Analytics, create custom fields (as described in [Map custom fields](#)) needed to parse the information that will be sent from Microsoft Teams Rooms consoles. This includes understanding the JSON schema documented in [Understand the log entries](#).
2. Develop a Microsoft Teams Rooms management view in Log Analytics. You can [Create a Microsoft Teams Rooms dashboard manually](#).

Individual Microsoft Teams Rooms Console requirements

Each Microsoft Teams Rooms console is an app running on a Surface Pro device in kiosk mode (normally, it's configured to be the only app that can run on the device). As with any Windows app, the Microsoft Teams Rooms app writes events like startup and hardware faults to the Windows Event Log. Adding an Microsoft Monitor agent on your Microsoft Teams Rooms device allows these events to be collected. (See [Connect Windows computers to the Log Analytics service in Azure](#) for details.)

Ongoing management

While using Azure Monitor to manage your Microsoft Teams Rooms devices, you'll need to understand the information contained in the event logs used by Azure Monitor. See [Understand the log entries](#) for details on these health messages.

Related Tasks

- Understand the Alerts generated by Microsoft Teams Rooms and how to resolve them (see the section titled [Understand the log entries](#))

See also

[Deploy Microsoft Teams Rooms management with Azure Monitor](#)

[Manage Microsoft Teams Rooms devices with Azure Monitor](#)

Deployment overview

12/7/2021 • 8 minutes to read • [Edit Online](#)

Deployment of Microsoft Teams Rooms essentially breaks down into phases:

- Confirming that your deployment locations (spaces) meet the deployment dependencies
- Creating Microsoft Teams or Skype for Business and Exchange accounts and assigning them to the console devices (see [Configure accounts for Microsoft Teams Rooms](#))
- (Optional) Setting up Azure Monitor for your systems (see [Deploy Microsoft Teams Rooms management with Azure Monitor](#))
- Setting up Teams Rooms in meeting spaces and connecting the peripheral devices you need (see the OEM documentation for your set of devices)

Site readiness

While the ordered devices are being delivered to your organization, work with your networking, facilities, and AV teams to make sure that deployment dependencies are met and each site and space is ready in terms of power, networking, and display. In addition, make sure the physical installation requirements are met. For physical installation considerations, consult with your vendor and leverage the experience of your AV team when installing and mounting screens and running cabling.

You can find out more about these dependencies in the planning guidance links below:

- [Check network availability](#)
- [Certificates](#)
- [Proxy](#)

Pro Tip - If you must use proxy servers to provide access to Teams, first [review this article](#). When it comes to Microsoft Teams real-time media traffic over proxy servers, we recommend bypassing proxy servers altogether. Microsoft Teams traffic is already encrypted, so proxy servers don't make it more secure. As part of your wider deployment, we recommend that you follow the guidance in [Prepare your network for Teams](#) for bandwidth planning and assessing your network's suitability for real-time traffic.

 Decision points	<ul style="list-style-type: none">• Confirm that your sites meet the key requirements for Microsoft Teams Rooms.• Confirm that you've provided sufficient bandwidth for each site.
 Next steps	<ul style="list-style-type: none">• Start to plan your device deployment and configuration.

Service readiness

To prepare for your Microsoft Teams Rooms deployment, do the following key, central tasks:

- Define Microsoft Teams Rooms resource accounts.
- If joining Teams Room to Azure Active Directory, prepare an Azure AD group with dynamic membership to

hold all of the Teams Rooms resource accounts. This will simplify future management, such as applying Conditional Access policies.

- If joining Teams Room to Active Directory, prepare an organizational unit and Active Directory group to hold your Microsoft Teams Rooms machine and service accounts, and—optionally—prepare Group Policy objects (GPOs) to enable PowerShell remoting.

Define Microsoft Teams Rooms resource account features

Depending on the collaboration scenarios that you've decided to enable with your Microsoft Teams Rooms deployment, you'll need to determine the features and capabilities that you assign to each Microsoft Teams Room that you enable.

SCENARIO	DESCRIPTION	MICROSOFT TEAMS ROOMS SERVICE ACCOUNT FEATURE
Interactive meetings	Using voice, video, and screen sharing; making the Microsoft Teams Rooms a bookable resource	Enabled for Microsoft Teams or Skype for Business; enabled for Exchange (Resource Mailbox)
Dial-in conferencing	Have an audio conferencing phone number when tapping "New meeting" on the console	Enabled for Audio Conferencing
Outbound/inbound PSTN Calling	Enable the Microsoft Teams Rooms console to make and receive PSTN calls	Enabled for Phone System

For more information about Microsoft Teams Rooms accounts, see [Configure accounts for Microsoft Teams Rooms](#).

 Decision points	<ul style="list-style-type: none"> • Decide which scenarios you'll support, and identify licensing requirements for your Microsoft Teams Rooms service accounts.
 Next steps	<ul style="list-style-type: none"> • Prepare to host machine and service accounts.

Sample Microsoft Teams Rooms service account planning table

SITE	ROOM NAME	ROOM TYPE	FUTURE ROOM CAPABILITIES	MICROSOFT TEAMS ROOMS ACCOUNT FEATURES
London HQ	Curie	Medium	1 screen, audio and video plus presentation Dial-in conferencing access PSTN access	Enabled for Exchange (Resource Mailbox) Enabled for Audio Conferencing Enabled for Phone System

SITE	ROOM NAME	ROOM TYPE	FUTURE ROOM CAPABILITIES	MICROSOFT TEAMS ROOMS ACCOUNT FEATURES
Sydney HQ	Hill	Large	2 Screens, audio and video plus presentation Dial-in conferencing access PSTN access	Enabled for Skype for Business Enabled for Exchange (Resource Mailbox) Enabled for Audio Conferencing Enabled for Phone System

Prepare to host Microsoft Teams Rooms and resource accounts (optional)

To enable you to manage and report on your Microsoft Teams Rooms and resource accounts, prepare your on-premises Active Directory or Azure Active Directory (Azure AD).

Define an on-premises Active Directory or Azure Active Directory group to add all Microsoft Teams Rooms service (user) accounts to. If using Azure Active Directory, consider using a dynamic group to automatically add and remove resource accounts from the group.

Define one organizational unit in your on-premises Active Directory hierarchy to hold all Microsoft Teams Rooms machine accounts (if they're joined to the domain) and one organizational unit to hold all the Microsoft Teams Rooms user accounts. Disable Group Policy inheritance to ensure that you apply only the policies you intended to apply to the domain-joined Microsoft Teams Rooms.

Create a Group Policy object assigned to the organization unit that contains your Microsoft Teams Rooms computer accounts. Use this to:

- [Set power and local account settings](#).
- Enable Windows Update.
- Enable PowerShell remoting. You can configure a start-up script to run a script: Enable-PSRemoting -Force

You can use PowerShell to perform several remote management activities, including getting and setting configuration information. PowerShell remoting must be enabled *before* any PowerShell remote management can take place and should be considered as part of your deployment processes or configured via Group Policy. For more information about these capabilities and enabling them, see [Maintenance and operations](#).

Configuration and deployment

Planning for configuration and deployment covers the following key areas:

- Account provisioning
- Device software installation
- Device deployment
- Microsoft Teams Rooms application and peripheral device configuration
- Testing
- Asset management

Account provisioning

Each Microsoft Teams Rooms device requires a dedicated and unique resource account that must be enabled for both Microsoft Teams or Skype for Business, and Exchange. This account must have a room mailbox hosted on Exchange. Calendar processing must be configured so that the device can automatically accept incoming meeting requests. For more information about creating these accounts, see [Configure accounts for Microsoft Teams Rooms](#).

Pro Tip - Each Microsoft Teams Rooms must have a valid and unique machine name on your network. Many monitoring and alerting systems display the machine name as a key identifier, so it's important to develop a naming convention for Microsoft Teams Rooms deployments that allows support personnel to easily locate the Microsoft Teams Rooms that has been flagged as requiring an action. An example might be using a pattern of *MTR-Site-Room Name* (MTR-LON-CURIE).

 Decision points	<ul style="list-style-type: none">• Decide the naming convention for your Microsoft Teams Rooms resource accounts.• Decide whether you'll create individual accounts or use bulk-provisioning scripts.
 Next steps	<ul style="list-style-type: none">• Start to plan your device deployment.

Device software installation

Teams Rooms comes pre-installed by the OEM.

We provide guidance on how to use [Microsoft Azure Monitor](#) to monitor the Microsoft Teams Rooms deployment and report on availability, hardware/software errors, and Microsoft Teams Rooms application version. If you decide to use Microsoft Operations Management Suite, you should install the Operations Management Suite agent as part of the software installation process and configure the workspace connection information for your workspace.

An additional consideration is whether the Microsoft Teams Rooms will be domain-joined. Information about the benefits of domain joining can be found in [Configuring Group Policy for Microsoft Teams Rooms](#).

 Decision points	<ul style="list-style-type: none">• Decide the Microsoft Teams Rooms resource account naming convention to be used during your deployment.• Decide whether you'll join Microsoft Teams Rooms devices to your domain.• Decide whether you'll use Azure Monitor to monitor the Microsoft Teams Rooms deployment.
 Next steps	<ul style="list-style-type: none">• Start to plan your device deployment approach.

Device deployment

After you've decided how to create and manager your Microsoft Teams Rooms resource accounts, create your plan to ship the devices and their assigned peripherals to your rooms, and then proceed to installation and configuration.

 Decision points	<ul style="list-style-type: none">• Decide who will manage the site-by-site deployment.• Identify the resources who will install Microsoft Teams Rooms on site and undertake the configuration and testing.

 Next steps	<ul style="list-style-type: none"> Start device testing.

Sample deployment table

SITE	ROOM NAME	ROOM TYPE	MICROSOFT TEAMS ROOMS SYSTEM	PERIPHERAL DEVICES	MICROSOFT TEAMS ROOMS COMPUTER NAME	MICROSOFT TEAMS ROOMS RESOURCE ACCOUNT
London HQ	Curie	Medium				
Sydney HQ	Hill	Large				

Microsoft Teams Rooms application and peripheral device configuration

After each Microsoft Teams Rooms system has been physically deployed and the supported peripheral devices connected, you'll need to configure the Microsoft Teams Rooms application to assign the Microsoft Teams Rooms resource account and password to enable Teams Rooms to sign in to Microsoft Teams or Skype for Business, and Exchange.

You can manually configure each Microsoft Teams Rooms system. Alternatively, you can use a centrally stored, per-Microsoft Teams Rooms XML configuration file to manage the application settings.

For more information about how to use the XML configuration file, see [Manage a Microsoft Teams Rooms console settings remotely with an XML configuration file](#).

You can use [remote PowerShell](#) to pull the Microsoft Teams Rooms configuration for reporting needs.

 Decision points	<ul style="list-style-type: none"> Decide whether you'll manually configure each Microsoft Teams Rooms system or use a central XML file (one per Microsoft Teams Rooms device).
 Next steps	<ul style="list-style-type: none"> Define your remote management approach.

Testing

After Teams Rooms has been deployed, you should test it. Check that the capabilities listed in [Microsoft Teams Rooms help](#) are working on the deployed device. We highly recommend that the deployment team verify that Microsoft Teams Rooms is appearing in Teams admin center. It's also important that you make a number of test calls and meetings to check quality. For more information, see this [useful deployment checklist](#).

We recommend that as part of the general Teams or Skype for Business rollout, you configure building files for Call Quality Dashboard (CQD), monitor quality trends, and engage in the Quality of Experience Review process. For more information, see [Improve and monitor call quality for Teams](#).

Asset management

As part of the deployment, you'll want to update your asset register with the room name, Microsoft Teams Rooms name, signed-in Microsoft Teams Rooms resource account, and assigned peripheral devices.

Sample asset table

SITE	ROOM NAME	ROOM TYPE	MICROSOF T TEAMS ROOMS SERIAL NO.	PERIPHERA L DEVICES/ SERIAL NOS./ PORTS	MICROSOF T TEAMS ROOMS COMPUTER NAME	MICROSOF T TEAMS ROOMS SERVICE ACCOUNT	DATE DEPLOYED
London HQ	Curie	Medium					
Sydney HQ	Hill	Large					

Configure accounts for Microsoft Teams Rooms

12/7/2021 • 3 minutes to read • [Edit Online](#)

Read this topic to learn about Microsoft Teams Rooms and how it integrates with Exchange and Skype for Business.

This topic introduces how to create accounts used by Microsoft Teams Rooms in Microsoft Exchange and Skype for Business. Your infrastructure will likely fall into one of the following configurations:

- Online deployment: Your organization's environment is deployed entirely on Microsoft 365 or Office 365. For more information, see [Deploy Microsoft Teams Rooms with Microsoft 365 or Office 365](#).
- On-premises deployment: Your organization has servers that it controls, where Active Directory, Exchange, and Skype for Business Server are hosted. For more information, see [Deploy Microsoft Teams Rooms with Skype for Business Server](#)
- Hybrid deployments: Your organization has a mix of services, with some hosted on premises and some hosted online through Microsoft 365 or Office 365. With Microsoft Teams Rooms, the following hybrid scenarios are supported:
 - Exchange Online with Skype for Business Server on premises. For more information, see [Deploy Microsoft Teams Rooms with Exchange Online \(Hybrid\)](#).
 - Exchange on premises with Microsoft Teams. For more information, see [Deploy Microsoft Teams Rooms with Exchange on premises \(Hybrid\)](#).

Which configuration you have will affect how you prepare for device setup.

Microsoft Teams Rooms needs to be assigned a "resource account" in Active Directory, Exchange, and Skype for Business. The account is used to access its meeting calendar and establish Microsoft Teams or Skype for Business connectivity. People can book this account by scheduling a meeting with it. Microsoft Teams Rooms will be able to join that meeting and provide various features to the meeting attendees.

IMPORTANT

Without a resource account, none of these features will work.

Every resource account is unique to a single Microsoft Teams Rooms installation, and requires some setup:

- The resource account must be configured correctly.
- Your infrastructure must be configured to allow Microsoft Teams Rooms to validate the resource account, and to reach the appropriate Microsoft services.

NOTE

If using Microsoft Teams panels, the Teams Rooms resource account signs in to both Teams Rooms and associated Teams panels.

IMPORTANT

It is highly recommended that account creation be done well in advance of actual hardware installation. Ideally, account preparation is started two to three weeks before installation.

In hybrid environments the account used for Microsoft Teams Rooms must have password sync enabled in Azure Active Directory (AAD) Sync because Microsoft Teams Rooms authentication requires Microsoft 365 or Office 365 authentication. When setting up the account, make sure that the account's SIP address matches its User Principal Name (UPN) in AAD.

You can think of a resource account as the resource account that people recognize as a conference room's or shared space's account. When you want to schedule a meeting using that space, you invite the account to that meeting.

If you already have a resource mailbox account set up for the space where you're installing Microsoft Teams Rooms, you can change that account into a Teams Rooms resource account. Once that's done, all you need to do is sign in to Microsoft Teams Rooms with that account.

Basic configuration

These properties represent the minimum configuration for a resource account to work with Microsoft Teams Rooms. Your resource account may require further setup.

PROPERTY	PURPOSE
Exchange mailbox (Exchange 2013 SP1 or later, or Exchange Online)	Enabling the account with an Exchange mailbox gives the resource account the capability to receive and send both mail and meeting requests, and to display a meetings calendar on the Microsoft Teams Rooms device. The Microsoft Teams Rooms mailbox must be a room mailbox.
Skype for Business is enabled	Skype for Business can be enabled in order to use various Skype for Business conferencing features, like video calls, IM, and screen-sharing.
Password-enabled	The resource account must be enabled with a password, or it cannot authenticate with Microsoft Teams, Exchange, or Skype for Business Server. Password expiration should be disabled on all Teams Rooms resource accounts.

Advanced configuration

While the properties for the basic configuration will allow the resource account to be set up in a simple environment, it is possible your environment has other restrictions on directory accounts that must be met in order for Microsoft Teams Rooms to successfully use the resource account.

PROPERTY	PURPOSE
Certificate-based authentication	Certificates may be required for both Exchange and Skype for Business Server. To deploy certificates, you can load them when logged in as Admin.

[Manage Microsoft Teams Rooms](#)

Set up Coordinated Meetings with Microsoft Teams Rooms and Surface Hub

12/7/2021 • 10 minutes to read • [Edit Online](#)

If you have one or more Microsoft Teams Rooms devices or Surface Hubs in a meeting room, you can set up Coordinated Meetings. Coordinated Meetings lets you set up your Teams Rooms devices and Surface Hubs so that when you join a meeting on one device, the other devices in the room are also joined to the same meeting. You can configure your cameras, speakers, and microphones so that the ones that give participants the best experience are enabled while others are disabled. This avoids the dreaded echo and feedback noise participants can experience when adding multiple devices to a meeting.

To set up Coordinated Meetings, you need to make sure your Teams Rooms devices and Surface Hubs are already correctly configured to participate in meetings. Most importantly, each device needs to have its own Exchange room mailbox. For information on how to set them up, see the following articles:

- [Deploy Microsoft Teams Rooms](#)
- [Create Surface Hub 2S device account](#)

After you've confirmed that your Teams Rooms devices and Surface Hubs can automatically accept meetings and join them successfully, you can set up Coordinated Meetings.

The following steps should be completed for each meeting room separately.

Step 1: Plan your Coordinated Meeting experience

Before you make any configuration changes, you need to decide which devices will do what in each meeting room. That is, for a given meeting room, you need to decide which device will have the active microphone, camera, and whiteboard. How you configure your devices depends on your specific environment, but here are some general recommendations to start with:

- **Microphone** Teams Rooms device
- **Camera** Teams Rooms device (on by default) and Surface Hub (off by default, but allowed to be turned on by participants)
- **Whiteboard** Surface Hub

IMPORTANT

Make sure you enable the microphone only on one device. If you enable it on more than one device, you'll experience audio echo and feedback.

Step 2: Get your devices' UPNs

When you set up a Coordinated Meeting experience in a meeting room, you need to tell the Teams Rooms devices and Surface Hubs in that room which devices to coordinate with. This is done by adding the user principal name (UPN) of the devices it should coordinate with to its configuration. If you don't know the UPNs for each of the devices you want to set up for Coordinated Meetings, you can find them using the Microsoft 365 admin center.

You need to be assigned an admin role to access the Microsoft 365 admin center. For more information, see [About admin roles](#).

To get the UPNs of your Teams Rooms devices and Surface Hubs, do the following:

1. Sign in to the Microsoft 365 admin center by visiting <https://admin.microsoft.com>.
2. Go to **Users > Active users**.
3. Find the name of your Teams Rooms device or Surface Hub in the **Display name** column (you can use the **Search** box if you have many users).
4. Find the UPN in the **Username** column (it'll look something like alias@contoso.com or alias@contoso.onmicrosoft.com).
5. Repeat this for each device that will participate in Coordinated Meetings.

Step 3: Create a deployment worksheet

After you've planned your Coordinated Meeting experience and gathered a list of your devices' UPNs, it's a good idea to create a deployment worksheet. A deployment worksheet will help you visualize the configuration you want to set across all of your devices, allowing you to validate your choices and check for errors.

In a spreadsheet app, add rows for the following in the first column:

SETTING	DESCRIPTION
Audio default	Determines on which device the microphone will be active when a meeting starts. Only one device (typically a Teams Rooms device) can have this field set to <code>true</code> while the rest of the devices must have this field set to <code>false</code> to avoid audio echo and feedback.
Audio enabled	Determines whether participants in a meeting can toggle the microphone on or off. Devices on which Audio default is set to <code>false</code> should have this setting set to <code>false</code> so that participants can't accidentally turn on a microphone and cause audio echo or feedback. If Audio default is set to <code>true</code> , this setting is ignored and participants can mute or unmute the microphone.
Video default	Determines on which device the camera will be active when a meeting starts. For the best experience, we recommend that only the Teams Rooms device be set to <code>true</code> while all other devices are set to <code>false</code> .
Video enabled	Determines whether participants in a meeting can toggle the camera on or off. You can set this to <code>true</code> on any other devices in the event participants want to share different video perspectives (such as if a participant is using the Surface Hub whiteboard). If you don't want participants to turn a camera on or off on a device, set this to <code>false</code> . If Video default is set to <code>true</code> , this setting is ignored and participants can turn the camera on or off.
Whiteboard default	Determines whether the Teams Rooms device will display a whiteboard shared by one of the meeting participants. We recommend that you set this to <code>false</code> if you have a Surface Hub and <code>true</code> if you don't have one. This setting has no effect on Surface Hubs. Surface Hubs will always display a whiteboard shared by meeting participants.

SETTING	DESCRIPTION
Whiteboard enabled	Determines whether participants in a meeting can toggle the whiteboard on or off. If you don't want participants to turn the whiteboard on or off on a device, set this to <code>false</code> . If Whiteboard default is set to <code>true</code> , this setting is ignored and participants can turn the whiteboard on or off.
Trusted accounts	This is a comma-separated list of UPNs for each Teams Room device or Surface Hub that the device should accept meeting join requests from, or to which meeting join requests should be sent.

In subsequent columns, add each of your Teams Rooms devices and Surface Hubs. In each column, fill out the values that correspond to the experience you want for the meeting room. Here's an example with one Teams Rooms device and one Surface Hub:

- Teams device
 - Audio and video are turned **on** when a meeting starts. Participants **can** toggle audio and video on or off.
 - Displaying a shared whiteboard is turned off.
- Surface Hub
 - Audio is turned **off** when a meeting starts. Participants **can't** toggle audio on or off.
 - Video is turned **off** when a meeting starts. Participants **can** toggle video on or off.

SETTING	TEAMS ROOM	SURFACE HUB
Audio default	<code>true</code>	<code>false</code>
Audio enabled	<code>true</code>	<code>false</code>
Video default	<code>true</code>	<code>false</code>
Video enabled	<code>true</code>	<code>true</code>
Whiteboard default	<code>false</code>	<code>false</code>
Trusted accounts	hub@contoso.com	room@contoso.com

Step 4: Configure Teams Rooms device

You can either set up Coordinated Meetings on a Teams Rooms device using the device's touch screen or, if you need to set up many devices and want to do so from a central location, you can use an XML configuration file.

Use the worksheet you created in the previous step to help you set up your devices.

Use the Teams Rooms device's touch screen

To set up Coordinated Meetings on a device, do the following:

1. Select ... **More** > **Settings**.
2. Enter the Administrator password and select **Yes**.
3. Select **Coordinated Meetings**.

4. Under **Options**, set **Coordinated Meeting** to *on*.
5. If **Audio default** in your worksheet is `true`, set **Turn on this device's microphone** to on, otherwise leave it *off*.
6. If **Audio enabled** in your worksheet is `true`, select **Let people enable when joining a meeting** under **Turn on this device's microphone**. This option can't be turned off if **Turn on this device's microphone** is set to on.
7. If **Video default** in your worksheet is `true`, set **Turn on this device's camera** to on, otherwise leave it *off*.
8. If **Video enabled** in your worksheet is `true`, select **Let people enable when joining a meeting** under **Turn on this device's camera**. This option can't be turned off if **Turn on this device's camera** is set to *on*.
9. If **Whiteboard default** in your worksheet is `true`, set **Turn on whiteboarding on this device** to *on*, otherwise leave it *off*.
10. Under **Trusted device accounts**, type each UPN listed in **Trusted accounts** in your worksheet. Separate multiple UPNs with commas.
11. Select **Save and exit**.

After you select **Save and exit**, the device will restart and it'll be ready to participate in Coordinated Meetings.

Use the Teams Rooms XML configuration file

Coordinated Meetings can be set up using the Teams Rooms device's `SkypeSettings.xml` XML configuration file. The `SkypeSettings.xml` file isn't a static file. When the Teams Rooms device starts, it checks in `C:\Users\Skype\AppData\Local\Packages\Microsoft.SkypeRoomSystem_8wekyb3d8bbwe\LocalState` for a file named `SkypeSettings.xml`. If the file exists, the device reads and applies the configuration specified in the file. After it's done applying the configuration, the file is deleted. For more information about the `SkypeSettings.xml` file, see [Manage console settings with an XML configuration file](#).

The following is the syntax of the Coordinated Meetings settings in the configuration file:

```
<CoordinatedMeetings enabled="true">
  <Settings>
    <Audio default="true" enabled="true"/>
    <Video default="true" enabled="true"/>
    <Whiteboard default="false" enabled="false"/>
  </Settings>
  <TrustedAccounts>hub@contoso.com</TrustedAccounts>
</CoordinatedMeetings>
```

To set up Coordinated Meetings on a device, do the following:

1. In a text file editor, such as Visual Studio Code or Notepad, paste the above XML into a new file.
2. Set each of the XML elements to the corresponding `true` or `false` value in your spreadsheet. For example, if **Audio default** is `true`, set `<Audio default="true">`.
3. Be sure to change `TrustedAccounts` to your list of UPNs.
4. Save the file with the name `SkypeSettings.xml`.
5. Place the file in the Teams Rooms device's `C:\Users\Skype\AppData\Local\Packages\Microsoft.SkypeRoomSystem_8wekyb3d8bbwe\LocalState` folder. You can do this a few ways:
 - **Copy the file to your Teams Rooms device** You'll need to enable file sharing and create a network share before you can copy files to your device. After you do that, you can connect to network share and copy the file to the device. For more information, see [Microsoft Teams Rooms maintenance and](#)

operations.

- **Use a Group Policy** Create a group policy to copy the file to device. For more information, see [Group Policy Overview](#).
- **Download the file on the Teams Rooms device** You can log into the device using Admin mode and then copy the file to the device from a network share or USB drive. For more information, see [Switching to Admin mode](#).

6. Restart the device. You can do this a couple ways:

- **Remote PowerShell** You can run the Shutdown command on the device using Remote PowerShell. For more information, see [Remote Management using PowerShell](#).
- **Run Restart-Computer** You can run the `Restart-Computer` cmdlet on your local computer and specify the computer name of the device you want to restart. For more information, see [Restart-Computer](#).

Step 5: Configure Surface Hub

You can use Windows Configuration Designer to create a provisioning package that you can use to apply Coordinating Meetings settings to your Surface Hubs. You'll paste the XML file you created above into Windows Configuration Designer to create the provisioning package.

Create Coordinated Meetings XML configuration file for Surface Hub

Both Windows Configuration Designer and Microsoft Intune are used to apply the Coordinated Meetings configuration to your Surface Hubs. The configuration is defined using XML. Before you go further, you need to create the XML that will be applied.

The following is the syntax of the Coordinated Meetings XML configuration file.

```
<SurfaceHubSettings>
  <BluetoothAdvertisementEnabled>true</BluetoothAdvertisementEnabled>
  <AutoAcceptProximateMeetingInvitations>true</AutoAcceptProximateMeetingInvitations>
  <CoordinatedMeetings enabled="true">
    <TrustedAccounts>room@contoso.com</TrustedAccounts>
    <Settings>
      <Audio default="false" enabled="false" />
      <Video default="false" enabled="true" />
    </Settings>
  </CoordinatedMeetings>
</SurfaceHubSettings>
```

Do the following to prepare the XML for Windows Configuration Designer or Microsoft Intune:

1. In a text file editor, such as Visual Studio Code or Notepad, paste the above XML into a new file.
2. Set each of the XML elements to the corresponding `true` or `false` value in your spreadsheet. For example, if **Audio default** is `true`, set `<Audio default="true">`.
3. Be sure to change `TrustedAccounts` to your list of UPNs.
4. Windows Configuration Designer requires that the XML be on a single line. Remove all the line breaks between each line so that the XML looks like the following:

```
<SurfaceHubSettings><BluetoothAdvertisementEnabled>true</BluetoothAdvertisementEnabled>...
```

5. Save the file on your computer.

After you've created your XML configuration file, use the steps in [Manage Microsoft Teams settings on Surface](#)

Hub to apply it to your Surface Hubs.

Manage Microsoft Teams settings on Surface Hub

12/7/2021 • 7 minutes to read • [Edit Online](#)

You can manage Microsoft Teams settings on a Surface Hub using Windows Configuration Designer or Microsoft Intune in Microsoft Endpoint Manager. Knowledge of Windows Configuration Designer or Microsoft Intune is required to make changes to Teams settings. For more information about these options, see the following articles:

- [Create a provisioning package for Windows 10](#)
- [What is Microsoft Intune device management?](#)

Windows Configuration Designer is a good option if you only have a few Surface Hub devices and you can access them easily. If you have many Surface Hubs, or if they're in remote locations, use Microsoft Intune in Microsoft Endpoint Manager if its deployed in your organization. Regardless of the method you choose, you need to create an XML configuration file for make changes to Teams settings on Surface Hub.

Teams configuration file syntax

Teams configuration on a Surface Hub is defined using an XML file. The XML file contains all the settings that can be used to control how Teams works. Both Windows Configuration Designer and Microsoft Intune use the same XML syntax. Here's an example of the Teams configuration XML file:

```
<SurfaceHubSettings>
  <BluetoothAdvertisementEnabled>true</BluetoothAdvertisementEnabled>
  <AutoAcceptProximateMeetingInvitations>true</AutoAcceptProximateMeetingInvitations>
  <CoordinatedMeetings enabled="true">
    <TrustedAccounts>room@contoso.com</TrustedAccounts>
    <Settings>
      <Audio default="false" enabled="false" />
      <Video default="false" enabled="true" />
    </Settings>
  </CoordinatedMeetings>
</SurfaceHubSettings>
```

The following table describes all the configuration settings available in the configuration file:

PARENT	ELEMENT	ATTRIBUTE	DESCRIPTION
None	<SurfaceHubSettings>		Contains all configuration elements for Teams configuration on a Surface Hub.
<SurfaceHubSettings>	<BluetoothAdvertisementEnabled>		Determines whether Surface Hub advertises that it's available for Bluetooth connections. Accepted values: <code>true</code> , <code>false</code>

PARENT	ELEMENT	ATTRIBUTE	DESCRIPTION
<SurfaceHubSettings>	<AutoAcceptProximateMeetingInvitations>		Determines whether Teams will automatically accept proximity-based meetings. Accepted values: <code>true</code> , <code>false</code>
<SurfaceHubSettings>	<CoordinatedMeetings>		Contains all configuration elements for Coordinated Meetings.
		<code>enabled</code>	Determines whether Teams is configured to participate in Coordinated Meetings with other devices. Accepted values: <code>true</code> , <code>false</code>
<CoordinatedMeetings>	<TrustedAccounts>		This is a comma-separated list of UPNs for each Teams Room device or Surface Hub that the device should accept meeting join requests from, or to which meeting join requests should be sent. Accepted values: string
<CoordinatedMeetings>	<Settings>		Contains configuration audio and video configuration elements for Coordinated Meetings
<Settings>	<Audio>		Controls audio configuration for Teams on a Surface Hub.
		<code>default</code>	Determines on which device the microphone will be active when a meeting starts. Only one device (typically a Teams Rooms device) can have this field set to <code>true</code> while the rest of the devices must have this field set to <code>false</code> to avoid audio echo and feedback. Accepted values: <code>true</code> , <code>false</code>

PARENT	ELEMENT	ATTRIBUTE	DESCRIPTION
		enabled	<p>Determines whether participants in a meeting can toggle the microphone on or off. Devices on which Audio default is set to <code>false</code> should have this setting set to <code>false</code> so that participants can't accidentally turn on a microphone and cause audio echo or feedback.</p> <p>If Audio default is set to <code>true</code>, this setting is ignored and participants can mute or unmute the microphone.</p> <p>Accepted values: <code>true</code>, <code>false</code></p>
<Settings>	<Video>		Controls video configuration for Teams on a Surface Hub.
		default	<p>Determines on which device the camera will be active when a meeting starts. For the best experience, we recommend that only the Teams Rooms device be set to <code>true</code> while all other devices are set to <code>false</code>.</p> <p>Accepted values: <code>true</code>, <code>false</code></p>

PARENT	ELEMENT	ATTRIBUTE	DESCRIPTION
		enabled	<p>Determines whether participants in a meeting can toggle the camera on or off. You can set this to <code>true</code> on any other devices in the event participants want to share different video perspectives (such as if a participant is using the Surface Hub whiteboard). If you don't want participants to turn a camera on or off on a device, set this to <code>false</code>.</p> <p>If Video default is set to <code>true</code>, this setting is ignored and participants can turn the camera on or off.</p> <p>Accepted values: <code>true</code>, <code>false</code></p>

Apply Teams settings to Surface Hub

Apply or update Teams configuration settings on Surface Hub using either Windows Configuration Designer or Microsoft Intune in Microsoft Endpoint Manager.

Use Windows Configuration Designer

You can use Windows Configuration Designer to create a provisioning package that you can use to apply Teams settings to your Surface Hubs. You'll paste the XML file you created above into Windows Configuration Designer to create the provisioning package.

IMPORTANT

If you've already applied Teams configuration to your Surface Hub using a provisioning package and want to change it, you need to remove the existing provisioning package first. For more information, see [Remove a provisioning package created by Windows Configuration Designer](#).

Do the following to create the provisioning package in Windows Configuration Designer:

1. Install Windows Configuration Designer from the Windows Store on your local computer and open it
2. Select **Provision Surface Hub devices** and then **Switch to advanced editor**
3. On the next screen, expand **WindowsTeamSettings > Teams** and select **Configurations**
4. In the field next to **Configurations** in the middle pane, paste the single line of XML you created above
5. Select **Export > Provisioning package**
6. Provide a name for the provisioning package in **Name** and select **Next > Next**
7. Specify a location to save the provisioning package and select **Next**
8. Select **Build** to create the provisioning package and then **Finish**

Finally, after you've created the provisioning package, do the following to apply the provisioning package to your Surface Hub:

1. Save the provisioning package you created above to a USB drive
2. Insert the USB drive into your Surface Hub
3. On your Surface Hub, open the Start menu, select **All apps**, and then select **Settings**
4. Provide your admin username and password and then select **Yes**
5. Go to **Surface Hub, Device management, Add or remove a provisioning package**, and then **Add a package**
6. Under **Select a package**, select **Add** next to your provisioning package, and then restart your Surface Hub

Use Microsoft Intune

If your Surface Hubs are managed using Microsoft Intune in Microsoft Endpoint Management, you can use it to apply Teams settings to your Surface Hubs. You'll create a new configuration profile and then paste the XML file you created above into it.

IMPORTANT

Your Surface Hubs need to be in a device group so that the Microsoft Intune can identify which devices to apply the configuration profile to. For information about how to create a device group, see [Add groups to organize users and devices](#).

Do the following to create a configuration profile to apply Teams settings to your Surface Hubs:

1. Sign in to Microsoft Endpoint Manager by visiting <https://endpoint.microsoft.com/>
2. Navigate to **Devices > Configuration profiles** and select **Create profile**
3. Under **Platform**, select **Windows 10 and later**
4. Under **Profile**, select **Custom**, and then click **Create**
5. On the **Basics** tab, in **Name**, provide a descriptive name for your configuration profile and select **Next**
6. On the **Configuration settings** tab, select **Add**
7. In the **Add row** pane, do the following:
 - a. Provide a descriptive name and, optionally, a description of the Teams setting you're adding
 - b. In **OMA-URI**, enter `./Vendor/MSFT/SurfaceHub/InBoxApps/Teams/Configurations`
 - c. In **Data type**, select **String (XML file)**
 - d. Open the file browser, select the XML file you created above, and **Open**
8. Select **Add** and then **Next**
9. On the **Assignments** tab, make sure **Assign to** is set to **Selected groups**
10. Under **Selected groups**, select **Select groups to include** and choose the group that contains your Surface Hubs, and then select **Select**
11. Select **Next, Next**
12. On the **Review + create**, select **Create**

Remove Teams settings from a Surface Hub

Remove Teams configuration settings on Surface Hub using either Windows Configuration Designer or Microsoft Intune in Microsoft Endpoint Manager.

Remove a provisioning package created by Windows Configuration Designer

If you applied Teams settings to a Surface Hub using a provisioning package created by Windows Configuration Designer, use the following steps to remove the package and its settings:

1. On your Surface Hub, open the Start menu, select **All apps**, and then select **Settings**
2. Provide your admin username and password and then select **Yes**
3. Go to **Surface Hub, Device management** and then **Add or remove a provisioning package**

4. Next to the provisioning package you want to remove, select **Remove**
5. Go to **Surface Hub** and then **Apps & features**
6. Find **Microsoft Teams for Surface Hub** and then select **Advanced Options**
7. Select **Reset**, and then **Reset** again
8. Restart your Surface Hub

Remove settings applied by Microsoft Intune

If you applied Teams settings to a Surface Hub using Microsoft Intune in Microsoft Endpoint Management, use the following steps to remove the configuration profile and its settings:

1. Sign in to Microsoft Endpoint Manager by visiting <https://endpoint.microsoft.com/>
2. Navigate to **Devices > Configuration profiles**
3. Select the configuration profile that contains the Coordinated Meeting settings you want to remove
4. On the configuration profile details page, select **Delete** and then **OK**

After you've removed configuration profile that contained the Coordinated Meeting settings for your Surface Hub, use the following steps to reset the Teams app on the Surface Hub:

1. On your Surface Hub, open the Start menu, select **All apps**, and then select **Settings**
2. Provide your admin username and password and then select **Yes**
3. Go to **Surface Hub** and then **Apps & features**
4. Find **Microsoft Teams for Surface Hub** and then select **Advanced Options**
5. Select **Reset**, and then **Reset** again
6. Restart your Surface Hub

Deploy Microsoft Teams Rooms with Microsoft 365 or Office 365

12/7/2021 • 5 minutes to read • [Edit Online](#)

Read this topic for information on how to deploy Microsoft Teams Rooms with Microsoft 365 or Office 365, where Microsoft Teams or Skype for Business and Exchange are both online.

The easiest way to set up user accounts is to configure them using remote Windows PowerShell. Microsoft provides [SkypeRoomProvisioningScript.ps1](#), a script that will help create new user accounts, or validate existing resource accounts you have in order to help you turn them into compatible Microsoft Teams Rooms user accounts. If you prefer, you can follow the steps below to configure accounts your Microsoft Teams Rooms device will use.

Requirements

Before you deploy Microsoft Teams Rooms with Microsoft 365 or Office 365, be sure you have met the requirements. For more information, see [Microsoft Teams Rooms requirements](#).

To enable Skype for Business, you must have the following:

- Skype for Business Online (Plan 2, or an Enterprise-based plan) or higher in your Microsoft 365 or Office 365 plan. The plan needs to allow dial-in conferencing capabilities.
- If you need dial-in capabilities from a meeting, you will need an Audio Conferencing and Phone System license. If you need dial-out capabilities from a meeting, you will need an Audio Conferencing license.
- Your tenant users must have Exchange mailboxes.
- Your Microsoft Teams Rooms account does require at a minimum a Skype for Business Online (Plan 2) license, but it does not require an Exchange Online license. See [Microsoft Teams Rooms licenses](#) for details.

For details on Skype for Business Online Plans, see the [Skype for Business Online Service Description](#).

Add a device account

1. Connect to Exchange Online PowerShell. For instructions, see [Connect to Exchange Online PowerShell](#).
2. In Exchange Online PowerShell, create a new room mailbox or modify an existing room mailbox. By default, room mailboxes don't have associated accounts, so you'll need to add an account when you create or modify a room mailbox that allows it to authenticate with Skype Room Systems v2.

- To create a new room mailbox, use the following syntax:

```
New-Mailbox -Name "<Unique Name>" -Alias <Alias> -Room -EnableRoomMailboxAccount $true -
MicrosoftOnlineServicesID <Account> -RoomMailboxPassword (ConvertTo-SecureString -String
'<Password>' -AsPlainText -Force)
```

This example creates a new room mailbox with the following settings:

- Name: Rigel-01
- Alias: Rigel1

- Account: Rigel1@contoso.onmicrosoft.com
- Account password: P@\$W0rd5959

```
New-Mailbox -Name "Rigel-01" -Alias Rigel1 -Room -EnableRoomMailboxAccount $true -
MicrosoftOnlineServicesID Rigel1@contoso.onmicrosoft.com -RoomMailboxPassword (ConvertTo-
SecureString -String 'P@$W0rd5959' -AsPlainText -Force)
```

- To modify an existing room mailbox, use the following syntax:

```
Set-Mailbox -Identity <RoomMailboxIdentity> -EnableRoomMailboxAccount $true -
RoomMailboxPassword (ConvertTo-SecureString -String '<Password>' -AsPlainText -Force)
```

This example enables the account for the existing room mailbox that has the alias value Rigel2, and sets the password to 9898P@\$W0rd. Note that the account will be Rigel2@contoso.onmicrosoft.com because of the existing alias value.

```
Set-Mailbox -Identity Rigel2 -EnableRoomMailboxAccount $true -RoomMailboxPassword (ConvertTo-
SecureString -String '9898P@$W0rd' -AsPlainText -Force)
```

For detailed syntax and parameter information, see [New-Mailbox](#) and [Set-Mailbox](#).

3. In Exchange Online PowerShell, configure the following settings on the room mailbox to improve the meeting experience:

- AutomateProcessing: AutoAccept (Meeting organizers receive the room reservation decision directly without human intervention: free = accept; busy = decline.)
- AddOrganizerToSubject: \$false (The meeting organizer is not added to the subject of the meeting request.)
- DeleteComments: \$false (Keep any text in the message body of incoming meeting requests.)
- DeleteSubject: \$false (Keep the subject of incoming meeting requests.)
- RemovePrivateProperty: \$false (Ensures the private flag that was sent by the meeting organizer in the original meeting request remains as specified.)
- AddAdditionalResponse: \$true (The text specified by the AdditionalResponse parameter is added to meeting requests.)
- AdditionalResponse: "This is a Microsoft Teams Meeting room!" (The additional text to add to the meeting request.)

This example configures these settings on the room mailbox named Rigel-01.

```
Set-CalendarProcessing -Identity "Rigel-01" -AutomateProcessing AutoAccept -AddOrganizerToSubject
$false -DeleteComments $false -DeleteSubject $false -RemovePrivateProperty $false -
AddAdditionalResponse $true -AdditionalResponse "This is a Microsoft Teams Meeting room!"
```

For detailed syntax and parameter information, see [Set-CalendarProcessing](#).

4. Connect to MS Online PowerShell to make Active Directory settings by running the

```
Connect-MsolService -Credential $cred
```

PowerShell cmdlet. For details about Active Directory, see [Azure ActiveDirectory \(MSOnline\) 1.0](#).

NOTE

Azure Active Directory PowerShell 2.0 is not supported.

5. If you do not want the password to expire, use the following syntax:

```
Set-MsolUser -UserPrincipalName <upn> -PasswordNeverExpires $true
```

This example sets the password for the account Rigel1@contoso.onmicrosoft.com to never expire.

```
Set-MsolUser -UserPrincipalName "Rigel1@contoso.onmicrosoft.com" -PasswordNeverExpires $true
```

You can also set a phone number for the account by running the following command:

```
Set-MsolUser -UserPrincipalName <upn> -PhoneNumber <phone number>
```

NOTE

If the password is not set to Never Expire, the account will no longer sign in on the device when the account reaches the expiry period. The password will then need to be changed for the account and also updated locally on the MTR device.

6. The device account needs to have a valid Microsoft 365 or Office 365 license, or Exchange and Microsoft Teams or Skype for Business will not work. If you have the license, you need to assign a usage location to your device account—this determines what license SKUs are available for your account. You can use `Get-MsolAccountSku` to retrieve a list of available SKUs for your Microsoft 365 or Office 365 organization as follows:

```
Get-MsolAccountSku
```

Next, you can add a license using the `Set-MsolUserLicense` cmdlet. This example adds the Meeting Room license to the account:

```
Set-MsolUser -UserPrincipalName "Rigel1@contoso.onmicrosoft.com" -UsageLocation "US"  
Set-MsolUserLicense -UserPrincipalName $acctUpn -AddLicenses "Contoso:MEETING_ROOM"
```

For detailed instructions, see [Assign licenses to user accounts with Office 365 PowerShell](#).

You can also add Phone System capabilities to this account, but you have to configure it first. See [What is Phone System?](#) for more details. This example adds the PSTN Domestic and International Calling Plan:

```
Set-MsolUserLicense -UserPrincipalName rigell1@contoso.onmicrosoft.com -AddLicenses "Contoso:MCOPSTN2"
```

NOTE

If you are configuring Teams Rooms to only natively join Microsoft Teams meetings, you should not proceed with the following step. The following is only required if you will also be enabling support for Skype for Business on-premises.

7. To enable the device account with Skype for Business on-premises, be sure your environment meets the requirements defined in [Microsoft Teams Rooms requirements](#).

Start a remote [Windows PowerShell session](#) as follows (be sure to [install Skype for Business Online PowerShell components](#)):

NOTE

Skype for Business Online Connector is currently part of the latest Teams PowerShell module.

If you're using the latest [Teams PowerShell public release](#), you don't need to install the Skype for Business Online Connector.

```
# When using Teams PowerShell Module

Import-Module MicrosoftTeams
$credential = Get-Credential
Connect-MicrosoftTeams -Credential $credential
```

Obtain the RegistrarPool information from the new user account being setup, as shown in this example:

```
Get-CsOnlineUser -Identity "Rigell@contoso.onmicrosoft.com" | Select -Expand RegistrarPool
```

Next, enable your Microsoft Teams Rooms account for Skype for Business Server by running the following cmdlet:

```
Enable-CsMeetingRoom -Identity "Rigell@contoso.onmicrosoft.com" -RegistrarPool  
"sippoolbl20a04.infra.lync.com" -SipAddressType EmailAddress
```

NOTE

New user accounts might not be created on the same registrar pool as existing user accounts in the tenant. The command above will prevent errors in account setup due to this situation.

Validate

For validation, you should be able to use any Skype for Business client to sign in to the account you created.

[Manage Microsoft Teams Rooms](#)

[Microsoft Teams Rooms Licensing](#)

Deploy Microsoft Teams Rooms with Skype for Business Server

12/7/2021 • 2 minutes to read • [Edit Online](#)

This topic explains how you add a device account for Microsoft Teams Rooms when you have a single-forest, on-premises deployment.

If you have a single-forest, on-premises deployment with Exchange 2013 SP1 or later and Skype for Business Server 2015 or later, then you can use the provided Windows PowerShell scripts to create device accounts. If you're using a multi-forest deployment, you can use equivalent cmdlets that will produce the same results. Those cmdlets are described in this section.

Before you begin to deploy Microsoft Teams Rooms, be sure you have the right permissions to run the associated cmdlets.

```
Set-ExecutionPolicy Unrestricted
$org='contoso.com'
$cred=Get-Credential $admin@$org
$sessExchange = New-PSSession -ConfigurationName microsoft.exchange -Credential $cred -AllowRedirection -
Authentication Kerberos -ConnectionUri
"http://$strExchangeServer/powershell" -WarningAction SilentlyContinue
$sessLync = New-PSSession -Credential $cred -ConnectionURI "https://$strLyncFQDN/OcsPowershell" -
AllowRedirection -WarningAction SilentlyContinue
Import-PSSession $sessExchange
Import-PSSession $sessLync
```

Note that `$strExchangeServer` is the fully qualified domain name (FQDN) of your Exchange server, and `$strLyncFQDN` is the FQDN of your Skype for Business Server deployment.

2. After establishing a session, you'll either create a new mailbox and enable it as a RoomMailboxAccount, or change the settings for an existing room mailbox. This will allow the account to authenticate to Microsoft Teams Rooms.

If you're changing an existing resource mailbox:

```
Set-Mailbox -Identity 'PROJECTRIGEL01' -EnableRoomMailboxAccount $true -RoomMailboxPassword
(ConvertTo-SecureString -String <password>
-AsPlainText -Force)
```

If you're creating a new resource mailbox:

```
New-Mailbox -UserPrincipalName PROJECTRIGEL01@contoso.com -Alias PROJECTRIGEL01 -Name "Project-Rigel-
01" -Room
-EnableRoomMailboxAccount $true -RoomMailboxPassword (ConvertTo-SecureString -String <password> -
AsPlainText -Force)
```

3. You can set various Exchange properties on the device account to improve the meeting experience for people. You can see which properties need to be set in the Exchange properties section.

```
Set-CalendarProcessing -Identity $acctUpn -AutomateProcessing AutoAccept -AddOrganizerToSubject $false -AllowConflicts $false -DeleteComments $false -DeleteSubject $false -RemovePrivateProperty $false
Set-CalendarProcessing -Identity $acctUpn -AddAdditionalResponse $true -AdditionalResponse "This is a Skype Meeting room!"
```

4. If you decide to have the password not expire, you can set that with Windows PowerShell cmdlets too. See Password management for more information.

```
Set-AdUser $acctUpn -PasswordNeverExpires $true
```

5. Enable the account in Active Directory so it will authenticate to Microsoft Teams Rooms.

```
Set-AdUser $acctUpn -Enabled $true
```

6. Enable the device account with Skype for Business Server by enabling your Microsoft Teams Rooms Active Directory account on a Skype for Business Server pool:

```
Enable-CsMeetingRoom -SipAddress sip:PROJECTRIGEL01@contoso.com -DomainController DC-ND-001.contoso.com -RegistrarPool LyncPool15.contoso.com -Identity PROJECTRIGEL01
```

You'll need to use the Session Initiation Protocol (SIP) address and domain controller for the Project

7. **Optional.** You can also allow Microsoft Teams Rooms to make and receive public switched telephone network (PSTN) phone calls by enabling Enterprise Voice for your account. Enterprise Voice isn't a requirement for Microsoft Teams Rooms, but if you want PSTN dialing functionality for the Microsoft Teams Rooms client, here's how to enable it:

```
Set-CsMeetingRoom PROJECTRIGEL01 -DomainController DC-ND-001.contoso.com -LineURI "tel:+14255550555;ext=50555"
Set-CsMeetingRoom -DomainController DC-ND-001.contoso.com -Identity PROJECTRIGEL01 -EnterpriseVoiceEnabled $true
Grant-CsVoicePolicy -PolicyName VP1 -Identity PROJECTRIGEL01
Grant-CsDialPlan -PolicyName DP1 -Identity PROJECTRIGEL01
```

Again, you'll need to replace the provided domain controller and phone number examples with your own information. The parameter value \$true stays the same.

Sample: room account setup in Exchange and Skype for Business Server on premises

```
New-Mailbox -Alias rigel1 -Name "Rigel 1" -Room -EnableRoomMailboxAccount $true -RoomMailboxPassword
(ConvertTo-SecureString -String "" -AsPlainText -Force)
-UserPrincipalName rigel1@contoso.com

Set-CalendarProcessing -Identity rigel1 -AutomateProcessing AutoAccept -AddOrganizerToSubject $false -
AllowConflicts $false -DeleteComments $false -DeleteSubject $false
-RemovePrivateProperty $false
Set-CalendarProcessing -Identity rigel1 -AddAdditionalResponse $true -AdditionalResponse "This is a Skype
Meeting room!"

Enable-CsMeetingRoom -Identity rigel1@contoso.com -RegistrarPool cs3.contoso.com -SipAddressType
EmailAddress
Set-CsMeetingRoom -Identity rigel1 -EnterpriseVoiceEnabled $true -LineURI tel:+15555555555
Grant-CsVoicePolicy -PolicyName dk -Identity rigel1
Grant-CsDialPlan -PolicyName e15dp2.contoso.com -Identity rigel1
```

Deploy Microsoft Teams Rooms with Exchange Online

12/7/2021 • 6 minutes to read • [Edit Online](#)

Read this topic for information on how to deploy Microsoft Teams Rooms with Exchange Online and Skype for Business Server on-premises.

If your organization has a mix of services, with some hosted on premises and some hosted online, then your configuration will depend on where each service is hosted. This topic covers hybrid deployments for Microsoft Teams Rooms with Exchange hosted online. Because there are so many different variations in this type of deployment, it's not possible to provide detailed instructions for all of them. The following process will work for many configurations. If the process isn't right for your setup, we recommend that you use Windows PowerShell to achieve the same end result as documented here, and for other deployment options.

The easiest way to set up user accounts is to configure them using remote Windows PowerShell. Microsoft provides [SkypeRoomProvisioningScript.ps1](#), a script that will help create new user accounts, or validate existing resource accounts you have in order to help you turn them into compatible Microsoft Teams Rooms user accounts. If you prefer, you can follow the steps below to configure accounts your Microsoft Teams Rooms device will use.

Requirements

Before you deploy Microsoft Teams Rooms with Exchange Online, be sure you have met the requirements. For more information, see [Microsoft Teams Rooms requirements](#).

To deploy Microsoft Teams Rooms with Exchange Online, follow the steps below. Be sure you have the right permissions to run the associated cmdlets.

NOTE

The [Azure Active Directory Module for Windows PowerShell cmdlets](#) in this section (for example, Set-MsolUser) have been tested in setting up accounts for Microsoft Teams Rooms devices. It's possible that other cmdlets may work, however, they haven't been tested in this specific scenario.

If you deployed Active Directory Federation Services (AD FS), you may have to convert the user account to a managed user before you follow these steps, and then convert the user back to a federated user after you complete these steps.

Create an account and set Exchange properties

1. Start a remote Windows PowerShell session on a PC and connect to Exchange Online as follows:

```
Set-ExecutionPolicy Unrestricted
$org = 'contoso.microsoft.com'
$cred = Get-Credential $admin@$org
$sess = New-PSSession -ConfigurationName Microsoft.Exchange -ConnectionUri
https://outlook.office365.com/powershell-liveid/ -Credential $cred -Authentication Basic -
AllowRedirection
Import-PSSession $sess -DisableNameChecking
```

2. After establishing a session, you'll either create a new mailbox and enable it as a RoomMailboxAccount, or

change the settings for an existing room mailbox. This will allow the account to authenticate into Microsoft Teams Rooms.

If you're changing an existing resource mailbox:

```
Set-Mailbox -Identity 'PROJECT01' -EnableRoomMailboxAccount $true -RoomMailboxPassword (ConvertTo-SecureString -String <password> -AsPlainText -Force)
```

If you're creating a new resource mailbox:

```
New-Mailbox -MicrosoftOnlineServicesID 'PROJECT01@contoso.com' -Alias PROJECT01 -Name "Project--01" -Room -EnableRoomMailboxAccount $true -RoomMailboxPassword (ConvertTo-SecureString -String <password> -AsPlainText -Force)
```

3. To improve the meeting experience, you'll need to set the Exchange properties on the user account as follows:

```
Set-CalendarProcessing -Identity 'PROJECT01@contoso.com' -AutomateProcessing AutoAccept -AddOrganizerToSubject $false -AllowConflicts $false -DeleteComments $false -DeleteSubject $false -RemovePrivateProperty $false  
Set-CalendarProcessing -Identity 'PROJECT01@contoso.com' -AddAdditionalResponse $true -AdditionalResponse "This is a Microsoft Teams Meeting room!"
```

Add an email address for your on-premises domain account

1. In **Active Directory Users and Computers AD** tool, right-click on the container or Organizational Unit that your Microsoft Teams Rooms accounts will be created in, click **New**, and then click **User**.
2. Type the display name (- Identity) from the prior cmdlet (Set-Mailbox or New-Mailbox) into the **Full name** box, and the alias into the **User logon name** box. Click **Next**.
3. Type the password for this account. You'll need to retype it for verification. Make sure the **Password never expires** checkbox is the only option selected.

NOTE

Selecting **Password never expires** is a requirement for Skype for Business Server on Microsoft Teams Rooms. Your domain rules may prohibit passwords that don't expire. If so, you'll need to create an exception for each Microsoft Teams Rooms user account.

4. Click **Finish** to create the account.
5. After you have created the account, run a directory synchronization. This can be accomplished by using [Set-MsolDirSyncConfiguration](#) in PowerShell. When that is complete, go to the users page and verify that the two accounts created in the previous steps have merged.

Assign a Microsoft 365 or Office 365 license

1. First, connect to Azure AD to apply some account settings. You can run this cmdlet to connect. For details about Active Directory, see [Azure ActiveDirectory \(MSOnline\) 1.0](#).

NOTE

[Azure Active Directory PowerShell 2.0](#) is not supported.

```
Connect-MsolService -Credential $cred
```

- The user account needs to have a valid Microsoft 365 or Office 365 license to ensure that Exchange and Skype for Business Server will work. If you have the license, you need to assign a usage location to your user account—this determines what license SKUs are available for your account. You'll make the assignment in a following step.
- Next, use `Get-MsolAccountSku` to retrieve a list of available SKUs for your Microsoft 365 or Office 365 organization.
- Once you list out the SKUs, you can add a license using the `Set-MsolUserLicense` cmdlet. In this case, `$strLicense` is the SKU code that you see (for example, `contoso:STANDARDPACK`).

```
Set-MsolUser -UserPrincipalName 'PROJECT01@contoso.com' -UsageLocation 'US'  
Get-MsolAccountSku  
Set-MsolUserLicense -UserPrincipalName 'PROJECT01@contoso.com' -AddLicenses $strLicense
```

Enable the user account with Skype for Business Server

NOTE

If you're setting up Teams Rooms to only join Microsoft Teams meetings, you don't need to do the following steps. The following steps are only required if you want to enable support for Skype for Business.

- Create a remote Windows PowerShell session from a PC as follows:

NOTE

Skype for Business Online Connector is currently part of the latest Teams PowerShell module.

If you're using the latest [Teams PowerShell public release](#), you don't need to install the Skype for Business Online Connector.

```
# When using Teams PowerShell Module  
Import-Module MicrosoftTeams  
$credential = Get-Credential  
Connect-MicrosoftTeams -Credential $credential
```

- To enable your Microsoft Teams Rooms account for Skype for Business Server, run this command:

```
Enable-CsMeetingRoom -Identity $rm -RegistrarPool 'sippoolbl20a04.infra.lync.com' -SipAddressType  
EmailAddress
```

If you aren't sure what value to use for the `RegistrarPool` parameter in your environment, you can get the value from an existing Skype for Business Server user using this command

```
Get-CsUser -Identity 'alice@contoso.com' | fl *registrarpool*
```

Assign a Skype for Business Server license to your Microsoft Teams Rooms account

NOTE

If you're setting up Teams Rooms to only join Microsoft Teams meetings, you don't need to do the following steps. The following steps are only required if you want to enable support for Skype for Business.

1. Log in as a tenant administrator, open the Microsoft 365 admin center, and click on the Admin app.
2. Click on **Users and Groups** and then click **Add users, reset passwords, and more**.
3. Click the Microsoft Teams Rooms account, and then click the pen icon to edit the account information.
4. Click **Licenses**.
5. In **Assign licenses**, select Skype for Business (Plan 2) or Skype for Business (Plan 3), depending on your licensing and Enterprise Voice requirements. You'll have to use a Plan 3 license if you want to use Enterprise Voice on Microsoft Teams Rooms.
6. Click **Save**.

For validation, you should be able to use any Skype for Business client to log in to this account.

NOTE

If you're currently using E1, E3, E4, or E5 SKUs with Skype for Business Plan 2 with Audio Conferencing or with Phone System and a Calling Plan, these will continue to work. However, you should consider moving to a simpler licensing model as described in [Teams Meeting Room Licensing Update](#), after current licenses expire.

IMPORTANT

If you're using Skype for Business Plan 2, you can only use the Microsoft Teams Rooms in Skype for Business Only mode, meaning all of your meetings will be Skype for Business meetings. In order to enable your meeting room for Microsoft Teams meetings, we recommend you purchase the Meeting Room license.

Deploy Microsoft Teams Rooms with Exchange on premises

12/7/2021 • 4 minutes to read • [Edit Online](#)

Read this topic for information on how to deploy Microsoft Teams Rooms in a hybrid environment with Exchange on-premises and Microsoft Teams.

If your organization has a mix of services, with some hosted on-premises and some hosted online, then your configuration will depend on where each service is hosted. This topic covers hybrid deployments for Microsoft Teams Rooms with Exchange hosted on-premises. Because there are so many different variations in this type of deployment, it's not possible to provide detailed instructions for all of them. The following process will work for many configurations. If the process isn't right for your setup, we recommend that you use Windows PowerShell to achieve the same end result as documented here, and for other deployment options.

Microsoft provides [SkypeRoomProvisioningScript.ps1](#), a script that will help create new user accounts, or validate existing resource accounts you have in order to help you turn them into compatible Microsoft Teams Rooms user accounts. If you prefer, you can follow the steps below to configure accounts your Microsoft Teams Rooms device will use.

Requirements

Before you deploy Microsoft Teams Rooms with Exchange on premises, be sure you have met the requirements. For more information, see [Microsoft Teams Rooms requirements](#).

If you are deploying Microsoft Teams Rooms with Exchange on-premises, you will be using Active Directory administrative tools to add an email address for your on-premises domain account. This account will be synced to Microsoft 365 or Office 365. You will need to:

- Create an account and synchronize the account with Azure Active Directory.
- Enable the remote mailbox and set properties.
- Assign a Microsoft 365 or Office 365 license.

Create an account and synchronize with Azure Active Directory

1. In the **Active Directory Users and Computers** tool, right-click on the folder or Organizational Unit that your Microsoft Teams Rooms accounts will be created in, click **New**, and then click **User**.
2. Type the display name into the **Full name** box, and the alias into the **User logon name** box. Click **Next**.
3. Type the password for this account. You'll need to retype it for verification. Make sure the **Password never expires** checkbox is the only option selected.

NOTE

Selecting **Password never expires** is a requirement for Microsoft Teams Rooms. Your domain rules may prohibit passwords that don't expire. If so, you'll need to create an exception for each Microsoft Teams Rooms device account.

4. After you've created the account, run a directory synchronization. When it's complete, go to the users page in your Microsoft 365 admin center and verify that the account created in the previous steps has merged to online.

Enable the remote mailbox and set properties

1. [Open the Exchange Management Shell](#) or [connect to your Exchange server using remote PowerShell](#).
2. In Exchange PowerShell, create a mailbox for the account (mailbox-enable the account) by running the following command:

```
Enable-Mailbox PROJECTRIGEL01@contoso.com -Room
```

For detailed syntax and parameter information, see [Enable-Mailbox](#).

3. In Exchange PowerShell, configure the following settings on the room mailbox to improve the meeting experience:
 - AutomateProcessing: AutoAccept (Meeting organizers receive the room reservation decision directly without human intervention: free = accept; busy = decline.)
 - AddOrganizerToSubject: \$false (The meeting organizer is not added to the subject of the meeting request.)
 - DeleteComments: \$false (Keep any text in the message body of incoming meeting requests.)
 - DeleteSubject: \$false (Keep the subject of incoming meeting requests.)
 - RemovePrivateProperty: \$false (Ensures the private flag that was sent by the meeting organizer in the original meeting request remains as specified.)
 - AddAdditionalResponse: \$true (The text specified by the AdditionalResponse parameter is added to meeting requests.)
 - AdditionalResponse: "This is a Microsoft Teams Meeting room!" (The additional text to add to the meeting request.)

This example configures these settings on the room mailbox named Project-Rigel-01.

```
Set-CalendarProcessing -Identity "Project-Rigel-01" -AutomateProcessing AutoAccept -  
AddOrganizerToSubject $false -DeleteComments $false -DeleteSubject $false -RemovePrivateProperty  
$false -AddAdditionalResponse $true -AdditionalResponse "This is a Microsoft Teams Meeting room!"
```

For detailed syntax and parameter information, see [Set-CalendarProcessing](#).

Assign a Microsoft 365 or Office 365 license

1. Connect to Azure Active Directory. For details about Azure Active Directory, see [Azure ActiveDirectory \(MSOnline\) 1.0](#).

NOTE

[Azure Active Directory PowerShell 2.0](#) is not supported.

2. The device account needs to have a valid Microsoft 365 or Office 365 license, or Exchange and Microsoft Teams will not work. If you have the license, you need to assign a usage location to your device account—this determines what license SKUs are available for your account. You can use `Get-MsolAccountSku` to retrieve a list of available SKUs.
3. Next, you can add a license using the `Set-MsolUserLicense` cmdlet. In this case, \$strLicense is the SKU code that you see (for example, contoso:STANDARDPACK).

```
Set-MsolUser -UserPrincipalName 'PROJECTRIGEL01@contoso.com' -UsageLocation 'US'  
Get-MsolAccountSku  
Set-MsolUserLicense -UserPrincipalName 'PROJECTRIGEL01@contoso.com' -AddLicenses $strLicense
```

For detailed instructions, see [Assign licenses to user accounts with Office 365 PowerShell](#).

For validation, you should be able to use any client to log in to this account.

[Configure a Microsoft Teams Rooms console](#)

[Manage Microsoft Teams Rooms](#)

Configure a Microsoft Teams Rooms console

12/7/2021 • 9 minutes to read • [Edit Online](#)

This article describes how to set up the Microsoft Teams Rooms console and its peripherals.

NOTE

The following steps only apply to Surface Pro-based Teams Rooms devices. For other devices, check with the Original Equipment Manufacturer (OEM) for support.

You should only perform these steps if the necessary Microsoft Teams or Skype for Business and Exchange accounts have already been created and tested as described in [Deploy Microsoft Teams Rooms](#). You will need the hardware and software described in [Microsoft Teams Rooms requirements](#). This topic contains the following sections:

- [Prepare the installation media](#)
- [Install a private CA certificate on the console](#)
- [Install Windows 10 and the Microsoft Teams Rooms console app](#)
- [Initial set up of the console](#)
- [Microsoft Teams Rooms deployment checklist](#)

NOTE

The following steps only apply to Surface Pro-based Teams Rooms devices. For other devices, check with the OEM for support.

Prepare the installation media

Installing the Microsoft Teams Rooms console app requires a USB storage device with at least 32GB of capacity. There should be no other files on the device; any existing files on the USB storage will be lost.

NOTE

Failure to create your Microsoft Teams Rooms installation media according to these instructions will likely result in unexpected behavior.

NOTE

The process below is for creating installation media to image new Microsoft Teams Rooms devices. Existing devices, by default, update automatically from Windows Update and the Windows Store.

IMPORTANT

The Windows 10 machine used to create the Microsoft Teams Rooms installation media must be on the same or later version of Windows as the target installation media.

1. Download the [CreateSrsMedia.ps1 script](#).
2. Run the CreateSrsMedia.ps1 script from an elevated prompt on a Windows 10 machine.
3. Follow the script's instructions to create a Microsoft Teams Rooms USB setup disk.

TIP

Each time the CreateSrsMedia.ps1 script starts, the screen output will include the name of a log file or transcript for the session. If there are issues with running the script, make sure to have a copy of that transcript available when requesting support.

The CreateSrsMedia.ps1 script automates the following tasks:

1. Download the latest MSI installer for Microsoft Teams Rooms.
2. Determine the build of Windows that the user must supply. The most recently released versions may or may not be tested and supported for use with Microsoft Teams Rooms devices.
3. Download necessary supporting components.
4. Assemble the needed components on the installation media.

A specific version of Windows 10 is required, and this version is only available to volume licensing customers. You can get a copy from the [Volume Licensing Service Center](#).

When finished, remove the USB disk from your computer and proceed to [Install Windows 10 and the Microsoft Teams Rooms console app](#).

Install Windows 10 and the Microsoft Teams Rooms console app

You now need to apply the setup media you've created. The target device will run as an appliance and the default user will be set to only run the Microsoft Teams Rooms console app.

1. If the target device will be installed in a dock (e.g., a Surface Pro), disconnect it from the dock.
2. Ensure the target device is not connected to the network.
3. Ensure the target device is connected to AC power.
4. Plug your USB setup disk into the target device.
5. Boot to the USB setup disk. Refer to the manufacturer instructions. If your target device is a Surface Pro, use the following steps to boot to the USB setup disk:
 - a. Press and continue to hold the volume down (-) button.
 - b. Press and release the power button.
 - c. Once Windows setup is booted, release the volume down (-) button.
6. The system will shut down once installation is complete.

After the system has shut down, it is safe to remove the USB setup disk. At this point, you can place the target device in its dock (if using a dock-based product), attach the peripherals needed for your meeting room, and connect to the network. Refer to the manufacturer instructions.

NOTE

Software updates for Microsoft Teams Rooms are automatically downloaded from the Microsoft Store for Business. See [Prerequisites for Microsoft Store for Business and Education](#) to verify that the room console will be able to access the store and self-update.

Selecting a language

In Creator's Update, you will need to use the `ApplyCurrentRegionAndLanguage.ps1` script in scenarios where implicit language selection does not provide the user with the actual application language they want (e.g., they want the console app to come up in French, but it's coming up in English).

NOTE

The following instructions work only for consoles created using Windows Creator's Update. Legacy/in-market systems that have not been set up using media with the new provisioning system will not be able to use these instructions, but should also not suffer from the initial issue that requires this manual intervention (Anniversary Edition let you pick your app language explicitly as part of setup).

To apply your desired language

1. Switch to Admin mode.
2. Select the Start menu.
3. Select the gear icon to launch the **Settings** app.
4. Select **Time & language**.
5. Select **Region & language**.
6. Select **Add a language**.
7. Select the language you wish to add.
8. Select the language you just added to the "Languages" list.
9. Select **Set as default**.
10. For any languages you wish to remove:
 - a. Select the language you wish to remove.
 - b. Select **Remove**.
11. Start an elevated command prompt.
12. Run the following command:

```
powershell -executionpolicy unrestricted c:\Rigel\x64\scripts\provisioning\scriptlaunch.ps1  
ApplyCurrentRegionAndLanguage.ps1
```

13. Restart the system.

Your desired language is now applied to the Microsoft Teams Rooms console.

Initial set up of the console

After Windows is installed, the Microsoft Teams Rooms console app will go into its initial Setup process when it

is started next or if the /reboot option was chosen.

1. The User Account screen appears. Enter the Skype sign-in address (in user@domain format) of the room account to be used with the console.
2. Enter the password for the room account, and re-enter it to verify.
3. Under "Configure Domain," set the FQDN for the Skype for Business Server. If the Skype for Business SIP domain is different from the Exchange domain of the user, enter the Exchange domain in this field.
4. Click **Next**.
5. Select the indicated devices on the Features screen and click **Next**. The default is to have Auto Screen sharing set to On and Hide meeting names set to Off. The devices to select are:
 - Microphone for Conferencing: the default microphone for this conference room.
 - Speaker for Conferencing: the default speaker for conferencing.
 - Default Speaker: the speaker used for audio from the HDMI ingest.

Each item has a drop-down menu of options to select from. You must make a selection for each device.

6. Click **Finish**.

The Microsoft Teams Rooms console app should immediately start signing in to Skype for Business Server with the credentials entered above, and should also begin syncing its calendar with Exchange using those same credentials. For details on using the console app, refer to the [Microsoft Teams Rooms help](#).

IMPORTANT

Microsoft Teams Rooms relies on the presence of certified console hardware. Even a correctly created image containing the Microsoft Teams Rooms console app will not boot past the initial setup procedure unless the console hardware is detected. For Surface Pro based solutions, the Surface Pro must be connected to its accompanying dock hardware to pass this check.

NOTE

Some non-English language users may need a physical keyboard connected to the console during initial setup in the event that symbols are not supported on the touch keyboard.

Install a private CA certificate on the console

The Microsoft Teams Rooms console needs to trust the certificates used by the servers it connects to. For O365 this is done automatically, since these servers are using public Certificate Authorities and these are automatically trusted by Windows 10. In a case where the Certificate Authority is private, for instance an on-premises deployment with Active Directory and the Windows Certificate Authority, you can add the certificate to the Microsoft Teams Rooms console in a couple of ways:

- You can join the console to Active Directory and that will automatically add the required certificates given the Certificate Authority is published to Active Directory (normal deployment option).
- You can install the certificate manually after the imaging process. Before you do this, you must complete [Initial set up of the console](#).

To manually install the certificate

1. Download the CA certificate to your computer and save it to "C:\Skype Room

Systems\x64\Scripts\Provisioning\CAcertificate.cer".

2. Place the console in admin mode (see [Admin mode and device management](#)).
3. Run the following command:

```
certutil -addstore -f -enterprise root "C:\Skype Room  
Systems\x64\Scripts\Provisioning\CAcertificate.cer"
```

Join an Active Directory domain (Optional)

You can join Microsoft Teams Rooms consoles to your domain. Microsoft Teams Rooms consoles should be placed in a separate OU from your PC workstations because many workstation policies are not compatible with Microsoft Teams Rooms. A common example are password enforcement policies that will prevent Microsoft Teams Rooms from starting up automatically. For information about the management of GPO settings, refer to [Manage Microsoft Teams Rooms](#).

To join Microsoft Teams Rooms to a domain

1. Sign into the console from the admin account (see [Admin mode and device management](#)).
2. Launch elevated Powershell command prompt.
3. Enter the following command in Powershell:

```
Add-Computer -DomainName <Fully qualified domain> -OUPath "OU=<Child OU>, ... ,OU=<Top level OU>,DC=  
<child domain>,...,DC=<top level domain>"
```

For example, if your fully qualified domain is redmond.corp.microsoft.com and you want your Microsoft Teams Rooms consoles to be in a "Microsoft Teams Rooms" OU that is a child of a "Resources" OU, the command will be:

```
Add-Computer -DomainName redmond.corp.microsoft.com -OUPath  
"OU=Microsoft_Teams_Rooms,OU=Resources,DC=redmond,DC=corp,DC=microsoft,DC=com"
```

If you would like to rename the computer when joining it to a domain, use the -NewName flag followed by the computer's new name.

Microsoft Teams Rooms deployment checklist

Use the following checklist while doing a final verification that the console and all its peripherals are fully configured:

Application settings

COMPLETED	CHECK
<input type="checkbox"/>	Room account name and phone # (if PSTN enabled) are correctly displayed in top right of console screen
<input type="checkbox"/>	Windows computer name is set correctly (useful for remote administration)
<input type="checkbox"/>	Administrator account password set and verified

COMPLETED	CHECK
<input type="checkbox"/>	All firmware updates have been applied

Audio/video peripherals

COMPLETED	CHECK
<input type="checkbox"/>	Camera peripheral firmware version is correct (if applicable)
<input type="checkbox"/>	Camera functional and positioned optimally
<input type="checkbox"/>	Settings for Playback Default Device and Playback Default Communications Device set to intended audio peripheral
<input type="checkbox"/>	Settings for Recording Default Communication Device set to the intended audio peripheral
<input type="checkbox"/>	Audio peripheral firmware version is correct (if applicable)
<input type="checkbox"/>	Audio input device functional and optimally positioned
<input type="checkbox"/>	Audio output device functional and optimally positioned

Dock

COMPLETED	CHECK
<input type="checkbox"/>	Cables are secure and not pinched
<input type="checkbox"/>	Audio ingest over HDMI is functional
<input type="checkbox"/>	Video ingest over HDMI is functional
<input type="checkbox"/>	Dock can swivel freely
<input type="checkbox"/>	Display brightness is acceptable for environment

[Manage Microsoft Teams Rooms](#)

Manually update a Microsoft Teams Rooms device

12/7/2021 • 3 minutes to read • [Edit Online](#)

The Microsoft Teams Rooms app is distributed through the Microsoft Store. Updates to the app are installed from the Microsoft Store automatically during nightly maintenance; this is the recommended method to get updates. However, there are some situations where a Teams Rooms device can't receive updates from the Microsoft Store. For example, security policies may not allow devices to connect to the Internet or may not allow apps to be downloaded from the Microsoft Store. Or, you may want to update a device before performing setup, during which the Microsoft Store isn't available.

If you can't get updates from the Microsoft Store, you can use an offline app update PowerShell script to manually update your Teams Rooms devices to a newer version of the Teams Rooms app. Follow the steps in this article to manually update your Teams Rooms devices.

NOTE

This process can only update a Teams Rooms device with the Teams Rooms app already installed. It can't be used to perform a new installation. It also can't be used to downgrade the app to an older version. To perform a new installation of the Teams Rooms app, contact your device's manufacturer for media specific to it, or see [Prepare the installation media](#).

Step 1: Download the offline app update script

First, download the latest version of the offline app update script. To download the script, click <https://go.microsoft.com/fwlink/?linkid=2151817>. The script will be downloaded to the default downloads folder on your device.

Downloaded files may be marked as blocked by Windows. If you need to run the script without any interaction, you'll need to unblock the script. To unblock the script, do the following:

1. Right-click on the file in File Explorer
2. Click **Properties**
3. Select **Unblock**
4. Click **OK**

To unblock the script using PowerShell, see [Unblock-File](#).

After the offline app update script is downloaded, transfer the file to the Teams Rooms device. You can transfer a file to the device by using a USB drive or by accessing the file from a network file share while in Admin Mode on the device. Be sure to note where you save the file on the device.

Step 2: Run the script to update the Teams Rooms app

The offline app update script needs to be run from an elevated command prompt while the Skype user (the user under which the app runs) is still signed in. For more information about how to log into an admin account to use the elevated command prompt while the Skype user is still logged in, see [Switching to Admin Mode and back when the Microsoft Teams Rooms app crashes](#).

Do the following to run the script from an elevated command prompt:

1. Switch to Admin Mode
2. Click the Start icon, type **Command Prompt**, and then select **Run as administrator**

3. Run the following command where `<path to script>` includes the full path to the script and the name of the script file:

```
PowerShell -ExecutionPolicy Unrestricted "<path to script>"
```

For example, if the script file is located in `C:\Users\Admin\Downloads`, and the script file name is `MTR-Update-4.5.6.7.ps1`, run the following command:

```
PowerShell -ExecutionPolicy Unrestricted "C:\Users\Admin\Downloads\MTR-Update-4.5.6.7.ps1"
```

Allow the script to run. When it's finished, the script will reboot the Teams Rooms device.

You can also run the script by using Remote PowerShell. For more information about using Remote PowerShell with Teams Rooms devices, see [Remote Management using PowerShell](#).

Step 3: Verify the app has been updated successfully

If the script runs successfully, the device will reboot into the Teams Rooms app.

If the script encounters a problem, it will indicate what the problem is on the command line and record its output to a file. Follow any instructions that the script provides. If you need to contact Microsoft Support, make sure to include the log file along with the support request. The script will provide you with the path to the log file.

Authentication in Microsoft Teams Rooms

12/7/2021 • 5 minutes to read • [Edit Online](#)

Account management for Microsoft Teams Rooms devices is handled at the application level. The application connects to Microsoft Teams, Skype for Business, and Exchange to get resources for the room account to enable calling and meeting experiences. The device uses a dedicated resource account to allow for always-on capabilities, calling scenarios (for devices configured with a Calling Plan), and custom lockdown mechanisms implemented on these devices. This means that authentication for these devices happen in a different way than for end-user devices.

Modern authentication is recommended for all customers using Microsoft Teams Rooms with Microsoft 365 or Office 365. If you have an on-premises deployment of Exchange server or Skype for Business server, configure [hybrid modern authentication](#) with Azure Active Directory (Azure AD) to enable using modern authentication.

Modern authentication is supported on Microsoft Teams Rooms version 4.4.25.0 and later.

Modern authentication

When you use modern authentication with the Microsoft Teams Rooms application, Active Directory Authentication Library (ADAL) is used to connect to Microsoft Teams, Exchange, and Skype for Business. Microsoft Teams Rooms is a shared device and performs a nightly reboot to ensure smooth functioning and to get critical operating system, driver, firmware, and application updates. The modern authentication mechanism uses the [resource owner password credentials](#) authorization grant type in OAuth 2.0, which doesn't require any user intervention. This is one of the key differences between how modern authentication works for user accounts versus resource accounts that are used by Microsoft Teams Rooms. Because of this, Microsoft Teams Rooms resource accounts shouldn't be configured to use multi-factor authentication (MFA), smart card authentication, or client certificate-based authentication (which are all available for end users).

The other key difference between how modern authentication works on Microsoft Teams Rooms and end-user devices is that you can't use a resource account to apply device-level conditional access policies in Azure Active Directory and Endpoint Manager as device info is not passed when using this grant type. Instead, you can enroll a device in Microsoft Endpoint Manager and apply compliance policies by using the guidance provided in [Managing Teams Meeting Rooms with Intune](#).

Enable modern authentication on a Microsoft Teams Rooms device

For Microsoft Teams Rooms to use modern authentication with Skype for Business and Exchange, enable the client-side setting for modern authentication on Microsoft Teams Rooms. You can do this in the device settings or in the XML config file.

NOTE

Before you enable the client-side setting for modern authentication, make sure that your environment is set up correctly to use modern authentication.

Using device settings

1. On Microsoft Teams Rooms, go to **More (...)**.
2. Select **Settings**, and then enter the device administrator username and password.
3. Go to the **Account** tab, turn on **Modern Authentication**, and then select **Save and exit**.

Using the XML config file

In your SkypeSettings.xml file, set the modern authentication XML element to **True**, as follows.

```
<ModernAuthEnabled>True</ModernAuthEnabled>
```

To apply the setting, see [Manage a Microsoft Teams Rooms console settings remotely with an XML configuration file](#).

Prepare your environment for modern authentication

Before you begin, make sure you understand the identity models to use with Office 365 and Azure AD. You can find more information at [Office 365 identity models and Azure Active Directory](#) and at [Hybrid identity and directory synchronization for Microsoft 365 or Office 365](#).

Enable modern authentication in Microsoft 365 or Office 365

To turn on modern authentication for Exchange Online, see [Enable modern authentication in Exchange Online](#).

We recommended that you do not remove basic authentication policies for Exchange Online or disable basic authentication for your tenant until you have validated that Microsoft Teams Rooms devices can successfully sign in with Exchange Online and Teams.

For more information about disabling basic authentication in Exchange Online, see [Disable Basic authentication in Exchange Online](#).

Hybrid modern authentication

To ensure successful authentication to your on-premises Exchange server and/or Skype for Business server, you must make sure the resource account that's used with Microsoft Teams Rooms is configured to get authorization from Azure AD.

Teams Rooms authentication flows vary depending on your authentication configuration. For customers using a managed domain, Teams Rooms uses [OAuth 2.0 Resource Owner Password Credentials](#) with Azure Active Directory. However, for customers using a federated domain, [OAuth 2.0 SAML Bearer Assertion Flow](#) is used.

NOTE

Your identity provider may need specific configurations or settings for integration with Azure Active Directory or Office 365. Contact your identity provider if you need help with configuring authentication with Teams Rooms.

Prerequisites specific to Microsoft Teams Rooms

The prerequisites to enable modern authentication in your hybrid topology are covered in [Hybrid modern authentication overview and prerequisites for using it with on-premises Skype for Business and Exchange servers](#). All the prerequisites discussed in the article apply.

However, because Microsoft Teams Rooms uses [resource owner password credentials](#) authorization and the underlying REST APIs for modern authentication, the following are important differences to be aware of that are specific to Microsoft Teams Rooms.

- You must have Exchange Server 2016 CU8 or later, or Exchange Server 2019 CU1 or later.
- You must have Skype for Business Server 2015 CU5 or later, or Skype for Business Server 2019 or later.
- MFA isn't supported regardless of the topology you have.
- Microsoft Teams Rooms does not support SIP and UPN mismatch. You must create a Microsoft Teams Rooms account with the same UPN and SIP for it to work.
- If you use a third-party authentication provider that's supported by Azure AD, it must support an active

authentication flow through WS-Trust.

- Do not use device-level conditional access policies for a resource account configured with the application. Doing so will result in sign-in failures. Instead, enroll a device in Microsoft Intune and apply compliance policies by using the guidance published in [Managing Teams Meeting Rooms with Intune](#).

Configure Exchange Server

To enable hybrid modern authentication in Exchange Server, see [How to configure Exchange Server on-premises to use hybrid modern authentication](#).

Configure Skype for Business Server

To enable hybrid modern authentication with Skype for Business Server, see [How to configure Skype for Business on-premises to use hybrid modern authentication](#).

Remove or disable Skype for Business and Exchange

If your setup doesn't allow for hybrid modern authentication or you need to remove or disable hybrid modern authentication for Exchange or Skype for Business, see [Removing or disabling hybrid modern authentication from Skype for Business and Exchange](#).

Azure AD conditional access

You can configure a resource account used with Microsoft Teams Rooms for IP/location-based access. To learn more, see [Conditional Access: Block access by location](#).

No other conditional access policies are supported. For more information about device compliance, see [Managing Teams Meeting Rooms with Intune](#).

Enable Teams Room devices to join third-party meetings

12/7/2021 • 4 minutes to read • [Edit Online](#)

Microsoft Teams Rooms devices support a one-touch experience for joining third-party online meetings, also referred to as Direct guest join. When enabled, you can use a Teams Rooms device to join meetings hosted on Cisco WebEx and Zoom just as easily as you can join meetings hosted in Microsoft Teams.

Before you can join third-party meetings from a Teams Rooms device, you need to do the following:

1. Configure the Teams Rooms device's Exchange Online room mailbox to process invites for third-party meetings.
2. Make sure your organization doesn't have any policies that would prevent you from connecting to third-party meeting services.
3. Configure your Teams Rooms devices to allow third-party meetings.

The following sections show you how to do each of these steps.

Step 1: Allow calendar invite processing for third-party meetings

The first thing you need to do to enable a one-touch join experience from a Team Rooms device is set the calendar processing rules for the device's Exchange Online room mailbox. The room mailbox needs to allow external meetings and keep the message body and subject so it can see the URL needed to join the third-party meeting. To set these room mailbox options using the [Set-CalendarProcessing](#) cmdlet, do the following:

1. Connect to Exchange Online PowerShell. For more information, see [Connect to Exchange Online PowerShell with Basic authentication](#) or [Connect to Exchange Online PowerShell using multi-factor authentication](#), depending on your authentication method.
2. Get the User Principal Name (UPN) of the room mailbox if you don't know it by running the following command:

```
Get-Mailbox | Where {$_.RoomMailboxAccountEnabled -eq $True} | Format-Table Name, UserPrincipalName
```

3. Find the name of the room mailbox associated with your Teams Rooms device and make note of its UPN.
4. After you find the room mailbox's UPN, run the following command. Replace `<UserPrincipalName>` with the room mailbox's UPN:

```
Set-CalendarProcessing <UserPrincipalName> -ProcessExternalMeetingMessages $True -DeleteComments $False -DeleteSubject $False
```

Learn more about [Exchange Online PowerShell](#).

Step 2: Configure Office 365 Threat Protection and link rewrite

To enable the one-touch join experience, meeting join link information from the third-party meeting needs to be present and readable in the meeting invite. If your organization uses the [Office 365 Advanced Threat Protection Safe Links](#) feature, or if you use a third-party solution that scans all incoming and outgoing URLs for threats, it may change the meeting join URLs and make the meeting unrecognizable by the Teams Rooms device. To make

sure this doesn't happen, you need to add the third-party meeting service's URLs to the ATP Safe Links "do not rewrite" list or the third-party URL rewrite exception list.

To add third-party meeting service URLs to the ATP Safe Links "do not rewrite" list, follow the steps in [Set up a custom do-not-rewrite URLs list using ATP Safe Links](#). If you use a third-party solution, refer to the instructions for that solution to add URLs to its URL rewrite exception list.

Here are some example entries that you may need to add to your ATP Safe Links "do not rewrite" list or third-party URL rewrite exception list:

- **Cisco WebEx** *.webex.com*
- **Zoom** *.zoom.us*, *.zoom.com*, *.zoomgov.com*

For a complete list of URLs to add to your ATP Safe Links "do not rewrite" list or third-party URL rewrite exception list, contact the third-party meeting service provider you want to accept meeting invites from.

Caution

Only add URLs that you trust to your ATP Safe Links "do not rewrite" list or third-party URL rewrite exception list.

Step 3: Enable third-party meetings on device

The last step you need to do is allow each Teams Rooms device to join third-party meetings. Third-party meetings require a username and email address to join them. If the username and email address that you need to use is different than the device's room mailbox, you need to add them to your device. You can do this in the device settings or in the XML config file.

Use device settings

To configure the Teams Rooms device using its touchscreen, do the following:

1. On the Microsoft Teams Rooms device, select **More**
2. Select **Settings**, and then enter the device administrator username and password.
3. Go to the **Meetings** tab and select **Cisco WebEx**, **Zoom**, or both.
4. If you want to join meetings with the username and email address associated with the room mailbox, select **Join with room info**.
5. If you want to join meetings with an alternate username and email address, select **Join with custom info** and enter username and email address you'd like to use.
6. Select **Save and exit**. Your device will restart.

Use the SkypeSettings.xml configuration file

The following settings can be added to the `SkypeSettings.xml` file located in `C:\Users\Skype\AppData\Local\Packages\Microsoft.SkypeRoomSystem_8wekyb3d8bbwe\LocalState`. For more information about the `SkypeSettings.xml` file, see [Manage a Microsoft Teams Rooms console settings remotely with an XML configuration file](#).

To enable Cisco WebEx meetings, set the `WebExMeetingsEnabled` XML element to **True**, as follows.

```
<WebExMeetingsEnabled>True</WebExMeetingsEnabled>
```

To enable Zoom meetings, set the `ZoomMeetingsEnabled` XML element to **True**, as follows.

```
<ZoomMeetingsEnabled>True</ZoomMeetingsEnabled>
```

You can optionally specify a custom username and email address to join third-party meetings using the

following XML elements. If the values you provide aren't valid, the Teams Rooms device will default to use room mailbox username and email address.

```
<UseCustomInfoForThirdPartyMeetings>true</UseCustomInfoForThirdPartyMeetings>  
  
<CustomDisplayNameForThirdPartyMeetings>guestname</CustomDisplayNameForThirdPartyMeetings>  
  
<CustomDisplayEmailForThirdPartyMeetings>guest@contoso.com</CustomDisplayEmailForThirdPartyMeetings>
```

NOTE

To join a Cisco WebEx meeting from a Teams Rooms device, the Cisco meeting needs to be hosted in WebEx Meetings Pro using Cisco WebEx web application version WBS 40.7 or later.

Deploy Microsoft Teams Rooms by using Microsoft Endpoint Configuration Manager

12/7/2021 • 27 minutes to read • [Edit Online](#)

This article gives you all the necessary information to create your Microsoft Teams Rooms deployments by using Microsoft Endpoint Configuration Manager.

With the easy-to-use methods provided by Configuration Manager, you can deploy the operating system and other applications to multiple target devices.

Use the approach illustrated below to guide you through your Configuration Manager configuration, and customize the sample packages and scripts provided throughout this guidance as needed for your organization.

IMPORTANT

This solution has only been tested with Surface Pro–based deployments. Follow the manufacturer's guidelines for configurations that aren't based on Surface Pro.

Validate prerequisites

To deploy Microsoft Teams Rooms with Configuration Manager, ensure that you meet the following prerequisites and requirements.

Microsoft Endpoint Configuration Manager requirements

- Microsoft Endpoint Configuration Manager version must be at least 1706 or above. We recommend using 1710 or later. Check out [Support for Windows 10 in Configuration Manager](#) to learn about the Windows 10 versions that Configuration Manager supports.
- A supported version of Windows Assessment and Deployment Kit (ADK) for Windows 10 must be installed. See the versions of the [Windows 10 ADK](#) that you can use with different versions of Configuration Manager, and ensure that your deployment includes the correct version.
- The site system servers must have been assigned the distribution point role, and the boot images should be enabled for [preboot execution environment \(PXE\) support](#) to enable network-initiated deployments. If PXE support isn't enabled, you can use [bootable media](#) for your deployments.
- A network access account must be configured to support new computer (bare metal) deployment scenarios. To learn more about the configuration of a network access account, see [Accounts used in Configuration Manager](#).
- We recommend that you enable [multicast support](#), if you're likely to deploy the same Microsoft Teams Rooms image to multiple units at the same time.

Networking requirements

- Your network should have a Dynamic Host Configuration Protocol (DHCP) server, configured for automatic IP address distribution to the subnets where Microsoft Teams Rooms units will be deployed.

NOTE

DHCP lease duration must be set to a value longer than the image deployment duration. Otherwise, the deployment might fail.

- Your network, including switches and virtual LANs (VLANs), should be configured to support PXE. Refer to your network vendor for more information about IP Helper and PXE configuration. Alternatively, you can use [bootable media](#) for your deployments, if PXE support isn't enabled.

NOTE

For Surface Pro devices, booting from the network (PXE boot) is only supported when you use an Ethernet adapter or docking station from Microsoft. Third-party Ethernet adapters don't support PXE boot with Surface Pro. See [Ethernet adapters and Surface deployment](#) for more information.

Configure Microsoft Endpoint Configuration Manager for operating system deployment

This article assumes you already have a healthy Configuration Manager deployment, and doesn't detail all the steps required to deploy and configure Configuration Manager from scratch. The [documentation and the configuration guidance](#) on the Microsoft Endpoint Configuration Manager is a great resource; we recommend you start with these resources if you haven't yet deployed Configuration Manager.

Use the following instructions to verify that the operating system deployment (OSD) features are configured properly.

Validate and upgrade Configuration Manager

1. In the Configuration Manager console, go to **Administration > Updates and Servicing**.
2. Check the installed build and applicable updates that haven't been installed yet.
3. Review [Support for Windows 10 in Configuration Manager](#); if you need to upgrade your deployment, select the update you want to install, and then select **Download**.
4. After the download is complete, select the update, and then select **Install Update Pack**.

Configure distribution points to support PXE and multicast

1. In the Configuration Manager console, go to **Administration > Distribution Points**.
2. Select the distribution point server that will serve the Microsoft Teams Rooms deployment, and then select **Properties**.
3. Select the **PXE** tab, and ensure that the following settings are enabled:
 - Enable PXE support for clients
 - Allow this distribution point to respond to incoming PXE requests
 - Enable unknown computer support
4. *Optional:* To enable multicast support, select the **Multicast** tab, and ensure that the following settings are enabled:
 - Enable multicast to simultaneously send data to multiple clients

- Configure the UDP port range as per your network team's recommendation

Configure the Network Access Account

1. In the Configuration Manager console, go to **Administration > Site Configuration > Sites**, and then select the site.
2. In the **Settings** group, select **Configure Site Components > Software Distribution**.
3. Select the **Network Access Account** tab. Set up one or more accounts, and then select **OK**.

NOTE

The accounts don't need any special rights, except for the **Access this computer from the network** right on the distribution point server. A generic domain user account will be appropriate. For more information, see [Accounts used in Configuration Manager](#).

Configure a boot image

1. In the Configuration Manager console, go to **Software Library > Operating System > Boot Images**.
2. Select **Boot image (x64)**, and then select **Properties**.
3. Select the **Data Source** tab, and enable **Deploy this boot image from the PXE-enabled distribution point**.
4. Select the **Optional Components** tab to install required components:
 - a. Select the star icon, and search for **HTML (WinPE-HTA)**
 - b. Select **OK** to add HTML application support in to the boot image.
5. *Optional:* To customize the deployment experience, select the **Customization** tab.
 - Enable **command support (testing only)** if you want to have access to a command prompt during the deployment. When this is enabled, you can start a command prompt by selecting **F8** at any time during the deployment.
 - You can also specify a custom background image to be displayed during the deployment. To set an image, enable **Specify the custom background image file (UNC path)** and select your background.
6. When asked, select **Yes** and distribute the updated boot image to your distribution points.

For more information, see [Manage boot images with Configuration Manager](#).

NOTE

You can create a bootable USB media to initiate Configuration Manager task sequence-based deployments for environments that have no PXE support. The bootable media contains only the boot image, optional prestart commands and their required files, and Configuration Manager binaries to support booting into Windows PE and connecting to Configuration Manager for the rest of the deployment process. For more information, see [Create bootable media](#).

Create Configuration Manager packages

IMPORTANT

The required operating system version for each SRS installer version changes with every MSI release. To determine the best operating system version for a given MSI, run the console setup script once. To learn more, see [Deploy Microsoft Teams Rooms by using Microsoft Endpoint Configuration Manager](#).

Configuration Manager requires a number of packages to deploy and configure the Microsoft Teams Rooms units.

You need to create and configure the following packages, and then distribute them to the Configuration Manager site systems that have been assigned the distribution point server role.

PACKAGE NAME	TYPE	DESCRIPTION
SRS v2 - SRS Application Package	Software package	Package for the Microsoft Teams Rooms deployment kit
SRS v2 - Sysprep Package	Software package	Package for the custom Unattended.xml to configure Microsoft Teams Rooms units
SRS v2 - Set-SRSCoordinateName Package	Software package	Package for the HTML application (HTA) to assign a computer name during the deployment
SRS v2 - Configure SRS Setup	Software package	Package to configure deployment of the Microsoft Teams Rooms app
SRS v2 - OS Updates Package	Software package	Package to deploy mandatory operating system updates
SRS v2 - Root Certificate Package	Software package	Optional - Package to deploy the root certificate (not required for domain-joined units)
SRS v2 - Microsoft Monitoring Agent Package	Software package	Optional - Package to deploy and configure the Microsoft Operations Management Suite agent
SRS v2 - WinPE Background Package	Software package	Package for the custom background image to use with boot images
Windows 10 Enterprise	Operating system image	Package for the operating system installation file (install.wim)
Surface Pro	Driver package	Package for the device drivers and firmware for Microsoft Surface Pro
Surface Pro 4	Driver package	Package for the device drivers and firmware for Microsoft Surface Pro 4

For more information, see [Packages and programs in Configuration Manager](#).

Create folders for the package source files

Configuration Manager requires package source files to be organized in a specific folder structure when they're first created and when they're updated.

Create the following folder structure on the Microsoft Endpoint Configuration Manager central administration site or primary site, or on a server share you're using to host package source files:

- SRS v2 - Microsoft Monitoring Agent Package
- SRS v2 - OS Updates Package
- SRS v2 - Root Certificate Package
- SRS v2 - Set-SRSComputerName Package
- SRS v2 - SRS Application Package
- SRS v2 - Configure SRS Setup
- SRS v2 - Sysprep Package
- Drivers
 - Surface Pro
 - Surface Pro 4
- Operating Systems
 - Windows 10 Enterprise

TIP

You may also [download](#) and use the zip file that includes the folder structure for the packages, the scripts that you need to use, and the task sequence template, that you need to import.

Create the Monitoring agent package

1. Download the Monitoring agent from <https://go.microsoft.com/fwlink/?LinkId=828603>.
2. Extract the package into the **SRS v2 - Microsoft Monitoring Agent Package** folder by opening a Command Prompt window and entering **MMASetup-AMD64.exe /C:** at the command prompt.
3. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
4. Enter the following information to create the package:
 - Name: **SRS v2 - Microsoft Monitoring Agent Package**
 - Manufacturer: **Microsoft Corporation**
 - Version: **8.1.11081.0** (enter the version of the downloaded installation file)
 - Select the **This package contains source files** check box, enter the path to the **SRS v2 - Microsoft Monitoring Agent Package** folder, and then select **Next**.
5. Select **Do not create a program**, and then select **Next**.
6. Review the **Confirm the settings** page, and then select **Next**.
7. Select **Close**.

Create the operating system updates package

1. In the **SRS v2 - OS Updates Package** folder, create a new PowerShell script named **Install-SRSv2-OS-Updates.ps1**.
2. Copy the script below into the **Install-SRSv2-OS-Updates.ps1** script. Alternatively, you can download the **Install-SRSv2-OS-Updates.ps1** script from [here](#).

```
# Install-SRSv2-OS-Updates.ps1
$strPath = split-path -parent $MyInvocation.MyCommand.Definition
$total = gci $strPath *.msu | measure | Select-Object -expand Count
$i = 0
gci $strPath *.msu | ForEach-Object {
    $i++
    WUSA "$_.FullName /quiet /norestart"
    Write-Progress -activity "Applying Mandatory Updates" -status "Installing
    $_ .. $i of $total" -percentComplete (($i / $total) * 100)
    Wait-Process -name wusa
}
```

3. Download the mandatory Windows Update packages into the same folder.

NOTE

At the time this article was published, only [KB4056892](#) was required. Check [Configure a Microsoft Teams Rooms console](#), to see whether any other updates are required.

4. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
5. Enter the following information to create the package:
 - Name: **SRS v2 – OS Updates Package**
 - Manufacturer: **Microsoft Corporation**
 - Version: **1.0.0**
 - Select the **This package contains source files** check box, enter the path to the **SRS v2 – OS Updates Package** folder, and then select **Next**.
6. Select **Do not create a program**, and then select **Next**.
7. Review the **Confirm the settings** page, and then select **Next**.
8. Select **Close**.

Create the root certificate package (optional)

You create this package to distribute the root certificate for devices that won't be joined to an Active Directory domain. Create this package only if both the following conditions apply:

- Your deployment includes on-premises Lync or Skype for Business Server.
 - Microsoft Teams Rooms units are configured to work in a workgroup instead of a domain member.
1. Copy the root certificate into the **SRS v2 – Root Certificate Package** folder.
 2. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
 3. Enter the following information to create the package:
 - Name: **SRS v2 – Root Certificate Package**
 - Manufacturer: *Your organization's name*
 - Version: **1.0.0**
 - Select the **This package contains source files** check box, enter the path to the **SRS v2 – Root Certificate Package** folder, and then select **Next**.
 4. Select **Do not create a program**, and then select **Next**.
 5. Review the **Confirm the settings** page, and then select **Next**.

6. Select **Close**.

Create the Microsoft Teams Rooms deployment kit package

1. Download the latest version of the **Microsoft Teams Rooms deployment kit** from <https://go.microsoft.com/fwlink/?linkid=851168>, and install it to a workstation.
2. Copy the content from C:\Program Files (x86)\Skype Room System Deployment Kit to the **SRS v2 - SRS Application Package** folder.
3. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
4. Enter the following information to create the package:
 - Name: **SRS v2 – SRS Application Package**
 - Manufacturer: **Microsoft Corporation**
 - Version: **3.1.104.0** (enter the version of the downloaded installation file)
 - Select the **This package contains source files** check box, enter the path to the **SRS v2 – SRS Application Package** folder, and then select **Next**.
5. Select **Do not create a program**, and then select **Next**.
6. Review the **Confirm the settings** page, and then select **Next**.
7. Select **Close**.

Create the computer name assignment package

1. In the **SRS v2 - Set-SRSComputerName Package** folder, create a new HTML application named **Set-SRSComputerName.hta**.
2. Copy the following script into the **Set-SRSComputerName.hta** file. Alternatively, you can download the **Set-SRSComputerName.hta** file from [here](#).

```
<!DOCTYPE HTML>
<html>
<head>
<title>Set SRS Computer Name</title>
<HTA:APPLICATION
  APPLICATIONNAME="Set SRS Computer Name"
  ID="SetSRSComputerName"
  VERSION="1.0"
  SCROLL="no"
  SINGLEINSTANCE="yes"
  WINDOWSTATE="maximize"
  MaximizeButton="no"
  MinimizeButton="no"
  SysMenu="no"
  ShowInTaskbar="no"
  Caption="no"
/>
<style type="text/css">
body {
  background-color: #fdfeff;
  color: darkblue;
  font-family: Calibri;
  font-size: 12pt;
  margin: 4em 3em;
}
</style>
</head>
<script language="VBScript">
Public strNewComputerName
Sub GenerateComputerName()
```

```

        strComputer = "."
        Set objWMIService = GetObject("winmgmts:\\." & strComputer & "\root\cimv2")
        Set colItems = objWMIService.ExecQuery("Select * from Win32_BIOS",,48)
        For Each objItem in colItems
            strSerialNumber = objItem.SerialNumber
        Next
        strNewComputerName = "SRS-" & right(replace(strSerialNumber, "-", ""), 10)
        TextArea1.innerHTML = "The serial number of the device: " & strSerialNumber
        strHTMLText = strHTMLText & "<br> Computer name to be assigned: <font color = red>" &
strNewComputerName & "</font>"
        strHTMLText = strHTMLText & "<br><br> Click Accept to use this as the computer name and continue
deployment, or Change to set a new name."
        strHTMLText = strHTMLText & "<p><input type=""button"" value=""Accept"" name = ""Accept_Button""
onclick=""SetComputerName"" />"
        strHTMLText = strHTMLText & " <input type=""button"" value=""Change"" name = ""Change_Button""
onclick=""ChangeComputerName"" />"
        TextArea2.innerHTML = strHTMLText
    End Sub

Sub SetComputerName()
    dim result
    result = MsgBox("Computer Name to be assigned: " & strNewComputerName & vbcrLf & "Are you sure you
want to continue?", 36)
    If (result = vbYes) then
        SET env = CreateObject("Microsoft.SMS.TSEnvironment")
        env("OSDComputerName") = strNewComputerName
        self.close
    elseif (result = vbNo) then
        Window_OnLoad
    End If
End Sub

Sub UpdateComputerName()
    strNewComputerName = newcomputername.value
    if len(trim(strNewComputerName)) = 0 then
        MsgBox "Computer name cannot be empty." & vbcrLf & "Update and try again.",16
        exit sub
    end if
    SetComputerName
End Sub

Sub ChangeComputerName()
    TextArea2.innerHTML = "<p>Type the new computer name and click Accept: <input type=""text""
name=""newcomputername"" value = " & strNewComputerName & " />"
    TextArea2.innerHTML = TextArea2.innerHTML & "<br><input type=""button"" value=""Update"" name =
""Update_Button"" onclick=""UpdateComputerName"" />"
End Sub

Sub Window_OnLoad
    Set oTSProgressUI = CreateObject("Microsoft.SMS.TsProgressUI")
    oTSProgressUI.CloseProgressDialog
    GenerateComputerName
End Sub
</script>

<body>
<span id = "TextArea1"></span>
<span id = "TextArea2">
</span>
</body>
</html>

```

3. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
4. Enter the following information to create the package:

- Name: **SRS v2 - Set-SRSComputerName Package**
- Manufacturer: **Microsoft Corporation**
- Version: **1.0.0**
- Select the **This package contains source files** check box, enter the path to the **SRS v2 - Set-SRSComputerName Package** folder, and then select **Next**.

5. Select **Do not create a program**, and then select **Next**.

6. Review the **Confirm the settings** page, and then select **Next**.

7. Select **Close**.

Create the Sysprep package

1. In the **SRS v2 – Sysprep Package** folder, create a new XML file named **Unattend.xml** .
2. Copy the following text into the **Unattend.xml** file. Alternatively, you can download the Unattend.xml file from [here](#).

```

<?xml version="1.0" encoding="utf-8"?>
<unattend xmlns="urn:schemas-microsoft-com:unattend">
<settings pass="specialize">
    <component name="Microsoft-Windows-Embedded-BootExp" processorArchitecture="amd64"

                        <Value>cwBmAGIAUABhAHMAcwB3AG8AcgBkAA==</Value>
                        <PlainText>>false</PlainText>
                    </Password>
                    <Name>Admin</Name>
                    <Group>Administrators</Group>
                    <DisplayName>Administrator</DisplayName>
                    <Description>Administrator</Description>
                </LocalAccount>
            </LocalAccounts>
        </UserAccounts>
    </component>
</settings>
<cpu:offlineImage cpi:source="wim:h:/install.wim#Windows 10 Enterprise" xmlns:cpi="urn:schemas-
microsoft-com:cpi" />
</unattend>

```

3. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
4. Enter the following information to create the package:
 - Name: SRS v2 - Sysprep Package

- Manufacturer: **Microsoft Corporation**
 - Version: **1.0.0**
 - Select the **This package contains source files** check box, enter the path to the **SRS v2 – Sysprep Package** folder, and then select **Next**.
5. Select **Do not create a program**, and then select **Next**.
 6. Review the **Confirm the settings** page, and then select **Next**.
 7. Select **Close**.

Create the Windows 10 Enterprise package

1. Obtain a Windows 10 Enterprise x64 media, and copy the **install.wim** file to the **Operating Systems\Windows 10 Enterprise** folder.
2. In the Configuration Manager console, go to **Software Library > Operating Systems > Operating System Images**, and then select **Add Operating System Image**.
3. Specify the path to the **install.wim** file you just copied, and then select **Next**.
4. Update the **Version** field to match the build number of the Windows 10 Enterprise image, and then select **Next**.
5. Review the **Details** page, and then select **Next**.
6. Select **Close**.

For more information, see [Manage OS images with Configuration Manager](#).

Create Surface Pro device driver packages

Microsoft Teams Rooms is supported for both Surface Pro and Surface Pro 4. You need to create a driver package for each Surface Pro model you have in your environment.

IMPORTANT

The drivers must be compatible with the Windows 10 Enterprise build and the Microsoft Teams Rooms deployment kit version. For more information, see [Download the latest firmware and drivers for Surface devices](#) and [Configure a console](#).

1. Download the latest drivers and firmware.
 - For Surface Pro: <https://www.microsoft.com/download/details.aspx?id=55484>
 - For Surface Pro 4: <https://www.microsoft.com/download/details.aspx?id=49498>
2. Extract the downloaded driver and firmware. Open a Command Prompt window and at the command prompt, enter one of the following commands:
 - `msiexec /a C:\SurfacePro_Win10.msi /passive TARGETDIR="C:_Sources\Drivers\Surface Pro"`
 - `msiexec /a C:\SurfacePro4_Win10.msi /passive TARGETDIR="C:_Sources\Drivers\Surface Pro 4"`
3. In the Configuration Manager console, go to **Software Library > Operating Systems > Drivers**, and then select **Import Driver**.
4. Select **Import all drivers in the following network path (UNC)**, select the source folder (for example, **C:_Sources\Drivers\Surface Pro**), and then select **Next**.
5. On the **Specify the details for the imported drivers** page, select all the listed drivers, and then select **Enable these drivers and allow computers to install them**.
6. Select **Categories**, create a new category that matches the Surface model, select **OK**, and then select **Next**.

7. Select **New Package**.
8. Specify the package name that matches the Surface Pro model, enter a folder path to store the driver package files in, select **OK**, and then select **Next**.
9. On the **boot images** page, ensure that no boot images are selected, and then select **Next**.
10. Select **Close**.
11. Go to **Software Library > Operating Systems > Drivers**, select **Folder > Create Folder**, and enter a folder name that matches the Surface Pro model that you just imported the drivers for.
12. Move all the imported drivers to the newly created folder for easier navigation and operation.

NOTE

Repeat the same steps for other Surface Pro models you might have. For more information, see [Manage drivers in Configuration Manager](#).

Create Microsoft Teams Rooms Configuration Package

1. In the Configuration Manager console, go to **Software Library > Application Management > Packages**, and then select **Create Package**.
2. Enter the following information to create the package:
 - Name: **SRS v2 - Configure SRS Setup Package**
 - Manufacturer: **Microsoft Corporation**
 - Version: **1.0.0**
 - Select the **This package contains source files** check box, enter the path to the **SRS v2 - Configure SRS Setup** folder, and then select **Next**.
3. Select **Do not create a program**, and then select **Next**.
4. Review the **Confirm the settings** page, and then select **Next**.
5. Select **Close**.

Distribute Configuration Manager packages

All the packages must be distributed to the servers that have been assigned the distribution point role in the Configuration Manager hierarchy. Follow the instructions below to initiate package distribution.

1. Distribute software packages.
 - a. In the Configuration Manager console, go to **Software Library > Application Management > Packages**. Select all the software packages you want to distribute, and then select **Distribute Content**.
 - b. Review the list of packages, and then select **Next**.
 - c. Add all the distribution point servers (or distribution point groups, depending on your Configuration Manager hierarchy) to the list, and then select **Next**.
 - d. Select **Next**, and then select **Close**.
2. Distribute driver packages.
 - a. In the Configuration Manager console, go to **Software Library > Operating Systems > Driver**

Packages. Select all the driver packages you want to distribute, and then select **Distribute Content**.

- b. Review the list of packages, and then select **Next**.
 - c. Add all the distribution point servers (or distribution point groups, depending on your Configuration Manager hierarchy) to the list, and then select **Next**.
 - d. Select **Next**, and then select **Close**.
3. Distribute operating system packages.
- a. In the Configuration Manager console, go to **Software Library > Operating Systems > Operating System Images**. Select all the operating system images you want to distribute, and then select **Distribute Content**.
 - b. Review the list of packages, and then select **Next**.
 - c. Add all the distribution point servers (or distribution point groups, depending on your Configuration Manager hierarchy) to the list, and then select **Next**.
 - d. Select **Next**, and then select **Close**.

NOTE

Package distribution might take some time, depending on the package size, Configuration Manager hierarchy, number of distribution point servers, and the bandwidth available in your network.

All the packages must be distributed before you can start deploying a Microsoft Teams Rooms unit.

You can review the status of your package distribution in the Configuration Manager console by going to **Monitoring > Distribution Status > Content Status**.

Configuration Manager task sequences

You use task sequences with Configuration Manager to automate the steps for deploying an operating system image to a destination computer. To deploy a Microsoft Teams Rooms unit in an automated fashion, you create a task sequence that references the boot image used to start the destination Microsoft Teams Rooms computer, the Windows 10 Enterprise operating system image that you want to install, and any other additional content, such as other applications or software updates.

Import the sample task sequence

You can download and easily import a sample task sequence and customize it to meet your needs.

1. **Download** the sample task sequence, and copy the downloaded zip file to a shared location.
2. In the Configuration Manager console, go to **Software Library > Operating Systems > Task Sequences**, and then select **Import Task Sequence**.
3. Select **Browse**, go to the shared folder location you used in step 1, select the **Microsoft Teams Rooms Deployment (EN-US).zip** file, and then select **Next**.
4. Set **Action** to **Create New**, and then select **Next**.
5. Confirm the settings, and then select **Next**.
6. Select **Close**.

Validate that the reference packages are correctly linked to each task sequence step.

1. Select the imported task sequence, and then select **Edit**.

The Task Sequence Editor opens and displays each sequential step that you need to deploy and configure a Microsoft Teams Rooms unit.

2. Walk through each step and complete the recommended updates:

- a. **Restart in Windows PE:** This step restarts and then boots the computer into Windows PXE. No changes are required for this step.
- b. **Partition Disk 0 – UEFI:** This step wipes the disk configuration and creates partitions based on the configured settings. We recommend that you not make any changes to this step.
- c. **Set SRS Computer Name:** This step includes an HTML application to provide a UI to set a computer name for the Microsoft Teams Rooms unit during the deployment.
 - This is an optional step, but it can only be disabled if you want to manage computer naming through an alternate process.
 - Verify that the **SRS v2 – Set-SRSComputerName** package is selected. If it isn't, browse to the package and select it.
- d. **Apply Operating System:** This step specifies the operating system image to be deployed and the unattended Sysprep answer file to use.
 - Verify that the correct Windows 10 Enterprise operating system image file is selected.
 - Verify that **Use an unattended or Sysprep answer file for a custom installation** is enabled, and the **SRS v2 – Sysprep Package** is selected. Also ensure that **File Name** is set to **unattend.xml**.
- e. **Apply Windows Settings:** This step gathers information about the Windows installation.
 - Provide licensing and registration information including the product key, local administrator account password, and time zone (depending on your needs).
- f. **Apply Network Settings:** This step allows you to specify a workgroup or Active Directory domain name and organizational unit.

NOTE

See [Skype Room System domain joining considerations](#) for recommended actions you need to take in deploying Microsoft Teams Rooms units as members of an Active Directory domain.

- g. **Apply Drivers:** This step and its sub-steps are used to deploy applicable device drivers and firmware based on the Surface Pro model you have. Update each step to specify the relevant driver package associated with this deployment.
 - Each driver package is configured to leverage Windows Management Instrumentation (WMI) filters to deploy relevant drivers and firmware based on the Surface Pro make and model.
 - We highly recommend that you not alter the configuration of these drivers, otherwise deployment might fail.
- h. **Set up Windows and Configuration Manager:** This step deploys and configures the Configuration Manager client. Update this step to specify the built-in Configuration Manager Client Package.
- i. **Install Root Certificate:** This step distributes the root certificate for non-domain-joined devices, and therefore is optional and disabled by default.
 - Enable this step if you need to deploy a root certificate to the Microsoft Teams Rooms units.
 - If you do need to perform this step, verify that the **SRS v2 – Root Certificate Package** and **Disable 64-bit file system redirection** are selected.

j. **Install and Configure Monitoring Agent:** This step installs the 64-bit version of the Microsoft Azure Monitor agent and configures the agent to connect to your Log Analytics workspace.

- This step is disabled by default. Enable this step only if you're going to use the Monitoring Agent to monitor the health of your Microsoft Teams Rooms units.
- Edit this step and update the command-line parameters to specify your **Workspace ID** and **Workspace Key**.
- See [Configure test devices for Azure Monitoring](#) for more information about obtaining the Operations Management Suite Workspace ID and the primary key.
- Verify that the **SRS v2 – Microsoft Monitoring Agent Package** and **Disable 64-bit file system redirection** are selected.
- For more information about monitoring the health of your Microsoft Teams Rooms deployment, see [Plan Microsoft Teams Rooms management with Azure Monitor](#), [Deploy Microsoft Teams Rooms management with Azure Monitor](#) and [Manage Microsoft Teams Rooms devices with Azure Monitor](#).

k. **Copy SRS v2 Configuration Files:** This step copies the required setup and configuration files from the Microsoft Teams Rooms deployment kit to the local hard drive. No customization is required for this step.

- Verify that the **SRS v2 – SRS Application Package** and **Disable 64-bit file system redirection** are selected.

l. **Install-SRSv2-OS-Updates:** This step deploys any mandatory operating system updates required with the Microsoft Teams Rooms deployment. Do the following:

- Check [Configure a Microsoft Teams Rooms console](#) to see which updates are required.
- Verify that your **SRS v2 – OS Updates Package** includes all the required updates.
- Verify that the **SRS v2 – OS Updates Package** is selected.
- Verify that the PowerShell execution policy is set to **Bypass**.

m. **Restart Computer:** This step reboots the computer after the mandatory operating system updates are installed. No customization is required for this step.

n. **Configure Windows Components:** This step configures the required Windows features. No customization is required for this step.

o. **Restart Computer:** This step reboots the computer after the Windows features are configured. No customization is required for this step.

p. **Add Local Skype User:** This step creates the local Skype account used to automatically sign in to Windows and start the Microsoft Teams Rooms application. This step doesn't have any software package associated with it, and no customization is required for it.

q. **Set up and configure SRS application:** This step configures the Microsoft Teams Rooms application installation for the next boot of the operating system.

- Verify that the **SRS v2 – Configure SRS Setup Package** and **Disable 64-bit file system redirection** are selected.

IMPORTANT

It is very important that the task sequence steps must be in the provided order. Modifying the order of steps, or configuring additional steps might break the deployment.

Set up and configure SRS application step must be the last step in the task sequence, otherwise the deployment might fail.

Create deployment for the task sequence

1. Select the task sequence, and then select **Deploy**.
2. Select **Browse** to select target collection for deployment.
3. Select **All Unknown Computers** and then select **OK**.
4. Select **Next**.
5. Select **Available** on the **Purpose** drop down list.
6. Select **Only Media and PXE** in the **Make available to the following** list, and then select **Next**.

WARNING

It is very important that **Purpose** is set to **Available**. Make sure that the **Purpose** is **NOT** set to **Required**. Also make sure that you select **Only Media and PXE** in the **Make available to the following**.

Setting these values to something else might cause all computers to get the Microsoft Teams Rooms deployment image when booted.

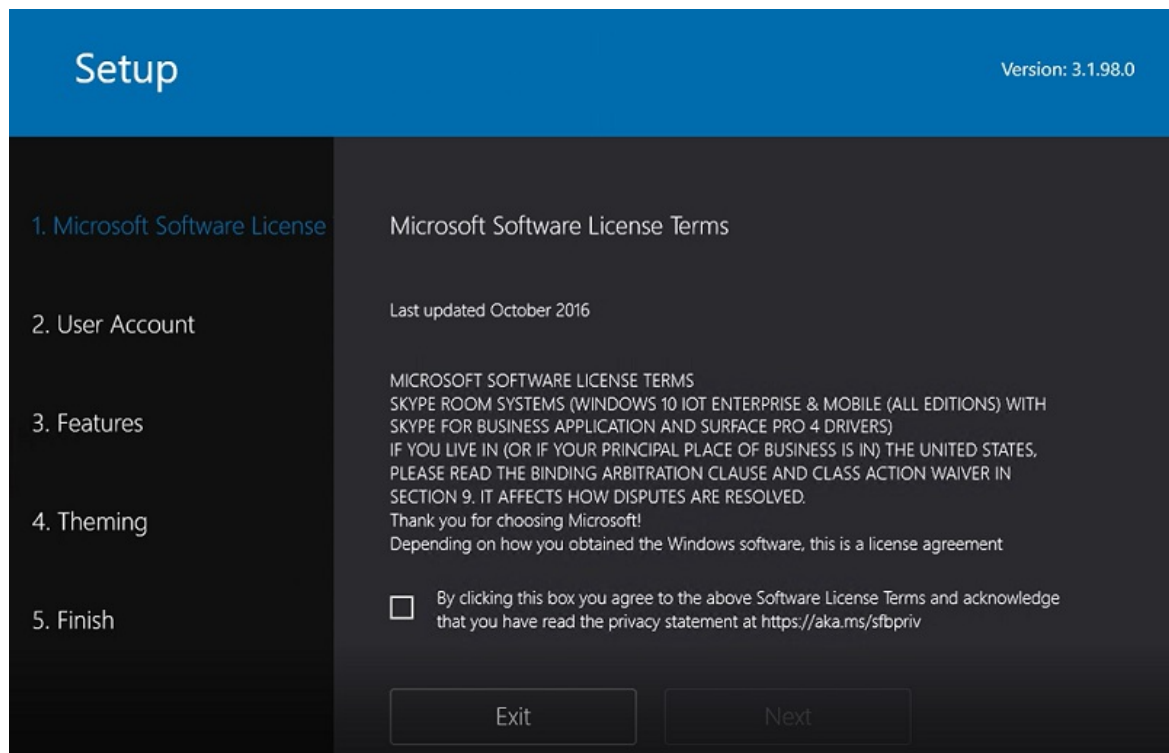

7. Do not specify any schedule and select **Next**.
8. Do not change anything within the **User Experience** section and select **Next**.
9. Do not change anything within the **Alerts** section and select **Next**.
10. Do not change anything within the **Distribution Points** section and select **Next**.
11. Confirm the settings and then select **Next**.
12. Select **Close**.

Validate and troubleshoot the solution

After you've completed the Microsoft Endpoint Configuration Manager task sequences, you'll need to perform a test run to validate that the task sequence can deploy and configure Microsoft Teams Rooms units.

1. Connect the test device to the wired network by using one of the supported Ethernet adapters or using the Surface dock. If PXE boot functionality hasn't been configured for your environment, you can use the boot image on the USB flash drive [that you created earlier](#) to boot from USB and connect to Configuration Manager.
2. Access the firmware and initiate PXE boot:
 - a. Ensure the Surface device is powered off.
 - b. Press and hold the **Volume Up** button.
 - c. Press and release the **Power** button.
 - d. After the device begins to boot, release the **Volume Up** button.
 - e. Select **Boot configuration**.
 - f. Do one of the following:
 - Select **PXE boot**, and drag it to the top of the list. Alternatively, you can swipe left on the network adapter to boot to the device immediately. This won't affect the boot order.
 - Select the USB flash drive that holds the boot media.
3. Select **Exit**, and then select **Restart Now**.

4. When prompted, select **Enter** for network boot service.
5. Windows PE will load into memory, and the Task Sequence Wizard will start. Select **Next** to continue.
6. Select the task sequence that you imported earlier, and then select **Next**.
7. After the disk configuration is applied, you'll be prompted to specify a computer name for the device. The user interface will display a recommended computer name based on the serial number of the Surface Pro device. You can either accept the proposed name or specify a new one. Follow the instructions on the computer name assignment screen. When you select **Accept**, the deployment begins.
8. The rest of the deployment process is automatic and doesn't ask for any more user input.
9. After the deployment task sequence finishes configuring the device, you'll see the following configuration screen that asks you to configure the Microsoft Teams Rooms application settings.

10. Plug the Surface Pro into the Microsoft Teams Rooms console, and configure the application settings.
11. Validate that the capabilities listed in [Microsoft Teams Rooms help](#) are working on the deployed device.

To troubleshoot a failed installation, check the **SMSTS.log** file, which logs all the steps executed in a Configuration Manager task sequence.

The SMSTS.log file is stored on one of a number of paths, depending on the stage of the build process. Check the following table to identify the path to the SMSTS.log file.

DEPLOYMENT PHASE	TASK SEQUENCE LOG PATH
WinPE, before HDD format	X:\Windows\Temp\smstslog\smsts.log
WinPE, after HDD format	C:_SMSTaskSequence\Logs\Smstslog\smsts.log
Operating system deployed, before the Configuration Manager agent was installed	c:_SMSTaskSequence\Logs\Smstslog\smsts.log

DEPLOYMENT PHASE	TASK SEQUENCE LOG PATH
Operating system and the Configuration Manager agent deployed	%windir%\System32\ccm\logs\Smstslog\smsts.log
Task sequence execution complete	%windir%\System32\ccm\logs\smsts.log

TIP

You can select **F8** at any time during the task sequence to open a command console, and then get access to the SMSTS.log file.

To troubleshoot PXE boot issues, check the two log files on the Configuration Manager server that are specific to PXE actions:

- **Pxecontrol.log**, located in the Configuration Manager installation logs directory
- **Smspxe.log**, located in Configuration Manager Management Point (MP) logs directory

For a complete list of the log files that you can use to further troubleshoot your Configuration Manager installation, see the Microsoft Endpoint Configuration Manager [Log file reference](#).

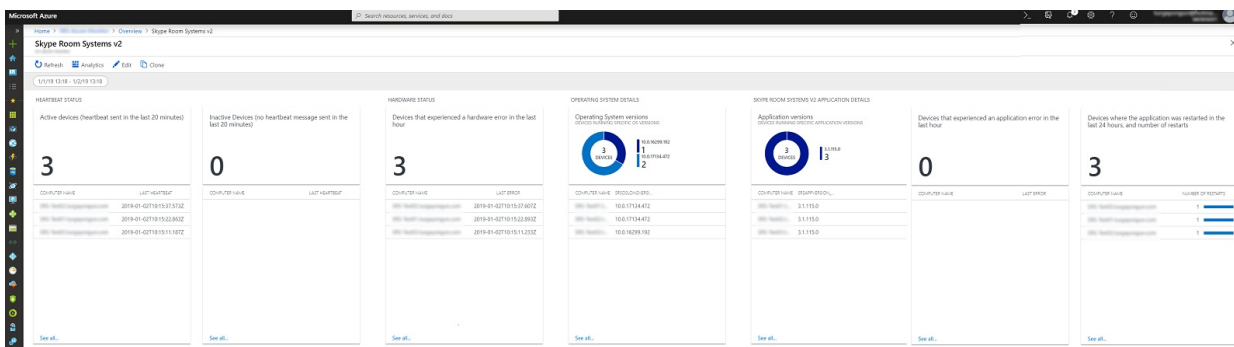

Deploy Microsoft Teams Rooms management with Azure Monitor

12/7/2021 • 20 minutes to read • [Edit Online](#)

This article discusses how to set up and deploy integrated, end-to-end management of Microsoft Teams Rooms devices by using Azure Monitor.

You can configure Log Analytics within Azure Monitor to provide basic telemetry and alerts that will help you manage Microsoft Teams Rooms meeting room devices. As your management solution matures, you might decide to deploy additional data and management capabilities to create a more detailed view of device availability and performance.

By following this guide, you can use a dashboard like the following example to get detailed status reporting for device availability, application and hardware health, and Microsoft Teams Rooms application and operating system version distribution.

At a high level, you need to perform the following tasks:

1. [Validate Log Analytics configuration](#)
2. [Configure test devices for Log Analytics management setup](#)
3. [Map custom fields](#)
4. [Define the Microsoft Teams Rooms views in Log Analytics](#)
5. [Define alerts](#)
6. [Configure all devices for Monitoring](#)
7. [Configure additional Azure Monitor solutions](#)

IMPORTANT

Although with minimal configuration, Azure Monitor Log Analytics can monitor a computer running a Windows operating system, there are still some Microsoft Teams Rooms-specific steps that you need to take before you start deploying agents to all Microsoft Teams Rooms devices. Therefore, we highly recommend you perform all configuration steps in the right order for a controlled setup and configuration. The quality of the end result very much depends on the quality of the initial configuration.

Validate Log Analytics configuration

You need to have a Log Analytics workspace to start collecting logs from Microsoft Teams Rooms devices. A workspace is a unique Log Analytics environment with its own data repository, data sources, and solutions. If you already have an existing Log Analytics workspace, you might use it to monitor your Microsoft Teams Rooms

deployment or alternatively, you can create a dedicated Log Analytics workspace specific to your Microsoft Teams Rooms monitoring needs.

If you need to create a new Log Analytics workspace, follow the instructions in the article [Create a Log Analytics workspace in the Azure portal](#)

NOTE

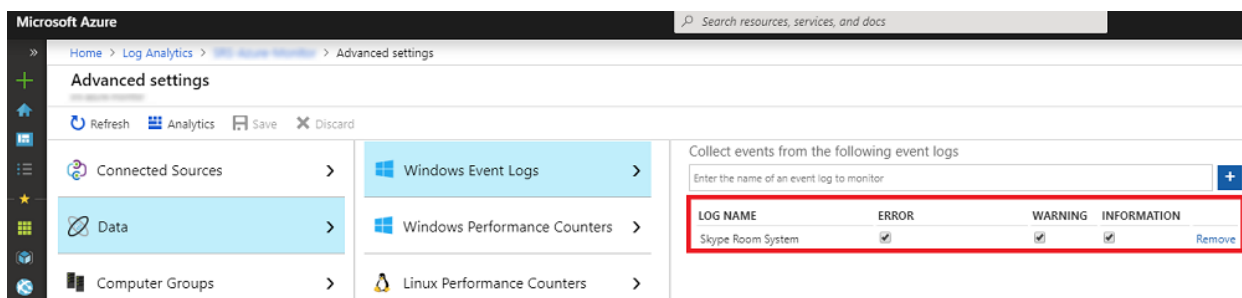

To use Log Analytics with Azure Monitor, you need to have an active Azure subscription. If you don't have an Azure subscription, you can create [a free trial subscription](#) as a starting point.

Configure Log Analytics to collect Microsoft Teams Rooms event logs

Log Analytics only collects events from the Windows event logs that are specified in the settings. For each log, only the events with the selected severities are collected.

You need to configure Log Analytics to collect the logs required to monitor Microsoft Teams Rooms device and application status. Microsoft Teams Rooms devices use the **Skype Room System** event log.

To configure Log Analytics to collect the Microsoft Teams Rooms events, see [Windows event log data sources in Azure Monitor](#)

IMPORTANT

Configure Windows Event Log settings and enter **Skype Room System** as event log name, and then select the **Error**, **Warning**, and **Information** check boxes.

Configure test devices for Azure Monitoring

You need to prepare Log Analytics to be able to monitor Microsoft Teams Rooms–related events. To start with, you need to deploy Microsoft Monitoring agents to just one or two Microsoft Teams Rooms devices that you have physical access to, and get those test devices generate some data and push it to the Log Analytics workspace.

Install Microsoft Monitoring agents to test devices

Deploy the Microsoft Monitoring agent to the test devices by using the instructions provided in [Connect Windows computers to the Log Analytics service in Azure](#). This article provides detailed information about the steps for deploying Microsoft Monitoring Agent for Windows, instructions for obtaining the Log Analytics **Workspace ID** and the **primary key** to get Microsoft Teams Rooms devices connected to your Azure Monitor deployment, and steps to verify agent connectivity to Log Analytics instance.

Generate sample Microsoft Teams Rooms events

After the Microsoft Monitoring agent is deployed onto the test devices, verify that the required event log data is collected by Azure Monitor.

NOTE

Reboot the device after the installation of the Microsoft Monitoring agent, and make sure that Microsoft Teams Rooms Meeting app is started, so that it can generate new events into the Event Log.

1. Sign in to the [Microsoft Azure portal](#) and go to Log Analytics and select your workspace.
2. List the heartbeat events generated by a Microsoft Teams Rooms device:
 - a. Select your workspace and go to **Logs** and use a query to retrieve the heartbeat records that will have the custom fields for Microsoft Teams Rooms.
 - b. Sample query: `Event | where Source == "SRS-App" and EventID == 2000`
3. Make sure that the query returns log records that include events generated by the Microsoft Teams Rooms meetings app.
4. Generate a hardware issue, and validate that the required events are logged in Azure Log Analytics.
 - a. Unplug one of the peripheral devices on the test Microsoft Teams Rooms system. This could be the camera, speakerphone, microphone, or Front Room Display
 - b. Wait 10 minutes for the event log to be populated in Azure Log Analytics.
 - c. Use a query to list hardware error events: `Event | where Source == "SRS-App" and EventID == 3001`
5. Generate an application issue, and validate that the required events are logged.
 - a. Modify Microsoft Teams Rooms application configuration, and type an incorrect Session Initiation Protocol (SIP) address/password pair.
 - b. Wait 10 minutes for the event log to be populated in Azure Log Analytics.
 - c. Use a query to list application error events:
`Event | where Source == "SRS-App" and EventID == 2001 and EventLevel == 1`

IMPORTANT

These sample event logs are required before custom fields can be configured. Don't proceed to the next step until you have collected the required event logs.

Map custom fields

You use custom fields to extract specific data from the event logs. You need to define custom fields that will be used later with your tiles, dashboard views, and alerts. See [Custom fields in Log Analytics](#) and become familiar with the concepts before you start creating your custom fields.

To extract your custom fields out of the captured event logs, follow these steps:

1. Sign in to the [Microsoft Azure portal](#) and go to Log Analytics and select your workspace.
2. List the events generated by a Microsoft Teams Rooms device:
 - a. Go to **Logs** and use a query to retrieve the records that will have the custom field.
 - b. Sample query: `Event | where Source == "SRS-App" and EventID == 2000`
3. Select one of the records, select the button to the left, and start the field extraction wizard.
4. Highlight the data you'd like to extract from the RenderedDescription and provide a Field Title. The field names that you should use are provided in Table 1.
5. Use the mappings shown in *Table 1*. Log Analytics will automatically append the `_CF` string when you

define the new field.

IMPORTANT

Remember that all JSON and Log Analytics fields are case-sensitive.

Pay attention to the queries required for each custom field in the table below. You need to use the correct queries for Log Analytics to successfully extract custom field values.

Table 1

JSON FIELD	LOG ANALYTICS CUSTOM FIELD	EVENT ID	QUERY TO USE WITH THE EXTRACTION
Description	SRSEventDescription	2000	Event where Source == "SRS-App" and EventID == 2000
ResourceState	SRSResourceState	2000	Event where Source == "SRS-App" and EventID == 2000
OperationName	SRSOperationName	2000	Event where Source == "SRS-App" and EventID == 2000
OperationResult	SRSOperationResult	2000	Event where Source == "SRS-App" and EventID == 2000
OS	SRSOSVersion	2000	Event where Source == "SRS-App" and EventID == 2000
OSVersion	SRSOSLongVersion	2000	Event where Source == "SRS-App" and EventID == 2000
Alias	SRSAlias	2000	Event where Source == "SRS-App" and EventID == 2000
DisplayName	SRSDisplayName	2000	Event where Source == "SRS-App" and EventID == 2000
AppVersion	SRSAppVersion	2000	Event where Source == "SRS-App" and EventID == 2000
IPv4Address	SRSIPv4Address	2000	Event where Source == "SRS-App" and EventID == 2000
IPv6Address	SRSIPv6Address	2000	Event where Source == "SRS-App" and EventID == 2000

JSON FIELD	LOG ANALYTICS CUSTOM FIELD	EVENT ID	QUERY TO USE WITH THE EXTRACTION
Conference Microphone status	SRSConfMicrophoneStatus	3001	Event where Source == "SRS-App" and EventID == 3001
Conference Speaker status	SRSConfSpeakerStatus	3001	Event where Source == "SRS-App" and EventID == 3001
Default Speaker status	SRSDefaultSpeakerStatus	3001	Event where Source == "SRS-App" and EventID == 3001
Camera status	SRSCameraStatus	3001	Event where Source == "SRS-App" and EventID == 3001
Front of Room Display status	SRSFORDStatus	3001	Event where Source == "SRS-App" and EventID == 3001
Motion Sensor status	SRSMotionSensorStatus	3001	Event where Source == "SRS-App" and EventID == 3001
HDMI Ingest status	SRSHDMIIngestStatus	3001	Event where Source == "SRS-App" and EventID == 3001

Define the Microsoft Teams Rooms views in Log Analytics

After data is collected and custom fields are mapped, you can use View Designer to develop a dashboard containing various tiles to monitor Microsoft Teams Rooms events. Use View Designer to create the following tiles. For more information, see [Create custom views by using View Designer in Log Analytics](#)

NOTE

Previous steps in this guide should have been completed for the dashboard tiles to work properly.

IMPORTANT

[View Designer in Azure Monitor](#) is retiring on 31 August 2023 and create and clone functionalities have been disabled on 30 November 2020. Workbooks can be used instead. For more information on the view designer transitioning guide to workbooks, see [Quickstart with preset view designer templates](#).

Create a Microsoft Teams Rooms dashboard manually

Alternatively, you can create your own dashboard and add only the tiles that you wish to monitor.

Configure the Overview Tile

1. Open **View Designer**.
2. Select **Overview Tile**, and then select **Two numbers** from the gallery.
3. Name the tile **Microsoft Teams Rooms**.

4. Define the **First Tile**:

Legend: Devices that sent a heartbeat at least once within the last month

Query:

```
Event | where EventLog == "Skype Room System" and TimeGenerated > ago(30d) | summarize TotalSRSDevices = dcount(Computer)
```

5. Define the **Second Tile**:

Legend: Active devices that sent a heartbeat within the last hour

Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" and TimeGenerated > ago(1h) | summarize TotalSRSDevices = dcount(Computer)
```

6. Select **Apply**.

Create a tile that displays active devices

1. Select **View Dashboard** to start adding your tiles.

2. Select **Number & list** from the gallery

3. Define the **General** properties:

Group Title: Heartbeat Status

New Group: Selected

4. Define the **Tile** properties:

Legend: Active devices (heartbeat sent in the last 20 minutes)

Tile Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" and TimeGenerated > ago(20m) | summarize AggregatedValue = count() by Computer | count
```

5. Define the **List** properties:

List Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" and TimeGenerated > ago(20m) | summarize TimeGenerated = max(TimeGenerated) by Computer | order by TimeGenerated
```

6. Define **Column Titles**:

Name: Computer Name

Value: Last Heartbeat

7. Define **Navigation Query**.

```
search {selected item} | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize arg_max(TimeGenerated, *) by Computer | project TimeGenerated, Computer, SRSAlias_CF, SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF, SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF, SRSEventDescription_CF
```

8. Select **Apply**, and then **Close**.

Create a tile that displays devices that have connectivity issues

1. Select **Number & list** from the gallery, and then add a new tile.

2. Define the **General** properties:

Group Title: Leave empty

New Group: Not Selected

3. Define the **Tile** properties:

Legend: Inactive Devices (no heartbeat message sent in the last 20 minutes)

Tile Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize LastHB = max(TimeGenerated) by Computer | where LastHB < ago(20m) | count
```

4. Define the **List** properties:

List Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize TimeGenerated = max(TimeGenerated) by Computer | where TimeGenerated < ago(20m) | order by TimeGenerated
```

5. Define **Column Titles**:

Name: Computer Name

Value: Last Heartbeat

6. Define **Navigation Query**:

```
search {selected item} | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" |
summarize arg_max(TimeGenerated, *) by Computer | project TimeGenerated, Computer, SRSAlias_CF,
SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF,
SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF, SRSEventDescription_CF
```

7. Select **Apply**, and then **Close**.

Create a tile that displays devices that have a hardware error

1. Select **Number & list** from the gallery, and then add a new tile.

2. Define the **General** properties:

Group Title: Hardware Status

New Group: Selected

3. Define the **Tile** properties:

Legend: Devices that experienced a hardware error in the last hour

Tile Query:

```
Event | where EventLog == "Skype Room System" and EventLevelName == "Error" and EventID == "3001" and
TimeGenerated > ago(1h) | summarize AggregatedValue = count() by Computer | count
```

4. Define the **List** properties:

List Query:

```
Event | where EventLog == "Skype Room System" and EventLevelName == "Error" and EventID == "3001" and
TimeGenerated > ago(1h) | summarize TimeGenerated = max(TimeGenerated) by Computer | order by
TimeGenerated
```

5. Define **Column Titles**:

Name: Computer Name

Value: Last Error

6. Define **Navigation Query**:

```
search {selected item} | where EventLog == "Skype Room System" and EventID == 3001 and EventLevelName ==
"Error" | summarize arg_max(TimeGenerated, *) by Computer | project TimeGenerated, Computer, SRSAlias_CF,
SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF,
SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF, SRSConfMicrophoneStatus_CF,
SRSConfSpeakerStatus_CF, SRSDefaultSpeakerStatus_CF, SRSCameraStatus_CF, SRSFORDStatus_CF,
SRSMotionSensorStatus_CF, SRSHDMIIngestStatus_CF, SRSEventDescription_CF | sort by TimeGenerated desc
```

7. Select **Apply**, and then **Close**.

Create a tile that displays Microsoft Teams Rooms Operating System versions

1. Select **Donut & list** from the gallery, and then add a new tile.

2. Define the **General** properties:

Group Title: Operating System details

New Group: Selected

3. Define the **Header** properties:

Title: Operating System versions

Subtitle: Devices running specific OS versions

4. Define the **Donut** properties:

Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize
OS_Version = max(SRSOSLongVersion_CF) by Computer | summarize AggregatedValue = count() by OS_Version |
sort by OS_Version asc
```

Center Text: Devices

Operation: Sum

5. Define the **List** properties.

List Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize
SRSOSLongVersion_CF = max(SRSOSLongVersion_CF) by Computer | sort by Computer asc
```

Hide Graph: Selected

Enable Sparklines: Not selected

6. Define **Column Titles**.

Name: Computer Name

Value: Leave Empty

7. Define **Navigation Query**.

```
search {selected item} | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" |  
summarize arg_max(TimeGenerated, *) by Computer | project TimeGenerated, Computer, SRSDisplayName_CF,  
SRSAlias_CF, SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF,  
SRSIPv6Address_CF, SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF,  
SRSEventDescription_CF
```

8. Select **Apply** and then **Close**.

Create a tile that displays Microsoft Teams Rooms application versions

1. Select **Donut & list** from the gallery, and then add a new tile.

2. Define the **General** properties:

Group Title: Microsoft Teams Rooms application details

New Group: Selected

3. Define the **Header** properties:

Title: Application versions

Subtitle: Devices running specific application versions

4. Define the **Donut** properties:

Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize  
App_Version = max(SRSAppVersion_CF) by Computer | summarize AggregatedValue = count() by App_Version |  
sort by App_Version asc
```

Center Text: Devices

Operation: Sum

5. Define the **List** properties.

List Query:

```
Event | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" | summarize  
SRSAppVersion_CF = max(SRSAppVersion_CF) by Computer | sort by Computer asc
```

Hide Graph: Selected

Enable Sparklines: Not selected

6. Define **Column Titles**.

Name: Computer Name

Value: Leave Empty

7. Define **Navigation Query**.

```
search {selected item} | where EventLog == "Skype Room System" and SRSOperationName_CF == "Heartbeat" |  
summarize arg_max(TimeGenerated, *) by Computer | project TimeGenerated, Computer, SRSAlias_CF,  
SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF,  
SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF, SRSEventDescription_CF
```

8. Select **Apply** and then **Close**.

Create a tile that displays devices that have an application error

1. Select **Number & list** from the gallery, and then add a new tile.

2. Define the **General** properties.

Group Title: Leave empty

New Group: Not Selected

3. Define the **Tile** properties.

Legend: Devices that experienced an application error in the last hour

Tile Query:

```
Event | where EventLog == "Skype Room System" and EventLevelName == "Error" and EventID == "2001" and  
TimeGenerated > ago(1h) | summarize AggregatedValue = count() by Computer | count
```

4. Define the **List** properties.

List Query:

```
Event | where EventLog == "Skype Room System" and EventLevelName == "Error" and EventID == "2001" and  
TimeGenerated > ago(1h) | summarize TimeGenerated = max(TimeGenerated) by Computer | order by  
TimeGenerated
```

5. Define **Column Titles**.

Name: Computer Name

Value: Last Error

6. Define **Navigation Query**.

```
search {selected item} | where EventLog == "Skype Room System" and EventID == 2001 and EventLevelName == "Error" | summarize arg_max(TimeGenerated, *) by Computer | project TimeGenerated, Computer, SRSAlias_CF, SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF, SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF, SRSEventDescription_CF | sort by TimeGenerated desc
```

7. Select **Apply** and then **Close**.

Create a tile that displays devices that have been restarted

1. Select **Number & list** from the gallery, and then add a new tile.

2. Define the **General** properties.

Group Title: Leave empty

New Group: Not Selected

3. Define the **Tile** properties.

Legend: Devices where the application was restarted in the last 24 hours, and number of restarts

Tile Query:

```
Event | where EventLog == "Skype Room System" and EventID == "4000" and TimeGenerated > ago(24h) | summarize AggregatedValue = count() by Computer | count
```

4. Define the **List** properties.

List Query:

```
Event | where EventLog == "Skype Room System" and EventID == "4000" and TimeGenerated > ago(24h) | order by TimeGenerated | summarize AggregatedValue = count(EventID) by Computer
```

5. Define **Column Titles**.

Name: Computer Name

Value: Number of Restarts

6. Define **Navigation Query**.

```
search {selected item} | where EventLog == "Skype Room System" and EventID == "4000" and TimeGenerated > ago(24h) | project TimeGenerated, Computer, SRSAlias_CF, SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF, SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF, SRSEventDescription_CF
```

7. Select **Apply** and then **Close**.

8. Select **Save** to save your dashboard.

Now you've completed creating your views.

Configure Alerts in Azure Monitor

Azure Monitor can raise alerts to notify the administrators, when a Microsoft Teams Rooms console encounters an issue.

Azure Monitor includes a built-in alerting mechanism that runs through scheduled log searches at regular intervals. If the results of the log search match some particular criteria, an alert record is created.

The rule can then automatically run one or more actions to proactively notify you of the alert or invoke another process. The possible options with alerts are:

- Sending an email
- Invoking an external process through an HTTP POST request
- Starting a runbook in Azure Automation service

See [Log alerts in Azure Monitor](#) to learn more about the alerts in Azure Monitor.

NOTE

The following examples send email alerts when a Microsoft Teams Rooms device generates a hardware or an application error.

Configure an email alert for Microsoft Teams Rooms hardware issues

Configure an alert rule that checks for Microsoft Teams Rooms devices that have encountered hardware issues within the last hour.

1. Sign in to the [Microsoft Azure portal](#) and go to Log Analytics and select your workspace.
2. Navigate to your Log Analytics workspace and select **Alerts** and then select **New alert rule**
3. Select **Add condition** and then **Custom log search**
4. Enter the following query to the Search query text box.

```
Event
| where EventLog == "Skype Room System" and EventLevelName == "Error" and EventID == "3001" and
TimeGenerated > ago(1h)
| summarize arg_max(TimeGenerated, *) by Computer
| project TimeGenerated, Computer, SRSAlias_CF, SRSAppVersion_CF, SRSOSVersion_CF,
SRSOSLongVersion_CF, SRSIPv4Address_CF, SRSIPv6Address_CF, SRSOperationName_CF,
SRSOperationResult_CF, SRSResourceState_CF, SRSConfMicrophoneStatus_CF, SRSConfSpeakerStatus_CF,
SRSDefaultSpeakerStatus_CF, SRSCameraStatus_CF, SRSFORDStatus_CF, SRSMotionSensorStatus_CF,
SRSHDMIIngestStatus_CF, SRSEventDescription_CF
|sort by TimeGenerated desc
```

5. Configure the Alert logic settings:
Based on: Number of results
Condition: Greater than
Threshold: 0
6. Configure Evaluation settings and select **Done**:
Period (in minutes): 60
Frequency (in minutes): 60
7. Configure action groups:
 - a. Select **Create New**
 - b. Provide suitable names for the *Action group name* and *Short Name* fields.
 - c. Specify a unique *Action Name* and select **Email/SMS/Push/Voice**, and then select **Edit details**.
 - d. Select the **Email** checkbox and provide the email address of the person or group that will receive the alerts.
 - e. You may also provide your phone number to get notified with SMS, a voice call or both.
 - f. Select **OK**.
8. **Customize Actions** if you like to override the subject line of the alert emails.
9. Specify a rule name and description.
Rule Name: Microsoft Teams Rooms Hardware Failure Alert
Description: List of devices that encountered a hardware issue within the last hour
10. Select the intended severity and make sure the rule is enabled.
11. Select **Create alert rule**.

Configure an email alert for Microsoft Teams Rooms application issues

Repeat the same procedure but use the following query to list devices that have encountered application issues within the last hour.

```
Event
| where EventLog == "Skype Room System" and EventLevelName == "Error" and EventID == "2001" and
TimeGenerated > ago(1h)
| summarize arg_max(TimeGenerated, *) by Computer
| project TimeGenerated, Computer, SRSAlias_CF, SRSAppVersion_CF, SRSOSVersion_CF, SRSOSLongVersion_CF,
SRSIPv4Address_CF, SRSIPv6Address_CF, SRSOperationName_CF, SRSOperationResult_CF, SRSResourceState_CF,
SRSEventDescription_CF
| sort by TimeGenerated desc
```

Now you've completed defining alerts. You can define additional alerts by using the examples above.

When an alert is generated, you'll get an email that lists the devices that encountered an issue within the last hour.

![Sample Azure Monitor alert email](../media/Deploy-Azure-Monitor-6.png "Sample Azure Monitor alert email")

Configure all devices for Azure Monitoring

After the dashboards and alerts are configured, you can set up and configure Microsoft Monitoring agent on all Microsoft Teams Rooms devices to complete your monitoring deployment.

Although you can install and configure the Microsoft Monitoring agent manually on each device, we highly recommend you leverage existing software deployment tools and methods.

If you're building your Microsoft Teams Rooms devices for the first time, you might want to include the Microsoft Monitoring agent setup and configuration steps as part of your build process. For more information, see [Install the agent using the command line](#).

Deploying Microsoft Monitoring agent by using a Group Policy Object (GPO)

If you already deployed your Microsoft Teams Rooms devices before you implement Azure Monitoring, you can use the provided script to set up and configure the agents by using Active Directory group policy objects.

1. Create a shared network path and grant read access to **Domain Computers** group.
2. Download the 64-bit version of the Microsoft Monitoring Agent for Windows from <https://go.microsoft.com/fwlink/?LinkID=517476>
3. Extract the contents of the setup package into the network share.
 - a. Open a Command Prompt window, and then execute **MMASetup-AMD64.exe /c**
 - b. Specify the share you just created, and extract the content.
4. Create a new Group Policy Object and assign it to the organizational unit where Microsoft Teams Rooms machine accounts are located.
5. Configure PowerShell execution policy:
 - a. Edit the newly created Group Policy Object and navigate to Computer Configuration \ Policies \ Administrative Templates \ Windows Components \ Windows PowerShell
 - b. Enable the **Turn on Script Execution** and set **Execution Policy** to **Allow Local Scripts**.
6. Configure the startup script:
 - a. Copy the following script and save it as **Install-MMAGent.ps1**.
 - b. Modify **Workspaceld**, **WorkspaceKey**, and **SetupPath** parameters to match your configuration.
 - c. Edit the same Group Policy Object and navigate to Computer Configuration \ Policies \ Windows Settings \ Scripts (Startup/Shutdown)

- d. Double-click to select **Startup**, and then select **PowerShell Scripts**.
 - e. Select **Show Files**, and then copy the **Install-MMAgent.ps1** file to that folder.
 - f. Select **Add**, and then **Browse**.
 - g. Select the ps1 script you just copied.
7. Microsoft Teams Rooms devices should install and configure the Microsoft Monitoring agent with the second reboot.

```
# Install-MMAgent.ps1
<#
Date:      04/20/2018
Script:    Install-MMAgent.ps1
Version:   1.0
#>

# Set the parameters
$WorkspaceId = "<your workspace id>"
$WorkspaceKey = "<your workspace key>"
$SetupPath = "\\Server\Share"

$SetupParameters = "/qn NOAPM=1 ADD_OPINSIGHTS_WORKSPACE=1 OPINSIGHTS_WORKSPACE_AZURE_CLOUD_TYPE=0
OPINSIGHTS_WORKSPACE_ID=$WorkspaceId OPINSIGHTS_WORKSPACE_KEY=$WorkspaceKey AcceptEndUserLicenseAgreement=1"

# $SetupParameters = $SetupParameters + " OPINSIGHTS_PROXY_URL=<Proxy server URL> OPINSIGHTS_PROXY_USERNAME=
<Proxy server username> OPINSIGHTS_PROXY_PASSWORD=<Proxy server password>"

# Start PowerShell logging
Start-Transcript -Path C:\Temp\MMA-Install.Log

# Check if the Microsoft Monitoring Agent is installed
$mma = New-Object -ComObject 'AgentConfigManager.MgmtSvcCfg'

# Check if the Microsoft Monitoring agent is installed
if (!$mma)
{
    #Install agent
    Start-Process -FilePath "$SetupPath\Setup.exe" -ArgumentList $SetupParameters -ErrorAction Stop -Wait
}

# Check if the agent has a valid configuration
$CheckMMA = $mma.GetCloudWorkspace($WorkspaceId).AgentId
if (!$CheckMMA)
{
    # Apply new configuration
    $mma.AddCloudWorkspace($WorkspaceId, $WorkspaceKey)
    $mma.ReloadConfiguration()
}

Stop-Transcript
```

NOTE

You can refer to the article [Managing and maintaining the Log Analytics agent](#) when you need to reconfigure an agent, move it to a different workspace, or modify proxy settings after the initial installation.

Additional Solutions

Azure Monitor provides built-in management solutions through its [solution gallery](#) to further help you monitor your environment. We highly recommend that you add [Alert Management](#) and [Azure Log Analytics Agent Health](#) solutions to your workspace as well.

NOTE

The Agent Health solution can help you identify outdated or broken Microsoft Monitoring agents within your environment, and the Alert Management solution provides details about the alerts that have been raised within a given period.

Migrate Lync Room System (LRS) devices to Microsoft Teams Rooms

12/7/2021 • 2 minutes to read • [Edit Online](#)

Lync Room System (LRS) devices with Skype Room System Version 1 (SRS v1) software has reached [end of support on October 9, 2018](#). This means Skype Room Systems v1 software will no longer get any product updates or fixes anymore. Customers with Lync Room System devices using Skype Room System v1 software are advised to upgrade their devices to Microsoft Teams Rooms.

Microsoft Teams Rooms software works with Microsoft Teams in addition to Skype for Business Server and Online services for meetings and calling on all Microsoft Teams Rooms supported devices.

Your existing devices **may** continue to work after the end of Skype Room System v1 software support. However, if this software hits a software bug that needs Microsoft to release a fix, it will not be supported. SRS v1 uses TLS 1.0/ 1.1 which will be deprecated by Microsoft in the future. You can learn more about [preparing for TLS 1.0/1.1 deprecation](#).

Which devices are affected?

Here is the list of the devices that are affected by this change:

- Crestron RL
- [Crestron RL2](#)
- [SMART Room systems](#)
- [Polycom CX8000](#)

Upgrade options

There are multiple options for upgrading Lync Room Systems to the next generation of Microsoft Teams Rooms.

Crestron hardware Trade-in program

Crestron will provide an upgrade to the [Crestron SR system](#) or equivalent for all Non-Crestron Lync Room System customers (e.g Smart or Polycom LRS). See details of this program [here](#) or [email](#) Crestron LRS support.

Crestron RL2 upgrade to Microsoft Teams Rooms

Existing Crestron RL2 (also referred to as Crestron RL200) customers can acquire an upgrade kit to upgrade current RL2 to RL3 using a for a minimal cost per device. See details of this program [here](#).

SMART Room Systems upgrade

For SMART LRS customers, apart from Crestron hardware trade-in program, SMART is also working on providing a solution to upgrade to Microsoft Teams Rooms. This upgrade will be provided by SMART Technologies Inc. to customer under product support. Please see more about this [here](#).

What should you do?

We recommend you plan to update Lync Room System devices to Microsoft Teams Rooms before TLS 1.0/1.1 deprecation using upgrade options mentioned above. Additionally, you may also consider replacing existing devices with new devices certified for Microsoft Teams Rooms. See [Room devices](#) for details and also take a look at [Microsoft Teams Rooms requirements](#).

NOTE

Microsoft Teams Rooms software supports the TLS 1.2 protocol as of December 14, 2018 with app version 4.0.64.0. For on-premises customers, enabling communication over TLS 1.2 for Microsoft Teams Rooms requires Skype for Business Server 2015 Cumulative Update 9 (CU9) or Skype for Business Server 2019 Cumulative Update 1 (CU1). The change should not affect Skype for Business Online customers as client changes are forward and backward compliant.

Content cameras

12/7/2021 • 4 minutes to read • [Edit Online](#)

You can now use a content camera with a Microsoft Teams Room system. A content camera interacts with special image-processing software and a whiteboard to allow a presenter to draw on an analog whiteboard and share the content with remote participants.

See the following video for examples of content camera functionality.

Set up a content camera

NOTE

Always adhere to your country or area's building code, which may define a minimum distance from the floor or a requirement that ceiling-mounted equipment be secured to a rafter or other structure. Follow the mounting instruction for the hardware provided with the camera you've selected. OEM camera mounting kits include a camera, USB 2.0 extenders, and required cabling.

The size of the whiteboard used for sharing affects the placement of the camera. Board size recommendations are:

- 3–6 ft. (0.9–1.8 m) wide — Supported
- 6–9 ft. (1.8–2.7 m) wide — Recommended
- 9–12 ft. (2.7–3.6 m) wide — Supported
- Above 12 ft. (3.6 m) wide — camera covers 9–12 ft. (2.7–3.6 m) and crops the rest.

Camera location

Ideal placement of a content camera is centered vertically and horizontally on the whiteboard. Local building codes may have height restrictions that require the camera be elevated higher than the top of the white board.

You can install the camera up to 6 in. (152 mm) higher than the top of the whiteboard, and centered on the white board as shown. Make sure that the camera image includes at least a 6 in. (152 mm) border on both sides horizontally. You can use the camera preview in the Microsoft Teams Rooms app to determine final placement of the camera.

Camera distances

Using typical whiteboard markers, the optimal remote user experience is to share ink strokes in the 1–2 mm per pixel range in the content camera image, and the best results use 1.5 mm per pixel. All supported cameras provide 1920 x 1080 resolution, and some can exceed that resolution.

The distance of the camera from the whiteboard combines with the camera resolution and Horizontal Field of View (HFOV) to determine the distance from the whiteboard. The following table shows examples of distances for various whiteboard sizes. You can use these values as starting points to determine final placement of the content camera.

Camera distance from whiteboard

CAMERA HFOV	3 FT. (0.91 M)	6 FT. (1.8 M)	9 FT. (2.74 M)	12 FT. (3.65 M)	MAX DISTANCE FROM WHITEBOARD
80°	1.79 ft. (0.54 m)	3.58 ft. (1.09 m)	5.36 ft. (1.6 m)	7.15 ft. (2.17 m)	7.51 ft. (2.28 m)
90°	1.5 ft. (0.45 m)	3.00 ft. (0.91 m)	4.5 ft. (1.37 m)	6.0 ft. (1.82 m)	6.3 ft. (1.92 m)
100°	1.26 ft. (0.38 m)	2.52 ft. (0.77 m)	3.78 ft. (1.15 m)	5.03 ft. (1.53 m)	5.29 ft. (1.61 m)
110°	1.05 ft. (0.32 m)	2.10 ft. (0.64 m)	3.15 ft. (0.96 m)	4.2 ft. (1.28 m)	4.41 ft. (1.31 m)
120°	0.87 ft. (0.26 m)	1.73 ft. (0.52 m)	2.60 ft. (0.79 m)	3.46 ft. (1.05 m)	3.64 ft. (1.10 m)

The distance between the content camera and the wall the whiteboard is mounted on depends on the HFOV for that model of camera, which varies. Install cameras with a larger HFOV (120 degrees for example) closer to the wall, and cameras with a narrower HFOV farther away from the wall. Check the HFOV before you start to install the chosen camera.

If you have whiteboards larger than 12 ft. (3.65 m) or with no corners (like full wall whiteboards), you can place the camera anywhere in the middle. The enhancement software selects an area in the middle if it fails to find whiteboard corners.

NOTE

You can use dark-colored tape or other items to create a defined content camera area on a full-wall white board. This helps in-room attendees know when they are drawing in an area being captured by the content camera.

You can choose to have the camera mounted on a moveable tripod instead of a permanent mount. Place the tripod centered on the whiteboard. This setup may be temporary or used where there is little chance of knocking over the equipment. If you use a temporary mount, remember that content enhancement will be impacted if you move the camera after the initial share and you will need to re-share to correct for movement.

A writing board that isn't white is not supported.

Supported cameras

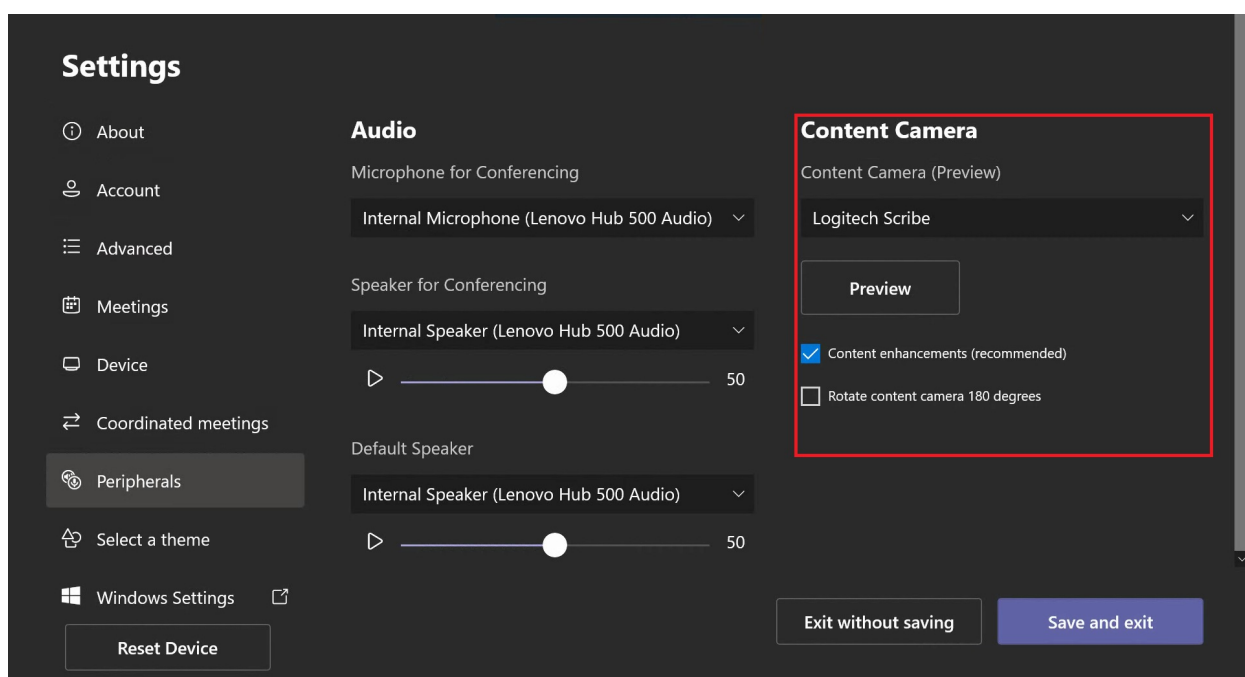

To determine whether you can use a camera as a content camera, refer to [Certified firmware versions for USB audio and video peripherals](#).

Or, refer to the Microsoft Teams devices marketplace for supported Content Camera Kits at aka.ms/teamsdevices.

Camera settings

Once the camera is installed in the room, set it up on that room's Microsoft Teams Rooms console:

1. Select **Settings** , log in as Admin, and select **Peripherals**.
2. In the **Content Camera** section, select the content camera and make sure that the **Content enhancements** option is selected.
3. (Optional) If the camera was installed upside down because the camera was mounted from the ceiling, check the **Rotate content camera 180°** option.
4. Select **Save and exit**.

You can also adjust these settings remotely using an [XML configuration file](#).

Manage voice recognition technology controls for an Intelligent Speaker

12/7/2021 • 5 minutes to read • [Edit Online](#)

An Intelligent Speaker uses voice profile information to recognize who said what in live transcription. When a Microsoft Teams Rooms for Windows meeting room is equipped with an Intelligent Speaker, live transcription can be used during the meeting. This article explains how you, a tenant admin, control the voice profiling that's used for voice recognition to generate live transcription. You can control to what degree the organization is using voice recognition and the following features:

- Edit the speaker's name in transcripts.
- Change the speaker of a single utterance in the transcript or change the speaker in all the utterances in the transcript (but not on future transcripts).
- Change the speaker identification for the people who are listed in the meeting.
- Remove the identification of one or more utterances identified as that speaker, on every transcript.

Review Intelligent Speaker requirements

An Intelligent Speaker includes a special seven-microphone array. The system uses voice profile information to identify voices of up to 10 people in meeting rooms.

The following items are Intelligent Speaker requirements:

- The customer tenant must be located in the U.S. (North America).¹
- The meeting room should have a maximum of 10 people present in person.
- The meeting room has an upload link of minimum 7 Mbps.

¹ An Intelligent Speaker and associated voice profile and usage will only be available in EN-US language and for US (NA-US region) tenants. Both conditions must be true for a tenant user to enroll and use an Intelligent Speaker for attributed transcription.

Set up an Intelligent Speaker

An Intelligent Speaker connects directly using USB to the Teams Rooms console. For best results, a Yealink brand Intelligent Speaker should be used with a Yealink brand console.

NOTE

A Yealink Intelligent Speaker **must** be used with a Yealink console.

NOTE

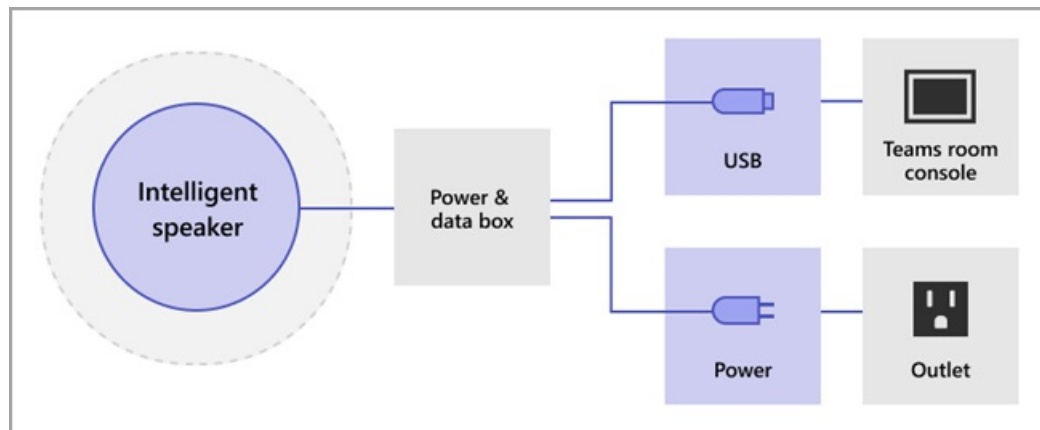

We don't support an Intelligent Speaker connected to Logitech Surface Pro Microsoft Teams Rooms. There is a known issue that Teams Rooms can't recognize the Intelligent Speaker through the dock.

An Intelligent Speaker should be placed at least 8 inches (20 cm) away from walls and large objects, such as laptops. If the Intelligent Speaker USB cable isn't long enough for your setup, use cable extenders.

1. Sign in to the console as administrator.

2. Set the Teams device settings to match the Intelligent Speaker microphone and speaker. You can also do this through the TAC portal instead of at the room console.

The diagram shows how the Intelligent Speaker is connected to the device if the device includes a data box.

The diagram shows how the Intelligent Speaker is connected to the device if the device doesn't include a data box.

NOTE

EPOS and Yealink devices should have "EPOS" or "Yealink" prefix and contain "UAC2_RENDER" in the speaker name and "UAC2_TEAMS" in the microphone name. If you don't find these microphone and speaker names in the dropdown menu, restart the Intelligent Speaker device.

Enable an Intelligent Speaker user recognition

Voice profile data can be used in any meeting with an Intelligent Speaker. See [Teams meetings policies](#) and the [PowerShell meeting cmdlets](#) for information on the meeting settings.

The voice profile data of the user is created when the policy is set to distinguish or a non-meeting invitee walks in during the meeting. The voice profile data is dismissed at the end of the meeting.

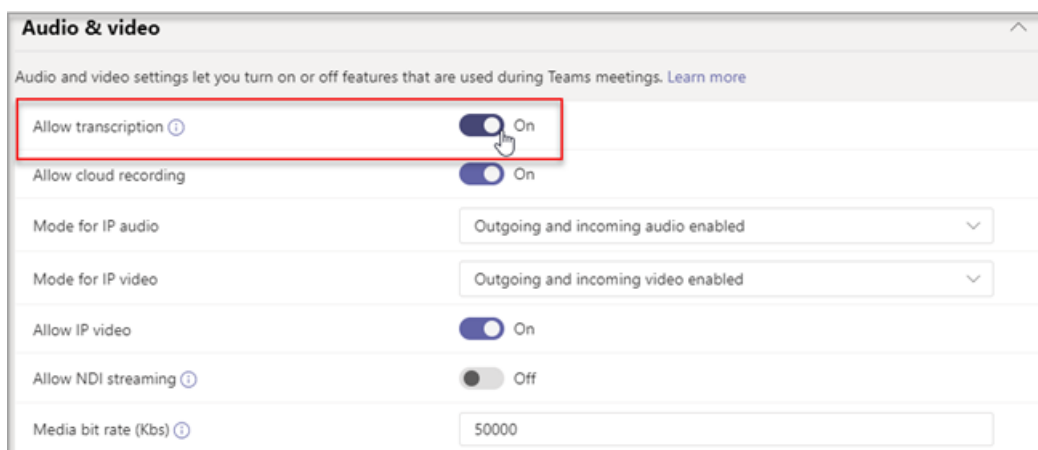

The following are the required policies to set an Intelligent Speaker and user recognition.

POLICY	DESCRIPTION	VALUES AND BEHAVIOR
--------	-------------	---------------------

POLICY	DESCRIPTION	VALUES AND BEHAVIOR
enrollUserOverride	Use to set voice profile capture, or enrollment, in Teams settings for a tenant.	<p>Disabled</p> <ul style="list-style-type: none"> • Users who have never enrolled can't view, enroll, or re-enroll. • The entry point to the enrollment flow will be hidden. • If users select a link to the enrollment page, they'll see a message that states this feature isn't enabled for their organization. • Users who have enrolled can view and remove their voice profile in the Teams settings. Once they remove their voice profile, they won't be able to view, access, or complete the enrollment flow. <p>Enabled</p> <ul style="list-style-type: none"> • Users can view, access, and complete the enrollment flow. • The entry point will show on Teams settings page under the Recognition tab.

POLICY	DESCRIPTION	VALUES AND BEHAVIOR
roomAttributeUserOverride	Control the voice-based user identification in meeting rooms. This setting is required for Teams Rooms accounts.	<p>Off</p> <ul style="list-style-type: none"> The Teams Rooms device won't send audio stream-saving bandwidth from the room. Meeting room users won't be attributed or distinguished, and their voice signatures won't be retrieved or used at all. Meeting room users are unknown. <p>Attribute</p> <ul style="list-style-type: none"> Rooms users will be attributed based on their enrollment status. Users who are enrolled are shown with their name in the transcription. Users who aren't enrolled show as Speaker <n>. The Teams Rooms device will send seven audio streams from the room. <p>Distinguish</p> <ul style="list-style-type: none"> Rooms users will be distinguished and separated as speaker 1, speaker 2,speaker <n> in the transcription. Irrespective of enrollment status of the user, their name will not show in the transcription. The Teams Rooms device will send seven audio streams from the room.
AllowTranscription	Required for user and Teams rooms accounts.	True and False

In the Teams admin center, set the **Transcription** policy. Settings are **Off** by default.

Frequently asked questions (FAQ)

Where is the voice profile data stored?

Voice profile data is stored in Office 365 cloud with user content.

What is the retention timeline and policy?

General retention policy is stated in the [Data retention overview](#). In addition, a user's voice profile data will be deleted after 3 years if the user isn't invited to any meetings with an Intelligent Speaker within that 3-year period. Data isn't used in any meetings for existing employees. If an employee has left the company, voice profile data is considered user content and is treated as such per Office 365 data retention policy described in the [Data retention overview](#).

Is voice profile data used across Microsoft services?

No, voice profile data is only used for the purpose for which the user has provided consent. Microsoft will not use the voice profile data except within Teams voice recognition scenarios.

For example, Microsoft won't use the data in the following situations:

Is my voice profile data used when I join a meeting in another organization?

No only in meetings organized by a user in your organization.

How can I export my voice profile?

Your IT admin can export your audio data at any time.

Manage Microsoft Teams Rooms

12/7/2021 • 8 minutes to read • [Edit Online](#)

If you have Microsoft Teams Rooms-certified devices in your organization, you have flexible management options. You can manage the devices yourself in the same central location where you manage all your Teams solutions, Microsoft Teams Admin Center. Alternately, you can transfer management responsibility to dedicated experts using [Microsoft Teams Rooms Managed Services](#). You can also delegate management access to a partner of your choice for either of the options.

With Microsoft Teams Admin Center, you can:

- Perform device management like restarting devices and downloading device logs
- Apply Teams-specific settings
- Check the health status of Microsoft Teams Room devices and their peripherals, including cameras, displays, microphones, and so on
- Review current and past meeting activity (such as details about call quality, network health and connectivity, and number of participants)
- See peripherals (such as cameras and projectors) connected to a Microsoft Teams Room device

To manage Teams Rooms devices, open the [Microsoft Teams admin center](#) and go to **Teams Devices > Teams Rooms on Windows**.

The screenshot shows the Microsoft Teams Admin Center interface. The left sidebar contains navigation options: Home, Teams, Users, Teams devices, Teams Rooms on Windows (selected), Teams Rooms on Android, Panels, Phones, Displays, Teams apps, Meetings, Messaging policies, Voice, Locations, Policy packages, Planning, Analytics & reports, and Notifications & alerts. The main content area is titled 'Teams Rooms on Windows' and includes a description: 'Control and manage Teams Rooms on Windows devices such as consoles, microphones, cameras, and displays, in your organization. You can configure settings, view activity information, manage updates, set up alert rules, and perform diagnostics to help with troubleshooting. [Learn more](#)'. Below this is a 'Devices summary' card showing 2 Total, 2 Online, and 0 Offline devices. A 'Health summary' card shows 2 Healthy, 0 Non-urgent, and 0 Critical devices. At the bottom, there is a table with 2 items, showing details for 'Townview-Conference Room 1' and 'Townview-Conference Room 2'.

✓	Display name	Username	Device name	Health status	Manufacturer	Model
	Townview-Conference Room 1	MTR-TVW-Conference1@t...	logitech-tap G6BE92100829	Healthy	logitech	tap
	Townview-Conference Room 2	MTR-TVW-Conference2@t...	logitech-smartdock 03180...	Healthy	logitech	smartdock

IMPORTANT

To manage devices using the Teams admin center, you need to be assigned the Global Administrator, Teams Administrator, or Teams Device Administrator roles.

Make changes to Teams Rooms devices

If you have more than one Teams Rooms device, you can do most actions on multiple devices at the same time. For example, you can set Teams app settings on all of your devices at the same time.

Device settings

You can change settings on one or more devices in your organization. To change settings, select the device or devices you want to manage and then select **Edit Settings**. A new pane will open with all of the settings you can change on your devices. The following table lists the settings you can change using the Teams admin center. Some settings are only available when you select a single device.

If you select more than one device, settings that support bulk editing show the two following options.

- **Keep existing value** If you choose this option, no changes will be made to the setting on the devices you selected.
- **Replace existing value with** If you choose this option, you can update the setting on the devices you selected with the value you provide.

Caution

Existing values on the settings you choose to update will be replaced with the value you provide. If you want to add to a list of existing values, you need to include the existing values with the value you want to add. For example, if a setting has an existing domain list of `contoso.com, fabrikam.com`, and you want to add `northwindtraders.com`, the value you need to provide would be

`contoso.com, fabrikam.com, northwindtraders.com`.

If you select multiple devices, the setting on all of the devices you select will be changed to the value you provide. If devices have different values for a setting, they'll all be updated to the same value.

SETTING	ACCEPTED VALUES	SUPPORTS BULK EDIT
<i>Account</i>

Cortana settings

You can enable Cortana for *Voice Activation* or *Push to talk* using PowerShell for all devices in your organization, or for each device separately.

- At the organization and group level, you must use PowerShell.
- At the device level, you have a few options. You can use PowerShell, edit the XML configuration file, or change the settings in Teams admin center.

To learn more about using PowerShell to configure Cortana, see [Admin control and limitations for Cortana in Teams](#).

To learn more about configuring your device using the XML configuration file, see [Manage a Microsoft Teams Rooms console settings remotely with an XML configuration file](#).

At the device level, you can configure Cortana to be activated for:

- *Push to talk* using PowerShell
 - How to turn it on: Cortana *Push to talk* is enabled by default for all devices that are set up with locale en-us regardless of the geographic region
 - How to turn it off: use Powershell.
- *Voice Activation* using XML configuration file or Teams admin center.
 - How to turn it on: set `<CortanaWakeWord>true</>` in the XML configuration file or use the corresponding setting in Teams admin center
 - How to turn it off: Cortana Voice Activation is off by default

Keep in mind that three conditions must be met to have Cortana *Voice Activation* on your device:

1. Your organization must have Cortana enabled
2. Your device must be set up with one of the following locales: en-au, en-ca, en-gb, en-in, en-us
3. You must have a Cortana certified device connected to your Teams Room [Learn More](#)

Device restart options

Changes to device settings will only take effect after the devices have been restarted. When you make changes that need a restart, you can choose whether to restart the devices immediately or schedule a restart. Here are the available restart options:

- **Immediate restart** If you choose this option, all of the devices you're making changes to will restart as soon as you select this option.
- **Scheduled restart** If you choose this option, you can restart the devices you're making changes to at a time that's less disruptive to your organization.
 - **Select date and time** - Choose the specific date and time to restart the device. The date and time you choose is local to the device being restarted.
 - **Leave update for nightly reboot** Devices are restarted nightly to perform maintenance. Changes you make to devices will be applied during this restart.

Caution

Devices in use at the time of a restart will become unavailable for the duration of the restart process. They'll be disconnected from in-progress meetings and won't be available to join new meetings.

Remove device

When you remove a device, the device is removed from your organization and no longer appears in your list of Teams Rooms devices in the Teams admin center.

If you remove a device and it's still configured with a valid username and password, it will be automatically re-added to your Teams Rooms devices list if it connects to Microsoft 365 again.

To remove one or more devices, do the following:

1. Go to **Teams Devices > Teams Rooms** and select the devices you want to remove.
2. Select **Remove**.

Download device logs

You can download a copy of a device's diagnostic log files if requested to do so by Microsoft support. Log files are compressed into a zip file that can be downloaded from the Teams admin center.

To download logs from a Teams Rooms device to your computer, do the following:

1. Go to **Teams Devices > Teams Rooms** and select the name of the device you want to download logs from.
2. Select **Download device logs**. It can take several minutes for device logs to become available.
3. Select the **History** tab and then select log file link under **Diagnostics file**. A zip file containing your device's diagnostic log files will be downloaded to your browser's default Downloads folder.

View device information

From the Teams admin center, you can view the overall status of all devices in your organization and view details of each device individually.

Teams Rooms system dashboard

The Teams Rooms system dashboard shows you the status and health of all of your devices at a glance.

Device details view

To view detailed information about a device, select its name from the device list. When in details view, you can see the following information about your device:

- **Health status** Shows the overall health of the Teams Room device. Health status can be either **Healthy** or **Unhealthy**.
- **Offline since** Shows the last time Microsoft 365 was able to communicate with the device.
- **Device status** Shows the current state of the device: **Idle**, **Teams meeting**, **Skype meeting**, or **Ingest**.
- **Peripherals** Shows the peripherals connected to your Teams Room device and their health status. Health status can be either **Connected** or **Disconnected**.
- **Health** Shows detailed information about the peripherals connected to your Teams Room device, network connectivity, sign in status to required services, and software version information.
- **Details** Shows manufacturer information, network IP address, and Teams Room device serial/MAC address.
- **Activity** Shows past meeting details including date and time of the meeting, number of participants, duration, and audio quality. For more information about meeting details, see the [Meeting activity details](#) section later in this article.
- **History** Shows a history of management activity on the Teams Room device, including configuration updates, device restarts, and device log download links.

Meeting activity details

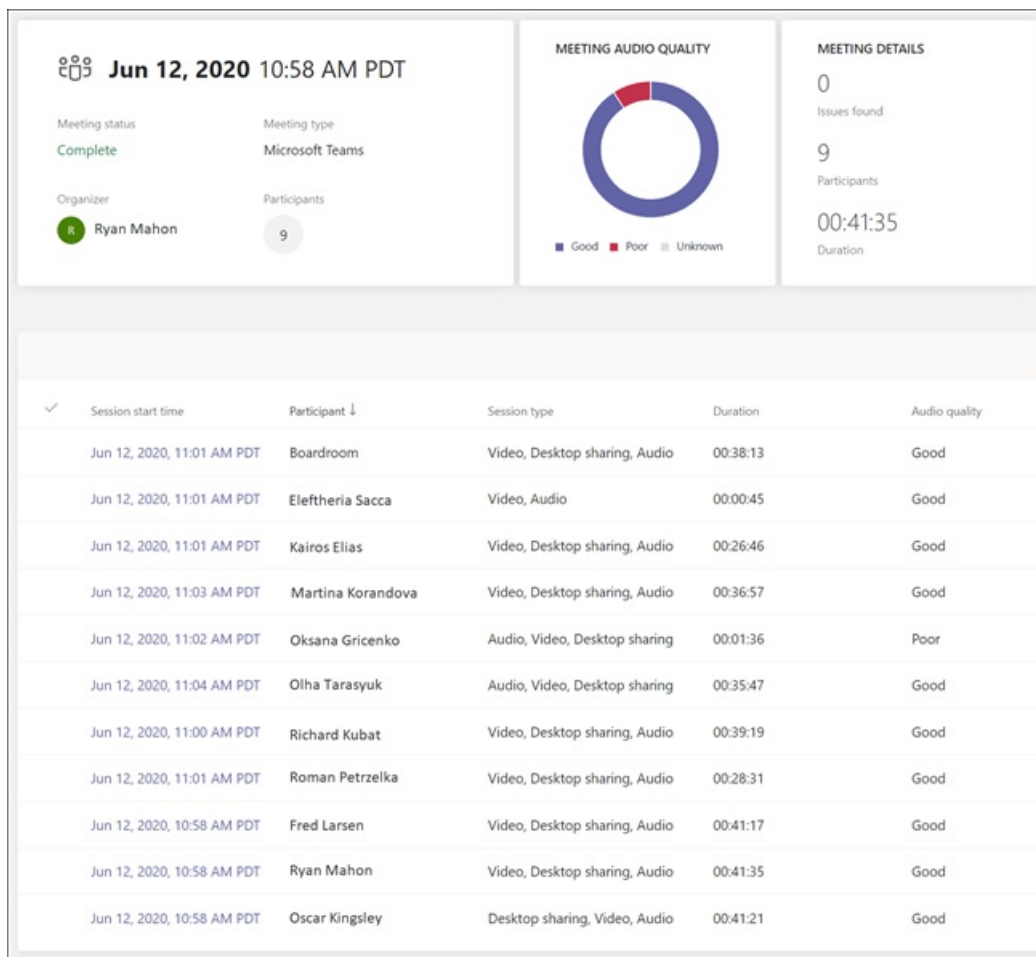

The **Activity** tab in Teams Room device details shows high-level and detailed information about all of the meetings the device has participated in over time. In the **Activity** tab, you can see when a meeting was held, how many participants attended the meeting, and the quality of audio during the meeting.

Peripherals	Health	Details	Activity	History
Activity				
✓	Start time (UTC)	Meeting participants	Duration	Audio quality
	Jun 12, 2020, 4:09 PM PDT	2 Participants	00:00:16	Good
	Jun 12, 2020, 4:05 PM PDT	2 Participants	00:00:15	Good
	Jun 12, 2020, 4:04 PM PDT	2 Participants	00:00:24	Good
	Jun 12, 2020, 10:58 AM PDT	9 Participants	00:41:35	Poor
	Jun 9, 2020, 4:49 PM PDT	2 Participants	00:00:18	Good
	Jun 5, 2020, 10:58 AM PDT	8 Participants	01:11:41	Poor
	Jun 1, 2020, 1:30 PM PDT	9 Participants	00:45:17	Poor
	May 29, 2020, 10:59 AM P...	8 Participants	01:11:06	Good
	May 20, 2020, 11:29 AM P...	8 Participants	00:34:45	Good

To see the detail information about a specific meeting, select the date and time of the meeting you want more information about. If a meeting has only two participants, you'll see the participant details page, otherwise you'll see a participant summary page.

Participant summary

The participant summary page shows all of the participants that attended the meeting. You can see when each participant joined the meeting, their name, audio quality, and what features were used during their session. To view the details of a participant's session, select the session start time for that participant.

Participant details

The participant details page shows end-to-end diagnostic information for that participant's session. As shown in the following graphic, **Device**, **System**, and **Connectivity** information is provided for the participant and for the Teams Rooms device. **Network** diagnostic information between the participant and the Teams Rooms device is also provided. Select the icon for the context you want more information about. For additional diagnostic information, select the **Advanced** tab.

Microsoft Teams Rooms maintenance and operations

12/7/2021 • 10 minutes to read • [Edit Online](#)

Read this topic to learn about management of Microsoft Teams Rooms.

Microsoft Teams Rooms is Microsoft's conferencing solution designed to transform your meeting room into a rich, collaborative experience. Users will enjoy its familiar Microsoft Teams or Skype for Business interface and IT administrators will appreciate an easily deployed and managed Windows 10 Teams Rooms app. Microsoft Teams Rooms is designed to leverage existing equipment for ease of installation to bring Microsoft Teams or Skype for Business into your meeting room.

Collecting logs on Microsoft Teams Rooms

You can collect logs via Teams admin center. In Teams admin center, navigate to Devices\Teams Rooms on Windows. From this page, click on the display name for which you want to download logs. In the top panel, click on "Download device logs". You will be prompted with a notice. Click "Got it". After a few minutes, the logs will be ready for download in the History tab.

You can also use PowerShell to collect logs. You must invoke the log collection script that ships with the Microsoft Teams Rooms app. In Admin mode, start an elevated command prompt, and issue the following command:

```
powershell -ExecutionPolicy unrestricted c:\rigel\x64\scripts\provisioning\ScriptLaunch.ps1  
CollectSrsV2Logs.ps1
```

The logs will be output as a ZIP file in c:\rigel.

Front of Room Display Settings

Configure the settings of your Front of Room display(s) to support Consumer Electronics Control(CEC) or enable PC Mode.

If you desire a front of room display to automatically switch to Teams Rooms when it wakes from standby mode, certain conditions must be met. This feature is optional but supported by Microsoft Teams Rooms software, provided underlying hardware supports the feature. A consumer TV used as a front of room display needs to support the Consumer Electronics Control (CEC) feature of HDMI. Depending on the dock or console selected (which might not support CEC, refer to manufacturer support documentation), a controller such as an [HD-RX-201-C-E](#) from Crestron or [Extron HD CTL 100](#) from Extron may be needed to enable the desired behavior.

Microsoft Teams Rooms Reset (Factory Restore)

If Microsoft Teams Rooms isn't running well, performing a factory reset might help. To do this, use the [Microsoft Teams Room recovery tool](#) and follow the factory restore instructions.

NOTE

There is a known issue where the Microsoft Teams Rooms can become unusable if the **Keep my files - Removes Apps and settings, but keeps your personal files** option is selected during the Windows Reset process. Do *not* use this option.

Supported Remote Options

The following table summarizes the possible remote operations and the methods you can use to accomplish them.

WORKGROUP	NOT DOMAIN JOINED	DOMAIN JOINED
Restart	Teams admin center Remote desktop Remote Powershell	Remote desktop (requires further configuration) Remote Powershell (requires further configuration) Configuration Manager
Update OS	Windows Update	Windows Update WSUS
App update	Windows Store	Windows Store Configuration Manager
Account Config	Teams admin center	Teams admin center
Access logs	Teams admin center PowerShell	Teams admin center PowerShell

Configuring Group Policy for Microsoft Teams Rooms

This section covers system settings that Microsoft Teams Rooms depends on to function properly.

Joining Teams Rooms to an Active Directory domain provides the following benefits:

- Domain-joining Teams Rooms enables you to grant domain users and groups administrative rights. By doing so, you will not have to remember the local machine level administrator account password.
- You can deploy Windows Quality of Service configuration to Teams Rooms.
- If using Skype for Business, Domain-joining the Teams Rooms helps in importing your organization's private root certificate chain automatically.

When you join Teams Rooms to a domain, it is required that you create a separate Organizational Unit (OU), so that you can provide Group Policy Object (GPO) exclusions to the OU where all Teams Rooms objects reside. Disable all GPO inheritance so that unsupported Group Policy settings do not get applied to Teams Rooms. Create machine objects in the OU before joining Teams Rooms to the domain to assure that Group Policies applied to the default computers OU are not applied.

NOTE

Even if you create a separate OU and block inheritance, there are some group policies which could cause issues if they have No Override set. A Group Policy with No Override set beats an OU with Block Policy Inheritance set.

Many organizations have the following GPOs, which affect Teams Rooms functionality. Ensure that you override or block the inheritance of these:

- Timeout of logon sessions (auto logout)
- Power management related policies
- Requiring additional authentication steps
- Denying access to local drives
- Prompting users for slow network connections
- Start a certain program at logon
- Create another domain user account on all domain-joined machines.
- Push Windows Update to Teams Rooms

When joining Microsoft Teams Rooms to a domain, ensure that your group policies don't override the settings in the following table.

SETTING	ALLOWS
HKLM\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon AutoAdminLogon = (REG_SZ) 1	Enables Microsoft Teams Rooms to boot up
Power Management -> On AC, turn screen off after 10 minutes Power Management -> On AC, never put system to sleep	Enables Microsoft Teams Rooms to turn off attached displays and wake up automatically
net accounts /maxpwage:unlimited Or equivalent means of disabling password expiration on the local account. Failure to do this will eventually cause the Skype account to fail logon complaining about an expired password. Note that this impacts all local accounts on the machine, and thus failure to set this will also cause the administrative account on the box to eventually expire as well.	Enables Skype account to always log in

NOTE

When Microsoft Teams Rooms is compatible with the next version of Windows 10 OS, Teams Rooms automatically updates to the next version through Windows Update. Microsoft Teams Rooms should not be upgraded to the next release of Windows 10 manually or via enabling Windows Update for Business (WUFB) group policies "Select the Windows readiness level for the updates you want to receive" and "Select when Preview Builds and Feature Updates are received" through GPO. Teams Rooms with these group policies enabled is known to run into issues with Windows 10 OS updates.

Remote Management using PowerShell

You can perform the following management operations remotely by using PowerShell (see the table below for script samples):

- Get attached devices

- Get app status
- Get system info
- Reboot system
- Retrieve logs
- Transfer files (requires a domain-joined Microsoft Teams Rooms)

NOTE

This functionality is off by default. You need to enable remote PowerShell for your environment on the Microsoft Teams Rooms system to perform the operations below. Refer to the documentation on [Enable-PSRemoting](#) for information about how to enable remote PowerShell.

For example, you can enable Remote PowerShell as follows:

1. Sign in as Admin on a Microsoft Teams Rooms device.
2. Open an elevated PowerShell command prompt.
3. Enter the following command: `Enable-PSRemoting -SkipNetworkProfileCheck -Force`
4. Open the Local Security Policy and add the *Administrators* security group to **Security Settings > Local Policies > User Rights Assignment > Access this computer from the network**.

To perform a management operation:

1. Sign in to a PC with account credentials that have permission to run PowerShell commands on a Microsoft Teams Rooms device.
2. Open a regular PowerShell command prompt on the PC.
3. Copy the command text from the table below and paste it at the prompt.
4. Replace `<Device fqdn>` fields with FQDN values appropriate to your environment.
5. Replace `<path>` with the file name and local path of the master SkypeSettings.xml configuration file (or Theme image).

To Get Attached Devices

```
invoke-command {Write-Host "VIDEO DEVICES:"
gwmi -Class Win32_PnPEntity | where {$_.PNPClass -eq "Image"} | Format-Table Name,Status,Present; Write-Host
"AUDIO DEVICES:"
gwmi -Class Win32_PnPEntity | where {$_.PNPClass -eq "Media"} | Format-Table Name,Status,Present; Write-Host
"DISPLAY DEVICES:"
gwmi -Class Win32_PnPEntity | where {$_.PNPClass -eq "Monitor"} | Format-Table Name,Status,Present} -
ComputerName <Device fqdn>
```

Get App Status

```
invoke-command { $package = get-appxpackage -User Skype -Name Microsoft.SkypeRoomSystem; if ($package -eq
$null) {Write-host "SkypeRoomSystems not installed."} else {write-host "SkypeRoomSystem Version : "
$package.Version}; $process = Get-Process -Name "Microsoft.SkypeRoomSystem" -ErrorAction SilentlyContinue;
if ($process -eq $null) {write-host "App not running."} else {$process | format-list StartTime,Responding}}
-ComputerName <Device fqdn>
```

Get System Info

```
invoke-command {gwmi -Class Win32_ComputerSystem | Format-List
PartOfDomain,Domain,Workgroup,Manufacturer,Model
gwmi -Class Win32_Bios | Format-List SerialNumber,SMBIOSBIOSVersion} -ComputerName <Device fqdn>
```

Reboot System

```
invoke-command { Shutdown /r /t 0 } -ComputerName <Device fqdn>
```

Retrieve Logs

```
$targetDevice = "<Device fqdn> "  
$logFile = invoke-command {$output = Powershell.exe -ExecutionPolicy Bypass -File  
C:\Rigel\x64\Scripts\Provisioning\ScriptLaunch.ps1 CollectSrsV2Logs.ps1  
Get-ChildItem -Path C:\Rigel\*.zip | Sort-Object -Descending -Property LastWriteTime | Select-Object -First  
1} -ComputerName $targetDevice  
$session = new-ssession -ComputerName $targetDevice  
Copy-Item -Path $logFile.FullName -Destination .\ -FromSession $session; invoke-command {remove-item -force  
C:\Rigel\*.zip} -ComputerName $targetDevice
```

Push an XML configuration file (or theme graphic)

```
$movefile = "<path>";  
$targetDevice = "\\<Device fqdn>  
\Users\Skype\AppData\Local\Packages\Microsoft.SkypeRoomSystem_8wekyb3d8bbwe\LocalState\SkypeSettings.xml";  
Copy-Item $movefile $targetDevice
```

Software updates

By default, Microsoft Teams Rooms attempts to connect to the Windows Store to get the latest version of Microsoft Teams Rooms software. Therefore, Teams Rooms requires regular internet access. Before contacting Microsoft with support issues, be sure Microsoft Teams Rooms is loaded with the latest version of the app.

Microsoft Teams Rooms connects to Windows Update to retrieve operating system and peripheral device firmware updates. Teams Room is configured to install them starting at 2:00AM local time.

If you must manage updates manually due to limitations in accessing Windows store, and are therefore unable to follow the normal procedure for [Microsoft Store for Business](#) to [Distribute offline apps](#), you can acquire the appropriate APPX file and dependencies from the [deployment kit](#) (from the instructions to [Configure a Microsoft Teams Rooms console](#)) that can be used with Configuration Manager. The deployment kit release lags behind the store release, so it might not always match the latest available build.

To update using Powershell

1. Extract the package from the installation [MSI](#) to a share the device can access.
2. Run the following script targeting the Microsoft Teams Rooms devices, changing <share> to the device share as appropriate:

```
Add-AppxPackage -Update -ForceApplicationShutdown -Path '\\  
<share>\$oem$\$1\Rigel\x64\Ship\AppPackages\*\*.appx' -DependencyPath (Get-ChildItem '\\  
<share>\$oem$\$1\Rigel\x64\Ship\AppPackages\*\Dependencies\x64\*.appx' | Foreach-Object  
{$_ .FullName})
```

Admin mode and device management

Some management functions, like manually installing a private CA certificate, require placing Teams Rooms in Admin mode.

Switching to Admin mode and back when the Microsoft Teams Rooms app is running

1. Hang up any ongoing calls, and return to the home screen.
2. Select the Gear icon and bring up the menu (options are **Settings**, **Accessibility**, and **Restart Device**).
3. Select **Settings**.
4. Enter the Administrator password. The Setup screen will appear. If the device isn't domain-joined, the local administrative account (username "Admin") will be used by default. The default password for this account is 'sfb'. Change this password as soon as possible. If the machine is domain-joined, you can sign in with an appropriately privileged domain account.
5. Select **Windows Settings** in the left column.
6. Log in to the desktop with your administrative credentials. You'll have the necessary privileges to manage the device.
7. Perform the necessary administrative tasks.
8. Restart the machine when you're finished.

The console is now back in its normal operation mode. The following procedure requires you to attach a keyboard to the device if one is not already attached.

Switching to Admin Mode and back when the Microsoft Teams Rooms app crashes

1. Press the Windows key five times in rapid succession. This will bring you to the Windows logon screen.
2. Log in to the desktop with your administrative credentials.
3. Perform the necessary administrative tasks.
4. Restart the machine when you're finished.

NOTE

This method doesn't log the Skype user off or gracefully terminate the app, but you'd use it if the app wasn't responding and the other method wasn't available.

The console restarts into its normal operation mode, running the Microsoft Teams Rooms app. You can remove the keyboard, if you attached one to complete this procedure.

Troubleshooting tips

- Meeting invitations might not appear when sent across domain boundaries (for example, between two companies). In such cases, IT admins should decide whether to allow external users to schedule a meeting. See the article for the Exchange PowerShell cmdlet [Set-CalendarProcessing](#), specifically the 'ProcessExternalMeetingMessages' parameter.
- Microsoft Teams Rooms doesn't support Exchange AutoDiscover redirects via Exchange 2010.
- In general, it's a good practice for IT admins to disable any audio endpoints they don't intend to use.
- In the event that a mirror image is displayed in room preview, the IT admin can correct by cycling camera power or flipping the image orientation using the camera settings.
- Loss of console touchscreen access has been known to occur. In such cases, the issue is sometimes resolved by restarting Teams Rooms.
- Loss of local audio when connecting a PC to console via wired ingest has been known to occur. In such cases, restarting the PC can resolve the local audio playback issue.

Known issues

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article lists the known issues for Microsoft Teams Rooms, by feature area.

Update

ISSUE TITLE	BEHAVIOR / SYMPTOM	KNOWN WORKAROUND	KB ARTICLE
Application not launching	After updating to application version 4.4.41.0, the system boots to black screen, or go to the logon screen after few minutes.	Follow the steps in Microsoft Teams Rooms application does not start after update to version 4.4.41.0 to fix this issue.	None
Low meeting volume after content sharing	Microsoft Teams Rooms devices on Windows 10 20H2 experience decreased media and meeting volume after sharing content via in-room HDMI. This is caused by an audio issue in Windows 10 20H2.	The fix for this issue is available in application version 4.9.12.0 .	None
App out of date	The Microsoft Teams Rooms console shows a "system config out of date" error.	Use the Microsoft Teams Rooms recovery tool	None

ISSUE TITLE	BEHAVIOR / SYMPTOM	KNOWN WORKAROUND	KB ARTICLE
Device updated to unsupported version of Windows 10	Windows 10 device updated from version 1803 to version 1809, which is not supported. The supported version is 1903.	<p>This can happen if the Group Policy or MDM setting for DeferFeatureUpdatesPeriodInDays setting, which lets you defer feature updates for a specified number of days, is set to the maximum of 365 days.</p> <p>Windows 10 version 1809 isn't supported with Microsoft Teams Rooms, while version 1903 is supported. However, as of March 27, 2020, version 1809 is over 365 days old. If this setting isn't changed, Windows attempts to install version 1809, which may cause issues with Microsoft Teams Rooms.</p> <p>To avoid this situation, remove any Group Policy or MDM setting for deferring updates. This allows Windows to update to the latest, supported OS version.</p> <p>IMPORTANT The Group Policy or MDM setting must be removed (left unconfigured) and not set to 0. If the policy is set to 0, Windows takes the latest available version which may not be supported.</p>	None

User interface

ISSUE TITLE	BEHAVIOR / SYMPTOM	KNOWN WORKAROUND	KB ARTICLE
Virtual keyboard missing	The virtual keyboard doesn't appear when you need to enter information in Microsoft Teams Rooms. This issue occurs in Windows 10, version 1903.	Install 2020-04 Cumulative Update for Windows 10, version 1903 for x64-based Systems through Windows Updates.	None

Hardware

ISSUE TITLE	BEHAVIOR / SYMPTOM	KNOWN WORKAROUND	KB ARTICLE
-------------	--------------------	------------------	------------

ISSUE TITLE	BEHAVIOR / SYMPTOM	KNOWN WORKAROUND	KB ARTICLE
Monitors not detected	When you run Microsoft Teams Rooms on a Surface Pro (Model 2017) device, monitors are not detected.	Hold down the Surface Pro power button for 20 or more seconds. When you do this, the device restarts and clears the graphics cache.	KB4055681

Limitations and expected behaviors

Microsoft Teams Rooms does not support HDCP input, which has been observed to cause issues with HDMI ingest functionality (video, audio). Take care to ensure that switches connected to Microsoft Teams Rooms have HDCP options turned off.

If you desire a front of room display to automatically switch to an active video source (such as an MTR console) when the source wakes from standby mode, certain conditions must be met. This feature is optional but supported by Microsoft Teams Rooms software, provided underlying hardware supports the feature. A consumer TV used as a front of room display needs to support the Consumer Electronics Control (CEC) feature of HDMI. Depending on the dock or console selected (which might not support CEC, refer to manufacturer support documentation), a controller such as an [HD-RX-201-C-E](#) from Crestron or [Extron HD CTL 100](#) from Extron may be needed to enable the desired behavior.

In addition, a consumer TV used as the front of room display may cause stability issues with Microsoft Teams Rooms software. This is due to inconsistent implementation of standby modes, active video source selection, and communicating faulty EDID information to the Microsoft Teams Rooms device. Known symptoms are a black/gray screen on the front of room display or the Microsoft Teams Rooms console becoming unresponsive after waking from standby. If experiencing issues when using consumer TVs, we recommend installing a configurable EDID controller or EDID emulator such as the [HD-RX-201-C-E](#) from Crestron or [DR-EDID Emulator](#) from FSR Video Products Group.

Always use a wired 1-Gbps network connection to assure you have the needed bandwidth.

If your Microsoft Teams Rooms device loses trust with the domain, you won't be able to authenticate into the device and open up Settings. For example, if you remove the Microsoft Teams Rooms from the domain after it is domain joined, trust is lost. The workaround is to log in with the local Admin account.

Microsoft Teams Rooms is a multi-window application and requires a front of room display to be connected to the HDMI port of the device, for the app to function correctly. Make sure that you either have an HDMI display connected or use a dummy HDMI plug if you are testing and do not have a display purchased yet.

[Manage Microsoft Teams Rooms](#)

Manage Microsoft Teams Rooms devices with Azure Monitor

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article discusses how to manage Microsoft Teams Rooms devices in an integrated manner using Azure Monitor.

You can configure Azure Monitor to provide basic telemetry to help you manage Microsoft Teams meeting rooms devices. See [Plan Microsoft Teams Rooms management with Azure Monitor](#) and [Deploy Microsoft Teams Rooms management with Azure Monitor](#) for details. As your management solution matures, you can use additional data and management capabilities to create a more detailed view of device performance.

Understand the log entries

The following event descriptions are inserted into the event log description field every five minutes, when the Microsoft Teams Rooms app records the corresponding information in the Windows event log. The Microsoft Monitoring Agent passes these records to Log Analytics in Azure Monitor, which parses them into the dashboard you created in [Deploy Microsoft Teams Rooms management with Azure Monitor](#). With the dashboard, you can look at individual log entries to determine courses of action if needed.

Event IDs 2000 and 3000 indicate that the device in question is working as expected. Event IDs 2001 and 3001 indicate that an issue was found. Event ID 4000 may require action if seen more often than you expect, compared to a baseline you set or to other deployed devices in your organization.

Understanding these event descriptions alerts you to problems quickly, and provides a starting point for further troubleshooting.

EVENT ID LEVEL	EVENT BEHAVIOR	EVENT DESCRIPTION
2000 Information	<p>This is a healthy heartbeat event. Every 5 minutes, Microsoft Teams Rooms checks that it is signed in to Microsoft Teams or Skype for Business and has network and Exchange connectivity.</p> <p>If all 3 factors are true, it writes Event ID 2000 into the event log every 5 minutes until the device is offline or one or more of the conditions is no longer met.</p>	<pre>{"Description": "Heartbeat is healthy.", "ResourceState": "Healthy", "OperationName": "Heartbeat", "OperationResult": "Pass", "OS": "Windows 10", "OSVersion": "10.0.14393.693", "Alias": "alias@contoso.com", "DisplayName": "Display name", "AppVersion": "1.0.38.0", "IPv4Address": "10.10.10.10", "IPv6Address": "IP v6 address"}</pre> <p>In this example, all heartbeat conditions were met and the Microsoft Teams Rooms device was marked as healthy. If there were errors, the app would record Event ID 2001 instead.</p>

EVENT ID LEVEL	EVENT BEHAVIOR	EVENT DESCRIPTION
<p>2001 Error</p>	<p>This is an app error event. Every 5 minutes, Microsoft Teams Rooms checks that it is signed in to Microsoft Teams or Skype for Business with network and Exchange connectivity. If one or more factors are not true, it writes EventID 2001 into the event log every 5 minutes until the device is offline or all conditions are met once again.</p>	<div data-bbox="1034 197 1417 539"> <pre>{ "Description": "Network status : Healthy. Exchange status : Connected. Signin status: Unhealthy. ", "ResourceState": "Unhealthy", "OperationName": "Heartbeat", "OperationResult": "Fail", "OS": "Windows 10", "OSVersion": "10.0.14393.693", "Alias": "", "DisplayName": "Display Name", "AppVersion": "1.0.38.0", "IPv4Address": "10.10.10.10", "IPv6Address": "ip v6 address" }</pre> </div> <p>In this example, Microsoft Teams Rooms determined that the network connection was healthy and the app was connected to Exchange, but the bolded portion indicates that the app is not connected. This could be a configuration issue on the device or host.</p> <p>The Network status shows as either Healthy or Unhealthy. If the status is unhealthy, you may have a network issue or the device may have been unplugged (but then you would probably also have Exchange and Microsoft Teams or Skype for Business errors).</p> <p>The Exchange Status shows as either Connected or one of the following: Disconnected, Connecting, AutodiscoveryError (the most commonly seen error), GeneralError, or ServerVersionNotSupported. If the status is Connecting, wait until the next health message is sent, for other errors refer the issue to an admin with experience in solving Exchange issues.</p> <p>The <i>Signin status</i> (indicating the app is signed in) shows as either <i>Healthy</i> or <i>Unhealthy</i>. If the status is unhealthy, send a technician to investigate further.</p>

EVENT ID LEVEL	EVENT BEHAVIOR	EVENT DESCRIPTION
3000 Information	This event verifies that a hardware check was run and found to be healthy. Every 5 minutes Microsoft Teams Rooms checks that configured hardware components such as front of room display, microphone, speaker, and camera are connected and functioning. If all components are healthy, it writes EventID 3000 into the event log. This event is written every 5 minutes unless there is an issue with a connected device.	<pre>{ "Description": "HardwareCheckEngine is healthy.", "ResourceState": "Healthy", "OperationName": "HardwareCheckEngine", "OperationResult": "Pass", "OS": "Windows 10", "OSVersion": "10.0.14393.693", "Alias": "alias@contoso.com", "DisplayName": "Display Name", "AppVersion": "1.0.38.0", "IPv4Address": "10.10.10.10", "IPv6Address": "ip v6 address" }</pre> <p>In this example, all hardware checks were passed. If there were errors, the app would record Event ID 3001 instead.</p>
3001 Error Event	This is a hardware error event. The Microsoft Teams Rooms app has a process that checks the health of connected hardware components (front of room, microphone, speaker, camera) every 5 minutes. If one or more of the components are unhealthy, it writes EventID 3001 into the event log. This event is written every 5 minutes until the issue with the device is fixed.	<pre>{ "Description": "Front of Room Display status : Unhealthy. Configured display count is 2. Real display count is 0. Conference Microphone status : Unhealthy. Conference Speaker status : Healthy. Default Speaker status : Healthy. Camera status : Healthy.", "ResourceState": "Unhealthy", "OperationName": "HardwareCheckEngine", "OperationResult": "Fail", "OS": "Windows 10", "OSVersion": "10.0.14393.1198", "Alias": "alias@contoso.com", "DisplayName": "Yosemite conference room", "AppVersion": "2.0.58.0", "IPv4Address": "10.10.10.10", "IPv6Address": "IPv6Address", "IPv4Address2": "10.10.10.10" }</pre> <p>Hardware peripherals are shown as either Healthy or Unhealthy. In this example, there are two <i>front of room</i> displays configured, and currently neither of them is available. The <i>Conference Microphone status</i> is <i>unhealthy</i>, which could have several possible causes. Since at least one resource did not pass the check, the ResourceState is listed as Unhealthy. Send a technician to investigate further.</p>

EVENT ID LEVEL	EVENT BEHAVIOR	EVENT DESCRIPTION
4000 Information	This is an App Restart event. Every time the app is restarted, it will log this event into the Windows event log.	<pre>{ "Description": "App restarts.", "ResourceState": "Healthy", "OperationName": "Restart", "OperationResult": "Pass", "OS": "Windows 10", "OSVersion": "10.0.14393.693", "Alias": "alias", "DisplayName": "Display Name", "AppVersion": "1.0.38.0", "IPv4Address": "10.10.10.10", "IPv6Address": "ip v6 address" }</pre> <p>The app may restart for various reasons. Compare the restart frequency of devices in the same building and in different buildings. Keep in mind known issues like power fluctuations and failures, as this may provide clues to infrastructure problems.</p>

Manage a Microsoft Teams Rooms console settings remotely with an XML configuration file

12/7/2021 • 11 minutes to read • [Edit Online](#)

This article discusses remote management of the default settings used by a Microsoft Teams Rooms device, including applying a custom theme. It discusses how to create a master settings file, and links to discussions of how to place them as needed on the remotely managed devices.

It is possible for you to change default settings of remotely managed devices by updating a master XML file and sending copies to the managed consoles. You can also implement Custom Themes on your Microsoft Teams Rooms consoles with XML configuration files.

Create an XML configuration file

Any text editor can be used to create a settings file. The **XML Elements** table explains the elements shown in this sample SkypeSettings.xml (required file name) configuration file.

```

<SkypeSettings>
  <AutoScreenShare>1</AutoScreenShare>
  <HideMeetingName>1</HideMeetingName>
  <AutoExitMeetingEnabled>true</AutoExitMeetingEnabled>
  <AudioRenderDefaultDeviceVolume>70</AudioRenderDefaultDeviceVolume>
  <AudioRenderCommunicationDeviceVolume>30</AudioRenderCommunicationDeviceVolume>
  <UserAccount>
    <SkypeSignInAddress>username@microsoft.com</SkypeSignInAddress>
    <ExchangeAddress>username@microsoft.com</ExchangeAddress>
    <DomainUsername>domain\username</DomainUsername>
    <Password>Password!</Password>
    <ConfigureDomain>domain1, domain2</ConfigureDomain>
    <ModernAuthEnabled>true</ModernAuthEnabled>
  </UserAccount>
  <TeamsMeetingsEnabled>true</TeamsMeetingsEnabled>
  <SfbMeetingEnabled>true</SfbMeetingEnabled>
  <IsTeamsDefaultClient>true</IsTeamsDefaultClient>
  <WebExMeetingsEnabled>true</WebExMeetingsEnabled>
  <ZoomMeetingsEnabled>true</ZoomMeetingsEnabled>
  <UseCustomInfoForThirdPartyMeetings>true</UseCustomInfoForThirdPartyMeetings>
  <CustomDisplayNameForThirdPartyMeetings>guestname</CustomDisplayNameForThirdPartyMeetings>
  <CustomDisplayEmailForThirdPartyMeetings>guest@microsoft.com</CustomDisplayEmailForThirdPartyMeetings>
  <BluetoothAdvertisementEnabled>false</BluetoothAdvertisementEnabled>
  <AutoAcceptProximateMeetingInvitations>true</AutoAcceptProximateMeetingInvitations>
  <CortanaWakewordEnabled>true</CortanaWakewordEnabled>
  <DualScreenMode>0</DualScreenMode>
  <DuplicateIngestDefault>true</DuplicateIngestDefault>
  <DisableTeamsAudioSharing>true</DisableTeamsAudioSharing>
  <SendLogs>
    <EmailAddressForLogsAndFeedback>username@microsoft.com</EmailAddressForLogsAndFeedback>
    <SendLogsAndFeedback>True</SendLogsAndFeedback>
  </SendLogs>
  <Devices>
    <MicrophoneForCommunication>Device1</MicrophoneForCommunication>
    <SpeakerForCommunication>DeviceX</SpeakerForCommunication>
    <DefaultSpeaker>DeviceX</DefaultSpeaker>
    <ContentCameraId>Camera1</ContentCameraId>
    <ContentCameraEnhancement>true</ContentCameraEnhancement>
    <ContentCameraInverted>false</ContentCameraInverted>
  </Devices>
  <Theming>
    <ThemeName>Custom</ThemeName>
    <CustomThemeImageUrl>file name</CustomThemeImageUrl>
    <CustomThemeColor>
      <RedComponent>100</RedComponent>
      <GreenComponent>100</GreenComponent>
      <BlueComponent>100</BlueComponent>
    </CustomThemeColor>
  </Theming>
  <CoordinatedMeetings enabled="true">
    <TrustedAccounts>username1@microsoft.com,username2@contoso.com</TrustedAccounts>
    <Settings>
      <Audio default="true" enabled="true"/>
      <Video default="true" enabled="true"/>
      <Whiteboard default="true" enabled="true"/>
    </Settings>
  </CoordinatedMeetings>
</SkypeSettings>

```

If a variable value is of the wrong type, elements are out of order, elements are unclosed, or another error is found, the XML file is *badly formed*. While processing a badly formed XML file, settings found up to the point where the error occurs are applied, then the rest of the file is ignored. Any unknown elements in the XML are ignored. If a parameter is omitted, it remains unchanged on the device. If a parameter value is invalid, its prior value remains unchanged.

XML elements

ELEMENT	TYPE	LEVEL	USAGE
<SkypeSettings>	Container for all elements.		Required.
<AutoScreenShare>	Boolean ②	First ①	If true, auto screen share is enabled.
<HideMeetingName>	Boolean ②	First ①	If true, meeting names are hidden.
<UserAccount>	Container	First ①	Container for credentials parameters. The sign-in address, Exchange address, or email address are usually the same, such as RainierConf@contoso.com.
<SkypeSignInAddress>	String ②		The sign-in name for the console's SfB or Teams device account.
<ExchangeAddress>	String ③		The sign-in name for the console's Exchange device account. If the ExchangeAddress is omitted, the SkypeSignInAddress will not be reused automatically.
<DomainUsername>	String ②		The domain and user name of the console device, for example Seattle\RanierConf.
<Password>	String ③		The password parameter is the same password used for the Skype for Business device account sign-in.
<ConfigureDomain>	String ②		You can list several domains, separated by commas.
<ModernAuthEnabled>	Boolean ②		<p>Disabled by default.</p> <p>When set to true, the Microsoft Teams Rooms application only uses modern authentication to connect to resources and doesn't fall back to basic authentication.</p>

ELEMENT	TYPE	LEVEL	USAGE
<TeamsMeetingsEnabled>	Boolean ②	First ①	<p>Disabled by default.</p> <p>The XML file is considered badly formed if both <SkypeMeetingsEnabled> and <TeamsMeetingsEnabled> are disabled, but it's acceptable to have both settings enabled at the same time.</p>
<SfbMeetingEnabled>	Boolean ③	First ①	Disabled by default.
<IsTeamsDefaultClient>	Boolean ②	First ①	Enabled by default.
<WebExMeetingsEnabled>	Boolean ②	First ①	<p>Disabled by default.</p> <p>If true, enables direct guest join experience for Cisco Webex meetings.</p>
<ZoomMeetingsEnabled>	Boolean ②	First ①	<p>Disabled by default.</p> <p>If true, enabled direct guest join experience for Zoom meetings.</p>
<UseCustomInfoForThirdPartyMeetings>	Boolean ②	First ①	<p>Disabled by default and uses conference room account info to join third party meetings.</p> <p>If this value is set to true, you must specify both <CustomDisplayNameForThirdPartyMeetings>, <CustomDisplayEmailForThirdPartyMeetings> must be specified.</p>
<CustomDisplayNameForThirdPartyMeetings>	String ③	First ①	Specify guest name used to join third party meetings. Third party service will display this data in their experience and may store in their service.
<CustomDisplayEmailForThirdPartyMeetings>	String ③	First ①	Specify guest email used to join third party meetings. Third party service will display this data in their experience and may store in their service.
<BluetoothAdvertisementEnabled>	Boolean ②	First ①	Enabled by default.

ELEMENT	TYPE	LEVEL	USAGE
<AutoAcceptProximateMeetingInvitations>	Boolean ②	First ①	If true, proximity based meetings are automatically accepted. Disabled by default.
<AutoExitMeetingEnabled>	Boolean ②	First ①	If true, device will automatically leave the meeting if it is the last participant remaining in the meeting. Disabled by default.
<DualScreenMode>	Boolean ②	First ①	If true, dual screen mode is enabled. Otherwise the device uses single screen mode.
<DuplicateIngestDefault>	Boolean ②	First ①	If true, content is shown on both screens in dual screen mode, when out of meeting.
<DisableTeamsAudioSharing>	Boolean ②	First ①	Set to true to disable HDMI audio sharing to meeting participants in Teams meeting. The default is false.
<CortanaWakewordEnabled>	Boolean ②	First ①	Set to true to enable the Cortana wake word "Hey Cortana". This setting doesn't have any effect unless the Cortana service is supported in your country or region and your connected audio peripheral supports Cortana. The default is false.
<SendLogs>	Container	First ①	
<EmailAddressForLogsAndFeedback>	String ③		Sets an optional email address that logs can be sent to when the "Give Feedback" window appears.
<SendLogsAndFeedback>	Boolean ②		If true, logs are sent to the admin. If false, only feedback is sent to the admin (and not logs).

ELEMENT	TYPE	LEVEL	USAGE
<Devices>	Container	First ❶	The connected audio device names in the child elements are the same values listed in the Device Manager app. The configuration can contain a device that does not presently exist on the system, such as an A/V device not currently connected to the console. The configuration would be retained for the respective device.
<MicrophoneForCommunication>	String ❸		Sets the microphone used as the recording device in a conference.
<SpeakerForCommunication>	String ❸		Device to be used as speaker for the conference. This setting is used to set the speaker device used in a call.
<DefaultSpeaker>	String ❸		Device to be used to play the audio from an HDMI ingest source.
<ContentCameraId>	String ❸		Define the instance path for the camera configured in room to share analog whiteboard content in a meeting. See Locate the Content camera USB instance path .
<ContentCameraInverted>	Boolean ❷		Specify if the content camera is physically installed upside down. For content cameras that support automatic rotation, specify false.

ELEMENT	TYPE	LEVEL	USAGE
<ContentCameraEnhancement>	Boolean ②		<p>When set to true (the default), the content camera image is digitally enhanced: the whiteboard edge is detected and an appropriate zoom is selected, ink lines are enhanced, and the person writing on the whiteboard is made transparent.</p> <p>Set to false if you intend to send a raw video feed to meeting participants for spaces where a whiteboard is not drawn on with a pen and instead the camera is used to show sticky notes, posters, or other media.</p>
<Theming>	Container	First ①	One of the features that can be applied with an XML file is a Custom Theme for your organization. You are able to specify a theme name, background image, and color.
<ThemeName>	String ③		<p>Used to identify the theme on the client. The Theme Name options are Default, one of the provided preset themes, or Custom. Custom theme names always use the name <i>Custom</i>. The client UI can be set at the console to the Default or one of the presets, but use of a custom theme must be set remotely by an Administrator.</p> <p>Preset themes include:</p> <ul style="list-style-type: none"> Default Blue Wave Digital Forest Dreamcatcher Limeade Pixel Perfect Roadmap Sunset <p>To disable the current theme, use "No Theme" for the ThemeName.</p>

ELEMENT	TYPE	LEVEL	USAGE
<CustomThemeImageUrl>	String ③		Required for a custom theme, otherwise optional. Input the file name only. For more information on the custom theme image, see the Custom Theme Images section.
<CustomThemeColor>	Container		Container for the <RedComponent>, <GreenComponent>, and <BlueComponent> values. These values are required, but do not impact theme color. Please specify any value between 0-255.
<RedComponent>	Byte (0-255)		Represents the red color component.
<GreenComponent>	Byte (0-255)		Represents the green color component.
<BlueComponent>	Byte (0-255)		Represents the blue color component.
<CoordinatedMeetings>	Boolean ②	First ①	Container for the configuration elements for Coordinated Meetings. This element has one attribute: <ul style="list-style-type: none"> • enabled Determines whether Teams is configured to participate in Coordinated Meetings with other devices.
<TrustedAccounts>	String		This is a comma-separated list of UPNs for each Teams Room device or Surface Hub that the device should accept meeting join requests from, or to which meeting join requests should be sent.
<Settings>	Container		Container for the configuration audio and video configuration elements for Coordinated Meetings.

ELEMENT	TYPE	LEVEL	USAGE
<Audio>	Boolean ②		<p>Controls audio configuration on a Teams Rooms device. This element has two attributes:</p> <ul style="list-style-type: none"> default Determines on which device the microphone will be active when a meeting starts. Only one device (typically a Teams Rooms device) can have this field set to <code>true</code> while the rest of the devices must have this field set to <code>false</code> to avoid audio echo and feedback. enabled Determines whether participants in a meeting can toggle the microphone on or off. Devices on which Audio default is set to <code>false</code> should have this setting set to <code>false</code> so that participants can't accidentally turn on a microphone and cause audio echo or feedback. <p>If Audio default is set to <code>true</code>, the Audio enabled setting is ignored and participants can mute or unmute the microphone.</p>

ELEMENT	TYPE	LEVEL	USAGE
<Video>	Boolean ②		<p>Controls video configuration on a Teams Rooms device. This element has two attributes:</p> <ul style="list-style-type: none"> • default Determines on which device the camera will be active when a meeting starts. For the best experience, we recommend that only the Teams Rooms device be set to <code>true</code> while all other devices are set to <code>false</code>. • enabled Determines whether participants in a meeting can toggle the camera on or off. You can set this to <code>true</code> on any other devices in the event participants want to share different video perspectives (such as if a participant is using the Surface Hub whiteboard). If you don't want participants to turn a camera on or off on a device, set this to <code>false</code>. <p>If Video default is set to <code>true</code>, the Video enabled setting is ignored and participants can turn the camera on or off.</p>

ELEMENT	TYPE	LEVEL	USAGE
<Whiteboard>	Boolean ❷		<p>Controls whiteboard configuration on a Teams Rooms device. This element has two attributes:</p> <ul style="list-style-type: none"> • default Determines on which device the whiteboard will be active when a meeting starts. For the best experience, we recommend that the Teams Rooms device be set to <code>false</code> and that you use the whiteboard on a Surface Hub. • enabled Determines whether participants in a meeting can toggle the whiteboard on or off. If you don't want participants to turn the whiteboard on or off on a device, set this to <code>false</code>. <p>If Whiteboard default is set to <code>true</code>, the Whiteboard enabled setting is ignored and participants can turn the whiteboard on or off.</p>

❶ All of the first-level elements are optional. If a first-level element is omitted, all of its child parameters remain unchanged on the device.

❷ A boolean flag can be: true, false, 0, or 1. Leaving boolean or numeric values empty can render the XML malformed and prevent changes to the settings.

❸ If a string parameter is present and empty, and empty is a valid value, the parameter is cleared on the device.

Manage console settings with an XML configuration file

At startup, if a Microsoft Teams Rooms console finds an XML file named `SkypeSettings.xml` located at `C:\Users\Skype\AppData\Local\Packages\Microsoft.SkypeRoomSystem_8wekyb3d8bbwe\LocalState`, it applies the configuration settings indicated by the XML file then deletes the XML file.

Depending on how many Microsoft Teams Rooms devices your enterprise has and how you choose to manage to configure them, there are several ways to place the XML configuration file. Once the file is pushed to the console, restart it to process the configuration changes. The XML configuration file is deleted after it is successfully processed. The management methods suggested for Microsoft Teams Rooms devices are discussed

in:

- [Configuring Group Policy for Microsoft Teams Rooms](#)
- [Remote Management using PowerShell](#) and [Configure a File Item](#)

You are free to use any method you like so long as you can use it to transfer files and trigger a restart on the console device. The file must be readable, writable, and delete-able by the device's local user account. Preferably it is owned by and has full privileges granted to that user. If the file permissions are not set correctly, the software can fail to apply the settings, can fail to delete the file upon successful processing, and can even potentially crash.

Supported Meeting modes App version 4.9

SETTING NAME	XML NOTATION	XML VALUE
Skype for Business (default) and Microsoft Teams	<TeamsMeetingsEnabled>	True
	<SfbMeetingEnabled>	True
	<IsTeamsDefaultClient>	False
:----- -----	:-----	:-----
Skype for Business and Microsoft Teams (default)	<TeamsMeetingsEnabled>	True
	<SfbMeetingEnabled>	True
	<IsTeamsDefaultClient>	True
:----- -----	:-----	:-----
Skype for Business only	<TeamsMeetingsEnabled>	False
	<SfbMeetingEnabled>	True
	<IsTeamsDefaultClient>	False
:----- -----	:-----	:-----
Microsoft Teams only	<TeamsMeetingsEnabled>	True
	<SfbMeetingEnabled>	False
	<IsTeamsDefaultClient>	True
:----- -----	:-----	:-----

Supported Meeting modes App version 4.8 or lower

SETTING NAME	XML NOTATION	XML VALUE
Skype for Business (default) and Microsoft Teams	<TeamsMeetingsEnabled>	True
	<IsTeamsDefaultClient>	False
:----- -----	:-----	:-----
Skype for Business and Microsoft Teams (default)	<TeamsMeetingsEnabled>	True
	<IsTeamsDefaultClient>	True
:----- -----	:-----	:-----
Skype for Business only	<TeamsMeetingsEnabled>	False
	<IsTeamsDefaultClient>	False
:----- -----	:-----	:-----

Custom Theme Images

The custom theme image file must be placed in the

C:\Users\Skype\AppData\Local\Packages\Microsoft.SkypeRoomSystem_8wekyb3d8bbwe\LocalState folder. Enter the file name and extension in the <CustomThemeImageUrl> variable.

The image file should be exactly 3840X1080 pixels and must be one of the following file formats: jpg, jpeg, png, and bmp. If your organization wants a custom image, a graphic designer can use the [Custom Theme Photoshop Template](#). It contains further detail on where various user interface elements are relative to the rest of a theme image and what areas appear on consoles and displays.

The XML configuration file must be updated at device startup to recognize the theme image. Once the new XML file is processed and deleted, the theme graphic file is deleted from the directory.

Locate the Content camera USB instance path

To locate the instance path:

1. Go into Windows settings on the Microsoft Teams Rooms console.
2. Enter the admin password.
3. From a Command Prompt, type `devmgmt.msc` to bring up Device Manager.
4. In **Device Manager**, look in the **Imaging devices** node and locate the content camera.
5. Right-click the camera, and open **Properties**.
6. Select the **Details** tab, and locate the **Device instance path** property in the drop-down.
7. The value shown is the device instance path to set in the XML configuration file. When specifying the path in XML, replace the ampersand (&) with `&`.

Use the Microsoft Teams Rooms recovery tool

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article discusses how to use the recovery tool for Microsoft Teams Rooms, which you would use to bring an out of date system into a supported state. This tool should be applied when either the Microsoft Teams Rooms console shows a "system config out of date" error, or prior to performing a push button reset [factory restore](#).

Prerequisites

Download the latest [Microsoft Teams Rooms installation package](#) and extract it to a USB memory stick or network share accessible to the Microsoft Teams Rooms device.

NOTE

Extracting the files from the MSI can be accomplished by many means. Any mechanism that extracts all the files and preserves their directory structure is acceptable. One such way is to use the command

`msiexec /a PathToMsi /qb TARGETDIR=PathToTarget` where `PathToMsi` represents the full path to the Microsoft Teams Room installation package, and `PathToTarget` represents the full path to the folder you would like the files extracted to.

Running the tool

1. Sign in to the admin account on your Microsoft Teams Rooms device, and launch an elevated command prompt.
2. Verify from the Microsoft Teams Rooms device that you are able to access the `RecoveryTool.ps1` file, which is included in the files extracted from the Microsoft Teams Rooms installation package. The kit can be found on the network share or USB drive used when preparing prerequisites.
3. Run `powershell.exe -ExecutionPolicy Unrestricted -File "<path to RecoveryTool.ps1>"`.
4. To perform a factory restore:
 - a. When prompted by the script select option 2: **Reset**.
 - b. If BitLocker is on, follow the instructions provided at the end of the script output to disable it.
 - c. Perform the factory restore.
 - a. Open the **Settings** app, and select **Update & Security**
 - b. Navigate to the **Recovery** tab.
 - c. Beneath **Reset this PC**, select **Get started**
 - d. Select **Remove everything**, then **Next** and **Reset**

WARNING

The Microsoft Teams Rooms device can become unusable if the **Keep my files - Removes Apps and settings, but keeps your personal files** option is selected during the Windows Reset process. Do not select this option. 5. The system will reboot multiple times. When the reset is complete, the system will be at the Windows "out of box experience" (OOBE) screen.

Microsoft Teams Rooms managed service

12/7/2021 • 6 minutes to read • [Edit Online](#)

The Microsoft Teams Rooms managed service is a cloud-based IT management and monitoring service that keeps Microsoft Teams Rooms devices and their peripherals up to date and proactively monitored, supporting an environment optimized for a great user experience.

The Microsoft Teams Rooms managed service is for organizations looking to improve their meeting room experience and rapidly scale their footprint by offering proactive management for Microsoft Teams Rooms devices. The service allows organizations to save time, money, and expertise that would otherwise be spent on "do it yourself" room management.

The Microsoft Teams Rooms managed service is built on a strong foundation of Microsoft's expertise in software-enabled management of end points, machine learning, and intelligent automation. The Microsoft Teams Rooms managed service helps organizations deliver a high-quality experience across multiple remote sites and can accommodate any pace of growth an organization might require.

Service capabilities

Here's an overview of the capabilities of the Microsoft Teams Rooms managed service.

CAPABILITIES	DESCRIPTION
Room planning and rollout	Room planning capabilities that allow you to understand your room equipment inventory and make decisions on equipment standards for new room deployments.
Monitoring and troubleshooting	Room health monitoring that detects problems with the room system and peripherals and provides a proactive incident management response driven by Microsoft.
Update management	Management and delivery of application and firmware updates for room systems and their peripherals performed by Microsoft.
Insights and recommendations	Insights into customer health, usage, utilization, and equipment reliability.
Compliance and certifications	Meets all applicable standards for Microsoft Online Services.
Customer support	24x7x365 ticket support through the dedicated Microsoft Teams Rooms managed service Service Operation Center (SOC). Escalation on your behalf to other primary vendors when applicable. To learn more, see Customer support .
Supported devices	Certified Microsoft Teams Rooms systems and their peripherals. <i>Surface Hub support coming in the second half of 2021</i>
Supported regions	See Supported regions .
Integration	Available integration with customer-hosted Service Now.

Service features

Here's a summary of important features the Microsoft Teams Rooms managed service provides to support the above capabilities.

FEATURE	DESCRIPTION
Inventory management	Room inventory tracking with a bulk export option that lists room devices, peripherals, makes, and models.
Room enrollment	Easy onboarding with self-enrollment of room devices to the Microsoft Teams Rooms managed service.
Room administration	Customer portal for managed service capabilities, insights, administrative settings, and room group management.
Monitoring	Application, operating system, peripheral and firmware health monitoring. Automated incident detection for issues affecting meeting experiences due to issues such as peripheral health. Health overview of the entire room real estate and incidents through the Microsoft Teams Rooms managed service portal.
Troubleshooting and remediation	Automated diagnostics and auto-remediation where applicable. Microsoft Teams Rooms managed service SOC-assisted incident remediation for non-automated cases. Service Now integration for incident coordination.
Update management	Automated meeting application and firmware update orchestration based on customer configurable deployment rings
Insights and recommendations	Usage, incidents, health, and overall reporting (historical views)

Service prerequisites

For the Microsoft Teams Rooms managed service to maintain service quality, enrolled rooms must be [Microsoft Teams Rooms supported devices](#), and you must prepare your environment with all the [required Office 365 URLs and IP address ranges](#) fully allowed and reachable by meeting room devices. To learn more, see [Prepare your environment](#) in the Microsoft Teams Rooms documentation.

As provider of a managed service, Microsoft needs to work with responsible stakeholders for rooms in your organization to keep rooms healthy and recover from issues. You're responsible for uncertified devices used in meeting rooms, third-party or custom software that you've chosen to deploy in your meeting room devices, and adhering to change management practices recommended by Microsoft.

Your organization or a partner contracted by your organization must be prepared to remediate last mile issues detected by the service.

Customer support

The Microsoft Teams Rooms managed service is supported through a dedicated Microsoft Teams Rooms managed service SOC. The primary mode for communication from the Microsoft Teams Rooms managed service SOC to customers is through the Microsoft Teams Rooms managed service portal. The Microsoft Teams Rooms managed service SOC provides first response and appropriate escalation on tickets raised by the system

or by your organization.

	DESCRIPTION
Scope	Incidents related to the meeting room app, room devices, and peripherals are included in Microsoft Teams Rooms managed service support.
Audience	IT Operations only
Supported languages	English
Support availability through the portal	24X7
Initial response time for the Microsoft Teams Rooms managed service SOC	4 hours
Automated closure of tickets in cases of customer inactivity	Customer-initiated tickets: 3 business days System-initiated tickets: 15 business days
Redirection to broader Microsoft Support	Issues related to another Microsoft product outside the scope of the Microsoft Teams Rooms managed service are directed to the appropriate support team.
Redirection to Original Equipment Manufacturer (OEM) support	The Microsoft Teams Rooms managed service SOC works to understand the issue and where applicable, helps coordinate support with the OEM. In some cases, you may be responsible for engaging directly with your OEM.

Additionally, keep in mind that the Microsoft Teams Rooms managed service SOC will assist IT Operations in your organization and isn't a replacement for help desk services for your end users.

For more details on the Microsoft Teams Rooms managed service support coverage, see [Support inclusions and exclusions](#).

Supported regions

The Microsoft Teams Rooms Premium license is available in all countries and regions where Microsoft 365 is available. For a complete list of countries and regions, see [Microsoft 365 international availability](#).

Support inclusions and exclusions

WHAT'S INCLUDED	WHAT'S EXCLUDED	SUPPORT CHANNELS FOR EXCLUDED ITEMS
Service configuration		
Investigation and guidance for Microsoft Teams Rooms Windows configuration including Microsoft Teams Rooms app settings, first-party network configuration, first-party software setup, and recommended power settings and configuration.	Any third-party software configurations and investigations that aren't directly part of the Microsoft Teams Room app. Also, any OEM-specific configurations that require configuration outside of first-party windows, or Microsoft Teams Room app settings.	Third-party standard support channels

WHAT'S INCLUDED	WHAT'S EXCLUDED	SUPPORT CHANNELS FOR EXCLUDED ITEMS
Room account setup		
Direction to available documentation for room account setup at request. For sign-in or account configuration issues, initial investigation is performed.	Execution of recommended remediation or issues with executing recommended remediation, configuration of third-party authentication providers, and configuration of individual-account features.	Microsoft mainstream support and third-party authentication provider support
Peripheral support		
Initial investigations are performed for certified peripherals such as cameras, microphones, and speakers.	Issues that aren't resolved by applying standard configurations or that involve a third-party application.	OEM support
RMA and device replacement		
Initial investigations are performed for certified peripherals such as cameras, microphones, and speakers. Handoff to OEM support is performed for the OEM to fulfill the replacement or warranty request.	Procurement, shipping, or installation of replacements.	OEM support
Root cause analysis		
All root causes for issues encountered in the meeting room experience are provided when available but are performed on an as-able basis.	Root cause analysis for third-party software issues isn't included.	Third-party standard support channels
Meeting experience		
Investigating issues within the meeting settings on Microsoft Teams Rooms app and guidance for properly configuring Quality of Service on the device is provided at request.	Root cause analysis or investigations for call-quality issues or network-related issues are excluded from this scope.	Microsoft mainstream support
Remediation, onboarding, and ongoing		
Customers receive guidance to bring their rooms to standards that are recommended by Microsoft Teams Rooms managed service at onboarding	Investigations with respect to in-house custom software images or non-compliant with recommended software version guidance from Microsoft Teams Rooms managed service aren't in scope.	

Data collection

The Microsoft Teams Rooms managed service monitors devices, collects device data, and allows Microsoft to remotely access and manage room devices. The Microsoft Teams Rooms managed service doesn't access the

live content of a meeting.

Data collected is specific to a room account, not an individual user. Incidental references to an individual user may be present in the activity log during use of the device. Collected data is processed by Microsoft in accordance with the [Microsoft Privacy Statement](#).

Role-based access control with the Microsoft Teams Rooms managed service

12/7/2021 • 3 minutes to read • [Edit Online](#)

Role-based access control (RBAC) in the Microsoft Teams Rooms managed service helps you manage user access to room resource data in your organization. By assigning roles to your service portal users, you can limit what they can see and change. Each role has a set of permissions that determine what users with that role can access and change within your organization.

To create, edit, or assign roles, your account must have one of the following permissions:

- Global Administrator through Azure Active Directory (Azure AD)
- Managed Service Administrator through the Microsoft Teams Rooms managed service portal

What is a role?

A role defines the set of permissions granted to users assigned to that role. For now, the Microsoft Teams Rooms managed service has three built-in roles: **Managed Service Administrator**, **Site Lead**, and **Site Tech**. They cover some common scenarios for users in your organization that may be involved in managing your rooms.

To see roles, in the left navigation of the Microsoft Teams Rooms managed service portal, go to **Roles**, and then select any of the roles to see the role's properties, permissions, and assignments.

- **Properties:** The name, role type, and description
- **Permissions:** Lists features and level of permissions to which the role has access.
- **Assignments:** A list of role assignments defining which users have the configured permissions over the scope of room resource accounts. A role can have multiple assignments, and a user can be in multiple assignments.

Built-in roles

You can assign built-in roles to groups or users without further configuration. Keep in mind that you can't delete or edit the name, description, type, or permissions of a built-in role.

- **Managed Service Administrator:** Has full access to the Microsoft Teams Room Premium service portal.
- **Site Lead:** Organizes rooms, has access to reports and can manage tickets. Can't reset enrollment key or make changes to the configuration of the service.
- **Site Tech:** Manages tickets for specific rooms. Doesn't have permissions to modify the service or organize rooms in the service.

The following table summarizes what each role can do.

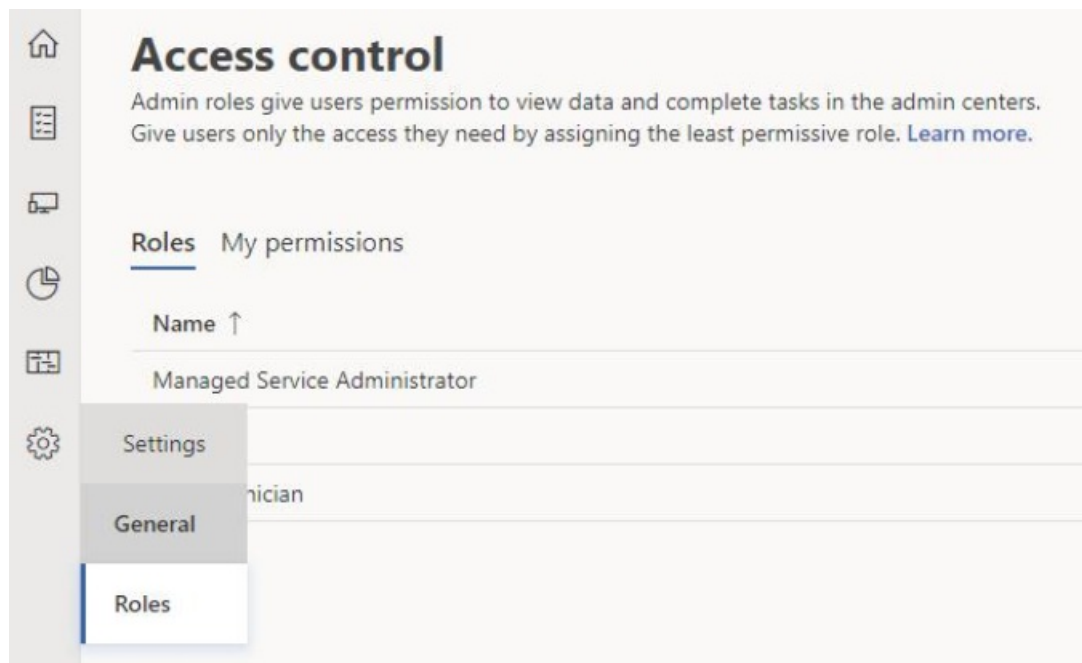

FEATURES	PERMISSION	MANAGED SERVICE ADMINISTRATOR	SITE LEAD	SITE TECH
Rooms	View	✓	✓	✓
	Modify	✓	✓	✓
	Reset key	✓		

FEATURES	PERMISSION	MANAGED SERVICE ADMINISTRATOR	SITE LEAD	SITE TECH
	Download key	✓	✓	✓
	Unenroll	✓	✓	✓
Group management	Create	✓		
	View	✓	✓	
	Modify	✓

	View	✓	✓	✓
	Update	✓	✓	✓
Microsoft Teams Rooms managed service settings	View	✓		
	Modify	✓		
Role management	View	✓		
	Modify	✓		

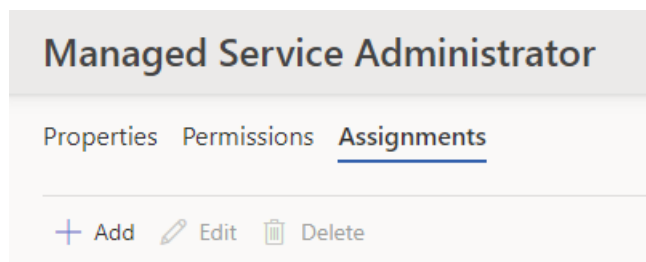

Assign a role

To assign roles, you must be a Global Administrator or Managed Service Administrator.

1. In the left navigation of the Microsoft Teams Rooms managed service portal, go to **Settings > Roles**.

2. Select the role you want to assign.
3. In the role pane, select **Assignments** > **Add**.

4. On the **General settings** page, under **Assignment properties**, enter a name for this assignment. The description is optional. Choose **Next**.
5. On the **Members** page, in the **Search for user or security group** box, enter the name of a user or security group in your tenant to which you want to give permissions, and then complete the selection. Choose **Next**.
6. On the **Scope** page, in the **Search for room or room group** box, type the name of either a room or room group that the user will be allowed to manage. Choose **Next**.
7. On the **Finish** page, review the details of the assignment. If you're satisfied with the configuration, choose **Add assignment**. If you want to edit a section, use the **Previous** button or select the step in the left navigation.

Getting started with Microsoft Teams Rooms Premium-managed service

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft recognizes that productive meetings are facilitated by behind-the-scenes efforts that involve ensuring conduciveness for excellent operations. The Microsoft Teams Rooms Premium-managed services reduces complexity for your IT with a continuous service that delivers improved room operations, enhancing in-room meeting productivity.

Obtain and assign a license

Microsoft Teams Rooms accounts require a Microsoft Teams Rooms Premium license to work with the Microsoft Teams Rooms Premium-managed service.

To assign a license, perform the following steps:

1. Log in to [Microsoft 365 admin center](#) as an administrator.

NOTE

This type of administrator is sometimes referred to as **global administrator**. See Overview of the [Microsoft 365 admin center](#).

2. Choose **Billing > Licenses** from the left navigation pane.
3. Select the appropriate **Teams Rooms premium** license for your intended usage (paid and trial licenses are available). See [Licensing Solutions for Shared Communications Devices](#) for a comparison between Microsoft Teams Rooms Standard and Premium SKUs.
4. On the **Billing accounts** page, select **Assign licenses**. The **Assign licenses to users** page appears.
5. Enter the existing **Microsoft Teams Rooms** accounts for **Teams Rooms Premium** license assignment. For more information about setting up new - or validating existing - Microsoft Teams Rooms accounts, see [Deploy Microsoft Teams Rooms with Microsoft 365 or Office 365](#).
6. Once account submission is completed, select **Assign** and then **Close**. The **Microsoft Teams Rooms Premium** licenses have been assigned to **Microsoft Teams Rooms** accounts.

You are now ready to enroll the accounts and the associated certified Microsoft Teams Rooms devices in the Microsoft Teams Rooms Premium-managed service. For more information, see [Enroll a device in the Microsoft Teams Rooms Premium managed service](#).

Enroll a device in the Microsoft Teams Rooms Premium managed service

12/7/2021 • 2 minutes to read • [Edit Online](#)

To enroll a Microsoft Teams Rooms device in the Teams Rooms Premium managed service, you need to assign one more users to the Managed Service Administrator and then complete the enrollment steps using that user.

Assign users to the Managed Service Administrator role

Complete the following steps to assign users to the Managed Service Administrator role:

1. Log in to the [Teams Rooms Premium portal](#) with the same administrator privileges as that used to log in to the Microsoft 365 admin center.
2. Navigate to **Settings > Settings > Roles** and then select **Managed Service Administrator**.
3. Under **Managed Service Administrator**, select the **Assignments** tab and then select **Add**.
4. Follow the wizard to name the assignment and select the users who should be added to it. The assignment will apply to all rooms and room groups.
5. At the end of the assignment wizard, select **Add assignment**.

Users who are assigned the Managed Service Administrator role are responsible for the day-to-day management and monitoring of the Teams Rooms Premium managed service portal.

After you've assigned users to the Managed Service Administrator role, continue to the [Enroll a device](#) section to add a Teams Rooms device to the managed service portal.

Enroll a Teams Rooms device

Complete the following steps to enroll a device in the Teams Rooms Premium managed service:

1. Log in to the [Teams Rooms Premium portal](#) with a user that's been assigned the Managed Service Administrator role.
2. Select on the ? icon at the top right-hand corner of the portal to launch the help menu. The help menu includes an [Installation guide](#) containing detailed enrollment instructions:
 - a. Review the **Pre-requisites** section in the Installation guide. Confirm that the URLs listed in the **URLs Required for Communication** list are added to your firewall's traffic allow list.
 - b. Follow the instructions in the **Enabling TPM Settings** section to enable the Trusted Platform Module (TPM) functionality on your device.
 - c. Follow the instructions in the **Adding Proxy Settings** section to configure your device to use your proxy gateway, if you have one.
 - d. Follow the instructions in the **Process** section to install the monitoring agent software and configure the self enrollment key on your device.
3. After the monitoring agent and unique XML key are configured on your device, navigate to **Rooms > room name > Status**, and then select **Enroll**.

NOTE

The Teams Rooms device will remain in the **Onboarding** state until a Managed Service Administrator enrolls the device using the portal.

Link to Installation guide

The **Help** menu provides a link to the [Installation guide](#) which in turn provides the following information:

- Instructions on URLs that need to be allow-listed to serve to enable room telemetry to be sent to the managed service.
- Instructions for applying the Microsoft Teams Rooms Premium monitoring agent and unique XML key as part of enrolling a device in the managed service.
- Troubleshooting instructions.

Configure ServiceNow for Teams Rooms

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article describes the prerequisites and steps to configure your ServiceNow environment in the Teams Rooms Premium portal.

Before you begin

Teams Rooms prerequisites

- You must have an assigned Service Administrator role. For more information, see [Role-based access control with the Microsoft Teams Rooms Managed Services](#).

ServiceNow prerequisites

- A Basic Authorization sign-in, OR an OAuth sign-in. For more information, see [Creating Credentials](#) in ServiceNow.
- A ServiceNow instance and its instance host name and API URI
- A role of incident_manager or higher
- A software version of ServiceNow that supports Table API

Configure your environment

How your environment is configured is highly customizable and will depend on your organization's needs. The following steps walk through how to copy your existing configuration in ServiceNow to the Teams Rooms Premium portal.

1. Open the ServiceNow instance you want to copy. You'll need to reference this as you complete the configuration form in the Teams Rooms Premium portal.
2. In a new browser tab, go to the [Teams Rooms Premium portal](#) and go to **Settings**. Then, select **ServiceNow** in the left navigation menu to open the configuration form.
3. Select an authentication method to sign in and enter your ServiceNow Instance Host and API URI.
4. All required items in the ServiceNow Field column of the Field Mapping section should be pre-filled. The table below contains each ServiceNow field and its corresponding Microsoft Teams Rooms field. Complete the action for each row of the Field Mapping section. For definitions of each ServiceNow field, see [ServiceNow field definitions](#).

SERVICENOW FIELD	MICROSOFT TEAMS ROOMS FIELD	ACTION
short_description	Incident description	No action needed. The Teams Rooms field is auto-filled.
description	First Message	No action needed. The Teams Rooms field is auto-filled.
assignment_group	Room group	Copy the assignment_group value in your ServiceNow instance and paste it into the ServiceNow value field in the configuration form. If you have more than one assignment_group, select Add Room Group for each additional custom value.

SERVICENOW FIELD	MICROSOFT TEAMS ROOMS FIELD	ACTION
severity	Rings	Severity is a custom value in ServiceNow. It's the fourth item in the second column of your ServiceNow instance. Copy the value and paste it into the ServiceNow value field in the configuration form. If you have more than one severity value, select Add Ring for each additional custom value.
Comments (optional)	Custom value*	To add a comments field to the configuration form, select Add at the top of the field mapping section. Copy the comment value in your ServiceNow instance and paste it to the ServiceNow field in the configuration form. Assign it a Microsoft Teams Room field from the dropdown menu, and copy and paste the ServiceNow value.
state (resolved)	Custom value*	Copy the resolution state from your ServiceNow instance and paste it into the ServiceNow value field in the configuration form.
close_code	Custom value*	In the Resolution Information tab of your ServiceNow instance, copy the close code and paste it into the ServiceNow value field into the configuration form.

*Select custom values from the dropdown menu

NOTE

If you can't locate your custom values, contact your ServiceNow administrator.

To add additional required fields to Resolve Incident section, select **Add**.

Test and enable

After completing the configuration form, select **Test** at the bottom of the page. Testing is required to submit your configuration.

Once your test passes successfully, select **Submit** to save your changes. Once you're ready to enable ServiceNow for your organization, switch the **Do you want to enable ServiceNow?** toggle to **On**.

ServiceNow field definitions

- **short_description:** The short description field in ServiceNow is a brief, 160-character alphanumeric value that provides a summary of the incident. Short description is equivalent to incident description in the Teams Rooms Premium portal.
- **description:** The description field in ServiceNow is the first value in the conversation history of a ServiceNow incident. Description is equivalent to First message in the Teams Rooms Premium portal.

- **assignment_group**: The assignment group field in ServiceNow is used to organize incidents. Assignment group are equivalent to Room groups in the Teams Rooms Premium portal. By default, there is one room group, and more can be added. You decide how many groups there are and how to group your incidents. For example, you might choose to organize your incidents by location.
- **severity**: The severity field in ServiceNow is used to organize incidents by priority. The values that designate priority are customizable. Severity is equivalent to the Ring field in the Teams Rooms Premium portal. To customize rings in the Teams Rooms Premium portal, go to **Updates** in the left navigation menu. Then go to the **Rings** tab and select **Add ring**.
- **comments**: Comments is an optional field in ServiceNow that is used to include custom required fields from your ServiceNow instance in your Teams Rooms Premium portal configuration. The equivalent of comments is a custom value in the Teams Rooms Premium portal.
- **state (resolved)**: The state (resolved) field in ServiceNow is used to designate how an incident was resolved and is required to close an incident. The state (resolved) value is customizable. The equivalent of state (resolved) is a custom value in the Teams Rooms Premium portal.
- **close_code**: A close code must be assigned to an incident once it's completely resolved. This value is customizable in ServiceNow. The equivalent of close code is a custom value in the Teams Rooms Premium portal.

Microsoft Teams: Managing your devices

12/7/2021 • 5 minutes to read • [Edit Online](#)

You can manage devices used with Microsoft Teams in your organization from the Microsoft Teams admin center. You can view and manage the device inventory for your organization and do tasks such as update, restart, and monitor diagnostics for devices. You can also create and assign configuration profiles to a device or groups of devices.

To manage devices, such as change device configuration, restart devices, manage updates, or view device and peripheral health, you need to be assigned one of the following Microsoft 365 admin roles:

- Microsoft 365 Global admin
- Teams Service admin
- Teams Device admin

For more information about admin roles in Teams, see [Use Teams administrator roles to manage Teams](#).

What devices can you manage?

You can manage any device that's certified for, and enrolled in, Teams. A device is automatically enrolled the first time a user signs in to Teams on the device. For a list of certified devices that can be managed, see:

- [Collaboration bars](#)
- [Conference phones](#)
- [Desk phones](#)
- [Microsoft Teams Rooms](#)
- [Teams displays](#)
- [Teams panels](#)

To manage devices, in the left navigation of the [Microsoft Teams admin center](#), go to **Teams Devices**, and then select the device type. Each type of device has its own respective section, which lets you manage them separately.

Manage Teams Rooms devices

You can use the Teams admin center to view and remotely manage your Teams Rooms devices across your organization. The Teams admin center makes it easy to see, at a glance, which devices are healthy and which need attention, and lets you focus on specific devices to see detailed information about device health, meeting performance, call quality, and peripherals.

Here are some things you can do to manage your Teams Rooms devices. Teams Rooms devices can be found in the [Microsoft Teams admin center](#) under **Teams Devices > Teams Rooms**.

For details about how to manage your Teams Rooms devices, see [Manage Microsoft Teams Rooms](#).

TO DO THIS...	DO THIS
Change settings on one or more devices	Select one or more devices > Edit settings . If you select multiple devices, the values you change will replace the values on all the selected devices.

TO DO THIS...	DO THIS
Restart devices	Select one or more devices > Restart . When you restart a device, you can choose whether to restart the device immediately or select Schedule restart to restart the device at a specific date and time. The date and time you select are local to the device being restarted.
View meeting activity	Select a device name to open device details > Activity . When you open the Activity tab, you can see all the meetings that the device has participated in. This summary view shows the meeting start time, the number of participants, its duration, and the overall call quality.
View meeting details	Select a device name to open device details > Activity > select a meeting. When you open a meeting's details, you can see all of the participants in the meeting, how long they were in the call, the Teams session types, and their individual call quality. If you want to see technical information about a participant's call, select the participant's call start time.

Manage phones, collaboration bars, Teams displays, and Teams panels

In the Teams admin center, you can view and manage phones, collaboration bars, Teams displays, and Teams panels enrolled in Teams in your organization. Information that you'll see for each device includes device name, manufacturer, model, user, status, action, last seen, and history. You can customize the view to show the information that fits your needs.

Phones, collaboration bars, Teams displays, and Teams panels are automatically enrolled in Microsoft Intune if you've signed up for it. After a device is enrolled, device compliance is confirmed and conditional access policies are applied to the device.

Here are some examples of how you can manage phones, collaboration bars, Teams displays, and Teams panels in your organization.

TO DO THIS...	DO THIS
Change device information	Select a device > Edit . You can edit details such as device name, asset tag, and add notes.
Manage software updates	Select a device > Update . You can view the list of software and firmware updates available for the device and choose the updates to install. For more information about updating devices, see Update Teams devices remotely
Upgrade Teams phones to Teams displays	On the IP phones page, select one or more Teams phones > Upgrade . This option is available only to phones that support upgrading to Teams displays. To learn more, see Upgrade Teams phones to Teams displays .
Assign or change configuration policies	Select one or more devices > Assign configuration .
Add or remove device tags	Select one or more devices > Manage tags . For more information about device tags, see Manage Teams device tags .
Restart devices	Select one or more devices > Restart .

TO DO THIS...	DO THIS
Filter devices using device tags	Select the filter icon, select the Tag field, specify a device tag to filter on, and select Apply . For more information about filtering devices using device tags, see Use filters to return devices with a specific tag .
View device history and diagnostics	Under the History column, click the View link for a device to view its update history and diagnostic details.

Use configuration profiles in Teams

Use configuration profiles to manage settings and features for different Teams devices in your organization, including collaboration bars, Teams displays, Teams phone, and Teams panels. You can create or upload configuration profiles to include settings and features you want to enable or disable, and then assign a profile to a device or set of devices.

Create a configuration profile

To create a configuration profile for a Teams device type:

1. In the left navigation, go to **Teams Devices** > select the Teams device type > **Configuration profiles**. For example, select **Teams Devices** > **Teams panels** > **Configuration profiles** to create a new configuration profile for Teams panels.
2. Click **Add**.
3. Enter a name for the profile and optionally add a friendly description.
4. Specify the settings you want for the profile, and then click **Save**. The newly created configuration profile is displayed in the list of profiles.

Assign a configuration profile

After creating a configuration profile for a Teams device type, assign it to one or more devices.

1. In the left navigation, go to **Teams Devices** > select the Teams device type. For example, to assign a configuration profile to a Teams panels device, select **Teams Devices** > **Teams panels**.
2. Select one or more devices, and then click **Assign configuration**.
3. In the **Assign a configuration** pane, search for configuration profile to assign to the selected devices.
4. Click **Apply**. For the devices to which you applied the configuration policy, the **Action** column displays **Config Update** and the **Configuration profile** column displays the configuration profile name.

Remote provisioning and sign in for Teams Android devices

12/7/2021 • 2 minutes to read • [Edit Online](#)

IT admins can remotely provision and sign in to a Teams Android device. To provision a device remotely, the admin needs to upload the MAC IDs of the devices being provisioned and create a verification code. The entire process can be completed remotely from the Teams admin center.

Review the supported devices

The following list shows the Android device firmware requirements.

DEVICE CATEGORY	DEVICE MODEL	FIRMWARE VERSION
Teams phones	Yealink T55/T56/T58	58.15.0.124
Teams phones	Yealink VP59	91.15.0.58
Teams phones	Yealink CP960	73.15.0.117
Teams phones	Yealink MP56/MP54/MP58	122.15.0.36
Teams phones	Crestron UC-2	1.0.3.52
Teams phones	Poly Trio C60	7.0.2.1071
Teams phones	CCX400/CCX500/CCX600	7.0.2.1072
Teams phones	Audio Codes C448HD/C450HD/C470HD	1.10.120
Teams panels	Crestron 770/1070	1.004.0115
Teams Rooms on Android	Logitech Rally Bar Mini	1.2.982
Teams Rooms on Android	Logitech Rally Bar	1.2.982
Teams Rooms on Android	AudioCodes RXV80	1.13.361
Teams Rooms on Android	EPOS EXPAND Vision 3T	1.2.2.21182.10
Teams Rooms on Android	Yealink MeetingBar A30	133.15.0.60
Teams Rooms on Android	Yealink MeetingBar A20	133.15.0.60
Teams Rooms on Android	Yealink CTP18 touch console	137.15.0.37
Teams Rooms on Android	Poly Studio X30	3.5.0.344025

DEVICE CATEGORY	DEVICE MODEL	FIRMWARE VERSION
Teams Rooms on Android	Poly Studio X50	3.5.0.344025
Teams Rooms on Android	Poly TC8 touch console	3.5.0.210489
Teams Rooms on Android	Yealink VC210	118.15.0.54

Add a device MAC address

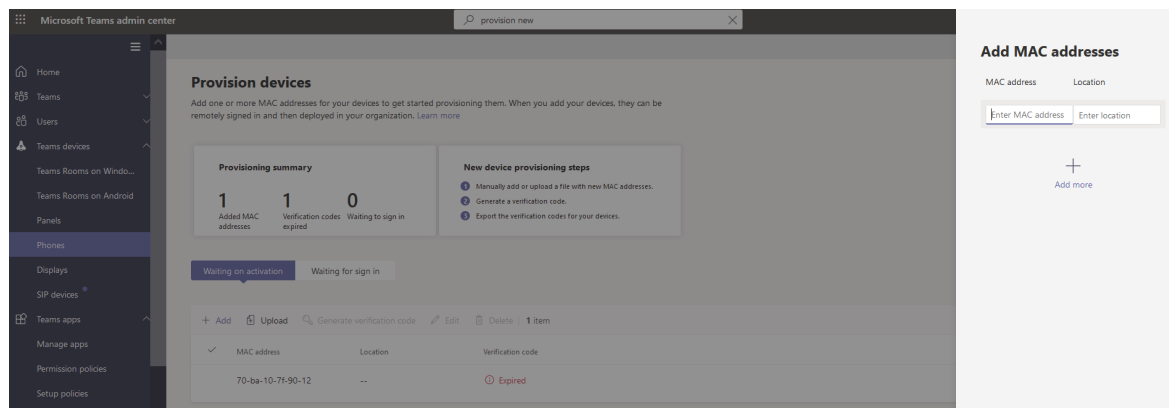

Complete the following steps to provision a new device.

1. Sign in to the Teams admin center.
2. Expand **Teams Devices**.
3. Select **Provision new device** from the **Actions** tab.

In the **Provision new devices** window, you can either add the MAC address manually or upload a file.

Manually add a device MAC address

1. From the **Waiting on activation** tab, select **Add MAC ID**.

2. Enter the MAC ID.
3. Enter a location, which helps technicians identify where to install the devices.
4. Select **Apply** when finished.

Upload a file to add a device MAC address

1. From the **Waiting on activation** tab, select **Upload MAC IDs**.
2. Download the file template.
3. Enter the MAC ID and location, and then save the file.
4. Select **file**, and then select **Upload**.

Generate a verification code

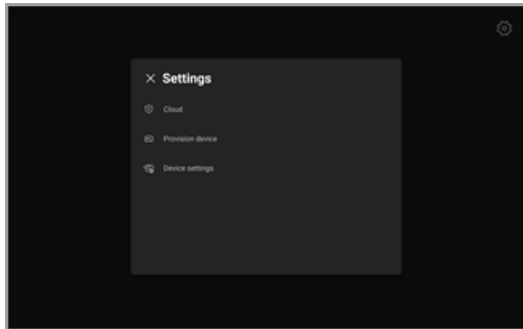

You need a verification code for the devices. The verification code is generated in bulk or at the device level and is valid for 24 hours.

1. From the **Waiting on activation** tab, select an existing MAC ID. A password is created for the MAC address and is shown in the **Verification Code** column.
2. Provide the list of MAC IDs and verification codes to the field technicians. You can export the detail directly in a file and share the file with the technician who is doing the actual installation work.

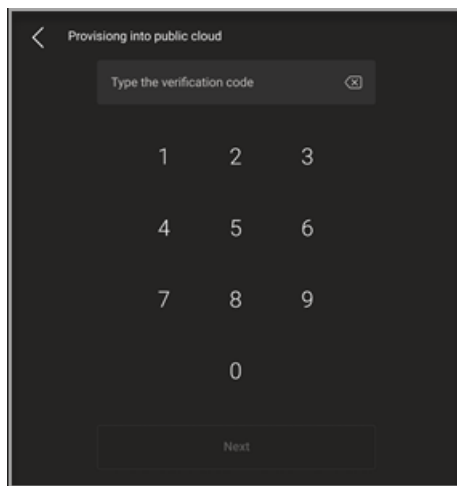

Provision the device

When the device is powered on and connected to the network, the technician provisions the device. These steps are completed on the Teams device.

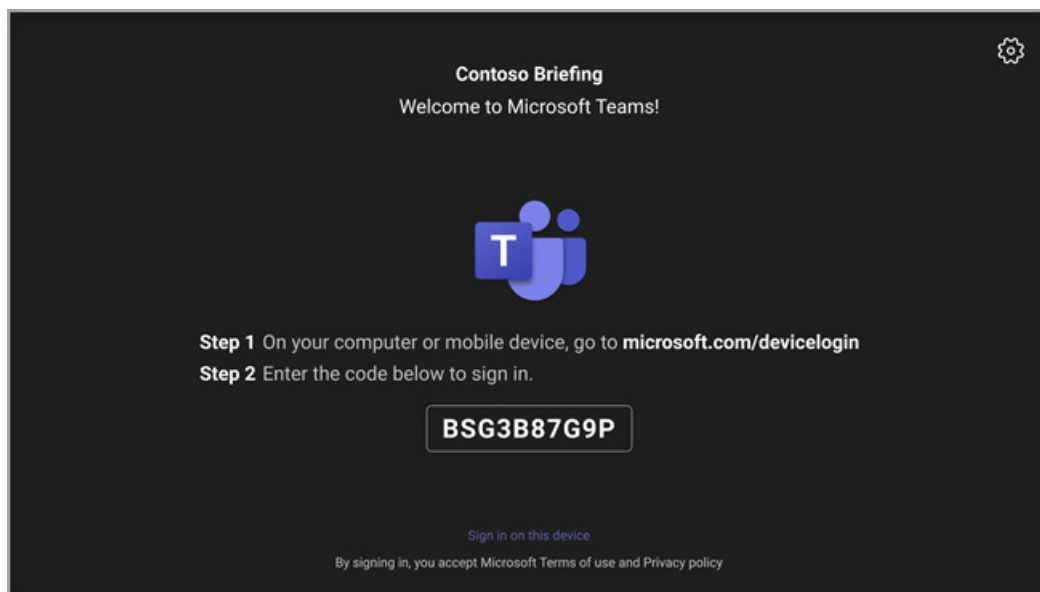

1. The technician selects **Provision device** from the **Settings**.

2. The technician enters the device-specific verification code in the provided input field.

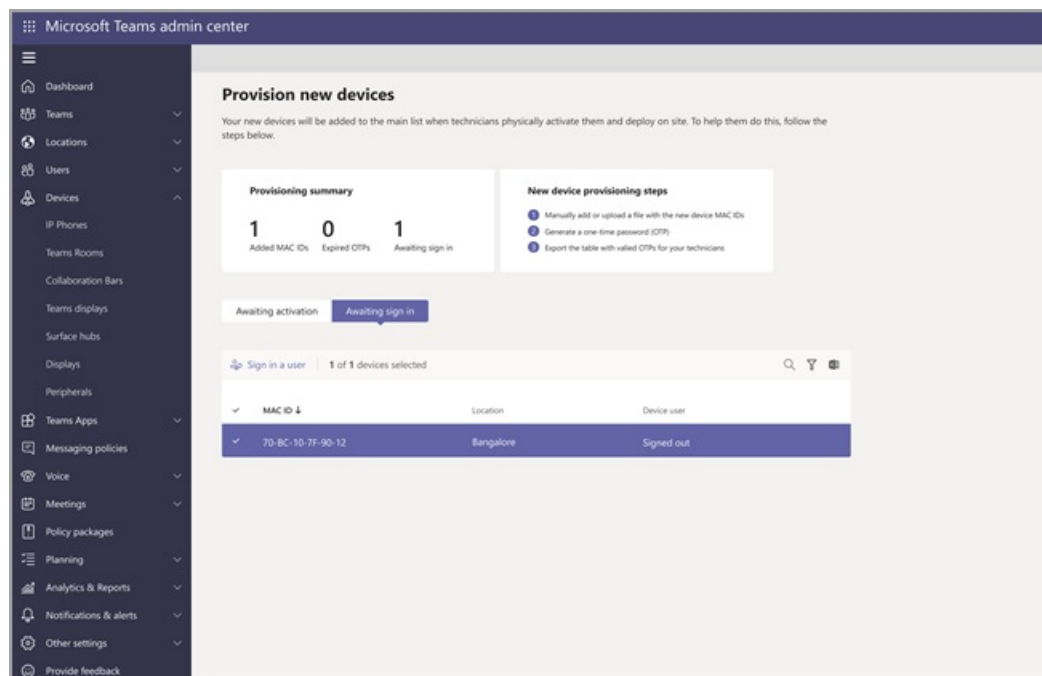

Once the device is provisioned successfully, the tenant name appears on the sign-in page.

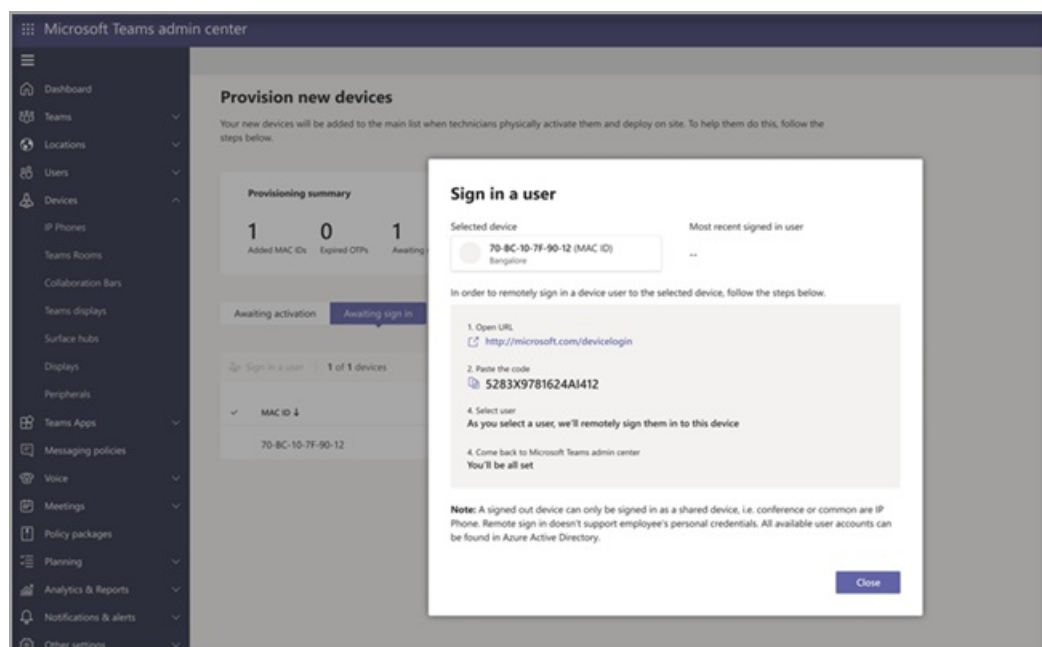

First time remote sign in

The provisioned device appears in the **Waiting for sign in** tab. Start the remote sign-in process by selecting the individual device.

1. Select a device from the **Waiting for sign in** tab.

2. Follow the instructions in **Sign in a user**, and then select **Close**.

Remote sign in and sign out for Teams Android devices

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article describes how to remote sign in and sign out Teams Android devices from the Teams admin center. If you haven't provisioned a device yet, or the device is provisioned but has never been signed-in, see [Remote provisioning and sign in for Teams Android devices](#).

Remote sign in

After a device is provisioned and signed in for the first time, it will appear on its corresponding page under the **Teams devices** node of the Teams admin center .

To sign in a device that has been signed out, go to the corresponding device page.

1. Select the device you want to sign in.
2. Go to the **Actions** menu, and select **Sign in a user**.

Remote sign out

1. Select the device you want to sign out from the corresponding page.
2. Go to the **Actions** menu, and select **Sign out**.

Update Microsoft Teams devices remotely

12/7/2021 • 3 minutes to read • [Edit Online](#)

Using the Microsoft Teams admin center, you can update your Teams devices, such as Teams phones, Teams panels, and collaboration bars, remotely, and you can choose device firmware automatic-update behavior. You can update the following on your devices using the Teams admin center:

- Teams app and teams admin agent
- Company portal app
- OEM agent app
- Device firmware

Device firmware updates can either be applied automatically or scheduled for a future date and time. Other available device updates aren't applied automatically, but can be applied manually or scheduled for a future date and time.

NOTE

While device firmware updates can be scheduled, if the scheduled date and time falls after the configured maximum 30 or 90 day delay, the firmware update is applied when the maximum delay is reached. The scheduled date and time are ignored. Additionally, updating Microsoft Teams devices remotely is a feature not yet available on US Government Cloud tenants (GCC-High).

To manage devices, you need to be a Global admin, Teams Service admin, or Teams Device admin. For more information about admin roles, see [Use Microsoft Teams administrator roles to manage Teams](#).

Choose automatic device firmware update behavior

Device firmware updates are applied automatically. You can decide whether to apply updates as soon as one is released (if you choose this option, updates are applied on the first weekend after an update is released), or 30 or 90 days after an update is released. By default, device firmware updates are applied 30 days one released.

IMPORTANT

The latest firmware update release isn't applied on your Teams device. Instead, the update that's automatically applied on your device is delayed by one version. For example, assume your device has version "10" applied, and version "11" is released. Version "11" won't be applied yet. Instead your device will only be updated to version "11" after version "12" is released.

NOTE

Some devices don't support automatic firmware update yet. Applying automatic firmware update settings on devices that don't support automatic updates won't have any effect on those devices. For questions about whether your device will support automatic firmware updates, contact your device manufacturer.

To choose the automatic update behavior for your devices, do the following:

1. Sign in to Microsoft Teams admin center by visiting <https://admin.teams.microsoft.com>.
2. Navigate **Teams Devices** > **IP phones** or **Collaboration bars** or **Teams panels**.

3. Select one or more devices and then select **Update**.
4. Under **Firmware auto-update**, select one of the following:
 - **As soon as available** Second-newest device firmware update is applied on the first weekend after the latest update is released.
 - **Defer 30 days** Second-newest device firmware update is applied 30 days after the latest update is released.
 - **Defer 90 days** Second-newest device firmware update is applied 90 days after the latest update is released.
5. Select **Update**.

If, for whatever reason, you need to revert a device firmware update, you need to reset your device to its factory settings. Reset your device using the instructions from its manufacturer.

Manually update remote devices

When you update one or more devices using the admin center, you can decide whether to update the devices immediately or schedule an update for a future date and time.

To manually update remote devices, do the following:

1. Sign in to Microsoft Teams admin center by visiting <https://admin.teams.microsoft.com>.
2. Navigate **Teams Devices** > **IP phones** or **Collaboration bars** or **Teams panels**.
3. Select one or more devices and then select **Update**.
4. Under **Manual updates**, select **Schedule** if you want to schedule the update for a future date and time. The updates are applied at the date and time in the timezone selected in **Timezone**.

What you'll see depends on whether you have one, or multiple, devices selected. The left image below shows multiple devices selected while the image on the right shows a single device selected.

The image displays two side-by-side screenshots of the Microsoft Teams admin center's 'Update status' interface.

Left Screenshot (Multiple devices selected):

- Update status** (2 selected)
- Firmware auto-update** (collapsed)
- Manual updates** (expanded)
- Schedule** (toggle: On)
- Date and time**
 - Timezone**: (UTC-08:00) Pacific Time (US & Canada)
 - Select date**: Fri Jun 26 2020
 - Select time**: 04:00
- Select the updates to be applied**
 - ☒ Teams admin agent
 - ☒ Firmware
 - ☐ Company portal app
 - ☐ Oem agent app
 - ☒ Teams app
- Update** (button) **Close** (button)

Right Screenshot (Single device selected):

- Update status**
- Firmware auto-update** (expanded)
- Manual updates** (collapsed)
- Schedule** (toggle: On)
- Date and time**
 - Timezone**: (UTC-08:00) Pacific Time (US & Canada)
 - Select date**: Fri Jun 26 2020
 - Select time**: 04:00
- Software component**
 - ☒ **Firmware**
 - Current version**: CD-18781Y.200307.057-IPPhone
 - New version**: CD-18781Y.200410.067
 - Published on**: Apr 26, 2020, 5:00 PM
- Update** (button) **Close** (button)

When you select multiple devices, you can choose which update types to apply to each selected device. Select the update types you want to apply and select **Update**.

When you select a single device, updates that are available for the device are shown. If multiple update types are available for the device, select each update type to apply. You can view the **Current version** applied on the device and the **New version** that will be applied. Select the update(s) you want to apply and select **Update**.

After you select **Update**, updates are applied to your devices at the date and time you selected if you scheduled an update. If you didn't select a future date and time, updates are applied to your devices within a few minutes.

Manage Microsoft Teams device tags

12/7/2021 • 5 minutes to read • [Edit Online](#)

Device tags in Microsoft Teams let you group, organize, and more easily manage the devices you've deployed in your organization. With the Microsoft Teams admin center, you can add one or more tags to devices, use filters to view devices that match the tag you specify, and then perform actions on the devices that have that tag.

You can add a device tag to more than one device type. However, when you open a device pane in the admin center, only the devices of that type are returned. For example, you can assign the "Corporate" tag to both phones and Teams Rooms devices. If you search for the "Corporate" tag while in **Teams Devices > Phones**, only phones are returned. Similarly, if you search for the "Corporate" tag in **Teams Devices > Teams Rooms**, only Teams Rooms devices are returned.

To manage device tags, you need to be a Global admin, Teams Service admin, or Teams Device admin. For more information about admin roles, see [Use Microsoft Teams administrator roles to manage Teams](#).

IMPORTANT

Device tags are assigned to the resource account that's logged into a device. If you sign a resource account out of one device and then use it to sign in to another device, the device tags are applied to the new device.

Create, remove, or rename device tags

Using the device tag management panel, you can:

- See all your device tags.
- Create multiple device tags easily and then assign them to devices at a later time. Tags can be up to 25 characters.
- Remove device tags that are no longer needed. Before you can remove a device tag, you'll need to remove it from all of the devices it has been added to.
- Rename device tags. When you rename a device tag, that change is reflected on all the devices it's been added to. Tags can be up to 25 characters.

1. Sign in to Microsoft Teams admin center by visiting <https://admin.teams.microsoft.com>.
2. Navigate to **Teams Devices** and then choose any device pane, such as **Phones**.
3. Select **Actions** in the upper-right corner of the page and select **All device tags**.
4. To create a device tag, select **+ Add**, provide a value for the device tag, and select the **Save** icon.
5. To remove a device tag, select the ellipsis ... next to the device tag you want to remove, and select **Delete**.

NOTE

If you try to remove a device tag that's been added to devices, you'll receive a message asking if you want to remove it from all devices. If you want to do this and continue to remove the device tag, select **Untag devices**.

6. To rename a device tag, select the ellipsis ... next to the device tag you want to rename, and select **Edit**. Provide a new value for the device tag and select the **Save** icon.

Add or remove tags on a single device

When you add tags to a device, you can either select an existing tag or create a new one. Tags can be up to 25 characters.

1. Sign in to Microsoft Teams admin center by visiting <https://admin.teams.microsoft.com>.
2. Navigate to **Teams Devices** and then choose the device pane that contains the device you want to add or remove tags on.
3. Place a check mark next to the device you want to add or remove tags on and select **Manage tags**.
4. If you want to add a tag:
 - a. Start typing the tag name you want to add.
 - b. If the tag already exists, select it from the list of tags that are returned.
 - c. If the tag doesn't exist, select **Add "<tag name>" as a new tag**. Tags can be up to 25 characters.
5. If you want to remove a tag, select **X** next to the tag you want to remove.
6. Repeat the steps above if you want to add or remove more tags.
7. Select **Apply**.

Add or remove tags on multiple devices

When you add tags to a device, you can either select an existing tag or create a new one. Tags can be up to 25 characters. If you want to remove a tag from multiple devices, you need to select the Teams user that's associated with the device and remove the tag from the user.

1. Sign in to Microsoft Teams admin center by visiting <https://admin.teams.microsoft.com>.
2. Navigate to **Teams Devices** and then choose the device pane that contains the devices you want to add or remove tags on.
3. Place a check mark next to the devices you want to add or remove tags on and select **Manage tags**.
4. If you want to add a tag:
 - a. Start typing the tag name you want to add in **Manage tags for all devices of Teams users**.
 - b. If the tag already exists, select it from the list of tags that are returned.
 - c. If the tag doesn't exist, select **Add "<tag name>" as a new tag**.
5. If you want to remove a tag:
 - a. Expand **Select Teams users**.
 - b. Expand **<x> tags** under the name of the Teams user you want to remove tags from.
 - c. Select **X** next to the tag you want to remove.
6. Repeat the steps above if you want to add or remove more tags.
7. Select **Apply**.

Use filters to return devices with a specific tag

If you've added device tags to your devices, you can use them to filter the device list to return only the devices that have had a specified tag added to them. This can be helpful if you just want to view all the devices in a specific room, all the devices of a certain type, or any other criteria you used when adding your tags. You can also perform bulk actions on returned devices, such as applying updates in waves, or setting different configuration policies depending on the groups of devices identified using device tags.

1. Sign in to Microsoft Teams admin center by visiting <https://admin.teams.microsoft.com>.
2. Navigate to **Teams Devices** and then choose the device pane that contains the devices you want to filter.
3. Select the **Filter** icon.
4. If you only want to specify a single tag, or if you want to find devices that have all the tags you specify, select **Match all of these conditions**.
5. If you want to find devices that match one or more device tags, select **Match any one of these conditions**.
6. Select the **Tag** field and then specify a device tag name in the **Enter a value** field.

7. If you want to add more device tags, select **Add more** and repeat step 6 for each tag you want to add.

8. Select **Apply**.

After you've filtered the devices in your device list, you can perform actions on them as you normally would. For example, you can select them and then assign configurations, edit their settings (if they're Teams Rooms devices), and so on. When you're done, you can remove the filter by selecting the X next to the **Tag** filter entry or by selecting **Clear all** on the right side of the list.

Phones for Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Teams supports a portfolio of desk phones for users who require a traditional phone experience. This article provides a complete overview of Teams phones and can help in planning, delivering, and managing Microsoft Teams phones as part of your Microsoft Phone System solution.

To deliver a high-quality and reliable Microsoft Teams experience on phones, we are partnering and actively working with Yealink, Crestron, Lenovo, Polycom, and Audiocodes to develop and certify a wide portfolio of desk phones and conference room audio devices. To get the latest and up-to-date information on Teams devices, go to [Teams Marketplace](#).

To manage phones, you need to be a Global admin, Teams Service admin, or Teams Device admin. For more information about admin roles, see [Use Microsoft Teams administrator roles to manage Teams](#).

Features supported by Teams phones

Teams-certified phones have a broad array of features to help your users do their jobs, and help you manage their use. Here's a summary of the features available in Teams-certified phones:

- **Authentication** Phones use Modern Authentication to simplify signing in and to improve security. Users can sign in by entering their username and password on the phone or by signing in from another device like PC/smartphone.
- **Speed dial and call history** Users have quick access to their contacts, call history, and voicemail. They can easily manage their contacts and speed dial entries directly from their phone.
- **Meetings and calls** Users can view their schedules and easily join meetings using Teams' one-touch join.
- **Call groups** Phone agents who participate in call groups can easily manage their availability and accept or decline incoming calls from the call queue.
- **User delegation** Executive assistants and admins can manage their executives' phones - intercept incoming calls; make calls on behalf of the executive; take over calls that the executive has placed on hold; and monitor whether the executive is on a call, on hold, and so on.
- **Hot desking** Users can get their contacts, meetings, and other preferences, just by signing into a phone. When they're done, they can sign out and leave the phone ready for the next user.
- **Video** Phones with video support let users join calls and video conferences just like they were at their computers. Users can keep their privacy by using a phone's camera shutter and microphone mute switch when available.
- **Better together** Phones can lock and unlock in an integrated fashion when connected to their Windows PC running a 64-bit Teams desktop client.
- **Accessibility** Phones have several accessibility features, such as high contrast text, to make it easier for anyone to use them.
- **Dynamic and enhanced E911 support** Signed-in users who call 911 will see their location on the phone.

IMPORTANT

If a phone isn't signed in, or if it doesn't have an Internet connection, 911 calls can't be placed. If this happens, a notification is displayed on the phone.

In addition to the above features, you can control what capabilities are available depending on the type of license and phone policy that are assigned to the user signing into the phone. For example, users who sign into

a phone with their personal accounts can access the full range of features - calling, meetings, voicemail, and so on. Accounts assigned a Common Area Phone license that sign into a phone, however, may only get access to a limited range of features; call history and meeting schedules may not be retained, for example, to protect users' privacy.

Required licenses

Teams licenses can be purchased as part of their [Microsoft 365 and Office 365 subscriptions](#). To learn more about the required licenses for using Teams on phones, see available [phone system licenses](#).

For more information about getting Teams, check out [How do I get access to Microsoft Teams?](#)

Deploy your phones using Intune

To learn more about how to deploy Teams displays using Intune, see [Deploy Teams phones and Teams displays](#).

Manage your phones

Manage and keep your Teams phones up-to-date using the Microsoft Teams admin center. For more information, see [Manage your devices in Teams](#).

Upgrade your phones to Teams displays

[Microsoft Teams displays](#) are a category of all-in-one dedicated Teams devices that feature an ambient touchscreen and a hands-free experience powered by Cortana. With Teams displays, users can use a microphone, camera, and speakers (or Bluetooth headset) for a reliable calling and meeting experience. Teams displays integrates with users' Windows PCs to bring a companion experience that allows for seamless cross-device interaction

You can upgrade Teams phones in your organization to Teams displays in the Microsoft Teams admin center. This option is available only to phones that support upgrading to Teams displays. To learn more, see [Upgrade Teams phones to Teams displays](#).

Microsoft Teams displays

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams displays are a category of all-in-one dedicated Teams devices that feature an ambient touchscreen and a hands-free experience powered by Cortana. This article provides an overview of Teams displays and can help you plan, deliver, and manage Teams displays in your organization.

Teams displays brings together your favorite Teams features—chat, meetings, calls, calendar, and files—into a single device. With Teams displays, users can use a microphone, camera, and speakers (or Bluetooth headset) for a reliable calling and meeting experience. Teams displays integrates with users' Windows PCs to bring a companion experience that allows for seamless cross-device interaction.

To learn more, check out [Get started with Teams displays](#).

Features supported by Teams displays

In addition to the [features supported by Teams phones](#), the following features are unique to Teams displays:

- **Dedicated displays for Teams** Users can access all core Teams features including chat, meetings, calls, teams and channels, files and more.
- **Ambient experience** Users can easily stay on top of their work with always-on and glanceable displays to see important activities and notifications without context-switching on their primary work device. Users can also personalize Teams displays by customizing the background through settings.
- **Hands-free with Cortana** Users can interact with Teams displays using their voice to effortlessly join and present in meetings, dictate replies to a Teams chat, check what's on the calendar, and more.
- **Leave a note on lock screen** Guests can choose to leave audio, video, and text notes, and users can check the notes left by guests and see who's stopped by.

Required licenses

Teams licenses can be purchased as part of [Microsoft 365 and Office 365 subscriptions](#). To learn more about the required licenses to use Teams displays, see [Voice and video calling with Microsoft Teams](#).

For more information about how to get Teams, check out [How do I get access to Microsoft Teams?](#)

Deploy Teams displays using Intune

To learn more about how to deploy Teams displays using Intune, see [Deploy Teams phones and Teams displays](#).

Manage Teams displays in your organization

To manage your Teams display devices, in the left navigation of the Microsoft Teams admin center, go to **Teams displays**. From here, you can change the device configuration profile, manage updates, restart devices, add and remove device tags, and more. For more information, see [Manage your devices in Teams](#).

Upgrade Teams phones to Teams displays

Teams displays is the evolution of Teams phones. You can upgrade Teams phones in your organization to Teams displays using the Microsoft Teams admin center. This option is available only to phones that support upgrading to Teams displays. To learn more, see [Upgrade Teams phones to Teams displays](#).

Microsoft Teams panels

12/7/2021 • 6 minutes to read • [Edit Online](#)

Microsoft Teams panels are the compact touchscreen devices that are mounted right outside of your meeting spaces, typically next to entrances. Teams panels provide you the ability to view location and meeting details at a glance—and reserve an available meeting space on the spot. With rich, large text and color-coded indicators, you can see the meeting space's availability from a distance.

Teams panels are dedicated Microsoft Teams devices that display meeting details scheduled via Teams or Outlook 365 calendaring applications. With meeting details prominently displayed, attendees can confirm they're in the right meeting space, at the right time, and for the right meeting.

This article provides an overview of Teams panels and can help you plan, deliver, and manage Teams panels devices in your organization.

Features supported by Teams panels

Teams panels support the following features:

- **Dedicated display of meeting space and meeting details.** You get at-a-glance details about a meeting space, including its location and availability. For a reserved meeting space, you can see key meeting details, such as meeting title, meeting schedule, and meeting organizer.
- **Reserve available meeting spaces for ad hoc meetings.** Using the touchscreen panel, you can reserve an available meeting space on the spot for an ad hoc meeting, and *join* that Teams meeting from the in-room Microsoft Teams Rooms or Surface Hub devices.
- **Color-coded indicators for space availability status.** You can see meeting space availability from afar and up close with vibrant LED and Home screen indicators. Green indicates that the meeting space is available, and if necessary, you can reserve it right from the panels itself. Red or purple indicates that the meeting space is reserved.
- **Customize wallpaper and reserved state indicator.** Admins can change the default look of the panels through settings. For example, admins can change the background wallpaper, or change the color of the busy state indicator.
- **Accessibility.** Teams panels have several accessibility features, such as high contrast text, to make it easier for anyone to use them.

To learn more about these features and how to use them, see [Use Microsoft Teams panels](#).

Partners certified for Teams panels

You can acquire your Teams panels devices from one of the following partners:

- Crestron
- Yealink

Teams panels requirements

The hardware, software, and network requirements to deploy panels devices may differ depending on which type of panels devices you're deploying. Refer to the Original Equipment Manufacturer (OEM) documentation to know what's required for your set of devices.

License requirement

To use Teams panels, you need [Microsoft Teams Rooms Standard License](#).

NOTE

If you already have Microsoft Teams Rooms deployed in the meeting space where you're installing Teams panels, then you don't need an additional license to use Teams panels.

Deploy Teams panels devices

If you're involved in planning, deploying, and managing Teams panels devices, then this section is for you. This section isn't intended for the end users of Teams panels.

Deployment of Teams panels devices can be broken down into the following tasks:

- [Meeting space inventory and capability planning](#): Create an inventory of your organization's sites and meeting spaces for deploying Teams panels devices.
- [Procurement](#): Procure the devices from your selected device partner.
- [Site readiness](#): Confirm that your deployment locations (meeting spaces) meet the deployment requirements.
- [Configuration and deployment](#): Create resource accounts and assign them to the devices.

Inventory sites and meeting spaces

Take an inventory of the existing bookable meeting spaces in your organization. Identify the sites and meeting spaces that are in scope for deploying Teams panels. Work with your facilities and audio-visual teams to determine where and how to install the Teams panels devices, and if any additional hardware is needed for mounting the panels.

Procurement

Based on the number of meeting spaces that are in scope for deploying Teams panels, procure the devices from one of the [partners certified for Teams panels](#). Visit the partners' websites to learn more about the devices and procurement options.

Meeting spaces in your organization may have different hardware requirements for installing or mounting the devices. For example, hardware required for mounting the device on a glass, plaster, drywall, or wood paneling may not be the same. Refer to the device partner's documentation for available mounting options.

Site readiness

While the ordered devices are being delivered to your organization, work with your networking, facilities, and audio-visual teams to make sure that deployment requirements are met and each site and meeting space is ready in terms of power and networking.

Our recommendations for Teams panels sites are:

- Dedicated resource accounts
- Power supply (Panels generally support Power over ethernet plus (PoE+) for power. Refer to the OEM documentation for any device-specific power requirements.)

For physical installation considerations, see the OEM documentation and, if you have one, use the experience of your audio-visual team before you install and mount devices and run cabling.

Configuration and deployment

Planning for configuration and deployment covers the following key areas:

- Resource account provisioning
- Testing

Resource account provisioning

Every Teams panels device requires a Microsoft 365 room resource account. You use the resource account credentials to sign in to Microsoft Teams app on the panels device.

To set up a Microsoft 365 resource account for Teams panels, we recommended that you purchase a [Microsoft Teams Rooms Standard license](#). For information on how to create a resource account and assign a license to it, see [Create a resource account using the Microsoft 365 admin center](#).

NOTE

- If you already have a room resource account set up for the meeting space where you're installing panels, use the same room resource account to sign in to the panels device. However, make sure that the room resource account has the Microsoft Teams Rooms Standard license assigned to it in order to use it as panels resource account.
- If you already have a Microsoft Teams Rooms deployed in the meeting space where you're installing Teams panels, you don't need to purchase a separate license for deploying panels. The admin signs in to the panels device with the same credentials as the Microsoft Teams Rooms for the same space.
- For large meeting spaces, such as board rooms or conference rooms, with multiple entrances, you can mount one panels device at each entrance. Multiple panels that belong to a single meeting space share the same resource account and sign in with the same credentials. You don't need to create separate resource accounts for each panels for the same space.

TIP

It is recommended to create the resource account well in advance of the actual Teams panels installation. Consider using naming conventions for the Teams panels resource account. Make the display names for your Microsoft 365 resource accounts descriptive and easy to understand. These are the names that users will see when they search meeting spaces while scheduling meetings in Outlook or Teams calendars.

Testing

After you've deployed panels, you should test them. Check that the [features supported by Teams panels](#) are working on the deployed device. Try creating several meetings for various time slots via Teams or Outlook 365 on your computer. Check if the panels correctly display the meeting details and availability for the scheduled meetings. Try using the **Reserve** button to check if you can reserve an available meeting space directly from the device.

Manage Teams panels in your organization

To manage your Teams panels devices, in the left navigation of the Microsoft Teams admin center, go to **Teams Devices > Panels**. From here, you can change the device configuration profile, manage updates, restart devices, add and remove device tags, and more. For more information, see [Manage your devices in Teams](#).

How to use Microsoft Teams panels

12/7/2021 • 10 minutes to read • [Edit Online](#)

Microsoft Teams panels are compact digital display devices that are mounted right outside of your meeting spaces, typically next to entrances. These touchscreen panels are dedicated Microsoft Teams devices that provide at-a-glance view about your meeting space and the scheduled meeting. With the vibrant color-coded LED and Home screen indicators, you can determine if the space is available or reserved from a distance. You can use Teams panels to reserve an available meeting space for an ad hoc meeting, on the spot.

Teams panels devices come preinstalled with Microsoft Teams and display meeting details that are scheduled through Outlook or Teams calendars.

This article provides guidance, to both end users and admins, on how to use the Teams panels devices. It also provides answers to the [frequently asked questions](#) about using these devices.

For an overview of the panels devices, and the guidance on how to plan, deliver, and manage them in your organization, see [Deploy Microsoft Teams panels](#).

For a quick start, check out [Get started with Teams panels](#).

Teams panels end-user experience

Explore the [Home screen](#) of your Teams panels device to view meeting space and meeting details. Or, tap and scroll on the touchscreen panel to do other actions.

Use your Teams panels devices to:

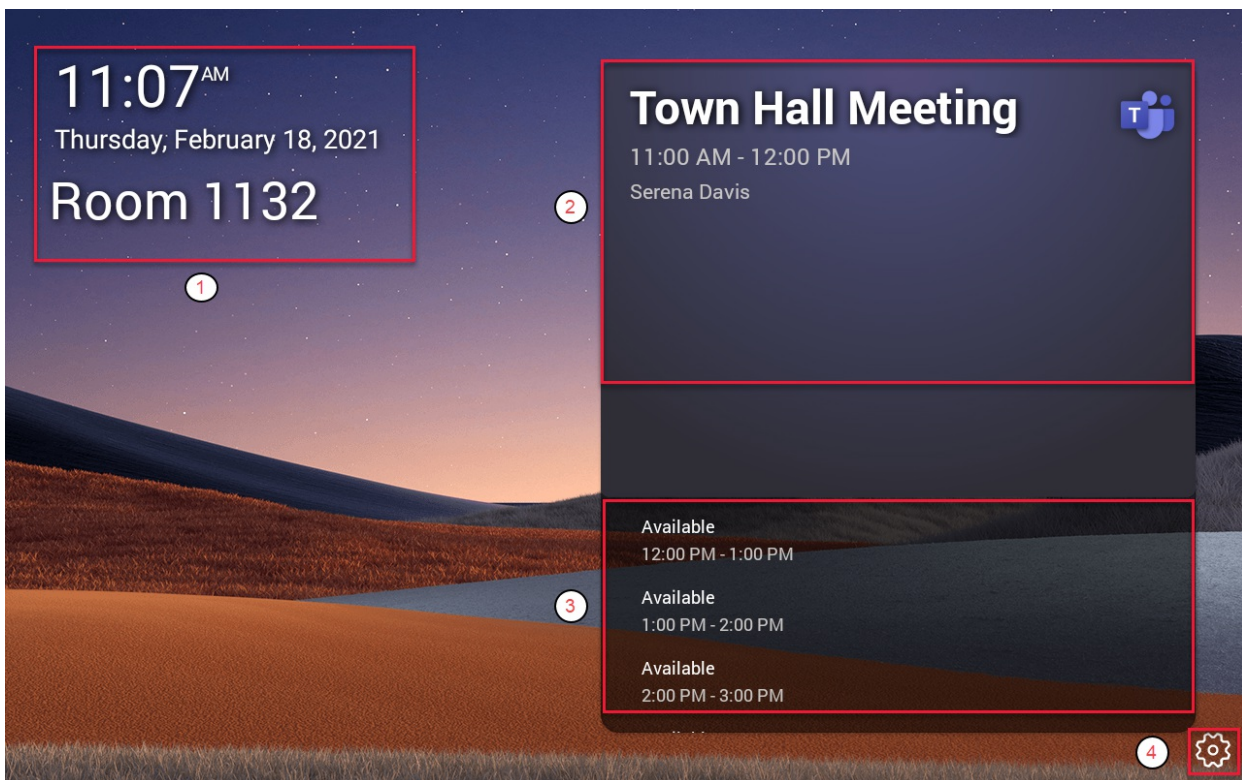

- [View meeting space details and availability, meeting details, upcoming reservations](#)
- [Reserve an available meeting space](#)
- [Report a problem](#)
- [View or update a device setting](#)

Explore Teams panels Home screen

The Home screen is the main visual interface of your Teams panels device.

From the Home screen, you can view location and meeting details, reserve a space, view upcoming reservations, and identify current availability status.

The following screenshot shows different parts or tiles on the Teams panels Home screen:

Refer to the following table for a description of each tile:

TILE	DESCRIPTION
1-Current time, day, date, and meeting space details	Displays current time, day, date, and meeting space name. The meeting space name is the name of the resource account that signed in to panels.
2-Meeting space availability and meeting details	Indicates meeting space availability and displays meeting details. See Meeting space availability and meeting details tile .
3-Upcoming Calendar	Displays the meeting space calendar and availability for up to 24 hours from the current hour. Scroll up or down to determine which time slots are available and which are reserved.
4-Settings	Displays the Settings icon. Tap it to report a problem or update available device settings.

Meeting space availability and meeting details tile

The appearance of this tile and its capabilities vary depending on the meeting space availability and type of reservation.

Meeting space is reserved for a scheduled meeting

The tile appears in purple for a meeting space that is reserved for a scheduled meeting (scheduled via Outlook or Teams). It displays meeting title in prominent text, meeting start and end times, and meeting organizer's name. For a Teams meeting, the Teams logo also appears. With meeting details prominently displayed, attendees can easily confirm they're in the right meeting space, at the right time, and for the right meeting.

NOTE

- After you schedule a meeting, it can take up to 90 seconds for the calendar to sync and reflect it on the panels screen.
- For a [scheduled meeting that is marked as private](#), **Private meeting** is displayed instead of the actual meeting title.

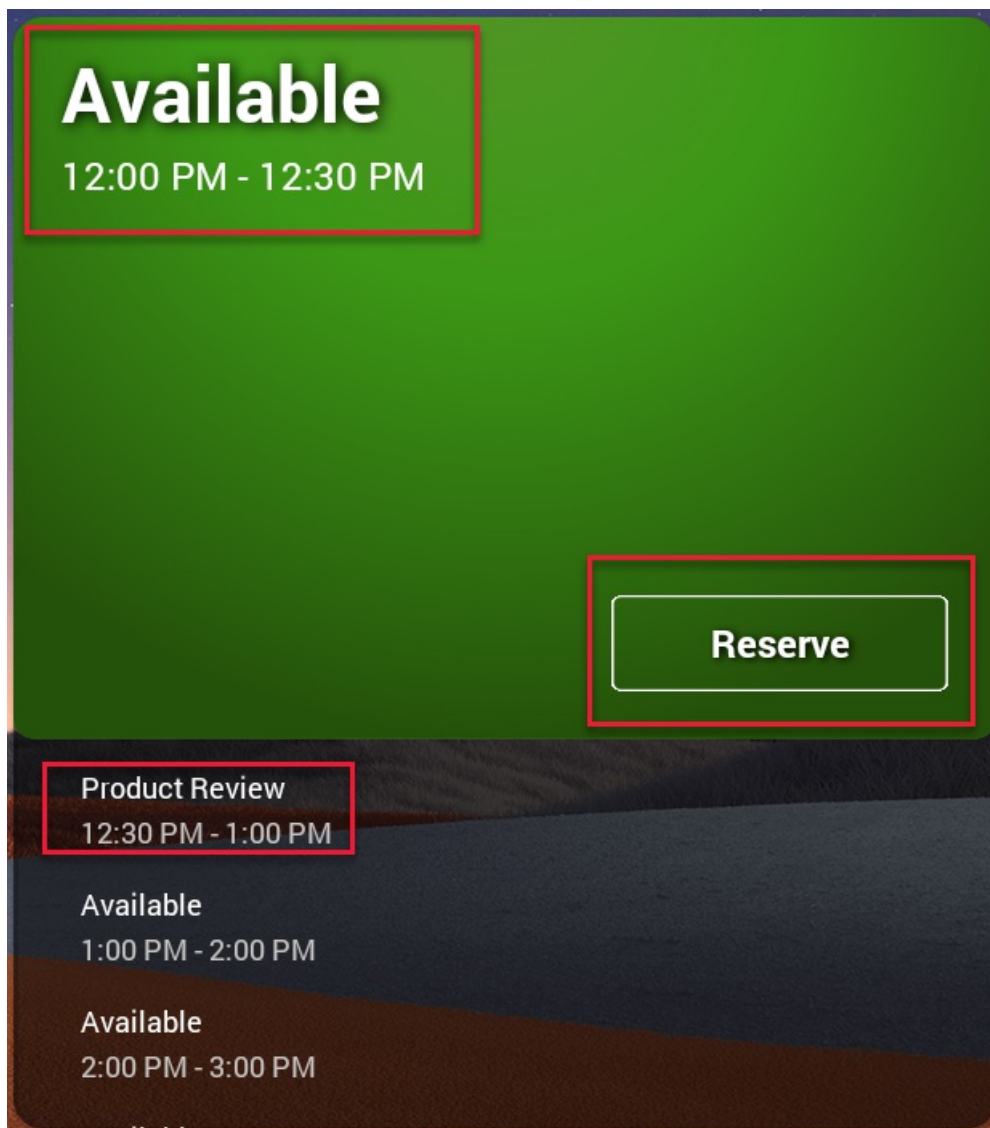

Meeting space is reserved for an ad hoc meeting

The tile appears in purple for a meeting space that is [reserved for an ad hoc meeting](#). It displays **Reserved** in prominent text along with the meeting start and end times. Ad-hoc meetings are automatically scheduled as Teams meetings, hence the Teams logo always appears on the screen.

Meeting space is available

The tile appears in green for an available meeting space. It displays **Available** in prominent text, and a **Reserve** button also appears that you can tap to [reserve the meeting space for an ad hoc meeting](#). You can check the upcoming calendar of the meeting space (right bottom tile) to decide the end time for your ad hoc meeting.

Reserve meeting spaces for ad hoc meetings

You can reserve an [available meeting space](#) directly from panels for an ad hoc meeting. All ad hoc meetings are automatically scheduled as Teams meetings. However, once reserved, you can't release or unreserve that meeting space through panels. Only admins of the device's resource account can cancel the ad hoc meeting (via Outlook or Teams calendar) to unreserve the space.

For ad hoc meetings that are booked directly from panels:

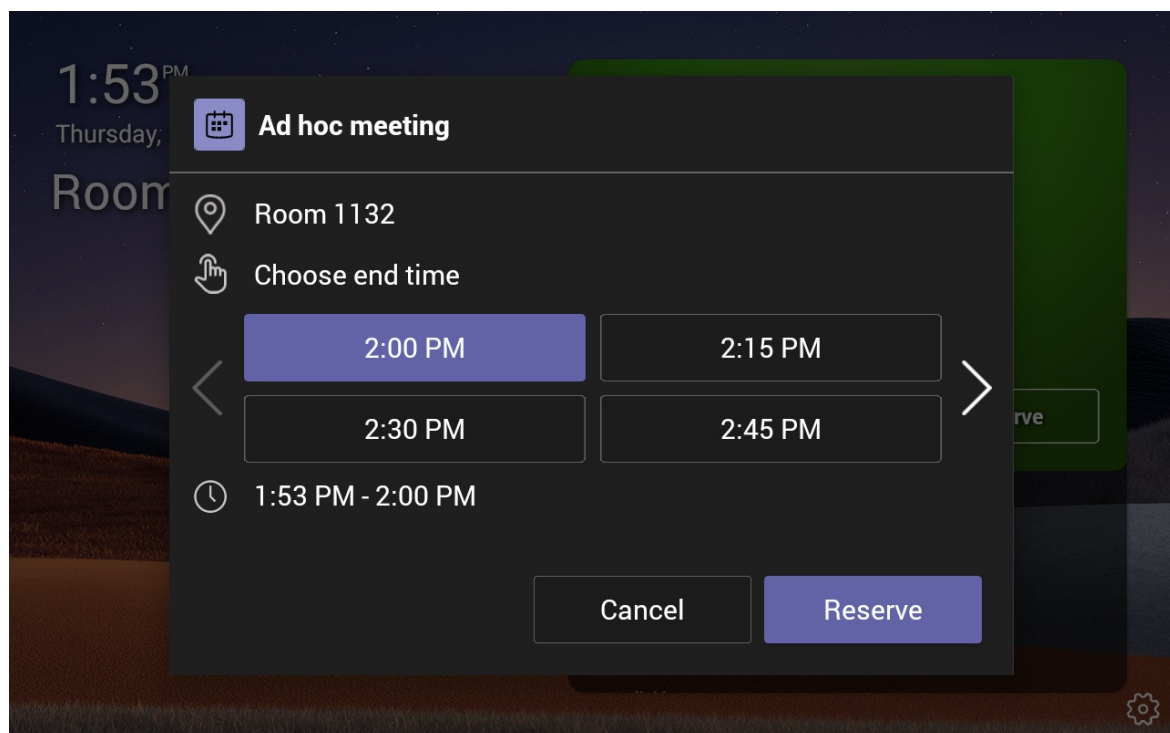

- The start time is always the current time and as such you can't schedule it for a future time.
- The end time can be until the next scheduled meeting or up to 24 hours from the current hour, whichever is earlier. Check the **Upcoming Calendar** tile on the Home screen to determine the time slots during which the meeting space is available or booked.

To reserve an available meeting space for an ad hoc meeting:

1. On the Home screen, tap the **Reserve** button.

2. In the **Ad hoc meeting** screen, review the available end time choices. You can use the right or left arrows to browse the available end time choices.

NOTE

- The end time choices are displayed in 15-minute intervals of an hour.
- The end time defaults to the next 15-minute interval that is at least five minutes after the current time. For example, if the current time is 1:57 PM, the default end time displays as 2:15 PM, and not 2:00 PM. This prevents users from booking the space for five minutes or less. In the above screenshot, the default end time displays as 2:00 PM, which is the next 15-minute interval that is at least five minutes after the current time (1:53 PM).
- An exception to the above rule is when the start time of the next meeting is within five minutes from the current time. In such cases, you can book the space until the next meeting start time. For example, if the current time is 1:57 PM and the next meeting start time is 2:00 PM, then 2:00 PM displays as the only end time option and you can reserve the space for three minutes.

3. Tap the desired end time interval, and then tap **Reserve**.

A confirmation window appears with a thumbs up emoji, meeting start and end time, and meeting space name.

The right tile on the Home screen now appears in purple and displays the **Reserved** text and the Teams logo. This indicates that the meeting space is now reserved for an ad hoc Teams meeting.

NOTE

If the meeting space is a Microsoft Teams Room, you can *join* this Teams meeting with the in-room Microsoft Teams Room or Surface Hub devices.

Report a problem

To report an issue with the device or the meeting space, to request a feature update, or to provide any feedback, use the **Setting** icon on the Home screen.

1. Tap the **Settings** gear icon on the Home screen.
2. Tap the **Report an issue** option.

The **Send Feedback** screen is displayed in a form format.

3. From the **Type** dropdown, select the type of request.
4. From the **Issue** dropdown, select the category.
5. In the **Title** text field, type the title using the panels keypad.
6. In the text field below **Title**, type additional details, if necessary.

NOTE

Do not include any personally identifiable information.

7. Review your entries and tap **Send**.

View or update a device setting

There are several device settings, such as about, accessibility, reboot, and privacy policy that you can view or update directly from panels. The available device settings may differ based on the Original Equipment Manufacturer (OEM) of your device. For information on settings specific to your device, see the OEM documentation.

To view or update a device setting:

1. Tap the **Settings** icon on the Home screen.
2. In the **Settings** screen, tap **Device settings**.
3. In the **Device Settings** screen, tap the setting that you want to view or update.
4. Follow the prompt on the screen to view or update the setting.

Teams panels admin experience

If you're the admin of [Teams panel's resource account](#), then you're also the admin of **Panels App** on the device. As the **Panels App** admin, you can do all the functions that are mentioned in the [end-user experience](#) section, in addition to managing the **Panels App** settings on the device.

Your panels devices provide two types of admin settings. You must be a device admin to access the available admin settings. End users can't access these settings.

- Admin settings that are specific to the device, such as display, time and date, language, bluetooth, WiFi, and so on. Refer to the OEM documentation to know more about these settings.
- Admin settings that are specific to **Panels App** on your device, such as wallpaper and LED indicator color. Only an admin of **Panels App** can access these settings. Since **Panels App** settings are available as part of admin settings, you must have admin sign in credentials for both the device and **Panels App** to access

Panels App settings.

NOTE

Any updates to the **Panels App** settings done via the device are applicable only to that specific device. Those updates will not impact other panels devices in your organization. For example, if you change the Home screen wallpaper image from the **Panels App** settings, the wallpaper image will change only for that specific device.

Access Panels App settings

You can access **Panels App**-specific settings by using the **Panels App Settings** option under the admin settings. The steps to access **Panels App Settings** may differ based on the OEM of your device.

To access the **Panels App Settings** option:

1. Tap the **Settings** icon on the Home screen.
2. On the **Settings** screen, tap **Device settings**.
3. Tap the **Admin Settings**.

NOTE

Depending on the OEM of your device, you may need to enter the device admin password now or after the next step.

4. Scroll down to find the **Panels App Settings** option. Tap it.
5. Tap the **Panels App Settings** button on the right screen. The screen with the available **Panels App** settings is displayed.

Wallpapers

LED settings

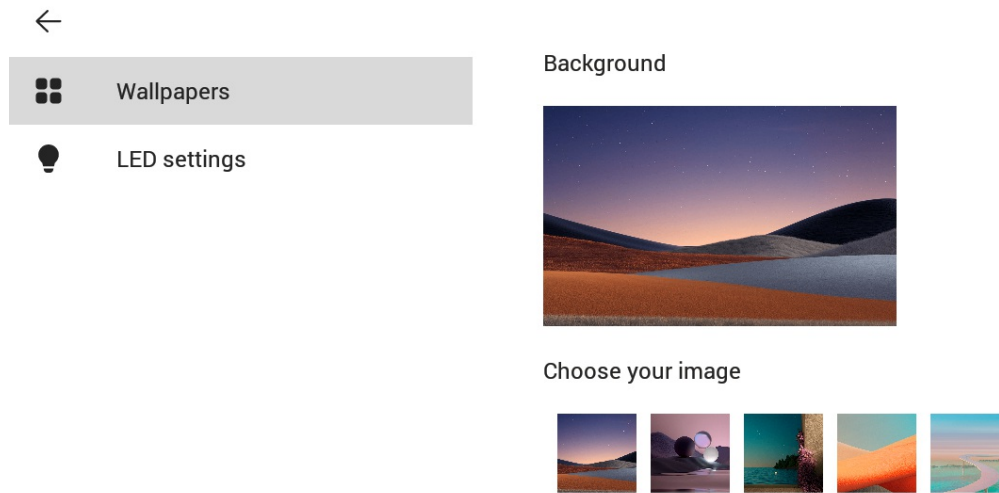

Use this screen to update the following **Panels App** settings for your device:

- [Wallpaper](#)
- [LED indicator](#)

Update the wallpaper

Change the Home screen wallpaper image.

1. [Access Panels App Settings](#).
2. Tap **Wallpapers**.
3. From **Choose your image**, select an image to set as the Home screen background image. Preview the selected image under **Background**.

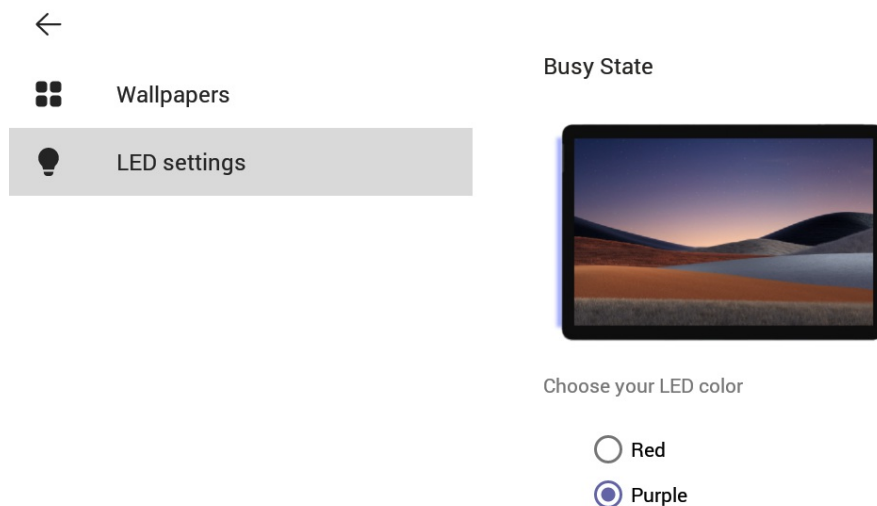

4. Go back to the Home screen and verify that the wallpaper is updated.

Change the busy state LED color

Admins can choose either red or purple as the LED color to indicate that the meeting space is busy or reserved. The LED color to indicate an available space is always green and can't be changed.

1. [Access Panels App Settings](#).
2. Tap LED Settings.
3. From **Choose your LED color**, select the desired color.

4. Go back to the Home screen and verify that the LED color for the busy state is updated. If the meeting space is currently available, try to schedule a test meeting to verify the change in LED color for the busy state.

Frequently asked questions

Find answers to frequently asked questions about the Teams panels devices.

How far in the future can I see the scheduling details of a meeting space?

In the **Upcoming Calendar** tile (bottom right) on the Home screen, you can see the scheduling details of a meeting space for up to 24 hours in the future from the current hour.

Can I reserve a meeting space for a future time from the Teams panels device?

No, you can't reserve a meeting space for a future time from panels. The start time is always the current time for an ad hoc meeting scheduled from panels.

How long I can reserve an available meeting space for an ad hoc meeting?

You can reserve an available meeting space starting from your current time until the next scheduled meeting time, or up to a maximum of 24 hours from your current hour, whichever is earlier. For example, if the current time is 10 AM, and the next meeting start time is 2 PM, you can reserve the meeting space from 10 AM until 2 PM.

Microsoft Teams apps/Line of Business (LOB) app support on Teams panels

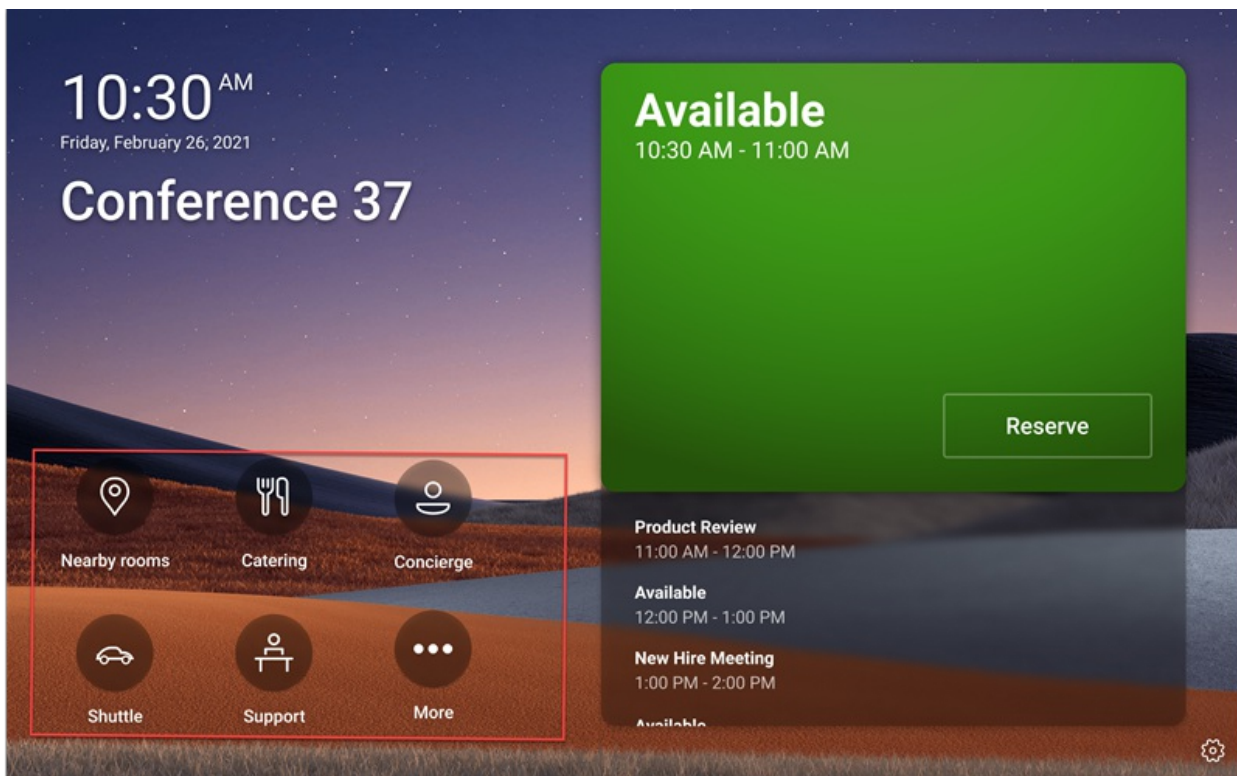

12/7/2021 • 5 minutes to read • [Edit Online](#)

Teams panels is adding support for [Teams apps/Line of Business \(LOB\) apps](#). This will enable enterprises to add additional experiences on the panels to meet your organization's needs. This release supports static web content.

IMPORTANT

This feature is only available after updating your Teams panels device(s). You need to have the Teams app version 1449/1.0.97.2021070601 or newer to have app support within Teams panels.

Teams app experience on Teams panels

The Teams panels home screen includes app navigation options, outlined in the screenshot in red. Note that these are example icons and may not be available for use.

Your app
content here

When an end-user taps on one of the app icons, they will see the Teams app screen displayed in the previous screenshot. The gray rectangle in the screenshot is where apps are displayed on the Teams panel. The app bar is fixed and part of the Teams panels app.

Set up and manage Teams panels apps in Teams admin center

Microsoft Teams apps bring key information, common tools, and trusted processes to where people gather, learn, and work. Teams apps work [through integrated capabilities](#). Now, as an IT administrator, you have the choice of which apps to include in your organization's Teams panels device and customize permissions via the [Teams admin center](#).

You can now use the Teams apps on Teams panels and customize the user experience based on your organization's needs. You can decide which web app your users can access and use and prioritize the app views. Some options, like the bot and messaging capabilities, are not supported at this time. Learn more about [the Teams apps](#) and [how to manage your devices in Microsoft Teams](#).

Manage apps on Teams panels in Teams admin center

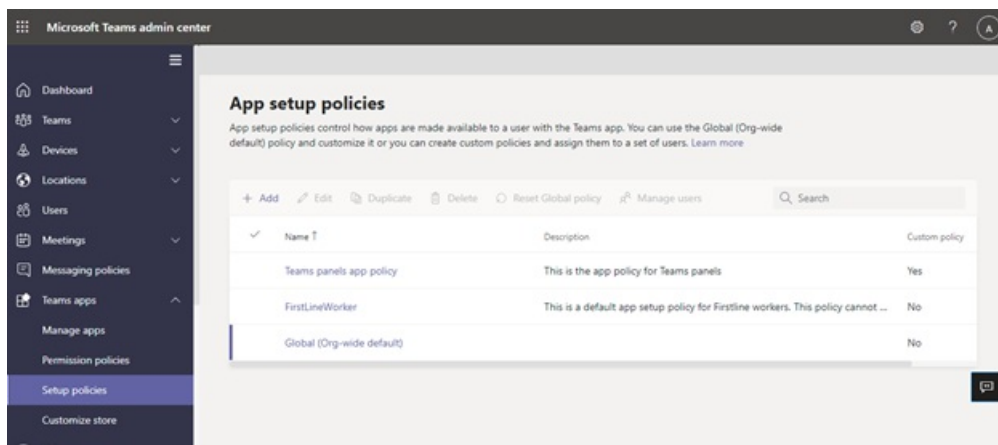

Note: You must be a global admin or a Teams service admin to access the [Teams admin center](#).

End users can view but not install apps on Teams panels. As an admin, you can view and manage all Teams apps for your organization via the Teams admin center. Learn more about how you can [manage your apps in the Microsoft Teams admin center](#) via the **Manage apps** page. The **Manage apps** page within the Teams admin center is also where you can upload [custom apps](#).

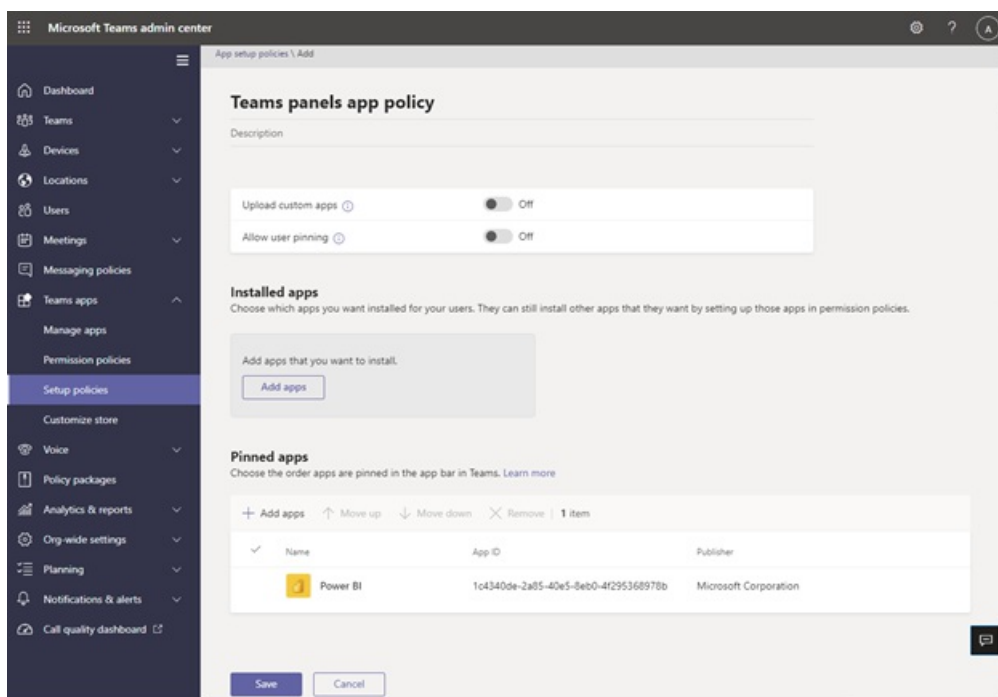

After setting up apps, you can use [app permission policies](#) and [app setup policies](#) to configure the app experience for specific room accounts in your organization.

Pin apps on Teams panels with app setup policies

Since Teams offers the capability to display a wide range of apps, admins can decide on which apps are most essential for the organization and pin only these for the Teams panels **Home** screen for quick access. If there are more than five pinned apps or any unpinned apps, they will appear under the **More** screen. Microsoft recommends creating a custom app setup policy specifically for Teams panels.

To manage pinned apps displayed on the Teams panels, sign in to the Teams admin center for your organization and navigate to **Teams apps > Setup policies > Select or Create a new policy > Pinned apps**.

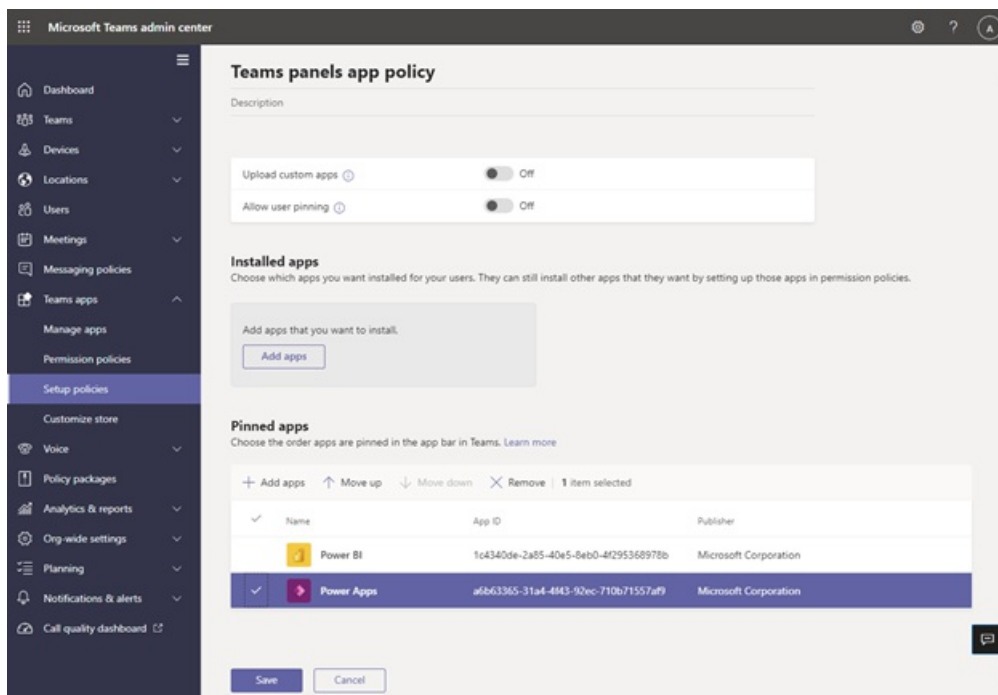

Apps included in this image are only examples and may not be available for use.

Microsoft recommends you turn off **Upload custom apps** and **User pinning** for the best Teams app experience on Teams panels.

For more about pinning apps, see [Manage app setup policies](#).

Manage apps display order in Teams panels

Apps included in this image are only examples and may not be available for use.

To manage the order in which apps are displayed on the Teams panels, sign in to the Teams admin center for your organization and navigate to **Teams apps > Setup policies > Select the Policy > Pinned apps: Move-up/down**.

Assigning setup policies to a room resource account

After creating the setup policy, the admin will need to assign this policy to the room resource account that will be signed into the Teams panels. For more information, refer to [Assign policies to users and groups](#).

FAQ

How long does it take for Teams panels to get the new or updated app setup policies?

After editing or assigning new policies in the Teams admin center, it can take up to 24 hours for changes to take effect. Admins can try to sign-out/sign-in from the panel, tap the **Settings** icon, and go back to the **Home** screen to try to refresh the policies.

What is the ordering of the apps on the “More” screen?

On the **More** apps page, the pinned apps will appear first. Then, any other installed apps will appear in alphabetical order.

Why are bot apps not showing up on Teams panels?

Only static tabs web content is supported at this time.

Why are native Teams apps, such as Calendar and Tasks, not appearing on Teams panels?

Native Teams apps, such as Calendar and Tasks, are not shown on Teams panels.

In the Teams admin center, under the setup policies section, what is the difference between installed apps and pinned apps?

For Teams panels, Microsoft recommends using pinned apps, so the admin is able to select the desired app and rearrange its ordering.

Note: Some apps do not support app pinning. Please contact the app developer to enable app pinning functionality.

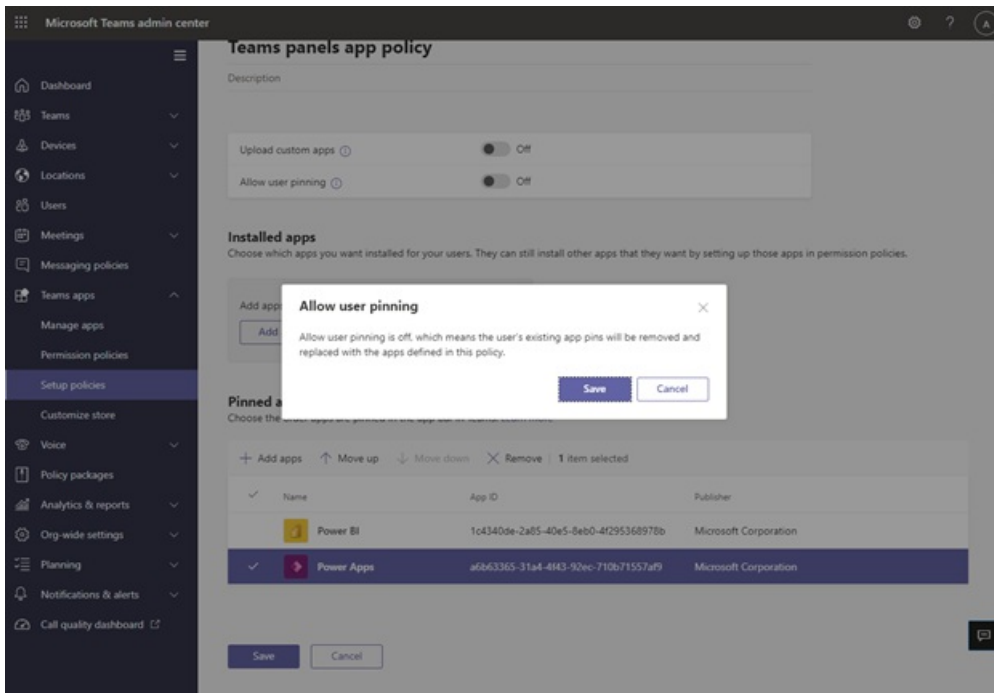

Why are other apps appearing in the “More” screen even though they are not part of the installed or pinned apps in the Teams app setup policy section?

If apps were previously installed via other app policies or manually in the Teams desktop/web clients for the room resource account used on Teams panels, the admin may need to sign in to the room resource account in Teams and manually uninstall the apps by right-clicking the app, then selecting **Uninstall**.

Why can't I find an app in the “Add pinned apps” pane?

Not all apps can be pinned to Teams through an app setup policy. Some apps may not support this functionality. To find apps that can be pinned, search for the app in the **Add pinned apps** pane. For more information, please refer to [the FAQ in Working with app setup policies](#).

Why am I seeing an “User pinning” pop-up in the setup policies panel after I turn off “User pinning?”

Apps included in this image are only examples and may not be available for use.

This behavior is expected for a device in a shared space and helps prevent unintentional app pinning.

Upgrade Teams phones to Teams displays

12/7/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Upgrading to Teams displays is available only on Lenovo ThinkSmart View devices. The information in this article applies only to this device model.

This article gives you an overview of how to upgrade your Teams phones to Teams display devices in the Microsoft Teams admin center. Doing this allows the devices to provide a rich experience for your users as Teams display devices.

Teams displays are a category of all-in-one dedicated Teams devices with an ambient touchscreen and a hands-free experience powered by Cortana. Teams displays are the evolution of Teams phones. In addition to [features supported by Teams phones](#), Teams displays include features such as an always-on display in which all Teams activity and collaboration options are always available. To learn more about features unique to Teams displays, see [Microsoft Teams displays](#).

What you need to know about upgrading to Teams displays

Which Teams phones can be upgraded?

Lenovo ThinkSmart View devices can be upgraded to Teams displays.

How can I prepare users?

To get your users ready, share [Get started with Teams displays](#) with your users to help them get familiar with using Teams displays. We recommend you do this well in advance of the upgrade.

Let them know that there's no changes to their data or preferences after the upgrade. For example, users can access all their meetings, missed calls, and voicemails in Teams displays.

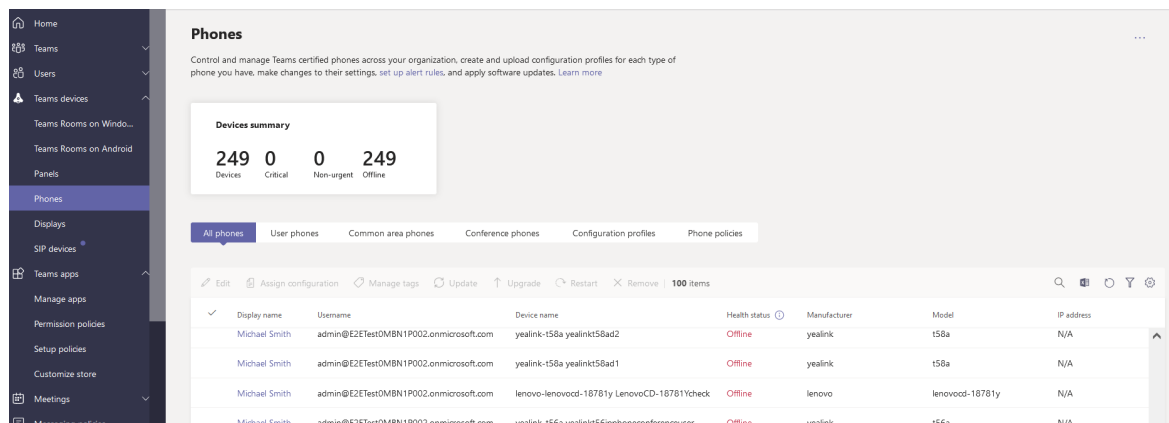

What happens after the upgrade?

After you upgrade a Teams phone to a Teams display device, the device is listed on the **Teams displays** page in the **Teams Devices** section of the Microsoft Teams admin center. You manage it in the same way that you manage any other Teams device. To learn more, see [Manage your devices in Teams](#).

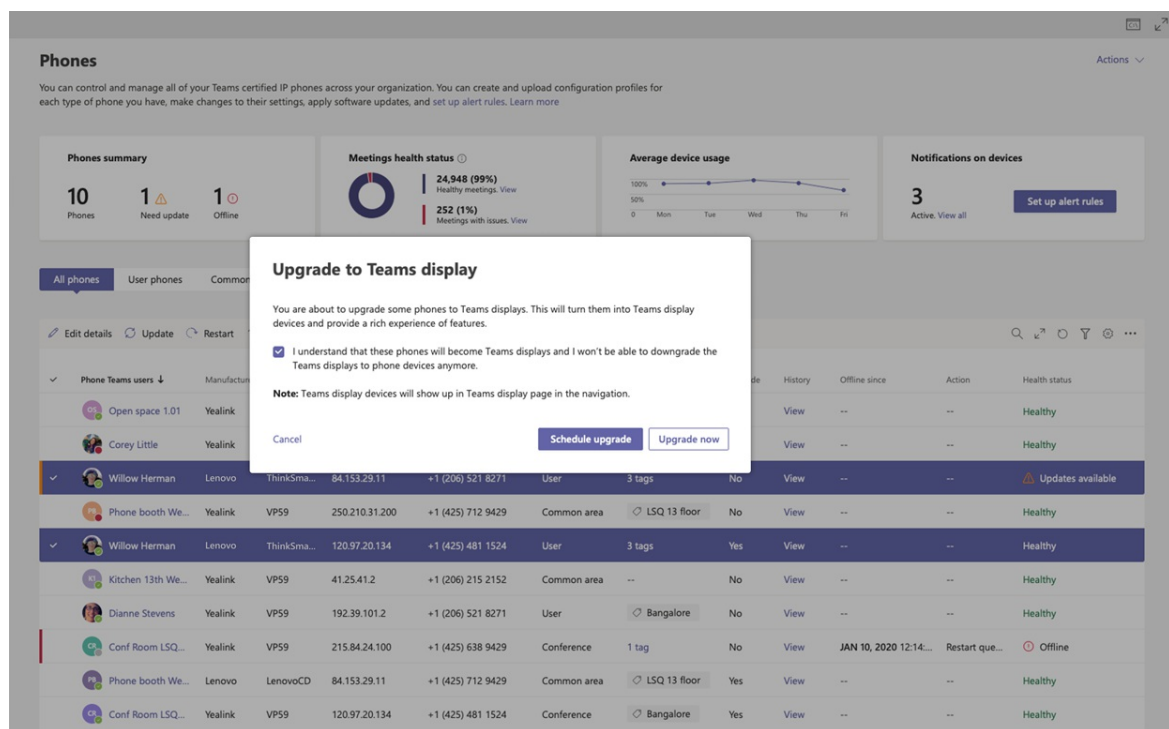

Keep in mind that after you upgrade a Teams phone to a Teams display device, the action can't be reversed. We recommend you first run a pilot with a group of early adopters before you upgrade your entire organization.

Upgrade your Teams phones to Teams displays

1. In the left navigation of the Microsoft Teams admin center, go to **Teams Devices > Phones**.
2. Select the Teams phones you want to upgrade, and then select **Upgrade**.

3. In the **Upgrade to Teams display** dialogue box, select **Schedule upgrade** to set a date and time for the upgrade or **Upgrade now**.

NOTE

If you receive a message that says your selected phones can't be upgraded, check to make sure that you select [phones that support the upgrade](#), and then try again.

During the upgrade process, the device's firmware is updated to a Teams display device, the device restarts, and is ready for use. When the upgrade is completed, you'll see the device listed on the **Teams displays** page in the Microsoft Teams admin center.

It can take up to an hour for the upgrade to complete. If the process hasn't completed after an hour, retry the upgrade. You can also go to the **History** tab of the device details page to see the status.

Known issues

Teams displays have the Default theme instead of the Dark theme

Dark theme support on Teams displays will be available in a future update. Teams phones that use the Dark theme will get the Default theme after the upgrade to Teams displays.

Some apps are missing from the Home screen

If certain apps are missing from the Home screen after the upgrade, sign out and sign in again. The fix for this will be available in a future update.

Deploy Teams phones, Teams displays, and Microsoft Teams Rooms on Android using Intune

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article gives you an overview of how to deploy Teams phones, Teams displays, and Microsoft Teams Rooms on Android using Intune.

Conditional Access

Conditional Access is an Azure Active Directory (Azure AD) feature that helps you to ensure devices accessing your Office 365 resources are properly managed and are secure. If you apply Conditional Access policies to the Teams service, Android devices (including Teams phones, Teams displays, and Microsoft Teams Rooms on Android) that access Teams need to be enrolled into Intune and their settings need to comply with your policies. If the device isn't enrolled into Intune, or if it's enrolled but its settings don't comply with your policies, Conditional Access will prevent a user from signing in to or using the Teams app on the device.

Typically, compliance policies defined within Intune are assigned to groups of users. This means that if you assign an Android compliance policy to user@contoso.com, that policy will apply equally to their Android smartphone and to any Android-based Teams device that user@contoso.com signs into.

If you use Conditional Access, which requires Intune enrollment to be enforced, in your organization, there are a couple things you need to set up to allow for a successful Intune enrollment:

- **Intune license** The user signing into the Teams device must be licensed for Intune. As long as the Teams device is signed in to a user account that has a valid Intune license, the device will automatically be enrolled in Microsoft Intune as part of the sign-in process.
- **Configure Intune** You must have a properly configured Intune tenant set up for Android Device Administrator enrollment.

Configure Intune to enroll Teams Android-based devices

Teams Android-based devices are managed by Intune via Android Device Administrator (DA) management. Before devices can be enrolled into Intune, there are a few basic steps to perform. If you are already managing devices with Intune today, you probably have already done all these things. If not, here's what to do:

NOTE

- If tenant admins want common area phones to be enrolled into Intune, they need to add an Intune license to the account and follow the steps for Intune enrollment.
- If the user account used to sign into a Teams device isn't licensed for Intune, Intune compliance policies and enrollment restrictions need to be disabled for the account.

1. Set Intune MDM (mobile device management) Authority.

If you've never used Intune before, you need to set the MDM authority before you can enroll devices. For more information, see [Set the mobile device management authority](#). This is a one-time step that has to be done upon creating a new Intune tenant.

2. Enable Android device administrator enrollment.

Android-based Teams devices are managed as device administrator devices with Intune. Device administrator enrollment is off by default for newly created tenants. See [Android device administrator enrollment](#).

3. Assign licenses to users.

Users of Teams devices enrolling to Intune must be assigned a valid Intune license. For more information, see [Assign licenses to users so they can enroll devices in Intune](#).

4. Assign Device Administrator compliance policies.

- a. Create an Android Device Administrator compliance policy.
- b. Assign it to the Azure Active Directory group that contains the users that will be signing into the Teams devices. See [Use compliance policies to set rules for devices you manage with Intune](#).

USB audio and video devices certified for Microsoft Teams

12/7/2021 • 10 minutes to read • [Edit Online](#)

The peripherals certification program ensures USB peripherals (such as headsets, speakerphones, webcams, and monitors) offer rich audio or video quality. Certified devices work (plug & play) with no extra configuration required, and offer call control with Microsoft Teams and Skype for Business. The products provide a great experience for end users and administrators.

To explore devices tested and certified for Microsoft Teams, head over to the [Teams store](#).

For more information about call control support with Teams, see [control calls using a headset in Teams](#).

TIP

Looking for devices certified for Skype for Business? Head over to [USB audio and video devices certified for Skype for Business](#).

Understanding certification categories

Users don't need to replace previously certified devices when upgrading to Teams from Skype for Business. All certified devices are supported for Microsoft Teams and Skype for Business users, with only a few differences. Certification also provides further designation for certain device categories.

- **Skype for Business certified with Teams upgrade** Devices certified at this level were initially certified for Skype for Business. Microsoft has worked with device manufacturers to deliver the best Teams integration experience possible without any changes to the original hardware. The *hookswitch* button acts as a Teams button when not in a call, and may include more functions over time. Devices in this category may carry the Teams certification badge on marketing materials.
- **Certified for Microsoft Teams** Devices certified at this level indicate the newest devices certified, for a no-compromise Teams experience. These devices offer all of the benefits of prior certification and also include a dedicated Teams button with LED indicator. With most form factors, the Teams button will be an easy-to-find tactile button with the Teams logo. Microsoft continues to work with device manufacturers to deliver new value via firmware updates over time.

Special usage designations

- **Premium Microphone for Open Office** All headsets are tested to provide clear audio, but open office and other noisy environments pose a greater challenge. Headsets with this designation pick up the voice of the headset user but not transmit the sound of their neighbors.
- **Meeting room size** Shared devices such as speakerphones and cameras have a supported usage distance. Recommended distances may be different depending on the manufacturer. To give customers clear guidance, all shared devices are tested at certification against well-defined rooms sizes and noise environments.

Browse [devices certified for Microsoft Teams](#).

End-user experience

New Teams certification benefits

- Dedicated Teams button and LED indicator light.

- User notification of events and alerts from the Teams client (for example, meeting starting, voicemail or missed call).
- Ability to activate the Teams client or respond to notification with a press of the button (for example, to join a meeting).
- Certification designed for extensibility (new device/client features to be delivered via firmware update).

Core certification benefits

- Automatic selection of default audio device and prioritization if multiple audio peripherals are present.
- Devices automatically register with the Teams client and are ready to use.
- Audio devices (for example, headsets, and speakerphones) offer:
 - Basic call control across when used with a PC or a Mac device. Basic controls include answer/hang-up, mute/unmute, and volume control.
 - Wide-band audio with no echo, distortion, or excessive glitches. Echo cancellation is also supported across devices.
- Video devices meet requirements for noise, color, image detail, jitter, latency, frame rate, and field of view.

Administrator Experience

- No provisioning required
- All devices support firmware updates to allow new features and performance improvements.

If you're a manufacturer and want to join the certification program, see [How to Join](#) for requirements and available programs.

Certified devices

Deploy Microsoft Teams Rooms on Android

12/7/2021 • 5 minutes to read • [Edit Online](#)

Deployment of Microsoft Teams Rooms on Android can be broken down into the following phases:

- **Site readiness** Confirm that your deployment locations (rooms) meet the deployment requirements.
- **Service readiness** Create resource accounts and assign them to the devices ([see Create a resource account using the Microsoft 365 admin center](#)). While we recommend using a dedicated room license, a properly licensed end user account can also sign in to Teams Rooms on Android.
- **Configuration and deployment** Set up Teams Rooms and connect the peripheral devices you need (see the manufacturer's documentation for details).

To manage Teams Rooms, you need to be a Global admin, Teams Service admin, or Teams Device admin. For more information about admin roles, see [Use Microsoft Teams administrator roles to manage Teams](#).

Site readiness

While the ordered devices are being delivered to your organization, work with your networking, facilities, and audio-visual teams to make sure that deployment requirements are met and each site and room is ready in terms of power, networking, and display.

Our recommendations for collaboration bar sites are:

- Rooms up to 5 people in size
- Dedicated resource accounts
- Touch-enabled displays
- Ethernet cabling
- Quality of Service (QoS) enabled on the network for Microsoft Teams media

For physical installation considerations, see the manufacturer's documentation and, if you have one, leverage the experience of your audio-visual team before you install and mount screens and run cabling.

TIP

Be sure to check out [Prepare your network for Teams](#) for bandwidth planning and assessing your network's suitability for real-time traffic.

We don't recommend placing proxy servers between Teams devices and the Internet. For more information about proxy servers and Teams, check out [Proxy servers for Teams](#).

Decision points

- Confirm that your sites meet the site readiness requirements for collaboration bars for Microsoft Teams.
- Confirm that you've provided sufficient bandwidth for each site.

 Next steps	<ul style="list-style-type: none"> • Start to plan your collaboration bar deployment and configuration.

Service readiness

Before you deploy Teams Rooms, you need to decide if they'll use Microsoft 365 resource accounts, end-user accounts, or a mixture of both. Microsoft 365 resource accounts are mailbox and Teams accounts that are dedicated to specific resources, such as a room, projector, and so on. These resource accounts can automatically respond to meeting invites using rules you define when they're created. Unless Teams Rooms is dedicated to a specific individual for their private use, we recommend setting up a Microsoft 365 resource account for it.

Using a resource account

If you decide to set up a Microsoft 365 resource account, you'll need to purchase a Meeting Room license for it. The Meeting Room license includes a resource mailbox that enables people in your organization to book the meeting room via Outlook or Teams. The license also enables video and audio conferencing and screen sharing among meeting participants.

If you need to receive or make calls to or from an external telephone number, you may need a Calling Plan or Microsoft 365 Business Voice [add-on license](#). If you have Direct Routing enabled in your organization, you only need the Meeting Room SKU.

When you create a resource account, you can choose whether to let the account automatically accept or decline meeting requests, allow recurring meetings, specify how far in advance people can book the resource, and so on.

IMPORTANT

Microsoft 365 resource accounts aren't the same as Teams resource accounts. Teams resource accounts can be used with call queues and auto attendants to accept phone calls from external phone numbers. Microsoft 365 resource accounts are tied to an Exchange Online mailbox and enable booking of shared resources, such as rooms, projectors, and so on.

If you want to know more about Teams resource accounts, see [Manage resources accounts in Microsoft Teams](#).

For more information about Microsoft 365 resource accounts, see [Create a resource account using the Microsoft 365 admin center](#).

 Decision points	<ul style="list-style-type: none"> • Decide whether you want to make or receive external phone calls and identify licensing requirements for your resource accounts.
 Next steps	<ul style="list-style-type: none"> • Prepare resource accounts.

Configuration and deployment

Planning for configuration and deployment covers the following key areas:

- Resource account provisioning
- Device deployment

- Teams Rooms application and peripheral device configuration
- Testing
- Asset management

Account provisioning

If you plan on using Microsoft 365 resource accounts to let users book collaboration bars, follow the instructions in [Create a resource account using the Microsoft 365 admin center](#) to create a Microsoft 365 resource account for each collaboration bar that needs one. This is also where you'll need to add a Meeting Room license to the resource account and, if you want to make or receive calls to or from external phone numbers, a Calling Plan or Business Voice license if your organization is not using Direct Routing.

If you want to assign Teams Rooms to individual users for their private use, you don't need to set up any additional accounts. Users can sign into collaboration bars using their personal accounts.

TIP

Make the display names for your Microsoft 365 resource accounts descriptive and easy to understand. These are the names that users will see when searching for and adding Teams Rooms to meetings. You could use a convention like *Site-Room Name(Max Room Capacity)*, so for example Curie, a 4-person meeting room in London, might have the display name LON-CURIE(4).

 Decision points	<ul style="list-style-type: none"> • Decide the naming convention for your dedicated resource accounts. • Decide whether you'll create individual accounts or use bulk-provisioning scripts.
 Next steps	<ul style="list-style-type: none"> • Start to plan your device deployment.

Device deployment

Next, you need to create your plan to deliver the devices and their assigned peripheral devices to your rooms, and then proceed with installation and configuration.

 Decision points	<ul style="list-style-type: none"> • Decide who will manage the site-by-site deployment. • Identify the resources who will install Teams Rooms on site and undertake the configuration and testing.
 Next steps	<ul style="list-style-type: none"> • Start device testing.

Testing

After you have deployed Teams Rooms, you should test them. Sign in to Teams Rooms and check that the expected capabilities are working. We highly recommend that you verify that they are appearing in the **Collaboration bars** section under the **Teams Devices** tab of Microsoft Teams admin center. It's also important that you make a number of test calls and meetings to check quality and performance.

We recommend that as part of the general Microsoft Teams rollout, you configure building files for Call Quality Dashboard (CQD), monitor quality trends, and engage in the Quality of Experience Review process. For more

information, see the [Quality of Experience Review Guide](#).

Asset management

As part of the deployment, you'll want to update your asset register with the room name, signed-in resource account, and assigned peripheral devices.

Set Microsoft Teams Android devices user interface

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Teams Android devices can display a specific user interface based on the type of license assigned to the signed-in account. You can override this behavior and control which interface is shown. This article details how the default user interface is chosen and how you can change the interface using a Powershell policy.

There are three types of user interfaces on Teams Android devices:

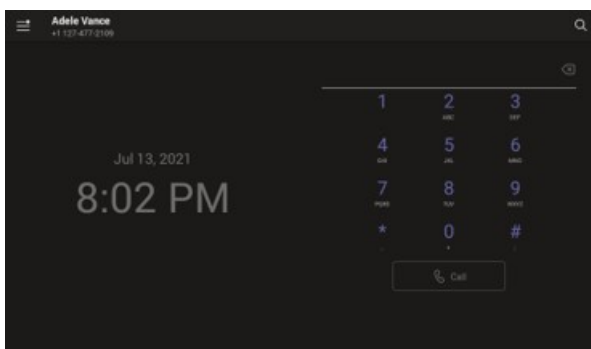

1. User
2. Common Area
3. Meeting

If you [assign a user license](#) to an account, like an E3 or an E5 license, the Teams device will display the default end-user interface which is fully featured for most user scenarios. However, if a device is performing a specific function, such as a common area phone or a meeting room, there are specific user interfaces for these usages.

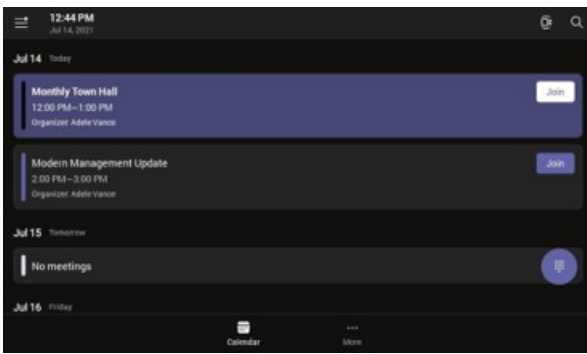

The following three images show how the user interface changes based on the license assigned to the user account. In the first image, the user account is assigned an E5 license. This is a user license, so the device shows the default end-user interface:

In this image, the user account has been assigned a [common area phone license](#). Common area phones are primarily used for making and receiving phone calls. As such, the dial pad is shown on the display:

Finally, this image shows a user account with a [Microsoft Teams Rooms Standard license](#) assigned. Teams Rooms licenses are meant to be used in meeting rooms or shared spaces, so the user interface changes to make it easy to join a meeting by showing the calendar view:

NOTE

Changing the user interface doesn't affect your ability to use other licensed features. For example, even though the Team Rooms license's default view is the calendar view, you can still make and receive Public Switch Telephone Network (PSTN) phone calls if the account is correctly licensed and configured.

IMPORTANT

There are other elements of the interface that change. For example, to prevent end-users from signing out of a common area phone or meeting room device, the "Sign out" option on these devices is moved to a part of the settings menu that requires administrator permissions to access.

Override automatic user interface detection

In some cases, you may choose to assign a license to an account that doesn't match its intended use. For example, you may assign a user license to an account meant to sign in to Teams Rooms on Android. By default, you would see the end-user interface instead of the meeting room interface. To override the default interface, create a new [Teams IP Phone Policy](#) and apply to it to that account.

NOTE

The license assigned to the user account must have at least the same license entitlements as the desired user interface. The Common Area Phone license only allows the Common Area phone user interface. The meeting room license allows meeting room and common area phone user interfaces. An E3 or E5 license supports all sign-in modes.

The following is an example of how to override automatic license detection. In this example, assume that a meeting room resource account named `conf-adams@contoso.com` has been assigned an E3 license. When this account is signed-in, you want users to see the meeting room user interface.

Create a new policy and assign to user

1. Start a remote Windows PowerShell session and connect to Microsoft Teams using the following cmdlet:

```
Connect-MicrosoftTeams
```

2. Create a new Teams IP Phone policy and set the sign-in mode to "MeetingSignIn":

```
New-CsTeamsIPPhonePolicy -Identity 'Meeting Sign in' -Description 'Meeting Sign In Phone Policy' -  
SignInMode 'MeetingSignIn'
```

3. You can now assign this new policy to the meeting room resource account:

```
Grant-CsTeamsIPPhonePolicy -Identity 'conf-adams@contoso.com' -PolicyName 'Meeting Sign In'
```

After granting the policy to the meeting room resource account, you'll need to wait for the policy assignment to replicate. You'll also need to sign out of the device and sign back in.

Microsoft Teams certified devices

12/7/2021 • 8 minutes to read • [Edit Online](#)

The Microsoft Teams certification programs ensure that customers who use certified desk phones and conference phones will experience high-quality audio calls and meetings experience.

Microsoft Teams Certification programs ensure a higher-quality bar with higher performance targets and audio quality metrics. Partners are actively working to meet this higher bar and are qualifying devices against certification requirements. Some of our partners are also working to provide support for the Skype for Business service on the same hardware as the Teams phones.

Plan for SIP Gateway

12/7/2021 • 4 minutes to read • [Edit Online](#)

SIP Gateway lets your organization use any compatible SIP device with Microsoft Teams to preserve your investments in SIP devices. Now you can sign-in to Teams with your corporate credentials and make and receive calls with a compatible SIP device. Compatible devices can be Skype for Business IP phones with standard SIP firmware, Cisco IP phones with multiplatform SIP firmware, or SIP devices from vendors such as Poly, Yealink, and AudioCodes. To find out how to configure your SIP devices for SIP Gateway, see [Configure SIP Gateway](#).

Benefits of SIP Gateway

SIP Gateway connects compatible SIP devices to Teams to help your users migrate seamlessly to Teams telephony. Using SIP Gateway, your users can do all of the following:

- **Make calls:** SIP device users can make calls to the Public Switched Telephone Network (PSTN), to other SIP devices, and to Teams and Skype for Business users. SIP device users can only call users who have phone numbers.
- **Receive calls:** SIP device users can receive a call from the PSTN, from Teams or Skype for Business users who have SIP devices, and from Teams and Skype for Business client applications. The SIP device acts as a Teams endpoint. Inbound calls will also be forked to the user's SIP device.
- **Multiple simultaneous calls:** A SIP device user in a call can put the call on hold to make or receive other calls. A SIP device user can also conference two calls.
- **Do not disturb:** A SIP device user can set do not disturb on the device so that the device will not ring for incoming calls. This has no impact on the user's status on all other Teams endpoints.
- **Hold/Resume and Mute/Unmute:** A SIP device user can hold and resume or mute and unmute a call by using the features for those actions on the device.
- **Voicemail:** SIP device users can listen to electronically stored voice messages that callers leave for them.
- **Message waiting indicator:** SIP device users can receive notifications that alert them when they have new voicemail messages.
- **Sign-in and sign-out:** SIP devices users can sign in and sign out of Teams on the device.
- **Dual-tone multi-frequency:** SIP device users can press number keys to provide input during interactive voice response calls.
- **Teams meetings:** A SIP device user can join a Teams meeting by dialing the meeting access number. Dialing out to a same organization user's phone number is currently not supported. However, guest users from another organization can be added to a Teams meeting by a participant who dials out to a guest user's number to include that guest. **NOTE:** Adding a Teams meeting participant via "request to join" currently won't alert a SIP device.
- **Call transfers:** SIP device users can transfer calls. SIP Gateway supports both blind and consultative transfers.
- **Local call forwarding:** A SIP device user can set forwarding rules (always, on timeout, and busy) for the device. If the device is connected to the SIP Gateway, then the call will be redirected to the target address based on the rule that the device user set. To make local call forwarding work, the admin must set the `AllowCallRedirect` attribute in `Set-CsTeamsCallingPolicy` to `Enabled`.

Requirements to use SIP Gateway

Teams users must have a phone number with PSTN calling enabled to use SIP Gateway.

Hardware, software, and licenses

If you have a 3PIP or SIP device, you must have:

- A license for Phone System (via E5 or a standalone license)
- PTSN enablement (i.e., a phone number) via a Microsoft Teams Calling Plan, Direct Routing, or Operator Connect
- A Common Area Phone license for any common area devices

Configure SIP Gateway

12/7/2021 • 10 minutes to read • [Edit Online](#)

This article explains how to configure SIP Gateway so that your organization can use compatible SIP devices with Microsoft Teams. To find out what SIP Gateway can do for your organization and what hardware, software, and licenses your organization needs for it, read [Plan for SIP Gateway](#).

Before you can configure SIP Gateway, do the following:

- **Reset SIP devices to factory default settings.** You or your organization's users must reset each SIP device used with SIP Gateway to its factory default settings. To find out how to do that, see the manufacturer's instructions.
- **Open your firewall to Microsoft 365 and Teams.** Open your network's firewall to Microsoft 365 and Teams traffic as described in [Office 365 URLs and IP address ranges](#).
- **Make sure the SIP devices are not behind a proxy.** Ensure that http/s traffic bypasses any corporate http/s proxy.
- **Open the UDP port.** Open UDP port in the range 49152 to 53247.
- **Open the TCP port.** Open TCP port 5061 for IP ranges 52.112.0.0/14 to 52.120.0.0/14.
- **Open the following https endpoints (IP addresses and URLs):**
 - 13.75.175.145
 - 52.189.219.201
 - 51.124.34.164
 - 13.74.250.91
 - 13.83.55.36
 - 23.96.103.40
 - <https://blobsdgapac.blob.core.windows.net>
 - <https://blobsdgamea.blob.core.windows.net>
 - <https://blobsdgnam.blob.core.windows.net>
 - <https://httpblobsdgapac.blob.core.windows.net>
 - <https://httpblobsdgamea.blob.core.windows.net>
 - <https://httpblobsdgnam.blob.core.windows.net>

The following sections describe what you must do as an administrator to configure SIP Gateway.

- [Verify that SIP Gateway is available for your organization.](#)
- [Enable SIP Gateway for the users in your organization.](#)
- [Set the SIP Gateway provisioning server URL.](#)

This article also describes how to:

- [Enroll SIP devices either individually or in batches for your convenience.](#)
- [View and monitor your SIP devices.](#)
- [Enable support for a multi-language user interface.](#)

Verify that SIP Gateway is available for your organization

1. Sign in to the [Teams admin center](#).
2. At the left, select **Teams devices** and see if the **SIP devices** tab is visible. If it is, the SIP Gateway service is enabled for your organization.

Enable SIP Gateway for the users in your organization

You can enable SIP Gateway for your organization in either of two ways: by using the Teams admin center, or by using a PowerShell cmdlet.

By using Teams admin center

To enable SIP Gateway in the Teams admin center, follow these steps:

1. Go to the [Teams admin center](#)
2. At the left, under **Voice**, select **Calling policies**.
3. At the right under **Manage policies**, select the appropriate calling policy assigned to users or, if necessary, create a new calling policy and assign it to the required users.
4. Select **Manage policies**, select a policy, and then select **Edit**.
5. Turn on the setting for **SIP devices can be used for calls**, and then select **Save**.

By using PowerShell

You can also enable SIP Gateway by using the PowerShell [Set-CsTeamsCallingPolicy](#) cmdlet. To enable users for SIP devices, select a policy, and set the `-AllowSIPDevicesCalling` attribute to `True`. The default value is `False`, so users will not be able to use their SIP devices unless you enable them.

Set the SIP Gateway provisioning server URL

You can set the SIP Gateway provisioning server's URL in your Dynamic Host Configuration Protocol (DHCP) server. Users who work remotely must configure it manually.

Using DHCP

For each SIP device, set one of the following SIP Gateway provisioning server URLs:

- EMEA: `http://emea.ipp.sdg.teams.microsoft.com`
- Americas: `http://noam.ipp.sdg.teams.microsoft.com`
- APAC: `http://apac.ipp.sdg.teams.microsoft.com`

Add SIP devices to your Teams organization by configuring the above SIP Gateway provisioning server URL in your DHCP server. To learn more about DHCP server, see [Deploy and manage DHCP](#). Also, you can use DHCP option 42 to specify the Network Time Protocol (NTP) server, and DHCP option 2 to specify the offset from Coordinated Universal Time (UTC) in seconds. The devices in your organization will be routed to the SIP Gateway provisioning server. Successfully provisioned SIP phones will display the Teams logo and a soft button for sign-in.

Ensure SIP devices are on the minimum supported firmware version for onboarding. During onboarding, SIP Gateway will push the default configuration and authentication user interface to the device. To find out the required firmware version for SIP devices, see [Plan for SIP Gateway](#).

Manually

Users who work remotely must manually configure the provisioning server URL into their SIP device by using the following steps:

1. Open **Settings** on the device and get the device's IP address.
2. Open a browser window, enter the device's IP address, log in (if necessary) and configure the provisioning server's URL in the device's web utility.
3. Under **Settings** or **Advanced settings** on the web utility, enter the provisioning server URL shown above.

NOTE

- Only compatible SIP devices can be onboarded to SIP Gateway.
- Cisco IP phones must be flashed to multiplatform firmware before they can be onboarded. To learn how, see [Cisco firmware conversion guide](#).
- For Yealink phones, use option 66.
- For Cisco, Poly, and AudioCode phones, use option 160.
- For Cisco devices, append `/$PSN.xml` to the provisioning server URL.

Configure conditional access

Conditional Access is an Azure Active Directory (Azure AD) feature that helps ensure that devices that access your Microsoft 365 resources are properly managed and secure. SIP Gateway authenticates SIP devices with Azure AD, so if your organization uses Conditional Access for devices in the corporate network, it should exclude the following IP addresses:

- North America:
 - East US: 52.170.38.140
 - West US: 40.112.144.212
- EMEA region:
 - North EU: 40.112.71.149
 - West EU: 40.113.112.67
- APAC region:
 - Australia East: 20.92.120.71
 - Australia Southeast: 13.73.115.90

For more information, see [IP address ranges](#).

Provision and enroll SIP devices as common area phones

NOTE

A SIP device must be onboarded to SIP Gateway before it can be enrolled.

To streamline your tasks, you can enroll SIP devices in the Teams admin center either one at a time or in batches. Here's how:

1. Log in to the [Teams admin center](#).
2. Select **Teams devices** > **SIP devices**.
3. At the upper right, select **Actions** > **Provision devices** and follow one of these steps:
 - **To provision one device:**
 - a. Under **Waiting on activation**, select **Add**.

- b. On the **Add MAC addresses** pane, enter the **MAC address** and **Location** of the device, and then select **Apply**.
 - c. Under **Waiting on activation**, select the device you just added, and then select **Generate verification code**.
 - d. On the **Provision devices** pane, under **Verification code**, note the verification code for the SIP device.
- To provision many devices:
 - a. Under **Waiting on activation**, at the right, select **Export** (the Microsoft Excel icon).
 - b. On the **Provision devices** pane, under **Upload multiple MAC addresses**, select **download a template**.
 - c. Save **Template_Provisioning.csv** to your computer and fill in the **MAC id** and **Location** fields.
 - d. On the **Provision devices** pane, select **Upload multiple MAC addresses**.
 - e. At the right on the **Upload MAC addresses** pane, select **Select a file**, and select the **Template_Provisioning.csv** file that contains your data.
 - f. On the **Provision devices** pane, under **Waiting on activation**, select a device and then select **Generate verification code** to generate a one-time verification code for each provisioned device. Note the verification code for each SIP device.
4. On the SIP device, dial the enrollment feature code followed by the verification code. For example, if the enrollment feature code is *55* and the verification code is 123456, dial *55*123456 to enroll the device.
 5. On the **Provision devices** pane, under **Waiting for sign in**, select **Signed out**.
 6. In the **Sign in a user** dialog, copy or note the SIP device's pairing code.
 7. Go to <https://microsoft.com/devicelogin>, and under **Enter code**, enter the SIP device's pairing code, and then select **Next**.
 8. On the Microsoft **Sign in** page, in the **Email or phone** field, enter the email address for the SIP device, and then select **Next**.
 9. On the **Password** page, enter the password for the email address for the SIP device, and then select **Sign in**.
 10. On the **Are you trying to sign in to Teams SIP devices gateway** page, select **Continue**.

How to sign in and sign out

Only local sign-in is supported for users' personal devices. To sign out a device from the Admin center, follow these steps:

1. Log in to the [Teams admin center](#).
2. Select **Teams devices > SIP devices**.
3. At the right, select a SIP device, and then select **Sign out**.

User pairing and sign-in

To pair a SIP device after the user authenticates using corporate credentials, a user must:

1. Press **Sign-in** on the SIP phone to display the authentication URL and pairing code. The pairing code is time-sensitive. If it expires, the user must press **Back** on the phone and start the sign-in process again.

2. Navigate to the authentication URL on the user's desktop or mobile browser and use corporate credentials to log in.
3. Enter the pairing code displayed on the SIP phone into the web authentication app to pair the SIP phone with the user's account. On a successful sign-in, which might take a while, the SIP phone will display the phone number and username, if the device supports it.

NOTE

The location of the device shown on the Azure Active Directory web authentication app is the SIP Gateway datacenter to which the device is connected. SIP phones in scope are not OAuth-capable, so SIP Gateway authenticates the user through the web authentication app and then pairs the device with the user's credentials. Learn more here: [Microsoft identity platform and the OAuth 2.0 device authorization grant flow](#).

Sign-out

To sign out, a device user can:

- Press **Sign-Out** on the SIP device and follow the steps described on the device.

To sign out a device on the Teams admin center:

1. Log in to the [Teams admin center](#).
2. Select **Teams devices** > **SIP devices**.
3. At the right, in the **SIP devices** pane, select the device.
4. On the device's **Details** pane, select the **Details** tab, and at the upper right on the **Actions** menu, select **Sign out**.

View and monitor SIP devices

You can view and monitor your SIP device inventory in the Teams admin center after the devices' users sign in at least once. Here's how:

1. Log in to the [Teams admin center](#).
2. Select **Teams devices** > **SIP devices**. All signed-in SIP devices are listed on the right.

Restart a SIP device

1. Log in to the [Teams admin center](#).
2. Select **Teams devices** > **SIP devices**.
3. On the right, select the SIP device that you want to restart, and then select **Restart**.

Sync policy changes to SIP devices to enforce policies

User details and policies will be fetched to SIP devices when users sign in. Any policy changes thereafter for signed-in users will be synced to the device within one hour. Devices must have their registration refreshed with the SIP Gateway periodically. SIP phones depend on Call Redirect, so the admin must set the `AllowCallRedirect` attribute in `Set-CsTeamsCallingPolicy` to `Enabled`.

Set a SIP device's UI language

A SIP device can usually display information in many languages. Setting its UI language affects its interface,

including softkeys and sign-in/sign-out system messages. Setting the UI language is done in the provisioning server, using DHCP server, or manually by appending a code string in the URL as in the following examples.

How to set German for Polycom, AudioCodes, and Yealink phones:

- `http://emea.ipp.sdg.teams.microsoft.com/lang_de`

How to set Japanese for Cisco phones:

- `http://emea.ipp.sdg.teams.microsoft.com/lang_ja/$PSN.xml`

Supported languages

LANGUAGE NAME	LANGUAGE CODE]
English (default)	en
Spanish	es
Japanese	ja
German	de
French	fr
Portuguese	pt

NOTE

- Japanese is not supported by Yealink and partially supported by Polycom VVX.
- The system defaults to English if the selected language is not supported by the SIP endpoint.
- When the **lang_xx** parameter is not set via the provisioning URL, English is used as the default language.
- If **Sign in to make an emergency call** text is not translated to other languages, an abbreviated version in English only will be presented on **Press Sign In** on the following IP phone models due to a screensize limitations:
 - Poly VVX 150, VVX 201
 - Cisco CP-6821, CP-7811, CP-7821, CP-7841, CP-7861
 - Voice mail softkey label is hardcoded with **VM** text across all languages for Poly VVX because of a limitation of string length.

Microsoft Teams and IPv6

SIP Gateway only supports IPv4. Microsoft Teams service and client support both IPv4 and IPv6. If you want to control communications to Microsoft Teams, use the IP address ranges in [Microsoft 365 URLs and IP address ranges](#).

Emergency calling

SIP Gateway only supports static—also called registered—emergency addresses. Currently, registered addresses are not supported for Direct Routing scenarios. For more information about emergency calling, see [Plan and manage emergency calling](#).

Report problems to Microsoft

To report problems, contact [Microsoft Support](#).

Microsoft Teams monitoring and alerting

12/7/2021 • 2 minutes to read • [Edit Online](#)

New monitoring and alerting capabilities for Microsoft Teams are available in the Teams admin center. Use different sets of rules available under the **Notifications & alerts** section in the Teams admin center to monitor Teams capabilities and receive alerts. For example, you can actively monitor the health of Teams devices such as IP Phones, collaboration bars, and others if they unexpectedly go offline.

Your organization can use Teams monitoring and alerting to do the following items:

- Automatically manage Teams capabilities
- Be alerted if they show something unexpected.
- Take corrective actions to get things back on-track.

How to manage monitoring and alerting

You must be a global admin in Microsoft 365 or a Teams service admin to configure alerting rules. See [Use Teams administrator roles to manage Teams](#) to learn more about Teams admin roles and which reports each admin role can access.

1. Sign in to the Teams admin center.
2. From the left navigation, select **Notifications & alerts**.
3. Choose the rule you want to configure from **Rules**.

Teams monitoring rules reference

We continue adding to and improving the Teams monitoring experience by adding various monitoring capabilities and configuration functionalities. Here's a list of the Teams monitoring rules currently available in the Teams admin center.

RULE	MONITORING CAPABILITY	WHAT'S MONITORED?
Device health status	Teams Devices	Pro-actively monitor Teams devices if they go offline.

Microsoft Teams device health monitoring

12/7/2021 • 3 minutes to read • [Edit Online](#)

Device health monitoring in the Microsoft Teams admin center gives you an ability to proactively monitor the health of various Teams devices. Monitor the offline state of a device and receive alerts in real time if the monitored device in your organization goes offline.

Before you start, you'll need the teams/channel creation permissions in your tenant. [Learn More](#).

Configure device state rule

1. In the left navigation of the Microsoft Teams admin center, select **Notifications & alerts** > **Rules**.

2. In the **Rules** Page, select **Device state rule**.
3. Select the device to configure the state rule for enabling alerts.

Device state rule

Alerts when the device health status is detected as offline

Rule type ⓘ

Device management

Condition

You can define the conditions under which you will be notified.

Parameter	Metric operator	Threshold
Device health status	=	Offline

Scope

Frequency of evaluation ⓘ

Real-time

Device users ⓘ

+ Add | 2 items

Potalawa ⓘ × Michael Smith ⓘ ×

Actions

You can define the notification options through which you will be notified.

Interpret the rule configuration

FIELD	DESCRIPTION
Rule type	The device state rule helps you effectively manage Teams devices and is classified as a device management type. In the future, more rules of device management type will be available to monitor other related capabilities (examples may include: unhealthy device and the sign-in status of device).
Condition	You can monitor the health of devices if they go offline. Learn more about device management in Teams admin center.
Scope	You can specify how frequently you want to monitor device health status by mentioning the rule evaluation frequency. By default Teams devices will be monitored in near real time if they go offline.
Device users	You can specify which devices need proactive offline status monitoring by selecting them based on signed-in users. Refer to Select devices for configuration for more details.
Actions > Channel alert	<p>In the Actions section, you can specify Teams channels you want to get alerts for. Currently, a default team named Admin Alerts and Notifications and channel named MonitoringAlerts will be created where notifications will be delivered to.</p> <p>Global administrators and Teams administrators in your tenant will be automatically added to this default team.</p>
Actions > Webhook	<p>You can also get notifications with an external webhook (optional). Specify an external public webhook URL in the webhook section where a JSON notification payload will be sent.</p> <p>The notification payload, via webhooks, can be integrated with other systems in your organization to create custom workflows.</p>

JSON payload schema for webhook:

```
{
  "type": "object",
  "properties": {
    "AlertTitle": { "type": "string" } ,
    "DeviceLoggedInUserId": { "type": "string" } ,
    "DeviceId": { "type": "string" } ,
    "MetricValues": {
      "type": "object",
      "properties": {
        "DeviceHealthStatus": { "type": "string"}
      }
    } ,
    "RuleName": { "type": "string"} ,
    "RuleDescription": { "type": "string"} ,
    "RuleFrequency": { "type": "string"} ,
    "RuleType": { "type": "string"} ,
    "TenantId": { "type": "string"} ,
    "RuleCondition": { "type": "string"} ,
    "AlertRaisedAt": { "type": "string"}
  }
}
```

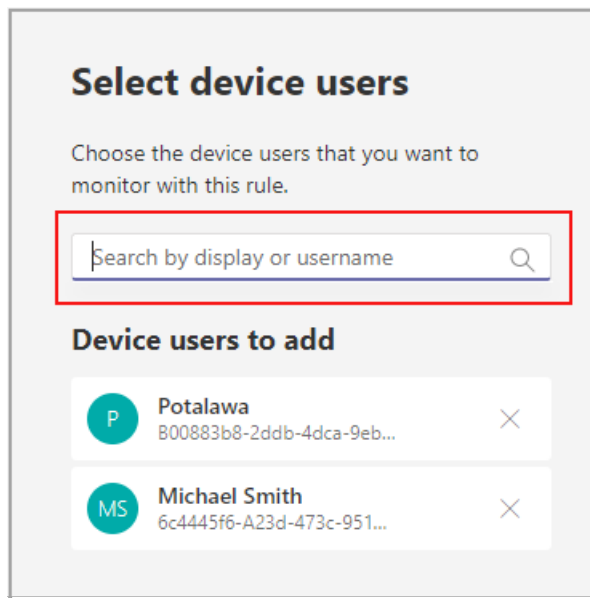

Sample JSON payload:

```
{
  "AlertTitle": "sample_device_name of User_Name has become offline",
  "DeviceLoggedInUserId": User_GUID ,
  "DeviceId": Device_GUID ,
  "MetricValues": {
    DeviceHealthStatus: "offline"
  },

  "RuleName": "Device state rule" ,
  "RuleDescription": "Alerts when device health status is detected as offline" ,
  "RuleFrequency": "Real-time" ,
  "RuleType": "Device Management" ,
  "TenantId": Tenant_GUID ,
  "RuleCondition": "DeviceHealthStatus = Offline" ,
  "AlertRaisedAt": "2020-02-28T12:49:06Z"
}
```

Select devices for configuration

1. You can select Teams devices you want to monitor by selecting users signed in to those devices. Select **Add** from the **Device users** section.
2. Select one or more users for which you want to monitor device health state

Select device users

Choose the device users that you want to monitor with this rule.

Search by display or username

Device users to add

P	Potalawa B00883b8-2ddb-4dca-9eb...	×
MS	Michael Smith 6c4445f6-A23d-473c-951...	×

The selected list of users shows in **Device users** section. You can modify this list by adding or removing users.

All the sign-in devices used by the selected list of users will be monitored for the offline health state.

Notifications in Teams client

The notifications are delivered in the auto-created **MonitoringAlerts** channel of the **Admin Alerts and Notifications** Team. You'll receive an alert within 15 minutes of the device going offline.

A device offline notification can include the following information:

- The device name that's offline.
- The user of the offline device.
- What time the device went offline. (Currently, the time is presented in UTC.)
- The type of rule that raised the alert.
- Why an alert is raised.

Manage the health of Teams devices

12/7/2021 • 3 minutes to read • [Edit Online](#)

Administrators can monitor the health of devices installed with Microsoft Teams by using health status, which indicates the severity of issues. To check the health of a device, you can go to the device list present under the **Teams Devices** section of the Teams admin center. The health status column in this list indicates the current health status of the device. Selecting that status opens the **Health status panel**, which provides more details about health issues.

Many types of issues can contribute towards device health status, and the Teams admin center system evaluates the severity of these issues as they occur.

The administrator managing the Teams devices for their organization may decide the severity of issues for them isn't the same as the default configuration Teams provides. There's a way for the administrators to customize the severity and the impact on the health of their devices to match their organization's priorities.

Teams Rooms devices have peripherals attached for providing a complete meeting experience, like Speaker, Microphone, Display, Camera. Details about them are available on the device page under the Peripherals and Health tabs. The connectivity of these peripherals impacts the health of the parent device.

Feature details

When viewing peripheral details on a device page, you'll now see a **Manage health impact** option. Additionally, administrators can also view the impact each peripheral has on the health of the device.

By default all peripherals are set to have **Critical impact** on the device health. If a peripheral is disconnected, the parent device's health will become **Critical** and this issue will show up under **Critical issues** in the health status panel.

NOTE

The peripheral categories **HDMI ingest** and **Compute** aren't available for customization as they are crucial to the functioning of the parent device.

How does this work?

1. An administrator can select the peripherals they want to change the health impact for. Then they can select **Manage health impact**. Alternatively they can also find the **Manage health impact** option under the **Peripherals** tab on each peripheral card.
2. The **Health impact** panel will open, and the administrator can select the desired impact level for the selected peripherals and save it.

SETTINGS OPTIONS	DESCRIPTION
Non-urgent	When set for a peripheral category (such as a display or a speaker) and the peripheral is disconnected, the health status of the Teams Rooms device will become Non-urgent (instead of Critical). New issues will be categorized in the Non-urgent section of the health status panel.

SETTINGS OPTIONS	DESCRIPTION
No Impact	When set for a peripheral category and the peripheral is disconnected, the health status of the Teams Rooms device will stay Healthy (instead of Critical). This health issue won't show up in the health status panel.
Critical	When set for a peripheral category and the peripheral is disconnected, the health status of the Teams Rooms device will become Critical . New such issues will be categorized in the Critical section of the health status panel.
Reset to default	When set for a peripheral category, the health impact for that category will be reset to Critical . Once this choice is saved, the changes will be applied and health impact will reflect those changes going forward.

Applicable device categories

Currently, this feature is available to manage the health impact of peripherals associated with the Microsoft Teams Rooms (Windows) devices.

Impact on other workflows

If the health impact of the peripherals is reduced in severity, administrators may not notice issues when they happen. You should be mindful of high-priority devices that need close monitoring.

For example if an alert is configured to be triggered for ConfRoom1 if its health becomes **Critical**. The administrator had reduced the health impact of the display and speaker for that meeting room from the default, **Critical**, to **Non-urgent**. Now, if the display is disconnected, the health of ConfRoom1 will become **Non-urgent**. In this case, the alert won't be triggered.

Apps, bots, & connectors in Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

Apps let you find content from your favorite services and share it in Teams. They help you do things such as pin services at the top of a channel, chat with bots, or share and assign tasks. To learn more, read [Overview of apps in Teams](#).

You can add apps to your Teams deployment by using the apps provided with Microsoft Teams, by using certified third-party apps and templates, and by creating your own custom apps.

Use Microsoft-provided apps

Teams comes with a set of built-in apps, including Lists, Tasks, Praise, Approvals, and more. We recommend that you include Teams featured apps - such as Planner - in your initial Teams rollout. Add other apps, bots, & connectors as you drive Teams adoption.

Use third-party apps

In addition to Microsoft-provided apps, you can use Microsoft-certified third-party apps. Microsoft works with Microsoft 365 developer partners to provide the information needed to expedite decisions about using Teams apps and add-ins. For more information, see [Microsoft Teams App Security and Compliance](#).

Use Teams templates

You can also use [Teams templates](#), production-ready apps for Microsoft Teams that are community driven, open-source, and available on GitHub.

Create custom apps

You can quickly build custom low-code solutions by using Teams integration with [Microsoft Power Platform](#). You can also create your own custom app to suit your business needs. For more information, see [Build apps for Microsoft Teams](#).

Apps deployment decisions

Teams provides a great out-of-the-box collaboration experience for your organization, and most organizations find that the default settings work for them. This article helps you decide whether to change any of the default settings, based on your organization's profile and business requirements, then it walks you through each change. We've split the settings into two groups, starting with the core set of [changes you're more likely to make](#). The second group includes the [additional settings](#) you may want to configure, based on your organization's needs.

Core deployment decisions

These are the apps settings that most organizations want to change (if the Teams default settings don't work for them).

App availability settings

Teams provides many apps published by Microsoft and by third parties to engage users, support productivity, and integrate commonly used business services into Teams. Get apps from the Teams Store. By default, all apps,

including custom apps that you've submitted via the [Teams Store approval process](#), are turned on for all users. For example, users can use the Planner app to build and manage team tasks in Teams.

By default, all Microsoft-provided, third-party, and custom apps are available, and you can turn individual apps on or off. There are org-wide settings that lets you turn all third-party and/or custom apps on or off for your entire organization.

ASK YOURSELF	ACTION
Will you change the default Teams apps settings?	For more information about policies and settings that you can use to manage apps in your organization, see Admin settings for apps in Microsoft Teams .

App permissions and other considerations

Apps are consented to by users and managed by the admin or IT pro through policies. However, for the most part, an app's permissions and risk profile are defined in the app itself.

ASK YOURSELF	ACTION
Which apps do I want to allow access to? Which ones do I not want to allow access to?	<ul style="list-style-type: none">• See Microsoft Teams apps permissions and considerations for a list of things you should consider when allowing access to an app, bot, tab, or connector.• See Manage your apps in the Microsoft Teams admin center for information about making an app available to users in your organization.

Bots for private chats and channels

Bots are automated programs that respond to queries or give updates and notifications about details users find interesting or want to stay informed about. Bots allow users to interact with cloud services such as task management, scheduling, and polling in a Teams chat. Teams supports bots in private chats and channels. Administrators can control whether the use of bots is allowed in a Microsoft 365 or Office 365 organization.

ASK YOURSELF	ACTION
Do I want to allow custom bots in my organization?	For more information about adding bots, see Add bots for private chats and channels in Microsoft Teams . For information about turning custom bots on or off, see Admin settings for apps in Microsoft Teams .

Built-in and custom tabs

Owners and team members can add tabs to a channel, private chat, and group chat to help integrate their cloud services. Add tabs to help users access and manage the data they need or use the most. In channels, the Conversations and Files tabs are created by default. In every private chat, the Conversations, Files, Organization, and Activity tabs are created by default. In addition to these built-in tabs, you can design and add custom tabs. To learn about turning Teams apps on or off for your organization, read [Admin settings for apps in Teams](#).

ASK YOURSELF	ACTION

ASK YOURSELF	ACTION
Do I want to allow custom tabs in my organization?	For more information, see Use built-in and custom tabs in Teams .

Custom connectors

Connectors keep your team current by delivering content and updates from services you frequently use directly into a channel. With connectors, your Teams users can receive updates from popular services such as Twitter, Trello, Wunderlist, GitHub, and Azure DevOps Services in their Teams chats.

ASK YOURSELF	ACTION
Do I want to allow users to create custom connectors?	For more information, see Use custom connectors in Teams .

Additional deployment decisions

You may want to change these settings, based on your organization's needs and configuration.

Activity reports

You can use activity reports to see how users in your organization are using Teams. For example, if some don't use Teams yet, they might not know how to get started or understand how they can use Teams to be more productive and collaborative. Your organization can use the activity reports to decide where to prioritize training and communication efforts. To view activity reports, you must be a global admin in Microsoft 365 or Office 365, Teams service admin, or Skype for Business admin.

ASK YOURSELF	ACTION
Who needs to see the activity reports, and do they have the correct permissions to view them?	<ul style="list-style-type: none"> If you don't want to assign an admin role to a user, you can assign the Reports reader role. See Roles and permissions and View and assign roles for information about assigning admin roles in Azure Active Directory.

App templates

App templates are production-ready apps for Microsoft Teams that are community driven, open-source, and available on GitHub. Each contains detailed instructions for deploying and installing that app for your organization, providing a ready-to-use app that you can install and begin using immediately. The complete source code is available as well, so you can explore it in detail, or fork the code and alter it to meet your specific needs.

ASK YOURSELF	ACTION
Do I want to install any Teams app templates, such as Icebreaker?	To learn more, read App templates for Teams .

Manage the Bookings app in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

The Bookings app in Microsoft Teams offers a simple way to schedule in-person and virtual appointments, such as healthcare visits, financial consultations, interviews, customer support, education office hours, and much more. To learn more, see [Virtual visits with Teams and the Bookings app](#).

Schedulers can manage multiple department and staff calendars, as well as communications with internal and external attendees, from a single experience. The virtual appointments themselves are held via Microsoft Teams meetings, which offers robust videoconferencing capabilities.

NOTE

Only schedulers need to have the Bookings app installed in Teams. Staff who conduct or participate in virtual appointments don't need the app. They can simply join appointments from their Outlook or Teams calendar or from the Teams meeting link in their booking confirmation email.

Prerequisites for using the Bookings app in Teams

- The Exchange mailbox must be in Exchange Online. On-premises Exchange Server mailboxes aren't supported.
- Microsoft Bookings must be turned on for the organization.
- Users must have an appropriate license. Office 365 A3, A5, E3, E5, F1, F3, Microsoft 365 A3, A5, E3, E5, F1, F3, and Business Standard are supported.
- All users of the Bookings app and all staff participating in meetings must have a license that supports Teams meeting scheduling.
- Your systems must meet all [software and browser prerequisites](#).

Availability of Bookings in Teams

Microsoft Bookings app for Teams is available on the desktop and web. It can be found under [Apps in Teams](#) and under **Manage Apps** in the Teams admin center.

Control access to Bookings within your organization

There are several ways to control who has access to the Bookings app and to specific features of the app.

To learn how to turn Microsoft Bookings on or off in the Microsoft 365 admin center and how to create a Bookings app policy to allow selected users to create Bookings calendars, see [Get access to Microsoft Bookings](#).

You can also [create a Teams app setup policy to pin the Bookings app for select users](#).

Recommended meeting policy settings

To enable the best experience for Bookings, create a Teams meeting policy to automatically admit **Everyone in your organization** and assign the policy to your staff. Doing this allows staff to join the appointment automatically and enable the lobby experience for external attendees. Learn more about how to [automatically admitting people to meetings](#).

Optional staff approvals setting

As an extra privacy setting, you can choose to require staff to opt in before their schedule availability information is shared through Bookings and before they can be booked for an appointment.

To enable this setting, go to **Microsoft 365 admin center** > **Settings** > **Settings**, and then select **Bookings**.

With this setting turned on, staff will receive an email in which they're asked to approve membership to a booking calendar.

This feature is gradually being rolled out worldwide to Microsoft 365 and Office 365 customers. If all options aren't yet available in your environment, check back soon.

Changing your default domain when setting up Bookings mailboxes

When setting up a Bookings mailbox, the default email domain of your Microsoft 365 or Office 365 organization is used. However, this can cause problems when sending meeting invites to external recipients; your invite might be flagged as spam and moved to the recipient's junk folder, so the recipient might never see your invite.

We recommend that you change the default domain before you create your Bookings mailbox. For information on how to do this, see the [Domains FAQ](#).

If you need to change the default domain after your Bookings mailbox has already been created, you can do so with PowerShell:

```
Set-Mailbox -identity business@domain.onmicrosoft.com -WindowsEmailAddress business@domain.com -  
EmailAddresses business@domain.com
```

For more information, see the PowerShell documentation for the [Set-Mailbox](#) cmdlet.

NOTE

If you're using an Exchange hybrid configuration, we recommend that you thoroughly test mail flow between on-premises Exchange and Exchange Online when changing the default domain.

Sending feedback

We welcome your feedback on:

- User experience or ease of use
- Feature gaps or missing functionality
- Bugs or issues

To send feedback, select the **Help** button near the bottom of the Teams left navigation bar, and then select **Report a Problem** for ALL issues. Indicate at the beginning of your feedback report that you're sending feedback about "Bookings" so we can easily identify Bookings issues.

Manage the Lists app for your organization in Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

Overview of Lists

The Lists app in Microsoft Teams helps users in your organization track information, organize work, and manage workflows. With Lists, users can track data such as issues, assets, routines, contacts, inventory, incidents, loans, patients, and more using customizable views, rules, and alerts to keep everyone on the team in sync.

In Teams, users access Lists as a tab in a channel. Click + to open the tab gallery and add a new Lists app tab instance to a channel to get started.

Users can create new lists or pin existing lists from within the same team or from a different SharePoint site that they have access to. New lists can be created from scratch, from built-in templates, based on the structure of an existing list, or by importing data from an Excel workbook. The Lists app is available in Teams desktop, web, and mobile clients.

Templates

Templates in Lists are tailored to common information tracking scenarios for users. Each template comes with a predefined list structure, form layouts, and formatting options at both a list view and a details view level to help users get started quickly. After selecting a template, users get a preview of what the list will look like, along with some sample data. Here's some examples of how teams in your organization can use the predefined templates in Lists:

- Track issues and bring them to closure using the Issue tracker template.
- Organize all your event details with the Event itinerary template.
- Use the Patients template to record the needs and status of patients for health teams in your healthcare organization to monitor and coordinate care.
- Track the status of loan applications with the Loans template.

Example scenario

A local post office is responsible for sorting and delivering mail in their district. Each morning, the post office has a team huddle to review daily goals, share announcements, and discuss known incidents.

After the huddle, mail carriers pick up their mail and start their delivery route. Incidents can occur along a route, for example, a vehicle accident, dog-related issue, or social unrest protest. When mail carriers encounter an incident, they use Teams on their mobile devices to record the incident details, which are tracked in a list in the team channel. Everyone on the team, including mail carriers in the field, can see this information and stay informed.

Before moving to Teams, mail carriers had to go back to the post office to complete a hard-copy form to report an incident which was entered in an Excel spreadsheet. Teams gives mail carriers a mobile first, experience where they can use Lists to report incidents in the field as they happen, share incident details with team members, have conversations about them on the channel, and drive incidents to resolution.

What you need to know about Lists

Lists is available in every team and channel

Lists is pre-installed for all Teams users and is available directly in the tab gallery of every team and channel. This means that users don't have to go to the Teams app store to install it.

Lists and SharePoint

Lists data is stored in the SharePoint Online team site. To learn more about how SharePoint Online interacts with Teams, see [How SharePoint Online and OneDrive for Business interact with Teams](#).

Permissions set in SharePoint apply to lists created in the Lists app. By default, lists inherit permissions from the site to which they belong. These permissions govern the types of actions that users can do, such as whether they can create or edit lists. To learn more, see [Permission levels in SharePoint](#) and [User permissions and permission levels in SharePoint Server](#).

In certain scenarios, you may want restrict what actions users can do in lists. For example, a person on a team edits a list view, which changes it for all team members, and you want to allow only the team owner or certain team members to edit list views. To learn more, see [Customize permissions for a SharePoint list or library](#).

NOTE

At this point, owner and member permissions in a team aren't linked in any way to permissions in the team site that govern the behavior of lists or the Lists App. However, based on customer feedback and usage, this will be considered for a future iteration of the product.

Limitations

With Lists, users get a desktop, web, and mobile experience. It's important to know that users can't create new lists or pin existing lists using Lists on the Teams mobile client. To view or edit a list on the Teams mobile client, a list must first be created or added using Lists on the Teams desktop or web client.

Guests can't create or delete a list. They can add list items to existing lists, start new conversations about list items, and reply to existing conversations about list items.

Lists and the SharePoint app

If users in your organization created lists using the SharePoint app, those lists will be automatically moved to Lists without any action needed from the user. To get the best and richest lists integration experience in Teams, use the Lists app and pin your existing lists.

Set up Lists

Enable or disable Lists in your organization

Lists is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. Do one of the following:
 - To turn off Lists for your organization, search for the Lists app, select it, and then click **Block**.
 - To turn on Lists for your organization, search for the Lists app, select it, and then click **Allow**.

Enable or disable Lists for specific users in your organization

To allow or block specific users in your organization from using Lists, make sure Lists is turned on for your organization on the [Manage apps](#) page, and then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Search the audit log for list events

Lists are enabled with enterprise-level auditing so you can search for lists and list item events in the audit log in the Security & Compliance Center. To learn more, see [Search the audit log in the Security & Compliance Center](#).

For a list of audit events that are relevant to the Lists app in Teams, see [SharePoint list activities](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Power Automate, Power Apps, and Graph API

Lists supports [Power Automate](#) for workflows and [Power Apps](#) for list forms. Developers can use the [Lists API](#) to connect list data as a source through Microsoft Graph.

Give feedback or report an issue

To send us feedback or report an issue, click **Help** near the bottom of the left navigation in Teams, and then select **Report a problem**. Select **Lists**, and then enter your feedback or details about the issue you're experiencing.

- [Lists help documentation](#)

Manage the Tasks app for your organization in Microsoft Teams

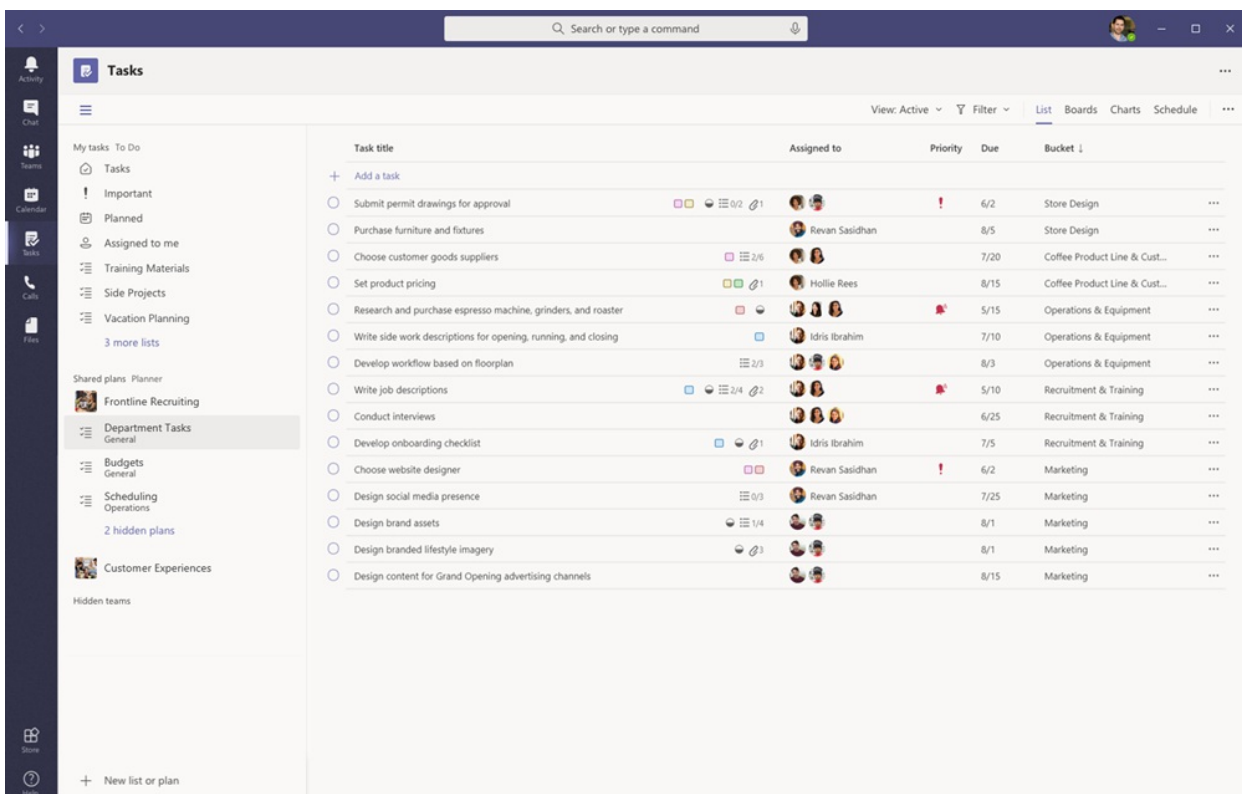

12/7/2021 • 8 minutes to read • [Edit Online](#)

Overview of Tasks

The Tasks app brings a cohesive task management experience to Microsoft Teams, integrating individual tasks powered by [Microsoft To Do](#) and team tasks powered by Planner in one place. Users can access Tasks as an app on the left side of Teams and as a tab in a channel within individual teams. **My tasks** and **Shared plans** in Tasks let users view and manage all their individual and team tasks and prioritize their work. Tasks is available in Teams desktop, web, and mobile clients.

NOTE

As we roll out the Tasks experience on Teams desktop clients, the app name will initially appear as **Planner** to users. The name will then temporarily change to **Tasks by Planner and To Do**, and later on, it will be renamed to **Tasks**. On Teams mobile clients, users will always see the app name as **Tasks**. There may be a short delay in the availability of the mobile experience after the desktop experience is available.

The screenshot displays the Microsoft Teams Tasks app interface. On the left, a sidebar shows navigation options: 'My tasks: To Do' (Tasks, Important, Planned, Assigned to me, Training Materials, Side Projects, Vacation Planning, 3 more lists) and 'Shared plans: Planner' (Frontline Recruiting, Department Tasks General, Budgets General, Scheduling Operations, 2 hidden plans, Customer Experiences, Hidden teams). The main area shows a list of tasks with columns: Task title, Assigned to, Priority, Due, and Bucket. The tasks are as follows:

Task title	Assigned to	Priority	Due	Bucket
Submit permit drawings for approval	Revana Sasidhan	High	6/2	Store Design
Purchase furniture and fixtures	Revana Sasidhan	Medium	8/5	Store Design
Choose customer goods suppliers	Hollie Rees	Medium	7/20	Coffee Product Line & Cust...
Set product pricing	Hollie Rees	Medium	8/15	Coffee Product Line & Cust...
Research and purchase espresso machine, grinders, and roaster	Idris Ibrahim	High	5/15	Operations & Equipment
Write side work descriptions for opening, running, and closing	Idris Ibrahim	Medium	7/10	Operations & Equipment
Develop workflow based on floorplan	Idris Ibrahim	Medium	8/3	Operations & Equipment
Write job descriptions	Revana Sasidhan	High	5/10	Recruitment & Training
Conduct interviews	Revana Sasidhan	Medium	6/25	Recruitment & Training
Develop onboarding checklist	Idris Ibrahim	Medium	7/5	Recruitment & Training
Choose website designer	Revana Sasidhan	High	6/2	Marketing
Design social media presence	Revana Sasidhan	Medium	7/25	Marketing
Design brand assets	Idris Ibrahim	Medium	8/1	Marketing
Design branded lifestyle imagery	Idris Ibrahim	Medium	8/1	Marketing
Design content for Grand Opening advertising channels	Idris Ibrahim	Medium	8/15	Marketing

For organizations who want to streamline task management for Frontline Workers, Tasks also includes capabilities that enable you to target, publish, and track tasks at scale across your Frontline Workforce. For example, corporate and regional leadership can create and publish task lists targeted to relevant locations, such as specific retail stores, and track progress through real-time reports. Managers can assign tasks to their staff and direct activities within their locations, and Frontline Workers have a prioritized list of their assigned tasks on mobile or desktop. To enable [task publishing](#), you'll first need to set up a team targeting hierarchy for your organization, which defines how all teams in the hierarchy are related to each other.

What you need to know about Tasks

Tasks is available as an app and as a tab in a channel. Keep in mind that the app comprises both individual tasks from To Do and team tasks from Planner whereas the tab shows only team tasks.

With Tasks, users get a desktop, web, and mobile experience. If Tasks is installed on the Teams desktop client, users will also see it on their Teams web and mobile clients. The exception is guest users. It's important to know that guests can only access Tasks as an app from the Teams mobile client. Guests will see Tasks tabs on both Teams desktop and web clients.

My tasks shows a user's individual tasks. **Shared plans** show tasks that the whole team is working on and includes any task list that's added as a Tasks tab to a channel. Note the following:

- Task lists that a user creates in the Tasks app will also appear in To Do clients for that user. Similarly, task lists that a user creates in To Do will appear in **My tasks** in Tasks for that user. The same is true for individual tasks.
- Any Tasks tab that's added to a channel will also appear in Planner clients. When a user creates a plan in Planner, the plan won't show in the Tasks or Planner app unless it's added as a tab to a channel. When a user adds a new Tasks tab, they can create a new list or plan or choose an existing one.

Set up Tasks

IMPORTANT

Settings and policies that you configured for Planner will also apply to Tasks.

Enable or disable Tasks in your organization

Tasks is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. In the list of apps, do one of the following:
 - To turn off Tasks for your organization, search for the Tasks app, select it, and then click **Block**.
 - To turn on Tasks for your organization, search for the Tasks app, select it, and then click **Allow**.

NOTE

If you can't find the Tasks app, search for the names in the first note of this article. The app could still be in the process of being renamed.

Enable or disable Tasks for specific users in your organization

To allow or block specific users in your organization from using Tasks, make sure Tasks is turned on for your organization on the [Manage apps](#) page, and then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Use an app setup policy to pin Tasks to Teams

App setup policies let you customize Teams to highlight the apps that are most important for users in your organization. The apps you set in a policy are pinned to the app bar—the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients—where users can quickly and easily access them.

To pin the Tasks app for your users, you can edit the global (Org-wide default) policy or create and assign a custom app setup policy. To learn more, see [Manage app setup policies in Teams](#).

A user's My tasks is visible if the user is licensed for Exchange Online

If you don't want a user to see **My tasks**, you can hide it. To do this, [remove the user's Exchange Online license](#). It's important to know that after you remove an Exchange Online license, the user no longer has access to their mailbox. Mailbox data is held for 30 days, after which the data will be removed and can't be recovered unless the mailbox is placed on [In-Place Hold or Litigation Hold](#).

We don't recommend this for information workers, but there may be some scenarios where this could apply, such as for Frontline Workers who don't depend on email.

Task publishing

With task publishing, your organization can publish task lists targeted to specific locations (teams) across your organization to define and share a work plan to be completed at those locations.

- People on the publishing team, such as corporate or regional leadership, can create task lists and publish them to specific teams.

- Managers on the recipient teams can review the published task lists and assign individual tasks to team members.

- Frontline Workers have a simple mobile experience to see tasks assigned to them. They can attach photos to show their work when appropriate and mark their tasks as completed.
- Publishers and managers can view reports to see assignment and completion status of tasks at each level, including by location (team), task list, and individual task.

Task title	Priority	Due	Bucket	Assigned	Completed
Implement new shrinkage prevention protocol ASAP	High	1/12	Store Execution	16%	12%
Update mannequins to showcase new semi-plaid kidswear apparel	Medium	1/14	Kidswear	12%	9%
Display the new Environmental Stewardship signage	Medium	1/15	Handbags	19%	12%
Replace handbags in window display with the newest releases	Medium	1/15	Handbags	19%	12%
Recycle previous week's circular ads and place this week's ads by entrance	Medium	1/12	Operations	14%	9%
Update pricing for family-size frozen dinners BOGO sale	Medium	1/12	Frozen Goods	19%	12%
Arrange muscat grapes next to persimmons, matching attached layout	Medium	1/13	Fresh Foods	19%	12%
Receive delivery of handbag promotional décor and signage	Medium	1/13	Operations	14%	9%
Receive new avocado hero display and pricing placards	Medium	1/13	Fresh Foods	16%	12%
Move bing cherry decor to backstage storage for later reuse	Medium	1/14	Fresh Foods	19%	12%
Place limited edition soda flavors on aisle 12 as indicated	Medium	1/14	Beverages	19%	14%
Receive incoming fresh produce delivery	Medium	1/14	Fresh Foods	19%	12%
Ensure racks are stocked with all available sizes of women's turtleneck dress line	Medium	1/15	Womenswear	5%	0%
Implement Mix and Match wall display to trade against solids	Medium	1/15	Kidswear	12%	9%

Users create, manage, and publish task lists on the **Published lists** tab in the Tasks app. This tab only shows for a user if your organization [set up a team targeting hierarchy](#) and the user is on a team that's included in the hierarchy. The hierarchy determines whether the user can publish or receive task lists and view reporting for received lists.

Example scenario

Here's an example of how task publishing works.

Contoso is rolling out a new food takeout and delivery promotion. To maintain a consistent brand experience, they need to coordinate consistent execution of the rollout across over 300 store locations.

The Marketing team shares the promotion details and the corresponding list of tasks with the Retail Communications Manager. The Retail Communications Manager, who serves as the gatekeeper for stores,

reviews the information, creates a task list for the promotion, and then creates a task for each unit of work that needs to be performed by each of the affected stores. When the task list is complete, she needs to select the stores that must complete the work. In this case, the promotion only applies to stores in the United States that have an in-store restaurant. In Tasks, she filters the store list based on the in-store restaurant attribute, selects the matching United States locations in the hierarchy, and then publishes the task list to those stores.

Store managers at each location receive a copy of the published tasks and assign those tasks to their team members. Managers can use the Tasks experience to understand all the work required across their store. They can also use the available filters to focus on a specific set of work, such as work due today or work in a particular area.

Frontline Workers at each store location now have a prioritized list of their work in Tasks on their mobile device. When they finish a task, they mark it complete. Some may even choose to upload and attach a photo to the task to show their work.

Contoso headquarters and intermediate managers can view reporting to see the assignment and completion status of tasks at each store and across stores. They can also drill down to a specific task to see the status within different stores. As the launch date gets closer, they can spot any abnormalities and check in with their teams as needed. This visibility allows Contoso to improve the efficiency of the rollout and provide a more consistent experience across their stores.

Set up your team targeting hierarchy

To enable task publishing in your organization, you have to first set up your team targeting schema in a .CSV file. The schema defines how all the teams in your hierarchy are related to each other and the attributes used to filter and select teams. After you create the schema, upload it to Teams to apply it to your organization. Members of the publishing team, such as the Retail Communications Manager in the example scenario, can then filter teams by hierarchy, attributes, or a combination of both to select the relevant teams that should receive the task lists, and then publish the task lists to those teams.

For steps on how to set up your team targeting hierarchy, see [Set up your team targeting hierarchy](#).

Power Automate and Graph API

Tasks supports Power Automate for To Do and Graph APIs for Planner. To learn more, see:

- [Planner tasks and plans API overview](#)
- [Using Microsoft To Do with Power Automate](#)

Manage the Praise app in the Microsoft Teams admin center

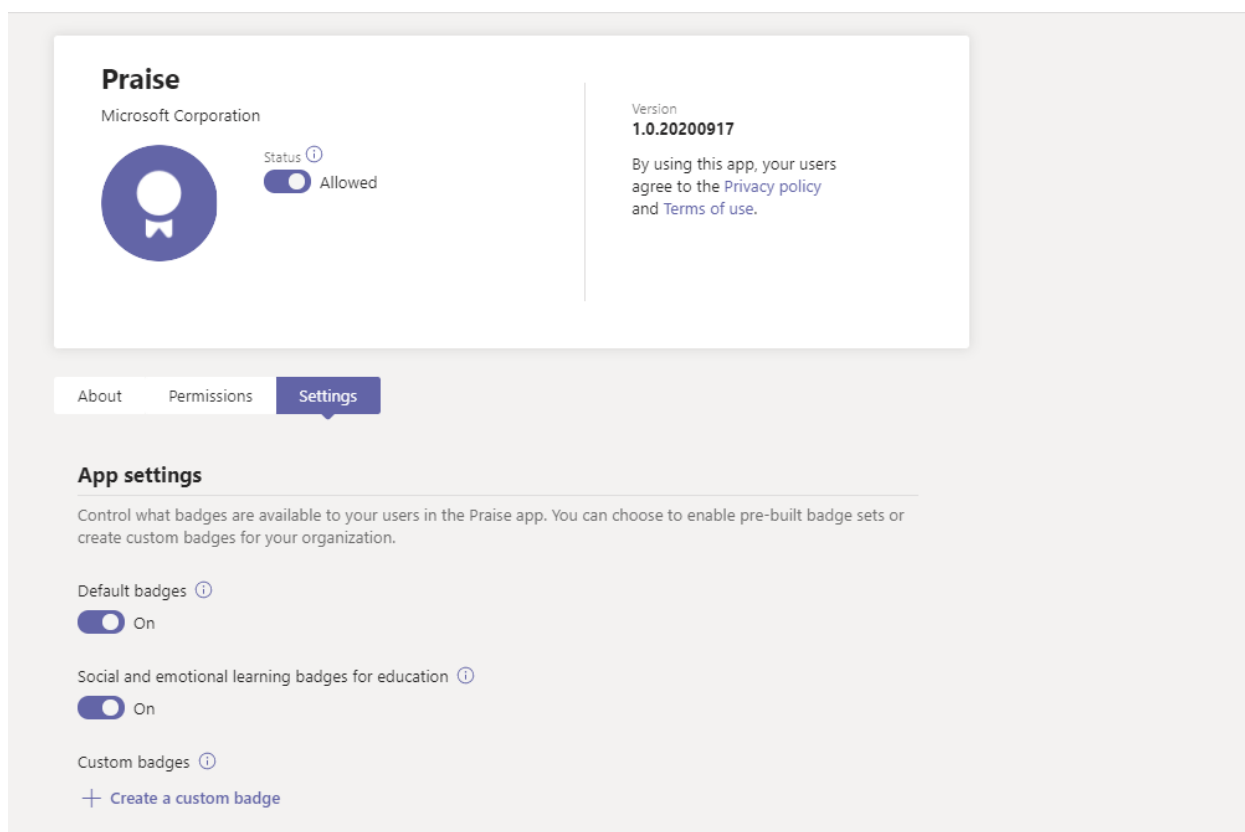

12/7/2021 • 5 minutes to read • [Edit Online](#)

NOTE

Admins must have a Teams license to access this feature. If you try to access this feature without a Teams license, you'll get an error message.

The Praise app in Microsoft Teams helps users show appreciation to members of their organization or classroom. With a selection of badge sets to choose from and the option to create your own badges, Praise is designed to help recognize the effort that goes into the wide range of work that Teams users do, from educators to Frontline Workers. To learn more, check out [Send Praise to people](#).

Admins can control what badges are available to their organization from the Microsoft Teams admin center. In the left navigation, go to **Teams apps** > **Manage apps**. In the list of apps, click **Praise**, and then select **Settings**. From here, you can choose to enable default and built-in badge sets and create custom badges.

NOTE

The Praise app is available for GCC cloud environment, but not for GCC High or DoD.

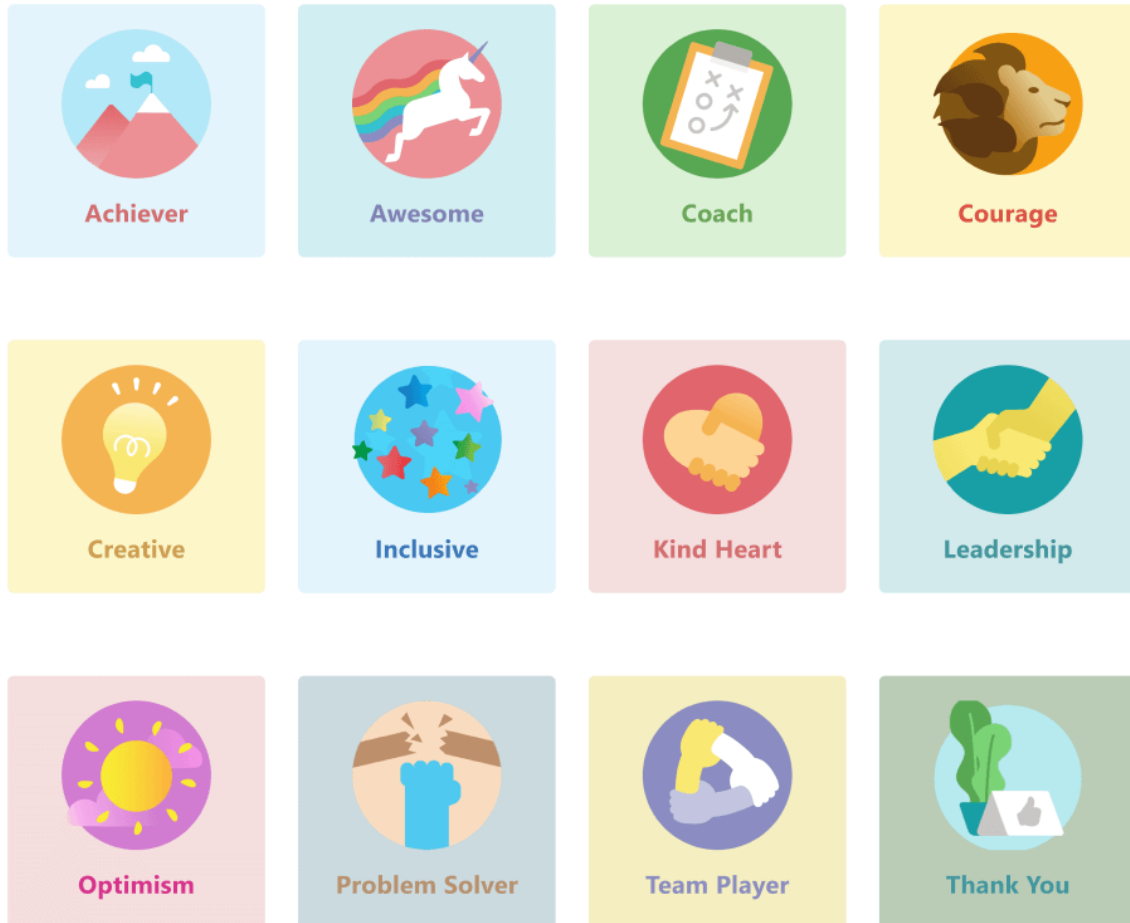

Use built-in badge sets

Built-in sets are collections of badges designed by Microsoft for the Praise app. These sets are not editable by admins. The default badge set is already enabled and available in the Praise app. To change the availability of the

default set or of any badges sets, switch the corresponding toggle to On or Off.

Default badges

The default badge set is designed to help Teams users recognize their peers for going above and beyond with their work.

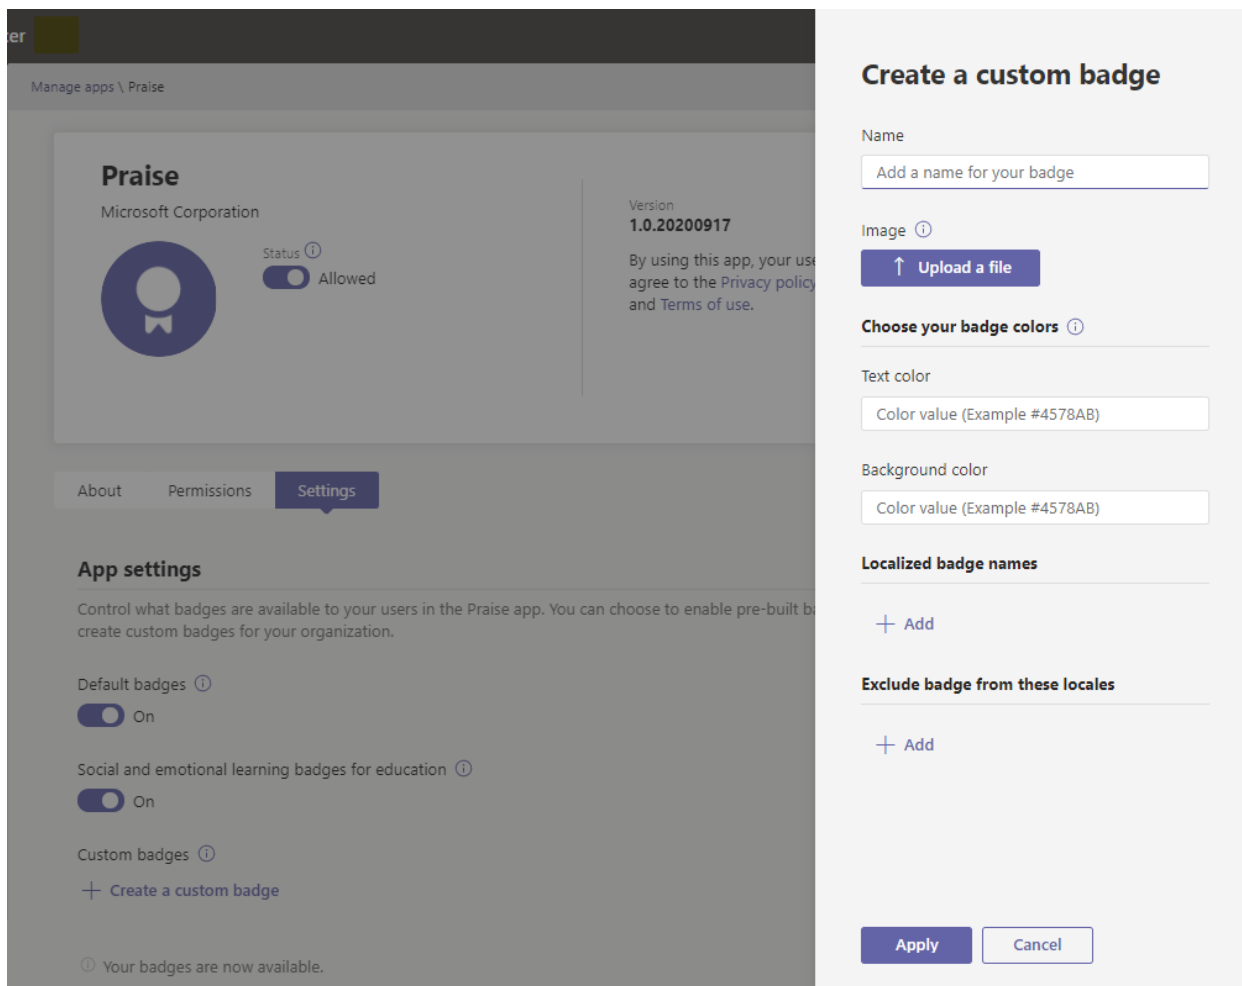

Social and emotional learning badges for education

Educators can recognize individual students for social and emotional learning (SEL) achievements and behaviors with badges that illustrate these concepts.

Create your own badges

Select **Create a custom badge**. From here, you can design a custom badge in the side panel. You can create up to 25 custom badges.

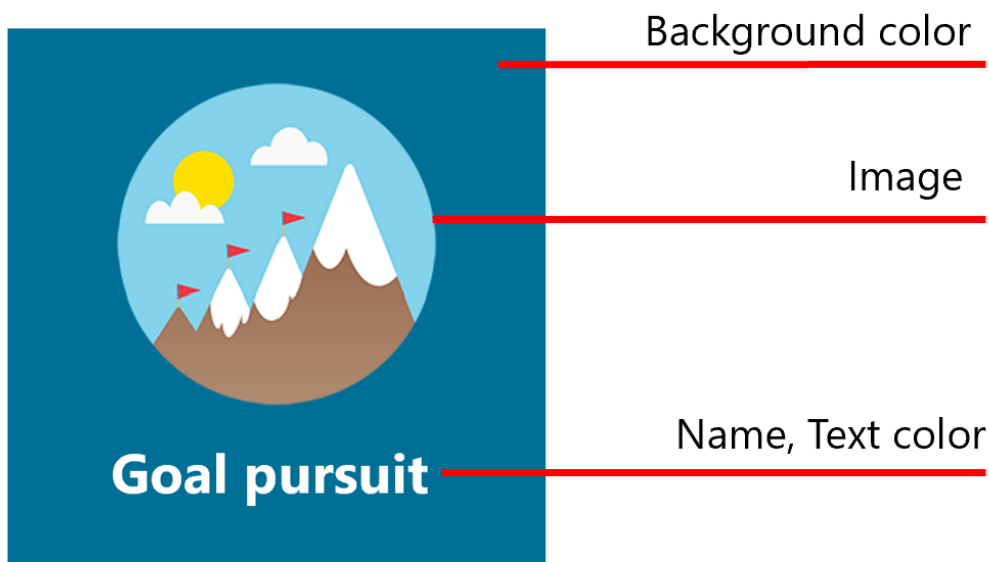

1. Enter a badge name. This is the name that will appear on the badge when users send praise.
2. Set your badge colors. To set the text and background colors of your badge, you need to enter the colors as hexadecimal (hex) values.

TIP

If you're new to hex values, this article includes a [quick introduction](#) to show you how to use them.

3. Upload a badge image. The accepted file type is .PNG. The image file must be less than 40 KB with maximum dimensions of 216 X 216 pixels.

4. Localize your badge name: Under **Localized badge names**, select **Add**. Select the desired locale from the drop-down list. Then enter the badge name in the designated language.
5. Exclude your badge from specific locales: Under **Exclude badge from these locales**, select **Add**. Select the locales you want to exclude from the drop-down list.
6. Select **Apply**. Your new badge will now appear in the custom badges table.

NOTE

If steps 4 and 5 are skipped, the badge will be in the default language for all locales.

When you're finished making changes to your badge selection, make sure to select **Submit**. It may take up to a few hours before these changes are available to your organization.

Specify colors with hex values

Hex color values are strings of six hexadecimal digits that represent the intensity of red (RR), green (GG), and blue (BB) in a specific color on a scale of 00 to FF. When you put the values of all three colors together, you get a hex value: #RRGGBB

For example, the hex value for the color red is #FF0000 because red is set at the highest possible value, FF, and green and blue are each set at the lowest possible value, 00.

To explore different colors and their hex values, check out [Bing color picker](#).

Below is a list of example colors to get you started:

COLOR	HEX VALUE
	#FF6666

COLOR	HEX VALUE
	#FFFFD4
	#FF75F0
	#00BFFF
	#800080
	#000000

Best practices for creating custom badges

Submit all your badges at once. Because it takes a while for new badges to be processed, it's best to add all your custom badges to the table before submitting them.

When choosing colors, keep accessibility in mind. Some colors go together better than others. Create contrast between your text and background colors to make the badge name easy to read. For example, if you chose a dark background color, choose a light text color.

When selecting an image, keep badge dimensions in mind. For the best quality, we recommend uploading an image file that is 216 x 216 pixels (which are the maximum dimensions). Avoid stretching or distorting the image to fit these dimensions.

If your badge image isn't rectangular, make the image transparent. You'll need to do this before uploading the image file to Praise.

Non-transparent image:

Transparent image:

Badge set assets

Built-in badge sets can't be modified, so when a built-in set is enabled, all badges in the set are added to the Praise app. If you want to add specific badges from a built-in set and leave out others, re-create the badges you

want to use as custom badges. You can download the badge image and find the text and background colors of badges from built-in sets in the tables below.

Default badges assets

BADGE NAME	IMAGE FILE	TEXT COLOR	BACKGROUND COLOR

Teams Approvals app availability

12/7/2021 • 6 minutes to read • [Edit Online](#)

The Approvals app is available as a personal app for all Microsoft Teams users. The Approvals app provides a simple way to bring auditing, compliance, accountability, and workflows to both structured and unstructured Approvals in Teams.

Users can pin the Approvals app to save it to the menu bar.

The first approval created from the Approvals app will trigger the provisioning of the Approval Solution in the default Common Data Service (CDS) environment. Approvals created from the Approvals app will be stored in the default CDS environment.

This article describes the Approvals app requirements and roles.

NOTE

This feature hasn't been released to Government Community Cloud (GCC), Government Community Cloud High (GCCH), and Department of Defense (DOD) users yet.

Required permissions and licenses

To deploy the Approvals app, you need permission for the following items:

- Permissions to create a Microsoft CDS database.
- An account on flow.microsoft.com
- Administrator Role in the target environment.
- License for [Power Automate](#), Office 365, or Dynamics 365.
- License for Microsoft Forms is required for users to set up new approval templates.

To use the Approvals app, you need a license for Power Automate, and your account will be added automatically to the Approvals User role in the target environment on your first approval assignment.

Storage with CDS

The Common Data Model (CDM) is the shared data language used by business and analytical applications in the CDS. It consists of a set of a standardized, extensible data schemas published by Microsoft and our partners that enables consistency of data and its meaning across applications and business processes. Learn more about the [Common Data Model of the Microsoft Power Platform](#).

Learn more about the [Approval workflow](#).

Approvals that are created from a template still store data in CDS, such as their title, details, template ID, and more. Responses that are submitted on the approval request are stored in Forms. Learn more about [Data storage for Microsoft Forms](#).

NOTE

If you delete the Form template on the Microsoft Forms site, it will break your Approval template and users will not be able to start the request. Users will get an error "CDB TableNotFound" when trying to open an Approval template that has been deleted on Microsoft Forms.

Org-scoped templates share the same lifetime of the tenant and team-scoped templates share the same lifetime of the team. So, permanently deleting the team deletes the related templates.

Approvals Teams app permissions

The Approvals Teams app lets you access the following features:

- Receive messages and data that you provide to it.
- Send you messages and notifications.
- Render personal apps and dialogs without a Teams-provided header.
- Access your profile information such as your name, email address, company name, and preferred language.
- Receive messages and data that team members provide to it in a channel.
- Send messages and notifications in a channel.
- Access your team's information:
 - team name
 - channel list
 - roster (team member's names and email addresses).

- Use the team's information to contact them.

Approval Template Permissions

- All team owners can create an approval template for teams that they own.
- When an Admin creates a template for their entire organization for the first time, it will automatically create a new Azure Active Directory(AAD) group for all admins of the tenant, including the global and Team's service admins. These admins will be added as owners of the group, so they can co-manage organizational templates. Admins that are new to the organization after the team has been created need to be manually added as group owners so they have the same permissions to manage organization-wide templates.

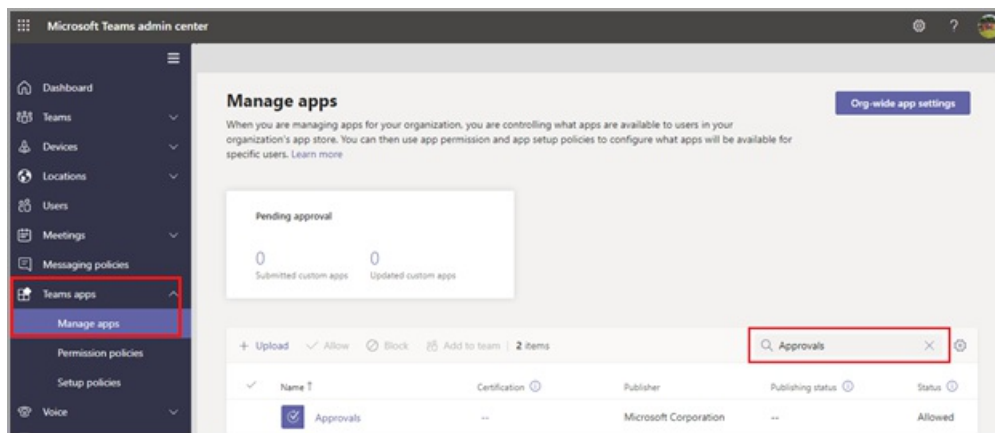

NOTE

If an admin deletes the group, you have one month to restore it within the Azure Active Directory (AAD) portal to restore all related data. After one month, or if the admin deletes this group within the recycle bin, you will lose all related data.

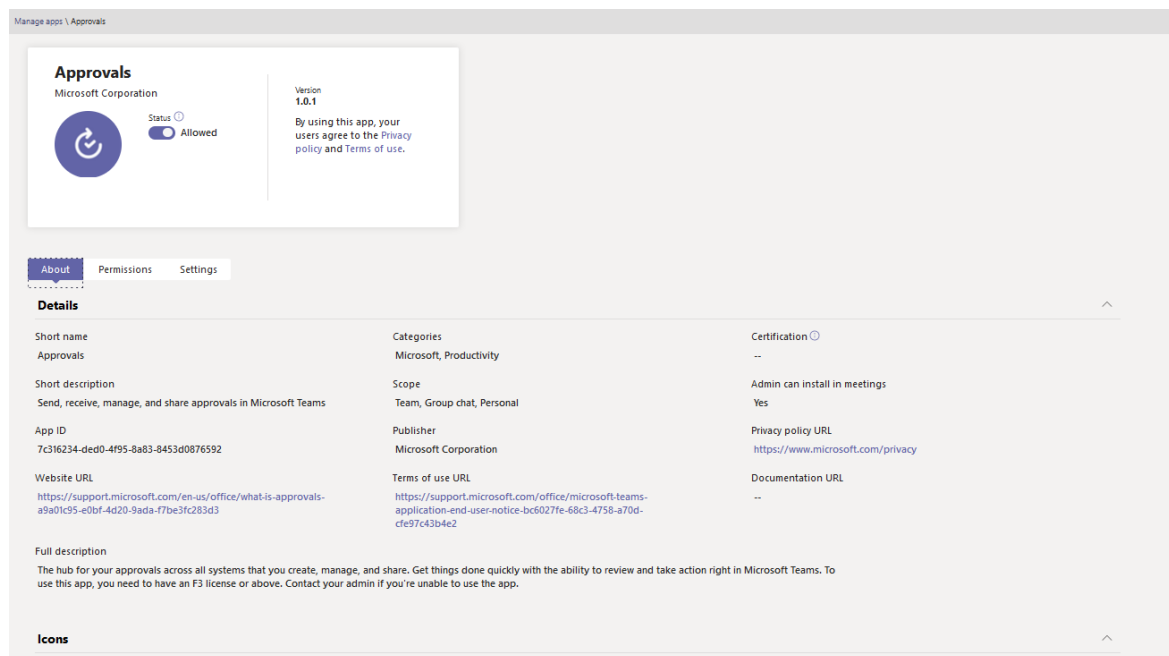

Disable the Approvals app

The Approvals app is available by default. You can disable the app in the Teams admin center.

1. Sign in to the Teams admin center.
2. Expand **Teams apps** and select **Manage apps**.
3. Search for the Approvals app.

4. Select Approvals.
5. Select the toggle to disable the app for your organization.

Retention policy

Approvals created from the Approvals App are stored in the default CDS environment, which doesn't support backups at this time. Learn more about how to [Back up and restore environments - Power Platform | Microsoft Docs](#).

Data stored in Forms will not be deleted until the team owners clean it up from the **deleted forms** tab in the Microsoft Forms web app.

Data limitations

Each team can contain at most 400 approvals templates, and each template can collect a maximum of 50,000 requests based on the current capability in Microsoft Forms.

Auditing

The Approvals App logs audit events within the Microsoft 365 Security and Compliance Center. You can view the audit log.

1. Go to the Microsoft 365 Compliance Site.
2. Select the **Audit** section.
3. Search for activities under **Microsoft Teams approvals activities**.

You can search for the following activities:

- Create new approval request
- View approval request details
- Approved approval request
- Rejected approval request
- Canceled approval request
- Shared approval request
- File attached to approval request

- Reassigned approval request
- Added e-signature to approval request
- Viewed e-signature request details
- Reviewed e-signature request
- Canceled e-signature request
- Create a new template
- Edit an existing template
- Enable/disable a template
- Viewed template

For access to more auditing approvals within Flow, enable and configure auditing in the default environment for the primary approval entities Approval, Approval Request, and Approval Response. Create, update, and delete operations are auditable events for Approval records. Learn more about [Audit data and user activity for security and compliance - Power Platform | Microsoft Docs](#).

Auditing can be customized further in the [Microsoft 365 Security and Compliance Center](#).

1. To use the preconfigured reports, sign in to Microsoft 365 Security and Compliance.
2. Select **Search & investigation**.
3. Search the Audit log and select the **Dynamics 365 activities** tab.

Learn more about [Microsoft Dataverse and model-driven apps activity logging - Power Platform](#).

Security

From the Teams Approvals app, users have access to create new Approvals and view Approvals that they have sent and received. Users won't have access to Approvals that are created by others unless they're either a responder or a viewer of the request.

NOTE

A user will be given a viewer role of a request if they are part of the chat or channel where the approval was created. They won't have the ability to take action on the request if they weren't given that role when the approval was created.

Approvals e-signature integration

E-signature approvals created from the Approvals app are stored in the selected provider's cloud environment. For further information about storage around the e-signature agreement, view the selected provider's storage documentation.

To use the Approvals app e-signature feature, you need the following items:

- License for the specific e-signature provider you're choosing to use. In order to obtain a license for your organization, you'll need to go to the provider's site.

For the Approvals e-signature functionality, third-party signature partners will appear in the Teams Approvals app by default. You can disable specific e-signature providers by accessing app settings in the Teams admin center.

1. In the Teams admin center, under **Manage apps**, select the **Approvals app** and choose **Settings**.

2. Each e-signature provider has a toggle next to it that is in the on position (right) by default. Slide the toggle to the left to disable a specific e-signature provider. If a Teams admin disables a provider, end users won't see the provider when creating an approval. End users will also be unable to view any e-signature requests that were made with that provider.

E-signature Approvals created from the Approvals App are stored in the selected provider's cloud. You will therefore need to go to the provider's site in order to export any data about e-signatures. Refer to the provider's documentation about export and retention of these agreements.

Manage the Shifts app for your organization in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Effective June 30, 2020, Microsoft StaffHub has been retired. We're building StaffHub capabilities into Microsoft Teams. Today, Teams includes the Shifts app for schedule management and additional capabilities will roll out over time. StaffHub stopped working for all users on June 30, 2020. Anyone who tries to open StaffHub is shown a message directing them to download Teams. To learn more, see [Microsoft StaffHub has been retired](#).

Overview of Shifts

The Shifts app in Microsoft Teams keeps frontline workers connected and in sync. It's built mobile first for fast and effective time management and communication for teams. Shifts let frontline workers and their managers use their mobile devices to manage schedules and keep in touch.

- Managers create, update, and manage shift schedules for teams. They can send messages to one person ("there's a spill on the floor") or the entire team ("the regional GM is arriving in 20 minutes"). They can also send policy documents, news bulletins, and videos.
- Employees view their upcoming shifts, see who else is scheduled for the day, request to swap or offer a shift, and request time off.

It's important to know that Shifts currently don't support guests. This means that guests on a team can't be added to or use shift schedules when Guest access is turned on in Teams.

NOTE

For details about Shifts capabilities on different platforms, see [Teams features by platform](#).

Availability of Shifts

Shifts is available in all Enterprise SKUs where Teams is available.

Location of Shifts data

Shifts data is currently stored in Azure in data centers in North America, Western Europe, and Asia Pacific. For more information about where data is stored, see [Where is my data?](#)

Set up Shifts

Enable or disable Shifts in your organization

Shifts is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. In the list of apps, do one of the following actions:

- To turn off Shifts for your organization, search for the Shifts app, select it, and then select **Block**.
- To turn on Shifts for your organization, search for the Shifts app, select it, and then select **Allow**.

Enable or disable Shifts for specific users in your organization

To allow or block specific users in your organization from using Shifts, make sure Shifts be turned on for your organization on the [Manage apps](#) page. Then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Use the FirstLineWorker app setup policy to pin Shifts to Teams

App setup policies let you customize Teams to highlight the apps that are most important for users in your organization. The apps set in a policy are pinned to the app bar—the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients—where users can quickly and easily access them.

Teams includes a built-in FirstLineWorker app setup policy that you can assign to frontline workers in your organization. By default, the policy includes the Activity, Shifts, Chat, and Calling apps.

To view the FirstLineWorker policy, in the left navigation of the Microsoft Teams admin center, go to **Teams app** > **Setup policies**.

Assign the FirstLineWorker app setup policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Search the audit log for Shifts events

(in preview)

You can search the audit log to view Shifts activity in your organization. To learn more about how to search the audit log and to see a list of [Shifts activities](#) that are logged in the audit log, see [Search the audit log for events in Teams](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). To learn more, see [Turn audit log search on or off](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Purchase third-party apps for Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Teams apps are free to install and some may require purchasing service subscriptions to experience the app's full functionality and scope. These service subscriptions are called Software as a Service (SaaS) offers, which are available for purchase through [AppSource](#) and now through the Microsoft Teams admin center.

The [Manage apps](#) page in the Microsoft Teams admin center is where you view and manage all Teams apps for your organization. For example, you can see the org-level status and properties of apps, upload new custom apps to your organization's app store, block or allow apps at the org level, and manage org-wide app settings.

Here, you can also purchase licenses for services offered by third-party apps for users in your organization. The **Licenses** column in the table indicates whether an app offers a SaaS subscription for purchase.

Manage apps

When you are managing apps for your organization, you are controlling what apps are available to users in your organization's app store. You can then use app permission and app setup policies to configure what apps will be available for specific users. [Learn more](#)

Purchase apps in the Teams admin center

IMPORTANT

If you want to block your users from purchasing an app through the Teams app store, you have to block the app. For more information on how to block an app, see [Manage app policies](#) or [learn how to block an app at the org-level](#).

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**. You must be a Global admin or Teams service admin to access the page.
2. Search for the app that you want. To identify apps that have a paid SaaS subscription, look in the **Licenses** column. Each app will have one of the following values:
 - **Purchase**: The app offers a SaaS subscription and is available to purchase.
 - **Purchased**: The app offers a SaaS subscription and you've purchased licenses for it.
 - **--**: The app doesn't offer a SaaS subscription.
3. When you find the app, click **Purchase** to go to the **Plans and pricing** tab of the app details page. Review the plans and pricing information for the SaaS offer for the app. If you need more information, select **Learn more** to go to the app's page on [AppSource](#).

NOTE

Private plans may also be listed for purchase, which include special pricing that your organization has previously negotiated with an ISV. These plans will have the label **Private plan** under the plan name.

- To subscribe to an app, choose the plan you want, and select **Purchase**. The checkout flow will open directly in the Teams admin center.
- Select the number of user licenses you want to buy.
- Check that the billing account and sold-to address is correct. If you don't already have one, add a new one by selecting **Add**. For more information on billing accounts, see [Understand billing accounts](#).

NOTE

You have to be a Global admin to add a new billing account.

- Check that the correct billing profile is selected. If you don't already have one, add a new one by selecting **Add new**. You have the option to pay with a credit card, debit card, or with [invoice billing](#). The billing profile also lets you add a purchase order number to identify your order later. For more information on billing profiles, see [Understand billing profiles](#).
- Select **Place order**.
- Select **Set up** to activate your subscription on the publisher's website. If you don't set up your subscription after your purchase, you can do it later by selecting **Manage licenses**.

After you've purchased the SaaS offer associated with the Teams app, you can view the following purchase details on the **Plans and pricing** tab of the app details page.

- License activation date:** Date on which your license was activated. If your account isn't yet set up, this shows as **Subscription pending activation**.
- Licenses:** Number of licenses you purchased.

The screenshot shows the 'Plans and pricing' tab for the ScrumGenius app. At the top, there's a card with the app logo, status (Allowed), and version (1.2.1). Below this is a navigation bar with tabs: About, Permissions, Settings, and Plans and pricing (which is selected). The main content area is titled 'ScrumGenius - Automate daily standups'. It includes a link for more information and a section for license activation details, showing 'Subscription pending activation' and '1' license. A 'Manage licenses' link is also present. Below this is a table showing the available plan:

Plan	Description	Monthly price	Annual price
Remote Standups	Automate your team status meetings. ScrumGenius runs automatic check-ins and stand-ups to help managers to track the progress, goals and performance of their employees. Let ScrumGenius help your team keep your agile sprints on track! Increase your team productivity with async standups in Microsoft Teams!	USD 5.00/user	--

A note at the bottom states: 'We are offering a discounted price for a limited time for Microsoft customers! Currently at \$5/user (Originally \$8/user)'.

Select **Manage licenses** to go to the Microsoft 365 admin center to view and manage the licenses you purchased.

Global admins can add more licenses, remove licenses, and cancel subscriptions for purchases made by anyone in the organization. Teams service admins can perform the same actions for purchases made by themselves. However, if a Teams service admin also has the Billing admin role, they can manage purchases made by anyone

in the organization.

NOTE

If a Global admin wants to manage a subscription purchased by another global admin, they need to be in the same billing account. You can give another Global admin access to a subscription you purchased by selecting the app in the Microsoft 365 admin center. From there, go to **View billing profile** > **Select billing account** > **Assign roles** > **Add other Global admins**.

Invoice billing

- Invoice billing is available as a payment option for some transactions.
- A credit review is required the first time you use invoice billing, which can take up to 24 to 48 hours for approval. Invoice billing won't be available until the credit check is complete. You can place your order with a credit card or try again later after your credit review is approved.
- Invoice billing is only available for Global admins or an admin with both Teams service admin and Billing admin permissions.
- Invoice billing isn't available when purchasing a plan with a 30-day free trial.

Have a SaaS offer for a Teams app that you want to list and sell in the Microsoft Teams admin center and AppSource?

Developers can create SaaS offers associated with their Teams apps. These offers are published through [Partner Center](#) and are available for organizations to purchase through [AppSource](#) and the Microsoft Teams admin center.

Third-party app developers can go to [Create a SaaS offer](#) for more information.

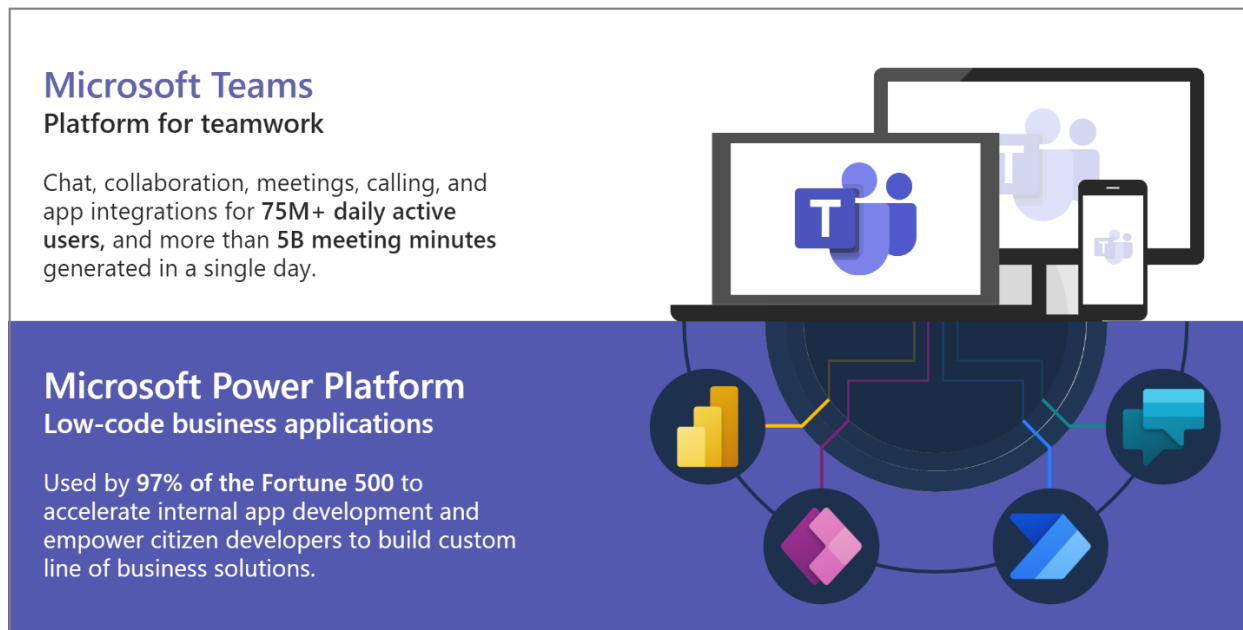

Related topics

- [Manage your apps in the Microsoft Teams admin center](#)

- [Microsoft 365 admin roles](#)

Teams integration with Microsoft Power Platform

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Power Platform helps users accelerate their development with low-code tools to analyze data using **Power BI**, build custom apps using **Power Apps**, automate processes using **Power Automate**, and create intelligent bots using **Power Virtual Agents** more quickly than ever. With the shift to remote and hybrid work, Microsoft Teams has enabled people around the world to continue to create, collaborate, and communicate. With more than 75 million daily active users, Teams is how people are getting work done.

Microsoft Power Platform provides many integration capabilities with Teams where you can embed **Power BI** reports in the Teams workspace, embed apps created using **Power Apps** as a tab or personal app, trigger a **Power Automate** flow from any message or use adaptive cards, and add your bot created using **Power Virtual Agents** to Teams for other members of your organization to interact with.

Starting September 2020, integration with Microsoft Power Platform has improved to let users do the following *without ever leaving the Teams interface*.

- Create and share dashboards, reports, and apps using **Power BI** to make data-driven decisions.
- Create and share low-code, purpose-built apps using an integrated **Power Apps** studio by connecting to your business data stored either in the new underlying data platform (Microsoft Dataverse for Teams), Microsoft 365, or in other data sources through connectors.
- Create automated workflows between your apps and services to synchronize files, get notifications, collect data, and more using **Power Automate**.
- Build bots using a guided, no-code graphical interface using **Power Virtual Agents** to easily create digital assistants within Teams and make them available to your colleagues to chat with.

The new capabilities to create apps, bots, and workflows are backed by the new built-in, low-code data platform for Teams, [Dataverse for Teams](#), which provides relational data storage, rich data types, enterprise grade governance, and one-click solution deployment. Dataverse for Teams is built on top of [Microsoft Dataverse](#). With Dataverse for Teams, Teams users can find and install custom, ready-to-use solutions from the Teams app store that showcase common scenarios across industries. You can customize and extend these custom solutions to adapt to your organization's branding and requirements.

Licensing

The new capabilities are available to the select Microsoft 365 subscriptions.

- For more information about licensing requirements for Power Apps, Power Automate, Power Virtual Agents, and Dataverse for Teams, see [Licensing](#).
- For more information about licensing requirements for Power BI, see [Requirements](#).

How do I get started?

Manage Microsoft Power Platform apps in the Microsoft Teams admin center

12/7/2021 • 5 minutes to read • [Edit Online](#)

Microsoft Power Platform apps in Teams

This article gives you an overview of how to manage [Microsoft Power Platform](#) apps in the Microsoft Teams admin center.

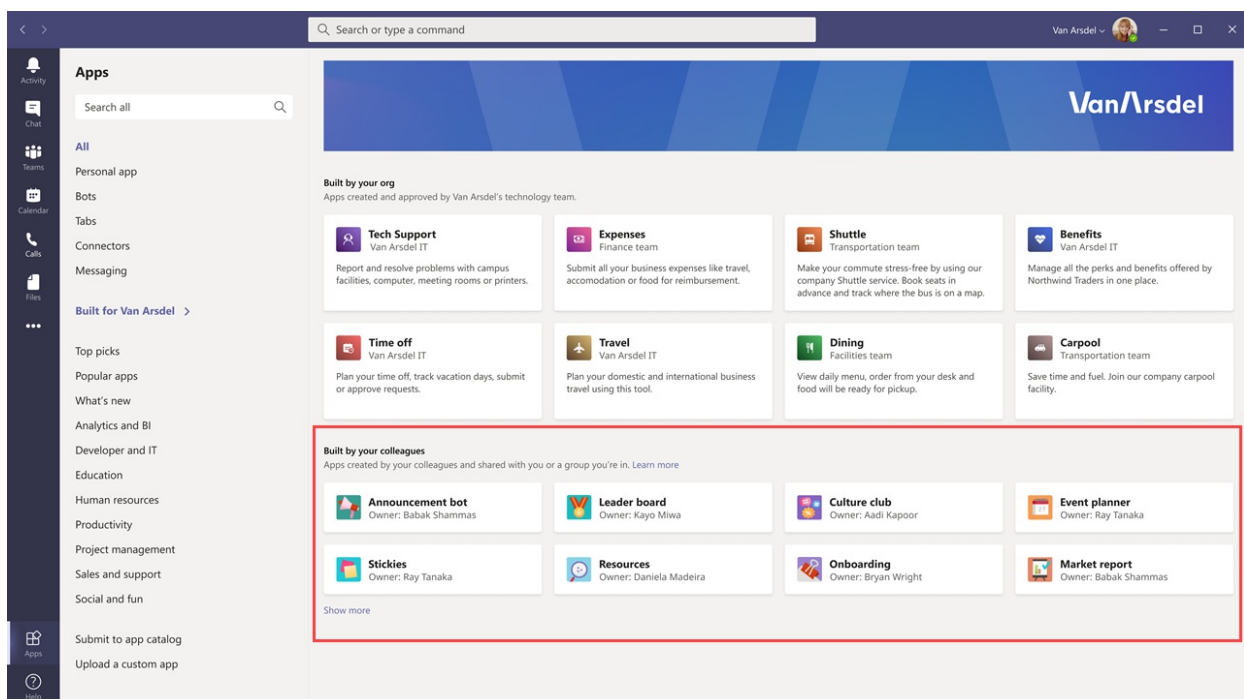

NOTE

This article applies to custom apps created by makers in your organization using Power Apps or Power Virtual Agents. These custom apps are automatically added to Teams. This article doesn't apply to the Power Apps app or Power Virtual Agents app that are installed from the Apps page or pinned to Teams through an app setup policy. You manage those apps as you would for any other app on the [Manage apps](#) page, using [app permission policies](#), and [app setup policies](#).

[Power Apps](#) is a low-code/no-code application development environment that makers in your organization can use to build custom apps that connect to your business data. [Power Virtual Agents](#) is a no-code bot building environment for makers to create powerful bots. With the integration of Microsoft Power Platform apps into Teams, organizations can streamline business processes, respond to changing business needs more rapidly to drive greater collaboration, and create and share custom solutions to be more productive.

Microsoft Power Platform apps created by makers in your organization are automatically added to Teams. Makers can control who can access their app by using the [sharing feature in Power Apps](#) and the [sharing feature in Power Virtual Agents](#).

When a Microsoft Power Platform app is created or shared, users can view and install it on the Apps page by going to **Built for *Your Organization Name* > Built by your colleagues**. (It might take a few minutes after an app is created or shared for the app to appear here.)

A user will see an app in **Built by your colleagues** if the app meets one of the following conditions.

POWER APPS	POWER VIRTUAL AGENTS
<ul style="list-style-type: none"> • The user created the app. • The app was shared directly with the user. • The user recently used the app. 	<ul style="list-style-type: none"> • The user created the bot. • The bot is owned by a team the user is a member of.

Users install Microsoft Power Platform apps in the same way they install any other Teams app. Keep in mind that users can only install apps to the context to which they have permissions, for example, a team they own, a chat that they're a part of, or their personal scope.

Manage access to Microsoft Power Platform apps in the Microsoft Teams admin center

As an admin, you can control whether Microsoft Power Platform apps are listed in **Built by your colleagues** on the Apps page in Teams. You can collectively block or allow all apps created in Power Apps or all apps created in Power Virtual Agents at the org level on the [Manage apps](#) page or for specific users using [app permission policies](#).

The **Shared Power Apps** and **Shared Power Virtual Agent Apps** apps in your organization's app store represent all apps created on that particular platform. If you block one or both these apps at the org level or for specific users, those users can't see any apps from those platforms in **Built by your colleagues** and can't install them in Teams.

Keep in mind that you can control access to all apps created in Power Apps and Power Virtual Agents but you can't allow or block individual apps. Makers decide who can access the apps they create through the sharing feature from within Power Apps and Power Virtual Agents. If a maker shared an app they created in Power Virtual Agents with a user and you blocked **Shared Power Virtual Agents Apps** for that user, the user won't be able to see or install any apps from that platform in Teams.

If a user is allowed to access apps from Power Apps or Power Virtual Agents, and you then block the user from accessing apps from one or both these platforms, the user can still access and use Microsoft Power Platforms apps that they installed before you blocked the app or apps. However, the user can no longer see or install any apps from those platforms in **Built by your colleagues**.

NOTE

The **Allow interaction with custom apps** org-wide app setting on the [Manage apps](#) page applies to everyone in your organization and governs whether they can interact with custom apps. Org-wide app settings govern the behavior for all users and override any other app permission policies assigned to users. By default, this setting is turned on. If this setting is turned off, users in your organization can't see or install any custom apps, including Microsoft Power Platform apps. To learn more, see [Manage org-wide app settings](#).

Allow or block Microsoft Power Platform apps for your organization

By default, **Shared Power Apps** and **Shared Power Virtual Agent Apps** are allowed for all Teams users in your organization. You can block or allow them at the org level on the [Manage apps](#) page of the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**. You must be a global admin or Teams service admin to access the page.
2. In the list of apps, do one of the following.

Manage apps

When you are managing apps for your organization, you are controlling what apps are available to users in your organization's app store. You can then use app permission and app setup policies to configure what apps will be available for specific users. [Learn more](#)

Pending approval

	Shared Power Apps	--		--	Allowed

- To block apps created in Power Apps or Power Virtual Agents for all users in your organization, search for **Shared Power Apps** or **Shared Power Virtual Agent Apps**, select it, and then click **Block**.
- To allow apps created in Power Apps or Power Virtual Agents for all users in your organization, search for **Shared Power Apps** or **Shared Power Virtual Agent Apps**, select it, and then click **Allow**.

Allow or block Microsoft Power Platform apps for specific users

To allow or block specific users in your organization from accessing apps created in Power Apps or Power Virtual Agents, create and assign one or more custom [app permission policies](#).

For example, to block specific users from accessing apps created in Power Apps, create a custom app permission policy to block **Shared Power Apps**, and then assign the policy to those users.

Vendor app permission policy

Use audit logs to investigate Microsoft Power Platform installation activity

You can use audit logs for Teams to investigate events where users installed Microsoft Power Platform apps

from the **Built by your colleagues** section of the Apps page in Teams. To do this, [search the audit log](#) for the **Installed app** Teams event (under the **AppInstalled** operation) for a user or set of users. To find apps installed from **Built by your colleagues**, look for the **TemplatedInstance** value in the **AppDistributionMode** property in a given record's details.

The screenshot displays the Office 365 Security & Compliance Center interface. On the left, the 'Audit log search' panel is visible, showing a search for 'Installed app' with filters for 'Start date' (2020-10-08) and 'End date' (2020-10-16). The 'Results' section shows 5 results found. The main panel displays a table of audit records. The first record is highlighted, showing details for the 'AppInstalled' operation. The 'AppDistributionMode' property is highlighted as 'TemplatedInstance'.

Publish a custom app submitted through the Teams App Submission API

12/7/2021 • 6 minutes to read • [Edit Online](#)

Overview

NOTE

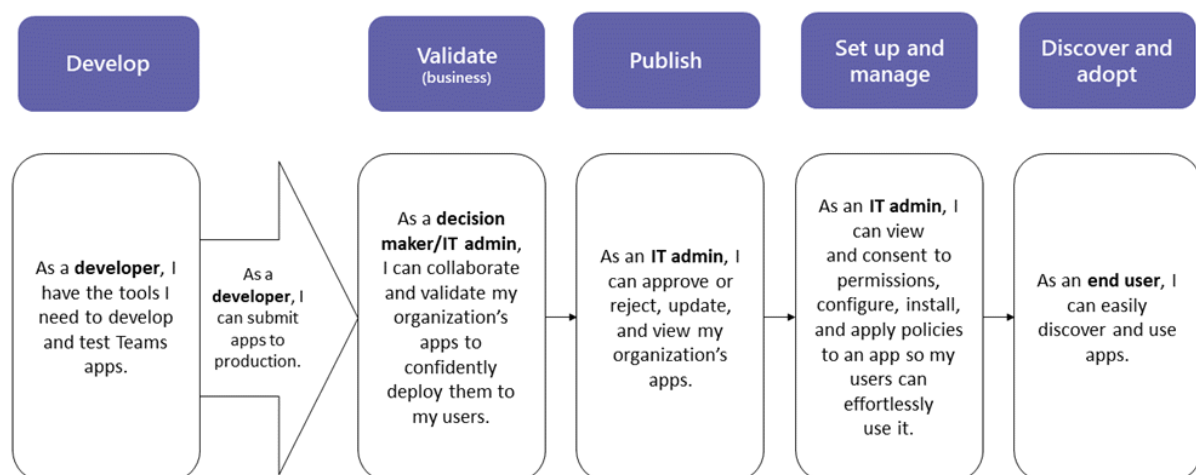

When you publish a custom Teams app, it's available to users in your organization's app store. There are two ways to publish a custom app and the way that you use depends on how you get the app. **This article focuses on how to approve and publish a custom app that a developer submits through the Teams App Submission API.** The other method, uploading a custom app, is used when a developer sends you an app package in .zip format. To learn more about that method, see [Publish a custom app by uploading an app package](#). The approve app widget isn't available in GCC tenants.

IMPORTANT

This method is not currently available for GCC environments. You must use the *uploading a custom app* method.

This article provides end-to-end guidance for how to take your Teams app from development to deployment to discovery. You'll get an overview of the connected experiences that Teams provides across the app lifecycle to streamline how to develop, deploy, and manage custom apps in your organization's app store.

We'll cover each step of the lifecycle, including how developers can use the Teams App Submission API to submit custom apps directly to the Microsoft Teams admin center for you to review and approve, how to set policies to manage apps for users in your organization, and how your users discover them in Teams.

This guidance focuses on the Teams aspects of the app and is intended for admins and IT pros. For information about developing Teams apps, see the [Teams developer documentation](#).

Develop

Create the app

The Microsoft Teams developer platform makes it easy for developers to integrate your own apps and services

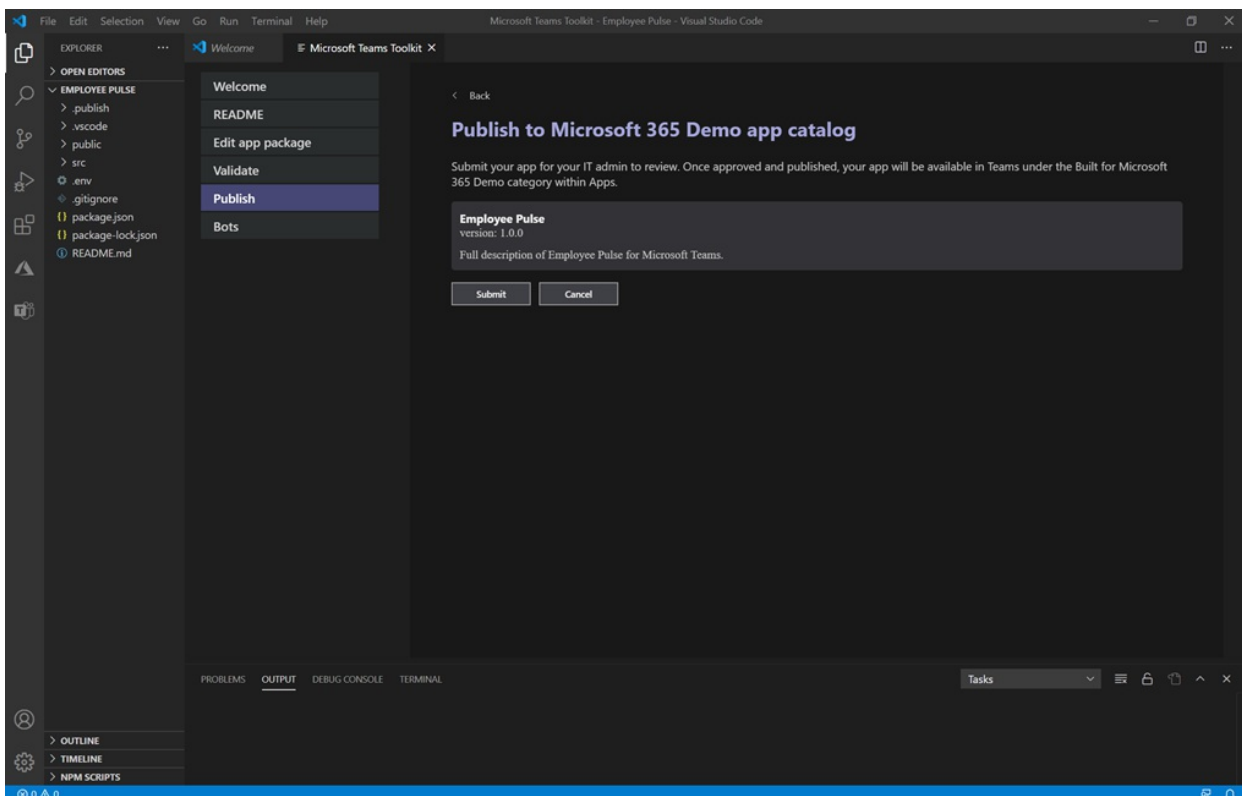

to improve productivity, make decisions faster, and create collaboration around existing content and workflows. Apps built on the Teams platform are bridges between the Teams client and your services and workflows, bringing them directly into the context of your collaboration platform. For more information, go to the [Teams developer documentation](#).

Submit the app

When the app is ready for use in production, the developer can submit the app using the Teams App Submission API, which can be called from [Graph API](#), an integrated development environment (IDE) such as Visual Studio Code, or a platform such as Power Apps and Power Virtual Agents. Doing this makes the app available on the [Manage apps](#) page of the Microsoft Teams admin center, where you, the admin, can review and approve it.

The Teams App Submission API, [built on Microsoft Graph](#), allows your organization to develop on the platform of your choice and automates the submission-to-approval process for custom apps on Teams.

Here's an example of what this app submission step looks like in Visual Studio Code:

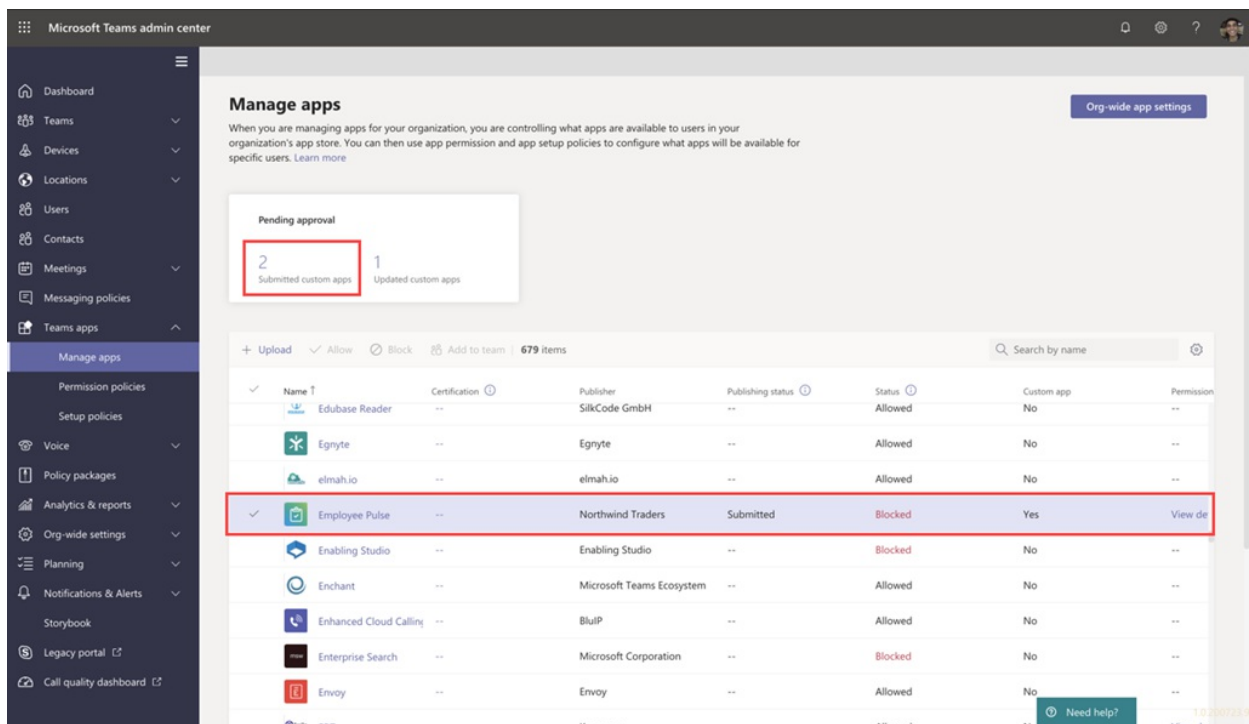

Keep in mind that this doesn't publish the app to your organization's app store yet. This step submits the app to the Microsoft Teams admin center where you can approve it for publishing to your organization's app store.

For more information about using the Graph API to submit apps, see [here](#).

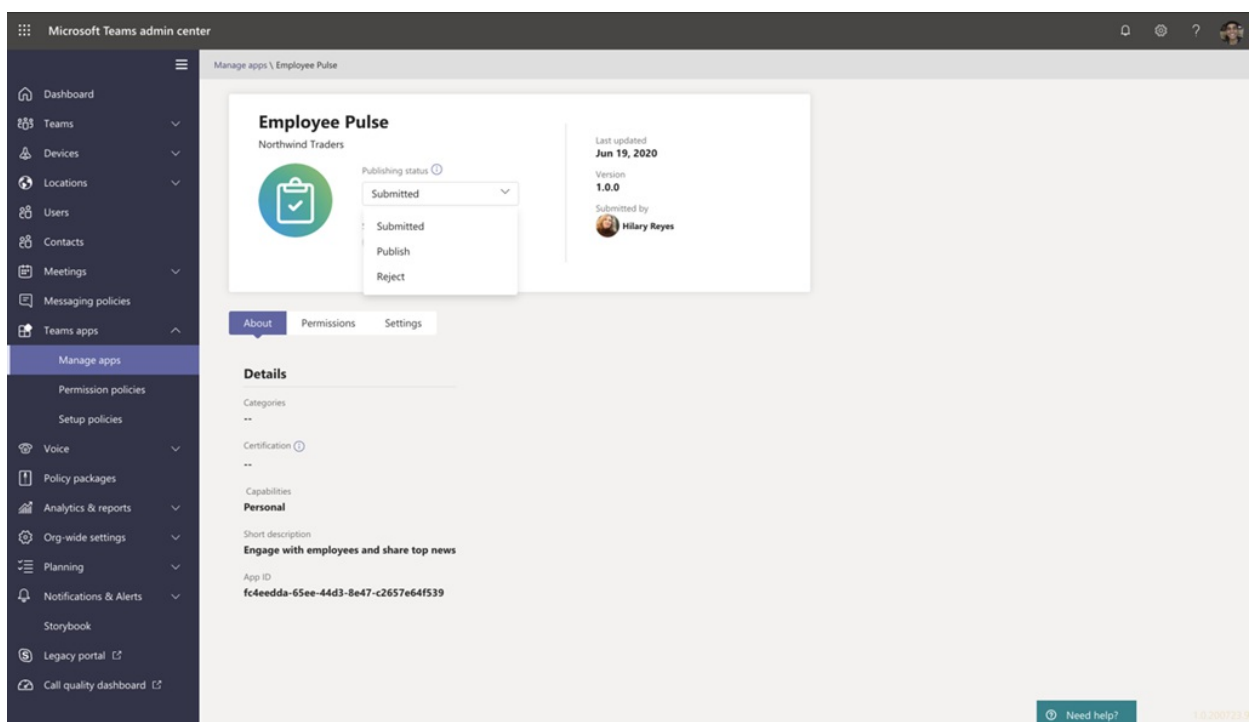

Validate

The [Manage apps](#) page in the Microsoft Teams admin center (in the left navigation, go to **Teams apps** > **Manage apps**), gives you a view into all Teams apps for your organization. The **Pending approval** widget at the top of the page lets you know when a custom app is submitted for approval.

In the table, a newly submitted app automatically shows a **Publishing status** of **Submitted** and **Status** of **Blocked**. You can sort the **Publishing status** column in descending order to quickly find the app.

Click the app name to go to the app details page. On the **About** tab, you can view details about the app, including description, status, submitter, and app ID.

For more information about using the Graph API to check the **Publishing status**, see [here](#).

Publish

When you're ready to make the app available to users, publish the app.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps** > **Manage apps**.
2. Click the app name to go to the app details page, and then in the **Publishing status** box, select **Publish**.

After you publish the app, the **Publishing status** changes to **Published** and the **Status** automatically changes to **Allowed**.

Set up and manage

Control access to the app

By default, all users in your organization can access the app in your organization's app store. To restrict and control who has permission to use the app, you can create and assign an app permission policy. To learn more, see [Manage app permission policies in Teams](#).

Pin and install the app for users to discover

By default, for users to find the app they have to go to your organization's app store and browse or search for it. To make it easy for users to get to the app, you can pin the app to the app bar in Teams. To do this, create an app setup policy and assign it to users. To learn more, see [Manage app setup policies in Teams](#).

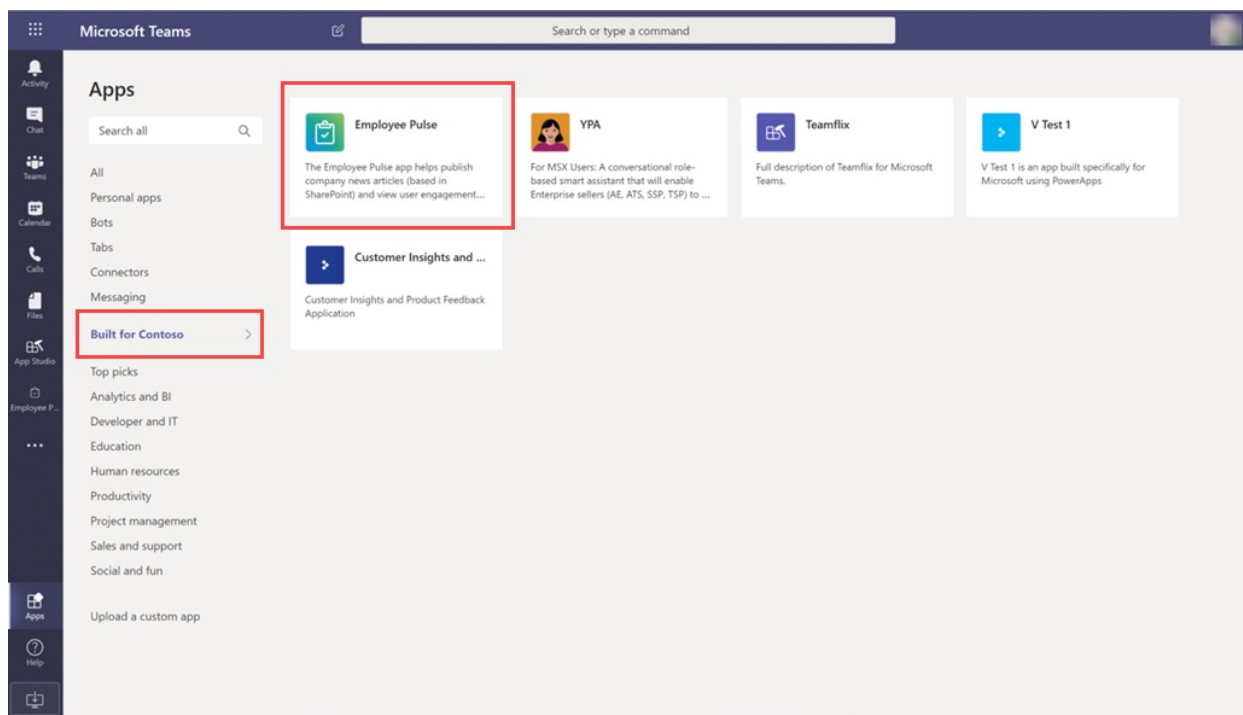

Search the audit log for Teams app events

You can search the audit log to view Teams apps activity in your organization. To learn more about how to search the audit log and to see a list of Teams activities that are logged in the audit log, see [Search the audit log for events in Teams](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). To learn more, see [Turn audit log search on or off](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Discover and adopt

Users who have permissions to the app can find it in your organization's app store. Go to **Built for *Your Organization Name*** on the Apps page to find your organization's custom apps.

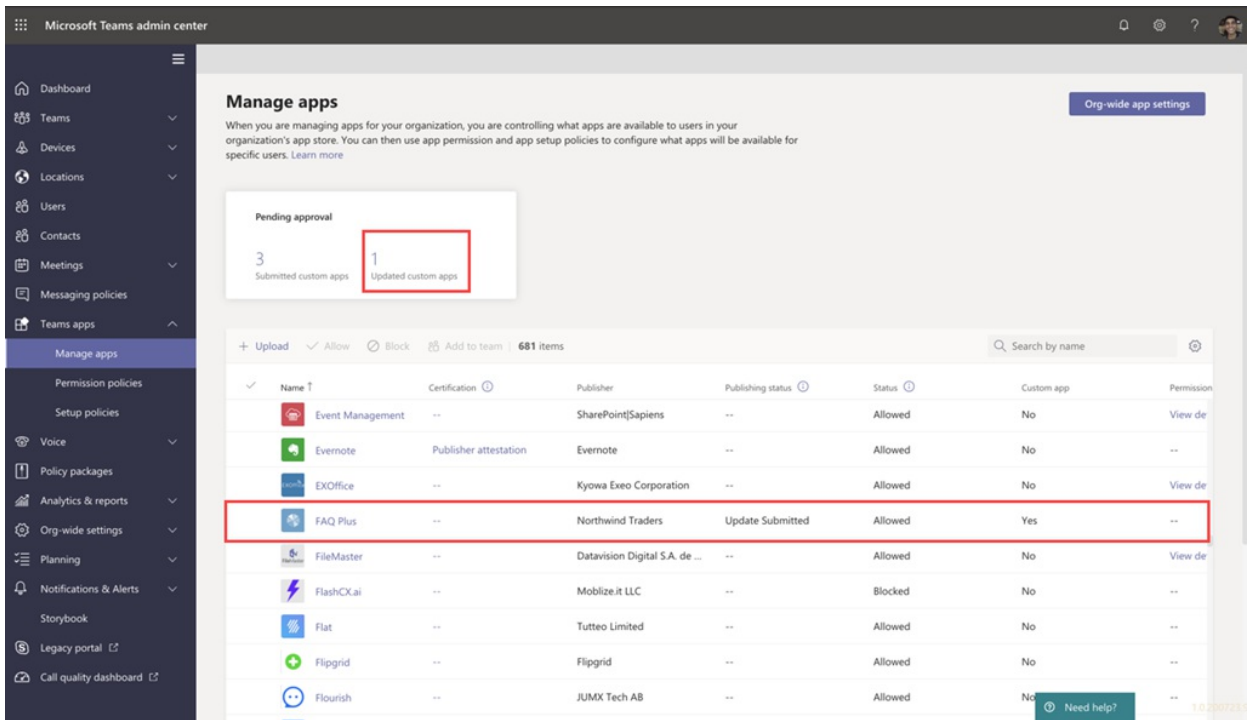

If you created and assigned an app setup policy, the app is pinned to the app bar in Teams for easy access for those users who were assigned the policy.

Update

To update an app, developers should continue to follow the steps in the [Develop](#) section.

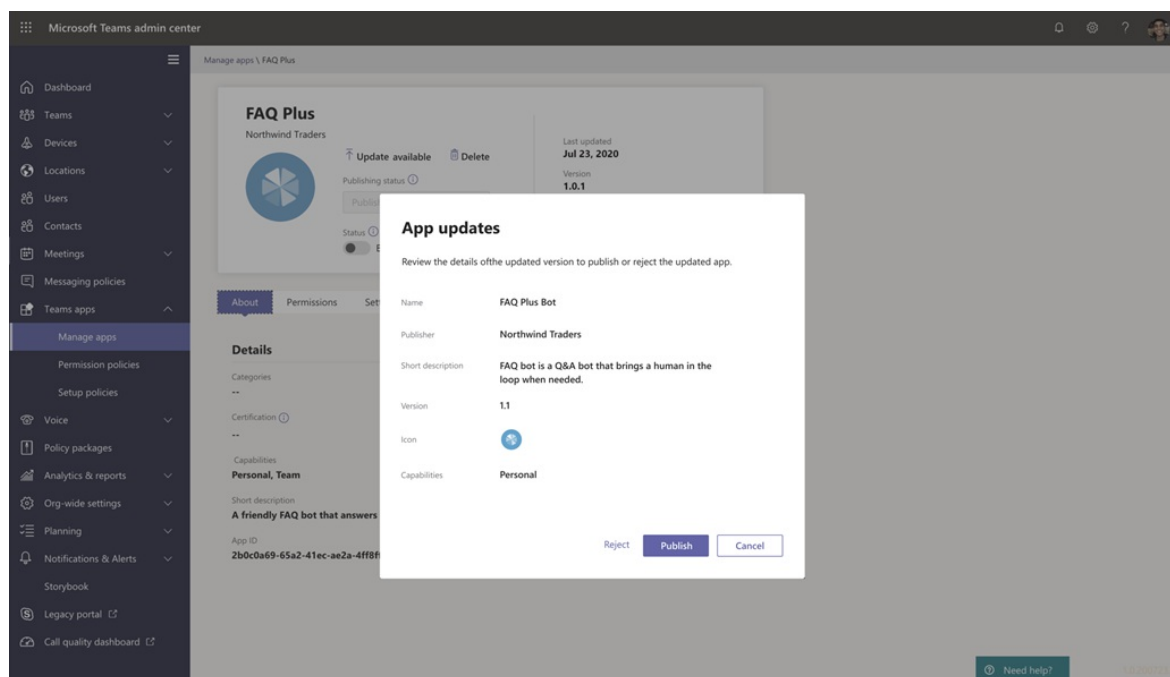

When the developer submits an update to a published custom app, you'll get notified in the **Pending approval** widget of the [Manage apps](#) page. In the table, the **Publishing status** of the app will be set to **Update**

submitted.

To review and publish an app update:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. Click the app name to go to the app details page, and then select **Update available** to review details of the update.

3. When you're ready, select **Publish** to publish the update. Doing this replaces the existing app, updates the version number, and changes the **Publishing status** to **Published**. All app permission policies and app setup policies remain enforced for the updated app.

If you reject the update, the earlier version of the app remains published.

Keep in mind the following:

- When an app is approved, any one can submit an update to the app. This means other developers, including the developer who originally submitted the app, can submit an update to the app.

- When a developer submits an app and the request is pending, only that same developer can submit an update to the app. Other developers can submit an update only after the app is approved.

For more information about using the Graph API to update apps, see [here](#).

Publish a custom app by uploading an app package

12/7/2021 • 6 minutes to read • [Edit Online](#)

NOTE

When you publish a custom Teams app, it's available to users in your organization's app store. There are two ways to publish a custom app and the way that you use depends on how you get the app. **This article focuses on how to publish a custom app by uploading an app package (in .zip format) that a developer sends you.** The other method, approving a custom app, is used when a developer submits an app directly to the [Manage apps](#) page through the Teams App Submission API. To learn more about that method, see [Publish a custom app submitted through the Teams App Submission API](#).

This article provides end-to-end guidance for how to take your Teams app from development to deployment to discovery. This guidance focuses on the Teams aspects of the app and is intended for admins and IT pros. For more information about developing Teams apps, see the [Teams developer documentation](#).

Develop

Create your app

The Microsoft Teams developer platform makes it easy for developers to integrate your own apps and services to improve productivity, make decisions faster, and create collaboration around existing content and workflows. Apps built on the Teams platform are bridges between the Teams client and your services and workflows, bringing them directly into the context of your collaboration platform. For more information, go to the [Teams developer documentation](#).

Validate

Get the app package

When the app is ready for use in production, the developer should produce an app package. They can use [App Studio](#) for that. They'll send you the file in .zip format.

Microsoft uses [these guidelines](#) to ensure apps comply with the quality and security standards of the global Teams apps store.

Allow trusted users to upload custom apps

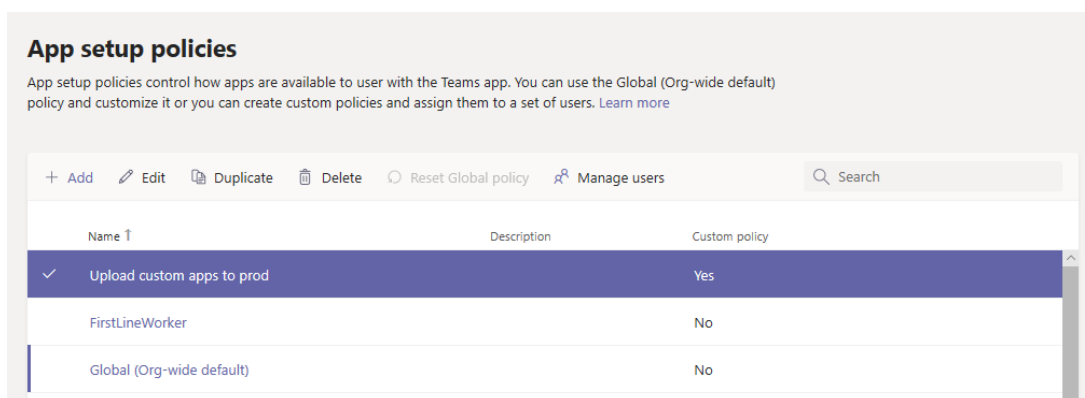

To validate that the app is working correctly in your production tenant, you need to allow yourself and/or trusted users to upload custom apps in the production tenant. You use [app setup policies](#) to do this.

NOTE

If you're uncomfortable with uploading the app to your production tenant for validation, even for yourself or trusted users, you can skip this step and follow the steps in the [Upload](#) and [Set up and manage](#) sections to publish the unvalidated app to your organization's app store. Then, restrict access to that app to only yourself and users you trust. These users can then get the app from your organization's app store to perform validation. After the app is validated, use the same permission policies to open access and roll the app out for production use.

To allow trusted users to upload custom apps, follow these steps:

1. Turn on the **Allow interaction with custom apps** org-wide app setting. To do this:
 - a. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**, and then click **Org-wide app settings**.
 - b. Under **Custom apps**, turn on **Allow interaction with custom apps**, and then click **Save**.
2. Turn off the **Upload custom apps** setting in the global app setup policy. To do this:
 - a. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**, and then click the **Global (Org-wide default)** policy.
 - b. Turn off **Upload custom apps**, and then click **Save**.
3. Create a new app setup policy that allows uploading custom apps and assign it to your set of trusted users. To do this:
 - a. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**, and then click the **Add**. Give the new policy a name and description, turn on **Upload custom apps**, and then click **Save**.
 - b. Select the new policy you created, and then click **Manage users**. Search for a user, click **Add**, and then click **Apply**. Repeat this step to assign the policy to all your trusted users.

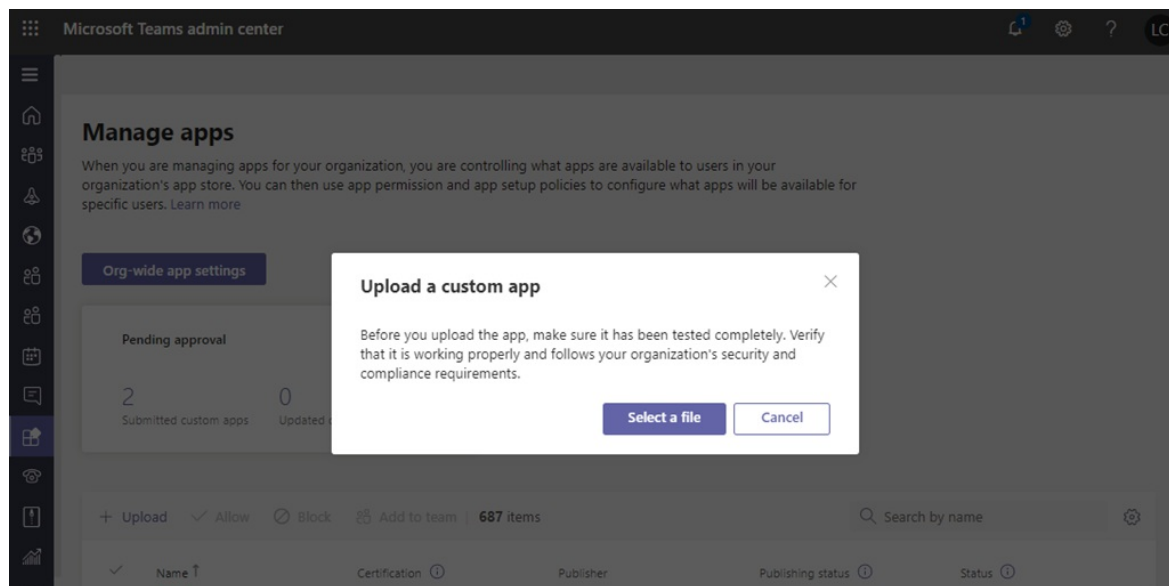

These users can now upload the app manifest to validate that the app is working correctly in the production tenant.

Upload

To make the app available to users in your organization's app store, upload the app. You can do this on the [Manage apps](#) page of the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. Click **Upload**, click **Select a file**, and then select the app package that you received from the developer.

Set up and manage

Control access to the app

By default, all users in your organization can access the app in your organization's app store. To restrict and control who has permission to use the app, you can create and assign an app permission policy. To learn more, see [Manage app permission policies in Teams](#).

Pin and install the app for users to discover

By default, for users to find the app they have to go to your organization's app store and browse or search for it. To make it easy for users to get to the app, you can pin the app to the app bar in Teams. To do this, create an app setup policy and assign it to users. To learn more, see [Manage app setup policies in Teams](#).

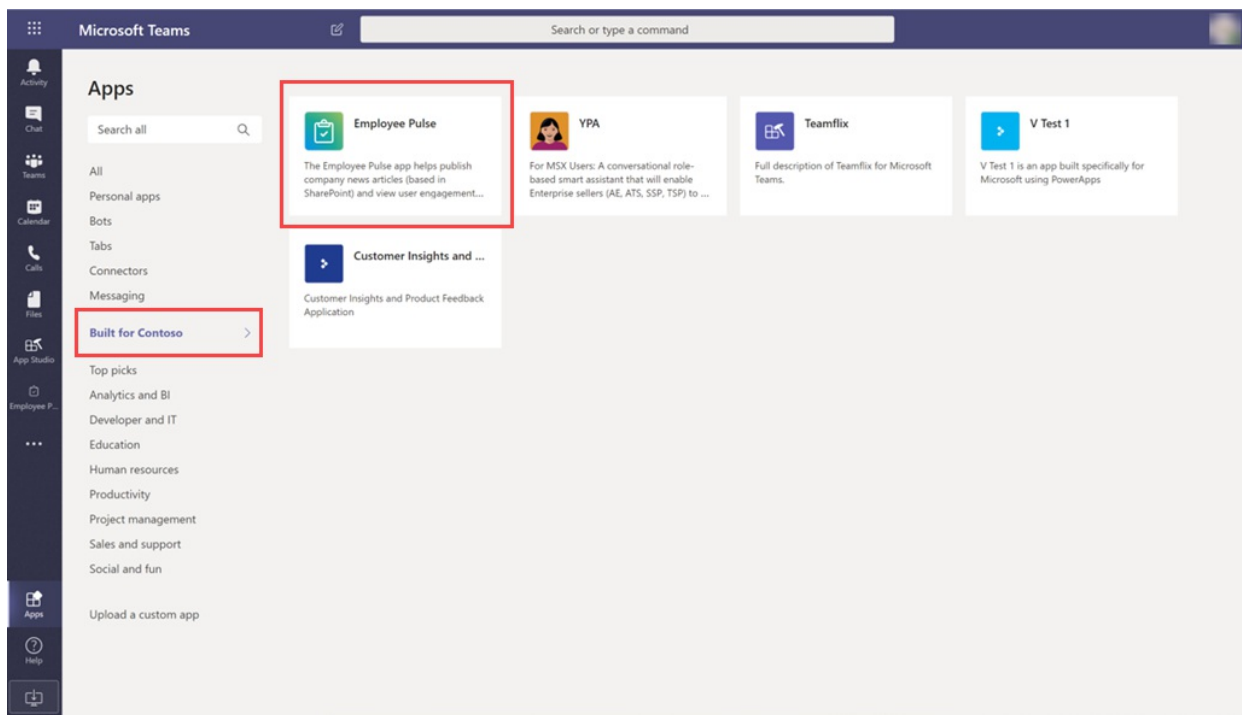

Search the audit log for Teams app events

You can search the audit log to view Teams apps activity in your organization. To learn more about how to search the audit log and to see a list of Teams activities that are logged in the audit log, see [Search the audit log for events in Teams](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). To learn more, see [Turn audit log search on or off](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Discover and adopt

Users who have permissions to the app can find it in your organization's app store. Go to **Built for *Your Organization Name*** on the Apps page to find your organization's custom apps.

If you created and assigned an app setup policy, the app is pinned to the app bar in Teams for easy access for those users who were assigned the policy.

Update

To update an app, developers should continue to follow the steps in the [Develop](#) and [Validate](#) sections.

You can update the app on the Manage apps page in the Microsoft Teams admin center. To do this, in the left navigation of the Microsoft Teams admin center, go to **Teams apps** > **Manage apps**. Click the app name, and then click **Update**. Doing this replaces the existing app, and all app permission policies and app setup policies remain enforced for the updated app.

End user update experience

In most cases, after you complete an app update the new version automatically appears for end users. However, there are some updates to the [Microsoft Teams manifest](#) that require user acceptance to complete:

- A bot was added or removed
- An existing bot's "botId" property changed
- An existing bot's "isNotificationOnly" property changed
- The bot's "supportsFiles" property changed
- A Messaging extension was added or removed
- A new connector was added
- A new static tab was added
- A new configurable tab was added
- Properties inside "webApplicationInfo" changed

Custom apps store in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Now you can customize your organization's apps store in Teams with your company branding by adding your logo, custom backgrounds, and custom text colors to make it more inviting to end users.

NOTE

Changes to branding will require 24 hours to take effect.

You can access the customize store in the admin center by selecting **Teams apps > Customize store**.

This article describes the Custom apps store features and how to use them.

Customize your organization logo

Here you can upload your organization logo. The logo selected will appear in the Teams client in **Apps > Built for your tenant** page.

When you select the **Choose a picture** option, you can upload the file of your choice. The logo should be 240x60, or it will be scaled to that size. It should be no larger than 5 MB. The supported formats are:

- .svg
- .png
- .jpg

The logo is shown in the top, right corner of the tenant app catalog in the Teams store.

Customize your small logo

Your organization logomark or small logo is an image or symbol that represents your organization brand and doesn't include your company name. The logomark helps team members identify the Apps store. The logo selected will appear in the Teams client in Apps page.

When you select the **Choose a picture** option, you can upload the file of your choice. The logomark should be 32x32 pixels, or it will be scaled to that size. It should be no larger than 5 MB. The supported formats are:

- .svg
- .png

- .jpg

The small logo is shown next to the **Built for tenant** section title in the Teams store landing page.

Customize the background color

Make sure that the background has enough contrast with the text so the users can read the text clearly. The background will appear in the Teams client in **Apps > Built for your tenant** header.

Your options are:

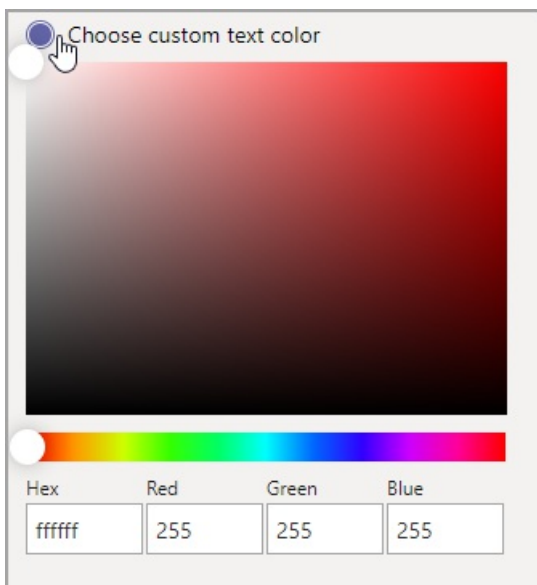

- Use Teams client default background theme
- Choose a picture. When you select the background picture, you can upload the file of your choice. The background should be 1212x100 pixels, or it will be scaled to that size. It should be no larger than 5 MB. The supported formats are:
 - .svg
 - .png
 - .jpg
- Choose a custom background. When you select **Choose a custom color**, a color chooser opens. Select the color that you want by adjusting the scale of the color chooser.

The background image or color is used as the background for the top banner in the Teams tenant app catalog.

Customize the text color of your name

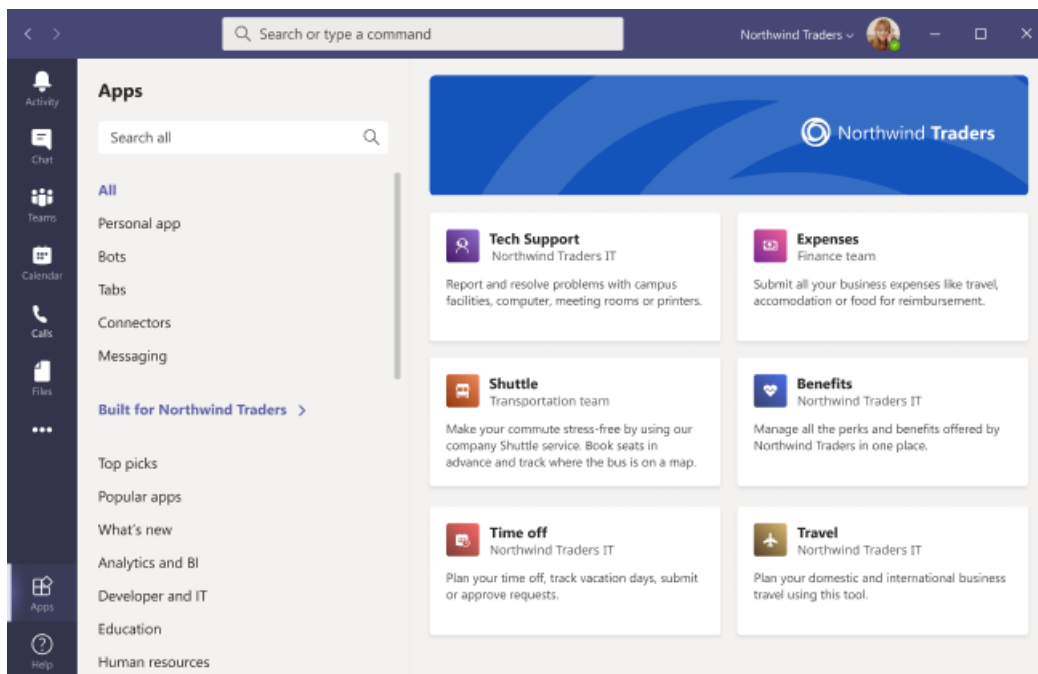

Make sure the text color has enough contrast with the background so that the users can read the name of your organization clearly. The text will appear in the Teams client in **Apps > Built for your tenant** header.

When you select **Choose a custom color**, a color chooser opens. Select the color that you want by adjusting the scale of the color chooser.

Complete the customization of your team apps store

When you've finished customizing your apps store, be sure to select **Save** to save your changes. To preview your changes, select **Preview apps store** to see a representation of your customized apps store.

NOTE

The representation might vary from the final version of your customized apps store because some default colors are based on your users' version of Teams client.

[Manage your apps](#)

Manage your apps in the Microsoft Teams admin center

12/7/2021 • 11 minutes to read • [Edit Online](#)

As an admin, you can view and manage all Teams apps for your organization. On the Manage apps page in the Teams admin center you can:

- [Allow or block apps at the org level](#)
- [Apps blocked by publishers](#)
- [Add apps to teams](#)
- [Approve or upload new custom apps to your organization's app store](#)
- [View permissions requested by apps](#)
- [Grant consent to apps](#)
- [Purchase service for third-party apps](#)
- [See org-level status and properties of apps](#)
- [Manage org-wide app settings](#)
- [View security and compliance information for Microsoft 365 Certified apps](#)

The Manage apps page gives you a view into all available apps, providing you with the information you need to decide which apps to allow or block across your organization. You can then use [app permission policies](#), [app setup policies](#), and [custom app policies and settings](#) to configure the app experience for specific users in your organization.

In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**. You must be a global admin or Teams service admin to access the page.

NOTE

The Manage apps page isn't available yet in Microsoft 365 Government Community Cloud High (GCCH) or Department of Defense (DoD) deployments of Teams.

View apps

You can view every app including the following information about each app.

Manage apps

When you are managing apps for your organization, you are controlling what apps are available to users in your organization's app store. You can then use app permission and app setup policies to configure what apps will be available for specific users. [Learn more](#)

App ID

0f56a9d1-f502-40f9-a9e8-816d7adbb68b

- **Certification:** If the app has gone through certification, you'll see either **Microsoft 365 certified** or **Publisher attestation**. Select the link to view certification details for the app. If you see "--", we don't have certification information for the app. To learn more about certified apps in Teams, read [Microsoft 365 App Certification program](#).
- **Publisher:** Name of the publisher.
- **Publishing status:** Publishing status of custom apps.
- **Status:** Status of the app at the org level, which can be one of the following:

- **Allowed:** The app is available for all users in your organization.
- **Blocked:** The app is blocked and not available for any users in your organization.
- **Blocked by publisher:** The app is blocked by the publisher and is hidden from end-users by default. After you set up the app using the publisher's guidance, you can allow or block the app to make it available to end-users.
- **Blocked org-wide:** The app is blocked in org-wide app settings. It's important to know that this column represents the allowed and blocked status of apps that were formerly on the **Org-wide settings** pane. You now view, block, and allow apps at the org-wide on the **Manage apps** page.
- **Licenses:** Indicates whether an app offers a Software as a Service (SaaS) subscription for purchase. This column applies only to third-party apps. Each third-party app will have one of the following values:
 - **Purchase:** The app offers a SaaS subscription and is available to purchase.
 - **Purchased:** The app offers a SaaS subscription and you've purchased licenses for it.
 - - -: The app doesn't offer a SaaS subscription.
- **Custom app:** Whether the app is a custom app.
- **Permissions:** Indicates whether a third-party or custom app that's registered in Azure Active Directory (Azure AD) has permissions that need consent. You'll see one of the following values:
 - **View details:** The app has permissions that require consent before the app can access data.
 - - -: The app doesn't have permissions that need consent.
- **Categories:** Categories that apply to the app.
- **Version:** App version.
- **Admin can install in meetings:** Indicates whether an app can be installed by admins in Team meetings. [Learn more](#)

To see the information that you want in the table, select **Edit Column** in the upper-right corner to add or remove columns to the table.

Publish a custom app to your organization's app store

Use the Manage apps page to publish apps that are built specifically for your organization. After you publish a custom app, it's available to users in your organization's app store. There are two ways to publish a custom app to your organization's app store. The way that you use depends on how you get the app.

- [Approve a custom app](#): Use this method if the developer submits the app directly to the Manage apps page using the Teams App Submission API. You can then review and publish (or reject) the app directly from the app details page.
- [Upload an app package](#): Use this method if the developer sends you the app package in .zip format. You publish the app by uploading the app package.

Approve a custom app

The **Pending approvals** widget on the Manage apps page notifies you when a developer submits an app by using the Teams App Submission API. A newly submitted app is listed with a **Publishing status** of **Submitted** and an **Status** of **Blocked**. Go to the app details page to see more information about the app, and then to publish it, set **Publishing status** to **Publish**.

You're also notified when a developer submits an update to a custom app. You can then review and publish (or reject) the update on the app details page. All app permission policies and app setup policies remain enforced for the updated app.

To learn more, see [Publish a custom app submitted through the Teams App Submission API](#).

Upload an app package

The developer creates a Teams app package using [Teams App Studio](#), and then sends it to you in .zip format. When you have the app package, you can upload it to your organization's app store.

To upload a new custom app, select **Upload** to upload the app package. The app isn't highlighted after it's uploaded so you'll need to search the list of apps on the Manage apps page to find it.

To update an app after it's uploaded, in the list of apps on the Manage apps page, select the app name, and then select **Update**. Doing this replaces the existing app and all app permission policies and app setup policies remain enforced for the updated app.

To learn more, see [Publish a custom app by uploading an app package](#).

Allow and block apps

The Manage apps page is where you allow or block individual apps at the org level. It shows every available app and its current org-level app status. (Blocking and allowing apps at the org level has moved from the **Org-wide app settings** pane to here.)

To allow or block an app, select it, and then select **Allow** or **Block**. When you block an app, all interactions with that app are disabled and the app doesn't appear in Teams for any users in your organization.

When you block or allow an app on the Manage apps page, that app is blocked or allowed for all users in your organization. When you block or allow an app in a Teams app permission policy, it's blocked or allowed for users who are assigned that policy. For a user to be able to install and interact with any app, you must allow the app at the org level on the Manage apps page and in the app permission policy that's assigned to the user.

NOTE

To uninstall an app, right-click the app, and then click **Uninstall** or use the **More apps** menu on the left side.

Apps blocked by publishers

When an ISV publishes an app to the global app store, they might need admins to configure or customize the app experience. The admin can make it available to end-users when the app is fully set up.

For example, Contoso Electronics is an ISV that built a help desk app for Microsoft Teams. Contoso Electronics wants its customers to set up certain properties of the app so that when users interact with it the app, it functions as expected. Before an admin can allow or block the application, it will show as **Blocked by publisher** in the Teams admin center and will be hidden from end-users by default. After following the publisher's guidance to set up the app, you can make it available to users by changing the status to **Allowed**, or block users from using the app by changing the status to **Blocked**.

Status ⓘ

Blocked by publisher

Add an app to a team

You use the **Add to team** button to install an app to a team. Keep in mind that this is only for apps that can be

installed in a team scope. The **Add to team** button isn't available for apps that can only be installed in the personal scope.

1. Search for the app you want, and then select the app by clicking to the left of the app name.
2. Select **Add to team**.
3. In the **Add to team** pane, search for the team you want to add the app to, select the team, and then select **Apply**.

Customize an app

You can now customize an app to include a specific look and feel according to your organization needs. See [Customize apps in Teams](#).

Purchase services for third-party apps

You can search for and purchase licenses for services offered by third-party apps for users in your organization directly from the Manage apps page. The **Licenses** column in the table indicates whether an app offers a paid SaaS subscription. Select **Purchase now** to view plans and pricing information and buy licenses for your users. To learn more, see [Purchase services for Teams third-party apps in the Microsoft Teams admin center](#).

Grant admin consent to apps

You can review and grant consent to apps that request permissions on behalf of all users in your organization. You do this so that users don't have to review and accept the permissions requested by the app when they start the app. The **Permissions** column indicates whether an app has permissions that need consent. You'll see a **View details** link for each app registered in Azure AD that has permissions that need consent. To learn more, see [View app permissions and grant admin consent in the Microsoft Teams admin center](#).

View resource-specific consent permissions

Resource-specific consent (RSC) permissions let team owners grant consent for an app to access and modify a team's data. RSC permissions are granular, Teams-specific permissions that define what an app can do in a specific team. You can view RSC permissions on the **Permissions** tab of the app details page for an app. To learn more, see [View app permissions and grant admin consent in the Microsoft Teams admin center](#).

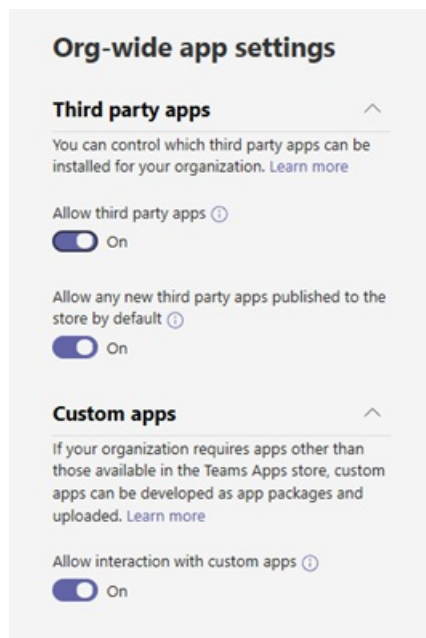

Manage org-wide app settings

Use org-wide app settings to control whether users can install third-party apps and whether users can upload or interact with custom apps in your organization. Org-wide app settings govern the behavior for all users and override any other app permission policies assigned to users. You can use them to control malicious or problematic apps.

NOTE

To learn how to use org-wide app settings in Microsoft 365 Government - Government Community Cloud High GCCH and Department of Defense (DoD) deployments of Teams, see [Manage app permission policies in Teams](#).

1. On the Manage apps page, select **Org-wide app settings**. You can then configure the settings you want in the panel.

2. Under **Third-party apps**, turn off or turn on these settings to control access to third-party apps:

- **Allow third-party apps:** This controls whether users can use third-party apps. If you turn off this setting, your users won't be able to install or use any third-party apps and the app status of these apps is displayed as **Blocked org-wide** in the table.

NOTE

When **Allow third-party apps** is off, [outgoing webhooks](#) are still enabled for all users, but you can control them at the user level by allowing or blocking the Outgoing Webhook app through [app permission policies](#).

Note that if you have existing [app permission policies](#) for **Microsoft apps** that use the **Allow specific apps and block all others** setting, and you want to enable outgoing webhooks for users, add the Outgoing Webhook app to the list.

NOTE

Teams users can add apps when they host meetings or chats with people from other organizations. They can also use apps shared by people in other organizations when they join meetings or chats hosted by those organizations. The data policies of the hosting user's organization, as well as the data sharing practices of any third-party apps shared by that user's organization, are applied.

- **Allow any new third-party apps published to the store by default:** This controls whether new third-party apps that are published to the Teams app store become automatically available in Teams. You can only set this option if you allow third-party apps.

3. Under **Custom apps**, turn off or turn on **Allow interaction with custom apps**. This setting controls whether users can interact with custom apps. To learn more, see [Manage custom app policies and settings in Teams](#).

4. Select **Save** for org-wide app settings to take effect.

View security and compliance information for Microsoft 365 Certified apps

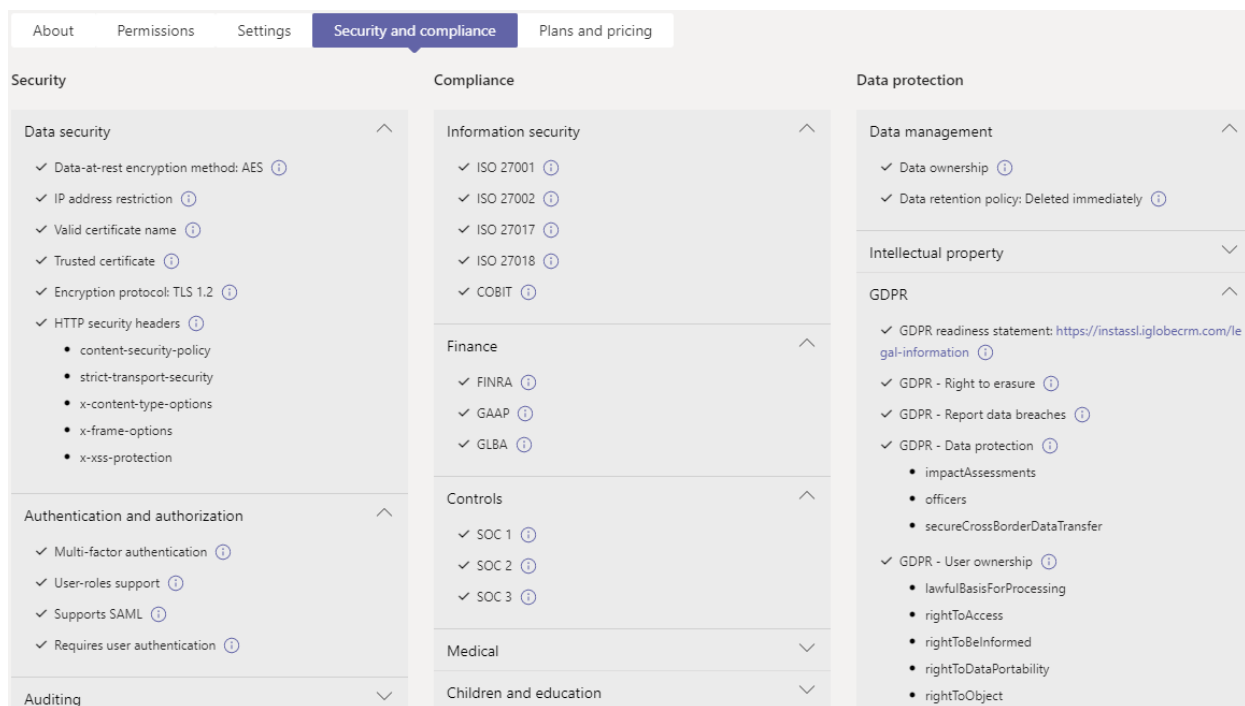

When evaluating an app for their organization, admins can use independent Cloud Access Security Brokers (CASB), such as Microsoft Cloud App Security (MCAS), to find information about security and behaviors of an app. The Teams admin center includes security and compliance information from MCAS for Microsoft 365 Certified apps so you'll have more information on whether or not the app meets your needs.

NOTE

This feature is available to all admins, whether or not your organization has a license that supports MCAS.

To access MCAS information, follow these steps:

1. In the Teams admin center, select **Manage apps** under **Teams apps**.
2. Select **Certification** to sort apps and push all Microsoft 365 Certified apps to the top of the table.
3. Choose a Microsoft 365 Certified app.
4. Select the **Security and compliance** tab.

On this tab, you'll find information on security, compliance, and data protection. You can also expand each dropdown list to get more details about which capabilities are supported for the selected application.

Manage app policies in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

App policies are used to control applications in Microsoft Teams.

App permission policies

App permission policies are used to control what apps are available to your users. As an admin, you can allow or block specific apps that your users install from the Teams app store. [App permission policies](#) are managed through the Microsoft Teams admin center.

The screenshot shows the 'Add app permission policy' page in the Microsoft Teams admin center. The left sidebar contains a navigation menu with options: Dashboard, Teams, Devices, Locations, Users, Meetings, Messaging policies, Teams apps (expanded), Manage apps, Permission policies (selected), Setup policies, Customize store, Voice, Policy packages, Analytics & reports, and Org-wide settings. The main content area is titled 'App permission policies \ Add' and includes a 'Description' field. Below this, there are three sections for app permissions: 'Microsoft apps' (set to 'Allow all apps'), 'Third-party apps' (set to 'Block all apps'), and 'Custom apps' (set to 'Block all apps'). Each section has a brief description and a dropdown menu for selection. At the bottom, there are 'Save' and 'Cancel' buttons.

View app permissions and grant admin consent in the Microsoft Teams admin center

12/7/2021 • 4 minutes to read • [Edit Online](#)

The [Manage apps](#) page in the Microsoft Teams admin center is where you view and manage all Teams apps for your organization. For example, you can see the org-level status and properties of apps, approve or upload new custom apps to your organization's app store, block or allow apps at the org level, and manage org-wide app settings.

Here, you can also grant org-wide admin consent to apps that request permissions to access data and view resource-specific consent (RSC) permissions for apps.

Grant org-wide admin consent to an app

If you're a global admin, you can review and grant consent to apps that request permissions on behalf of all users in your organization. You do this so that users don't have to review and accept the permissions requested by the app when they start the app. Additionally, depending on the user's [consent settings](#) in Azure Active Directory (Azure AD), some users may not be allowed to grant consent to apps that access company data.

Examples of permissions requested by apps include the ability to read information stored in a team, read a user's profile, and send an email on behalf of users. To learn more, see [Permissions and consent in the Microsoft identity platform endpoint](#).

The **Permissions** column indicates whether an app has permissions that need consent. You'll see a **View details** link for each app registered in Azure AD that has permissions that need consent. Keep in mind that this applies only to custom and third-party apps. You won't see this link or need to grant admin consent for apps published by Microsoft.

The screenshot shows the Microsoft Teams admin center interface. On the left is a navigation pane with options like Dashboard, Teams, Devices, Locations, Users, Meetings, Messaging policies, and Teams apps. The main area is titled 'Manage apps' and contains a 'Pending approval' summary card showing 2 submitted and 1 updated custom app. Below this is a table of apps with columns: Name, Certification, Publisher, Publishing status, Status, Licenses, Custom app, and Permissions. The 'Permissions' column contains a 'View details' link for each app. A red box highlights the 'Permissions' column header and the 'View details' links.

Name	Certification	Publisher	Publishing status	Status	Licenses	Custom app	Permissions
qChange Leader Experience	--	qChange Software Solutio...	--	Allowed	--	No	View details
Thanks	--	Kwench	--	Allowed	--	No	View details
Cloverpop	--	Cloverpop	--	Allowed	--	No	View details
Virtio Calendar	--	Virtosoftware	--	Allowed	--	No	View details
IsMyConnect	--	Call My Way NY S.A.	--	Allowed	--	No	View details
Priority Matrix	Microsoft 365 certified	Appfluence inc	--	Allowed	--	No	View details
Myfone	--	Flexfone	--	Allowed	--	No	View details
Bites	--	Bites	--	Allowed	--	No	View details

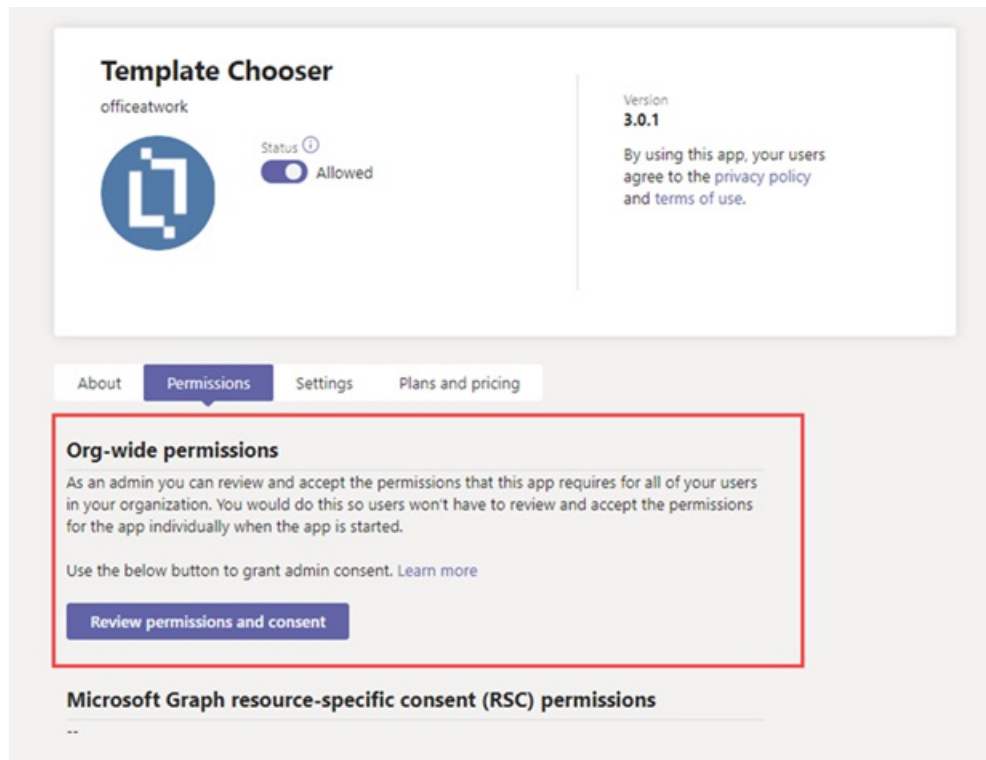

To grant org-wide consent to an app, follow these steps:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. Do one of the following:
 - Search for the app you want, click the app name to go to the app details page, and then select the **Permissions** tab.

- Sort the **Permissions** column in descending order to find the app, and then select **View details**.

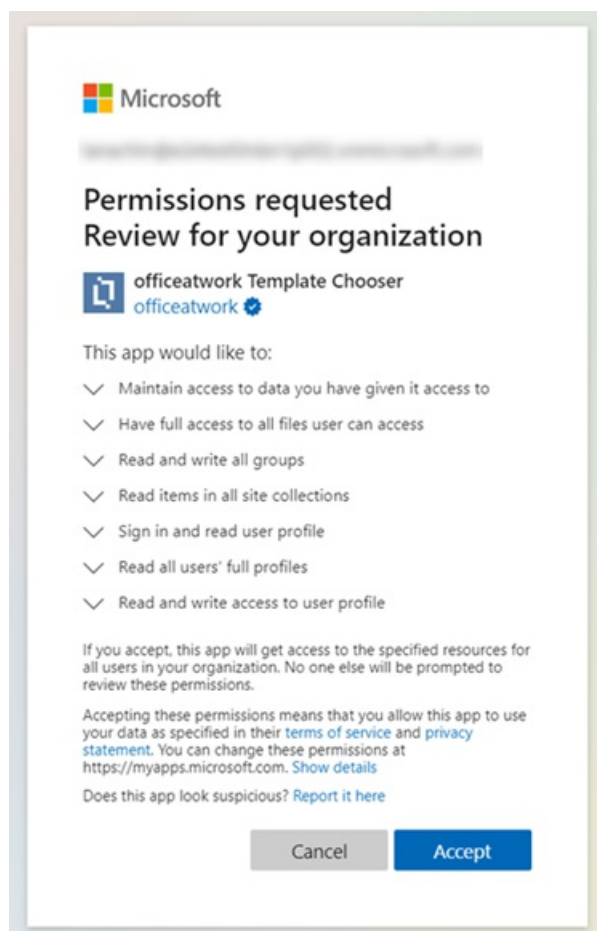

Doing this takes you to the **Permissions** tab of the app details page.

3. Under **Org-wide permissions**, select **Review permissions and consent**.

You must be a global admin to do this. This option isn't available to Teams service admins.

4. On the **Permissions** tab, review the permissions requested by the app.

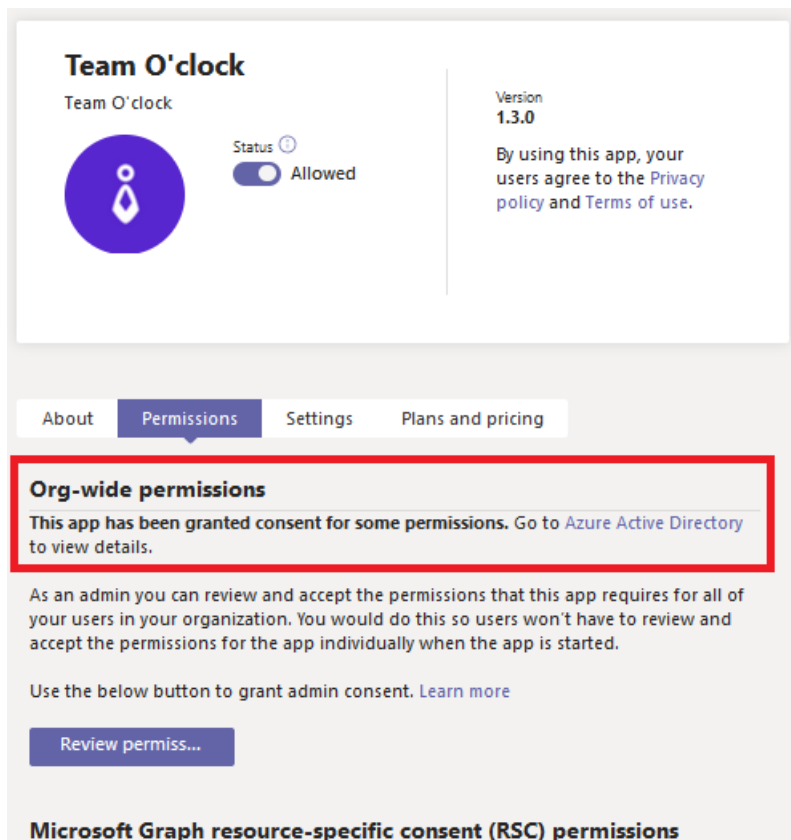

IMPORTANT

Granting org-wide consent to an app allows the app to access your organization's data. Carefully review the permissions requested by the app before you grant consent.

5. If you agree with the permissions requested by the app, click **Accept** to grant consent. A banner temporarily appears at the top of the page to let you know that the requested permissions have been granted for the app. The app now has access to the specified resources for all users in your organization and no one else will be prompted to review the permissions.

After you accept the permissions, you'll see a message under **Org-wide permissions** on the app details page to let you know that consent was granted. To view details about the app's permissions, click the **Azure Active Directory** link to go to the app's page in the Azure AD portal.

Team O'clock
Team O'clock

Status Allowed

Version **1.3.0**

By using this app, your users agree to the [Privacy policy](#) and [Terms of use](#).

About Permissions Settings Plans and pricing

Org-wide permissions

This app has been granted consent for some permissions. Go to [Azure Active Directory](#) to view details.

As an admin you can review and accept the permissions that this app requires for all of your users in your organization. You would do this so users won't have to review and accept the permissions for the app individually when the app is started.

Use the below button to grant admin consent. [Learn more](#)

[Review permissions...](#)

Microsoft Graph resource-specific consent (RSC) permissions

If users in your organization are allowed to grant consent and if one or more users granted consent to a particular app, you'll also see the same message to let you know that consent was granted and the Azure Active Directory link to the app's page in the Azure AD portal.

NOTE

Although, the **Review permissions and consent** option isn't available to Teams service admins and they can't grant org-wide admin consent to apps, Teams service admins can view the content on the **Permissions** tab for an app. For example, a Teams service admin can click the **Azure Active Directory** link to view app permissions details in the Azure AD portal.

View resource-specific consent permissions of an app

RSC permissions let team owners grant consent for an app to access and modify a team's data. RSC permissions are granular, Teams-specific permissions that define what an app can do in a specific team. Examples of RSC permissions include the ability to create and delete channels, get the settings for a team, and create and remove

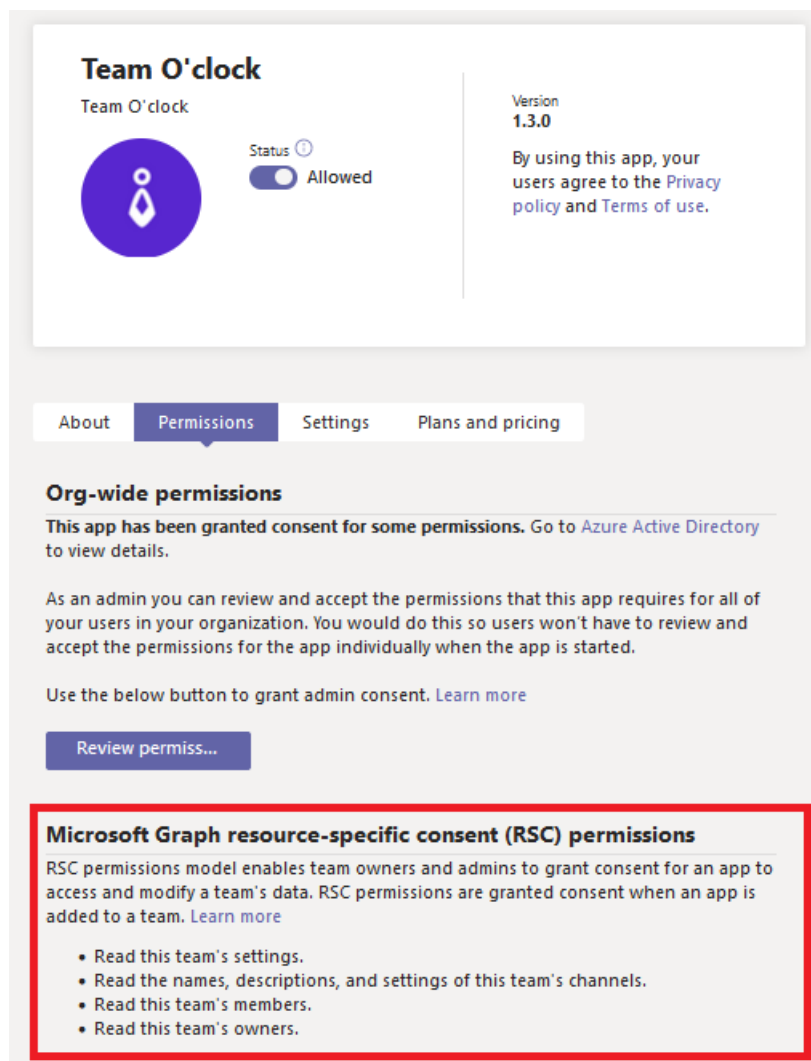

channel tabs.

RSC permissions are defined in the app manifest and not in Azure AD. You grant consent to RSC permissions when you add the app to a team. To learn more, see [Resource-specific consent \(RSC\)](#).

Global admins and Teams service admin can view RSC permissions for an app on the **Permissions** tab of the app details page.

To view RSC permissions for an app, follow these steps:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps** > **Manage apps**.
2. Search for the app you want, click the app name to go to the app details page, and then select the **Permissions** tab.
3. Under **Microsoft Graph resource-specific consent (RSC) permissions**, review the RSC permissions requested by the app.

Known issues

The "View details" link isn't displayed in the Permissions column for some third-party apps that request permissions

Currently, the ability to review permissions and grant consent isn't available for all third-party apps registered in Azure AD that request permissions. Instead of the **View details** link, you'll see -- in the **Permissions** column. We're working with ISVs to enable this feature for their apps.

Resource-specific consent in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

This is a preview or early release feature.

Resource-specific consent in Microsoft Teams lets team owners give consent to apps to access team data. Examples of such access include the ability to read channel messages, create and delete channels, and create and remove channel tabs.

As an admin, you control whether team owners in your organization can give consent through settings that you configure by using the Azure Active Directory (Azure AD) PowerShell module or the Azure portal and the Microsoft Teams admin center.

Set whether team owners can give consent to apps

Here are the settings that you must set to control whether team owners can give consent to apps. Be sure to review all the following settings.

Settings in Azure AD

The following two settings determine whether team owners can give consent to apps.

IMPORTANT

Changing any of these settings doesn't affect data access for apps that were already granted consent. For example, if you configure these settings to prevent team owners from giving consent, these changes don't remove data access that's already been granted.

The "Users can consent to apps accessing company data on their behalf" setting

This setting controls whether users in your organization can consent to apps on their behalf. To enable team owners to give consent, this setting must be set to **Yes**. To manage this setting, do the following:

1. In the Azure portal, go to **Enterprise applications > User settings**.
2. Under **Enterprise applications**, set **Users can consent to apps accessing company data on their behalf** to **No** or **Yes**.

You can also manage this setting using PowerShell. To learn more, see [Configure user content to applications](#).

The "EnableGroupSpecificConsent" setting

This setting controls whether users in your organization can consent to apps accessing company data for the groups that they own. This setting must be enabled for team owners to give consent. For steps on how to manage this setting by using PowerShell, see [Configure group owner consent to apps accessing group data](#).

Settings in the Microsoft Teams admin center

In addition to settings in Azure AD, [org-wide app settings](#) on the [Manage apps](#) page, whether an app is blocked or allowed on the [Manage apps](#) page, and the [app permission policy](#) assigned to the team owner determine whether a team owner can give consent.

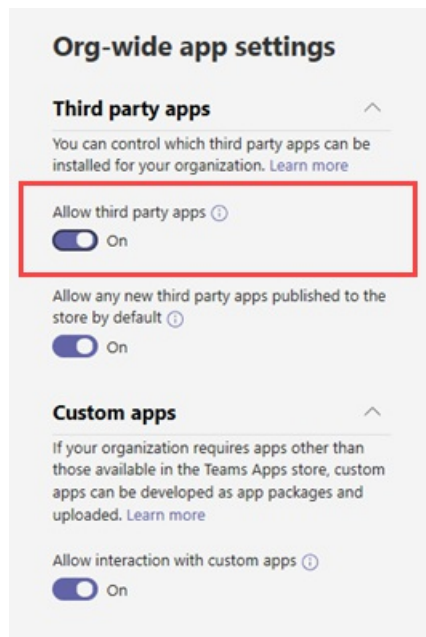

IMPORTANT

Changing any of these settings doesn't affect data access for apps that were already granted consent. For example, if you disable third-party apps org-wide or if you block specific apps to prevent team owners from giving consent, these changes don't remove data access that's already been granted.

The "Allow third party apps" setting in org-wide app settings

This org-wide app setting controls whether users in your organization can use third-party apps. This setting must be on to enable team owners to give consent. To manage this setting, do the following:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**, and then click **Org-wide app settings**.
2. Under **Third party apps**, turn off or turn on **Allow third party apps**.

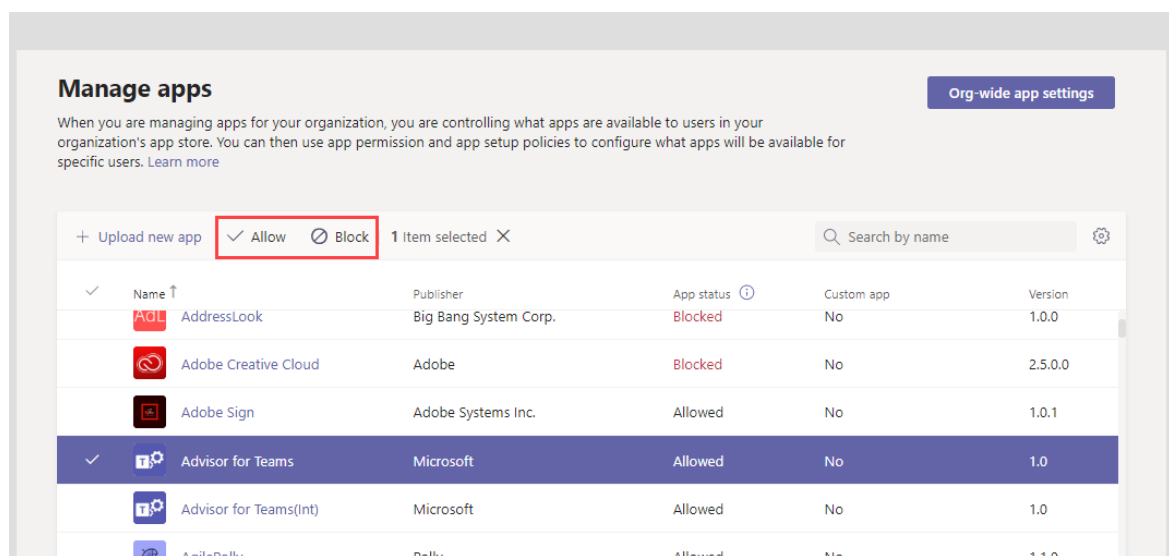

You may have to wait up to 24 hours for your changes to take effect.

Allow or block the app at the org level

When you block or allow an app on the [Manage apps](#) page, that app is blocked or allowed for all users in your organization. Team owners can only give consent to an app if the app is allowed. To allow or block an app at the org level, do the following:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. On the Manage apps page, select the app, and then click **Block** to block it or click **Allow** to allow it.

App permission policy assigned to the team owner

Team owners can only give consent to apps that their app permission policy allows them to run. To view and manage the app permission policy that's assigned to a team owner, do the following:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**.
2. Double-click the display name of the team owner, and then click **Policies**.
3. The policy assigned to the team owner is listed under **App permission policy**.
 - To assign a different policy, click **Edit**, and then select the policy that you want to assign.
 - To edit the settings of the policy that's assigned to the team owner, click the policy name, and then make the changes that you want.

Uploading custom apps

When uploading a custom app (also known sideloading) that uses resource-specific consent, the app must come from the tenant that it's being installed to. In other words, the Azure AD app registration must be from this tenant. Global admins are exempted from this restriction, and can upload custom apps from any tenant, either directly to a team (sideloading) or to the tenant app catalog.

Microsoft Teams apps permissions and considerations

12/7/2021 • 8 minutes to read • [Edit Online](#)

Microsoft Teams apps are a way to aggregate one or more capabilities into an *app package* that can be installed, upgraded, and uninstalled. The capabilities include:

- Bots
- Messaging extensions
- Tabs
- Connectors

Apps are consented to by users and managed by IT from a policy perspective. However, for the most part, an app's permissions and risk profile are defined by the permissions and risk profiles of the capabilities that the app contains. Therefore, this article focuses on permissions and considerations at the capability level.

The permissions listed below in capital letters, for example RECEIVE_MESSAGE and REPLYTO_MESSAGE, don't appear anywhere in the [Microsoft Teams developer documentation](#) or the [permissions for Microsoft Graph](#). They're simply a descriptive shorthand for the purpose of this article.

TITLE	DESCRIPTION
 Decision point	<ul style="list-style-type: none">• Use the tables below as a guide to understand which permissions the apps you're investigating are requesting.
 Next step	<ul style="list-style-type: none">• Research the app or service itself to decide whether you want to allow access to it within your organization. For example, bots send and receive messages from users, and—except for enterprise custom bots—they're located outside the compliance boundary. Therefore, any app that includes a bot requires those permissions and has that risk profile, at a minimum.

See also [Request device permissions for your Microsoft Teams tab](#).

Global app permissions and considerations

Required permissions

None

Optional permissions

None

Considerations

- An app must disclose what data it uses and what the data is used for in its terms of use and privacy policy links.
- [Resource-specific consent](#) provides a set of permissions that apps can request, which appears on the

installation screen of the app. To learn more about resource-specific consent permissions, see [Graph permissions reference](#).

- Apps may also need permissions other than resource-specific consent permissions. After an app is installed, the app may request Graph permissions through a consent prompt. To learn more, see [Understanding Azure AD application consent experiences](#). You can configure API permissions and consent in the Azure portal. To learn more, see [Azure Active Directory consent framework](#).

Bots and messaging extensions

Required permissions

- RECEIVE_MESSAGE, REPLYTO_MESSAGE. The bot can receive messages from users and reply to them.¹
- POST_MESSAGE_USER. After a user has sent a message to a bot, the bot can send the user direct messages (also called *proactive messages* at any time.
- GET_CHANNEL_LIST. Bots added to teams can get a list of names and IDs of the channels in a team.

Optional permissions

- IDENTITY. When it's used in a channel, the app's bots can access basic identity information of team members (first name, last name, user principal name [UPN], email address); when it's used in a personal or group chat, the bot can access the same information for those users.
- POST_MESSAGE_TEAM. Allows an app's bots to send direct (proactive) messages to any team member at any time, even if the user has never talked to the bot before.
- The following are not explicit permissions, but are implied by RECEIVE_MESSAGE and REPLYTO_MESSAGE and the scopes into which the bots can be used, declared in the manifest:
 - RECEIVE_MESSAGE_PERSONAL, REPLYTO_MESSAGE_PERSONAL
 - RECEIVE_MESSAGE_GROUPCHAT, REPLYTO_MESSAGE_GROUPCHAT
 - RECEIVE_MESSAGE_TEAM, REPLYTO_MESSAGE_TEAM
- SEND_FILES, RECEIVE_FILES.² Controls whether a bot can send and receive files in personal chat (not yet supported for group chat or channels).

Considerations

- Bots only have access to teams to which they've been added or to users who have installed them.
- Bots only receive messages in which they're explicitly mentioned by users. This data leaves the corporate network.
- Bots can only reply to conversations in which they're mentioned.
- After a user has conversed with a bot, if the bot stores that user's ID, it can send that user direct messages at any time.
- It is theoretically possible for bot messages to contain links to phishing or malware sites, but bots can be blocked by the user, the tenant admin, or globally by Microsoft.
- A bot can retrieve (and might store) very basic identity information for the team members the app has been added to, or for individual users in personal or group chats. To get further information about these users, the bot must require them to sign in to Azure Active Directory (Azure AD).
- Bots can retrieve (and might store) the list of channels in a team; this data leaves the corporate network.
- When a file is sent to a bot, the file leaves the corporate network. Sending and receiving files requires user approval for each file.

- By default, bots don't have the ability to act on behalf of the user, but bots can ask users to sign in; as soon as the user signs in, the bot will have an access token with which it can do additional things. Exactly what those additional things are depends on the bot and where the user signs in: a bot is an Azure AD app registered at <https://apps.dev.microsoft.com/> and can have its own set of permissions.
- Bots are informed whenever users are added to or deleted from a team.
- Bots don't see users' IP addresses or other referrer information. All information comes from Microsoft. (There is one exception: if a bot implements its own sign-in experience, the sign-in UI will see users' IP addresses and referrer information.)
- Messaging extensions, on the other hand, do see users' IP addresses and referrer information.
- App guidelines (and our AppSource review process) require discretion in posting personal chat messages to users (via the POST_MESSAGE_TEAM permission) for valid purposes. In the event of abuse, users can block the bot, tenant admins can block the app, and Microsoft can block bots centrally if necessary.

¹ Some bots only send messages (POST_MESSAGE_USER). They're called "notification-only" bots, but the term doesn't refer to what a bot is allowed or not allowed to do, it means that the bot doesn't want to expose a conversational experience. Teams uses this field to disable functionality in the UI that would ordinarily be enabled; the bot isn't restricted in what it's allowed to do compared to bots that do expose a conversational experience.

² Governed by the supportsFiles Boolean property on the bot object in the manifest.json file for the app.

NOTE

If a bot has its own sign-in, there's a second—different—consent experience the first time the user signs in.

Currently, the Azure AD permissions associated with any of the capabilities inside a Teams app (bot, tab, connector, or messaging extension) are completely separate from the Teams permissions listed here.

Tabs

A tab is a website running inside Teams.

Required permissions

SEND_AND_RECEIVE_WEB_DATA

Optional permissions

None (currently)

Considerations

- The risk profile for a tab is almost identical to that same website running in a browser tab.
- A tab also gets the context in which it's running, including the sign-in name and UPN of the current user, the Azure AD Object ID for the current user, the ID of the Microsoft 365 Group in which it resides (if it's a team), the tenant ID, and the current locale of the user. However, to map these IDs to a user's information, the tab would have to make the user sign in to Azure AD.

Connectors

A connector posts messages to a channel when events in an external system occur.

Required permissions

POST_MESSAGE_CHANNEL

Optional permissions

REPLYTO_CONNECTOR_MESSAGE. Certain connectors support actionable messages, which allow users to post targeted replies to the connector message, for example by adding a response to a GitHub issue or adding a date to a Trello card.

Considerations

- The system that posts connector messages doesn't know who it's posting to or who receives the messages: no information about the recipient is disclosed. (Microsoft is the actual recipient, not the tenant; Microsoft does the actual post to the channel.)
- No data leaves the corporate network when connector messages are posted to a channel.
- Connectors that support actionable messages (REPLYTO_CONNECTOR_MESSAGE permission) also don't see IP address and referrer information; this information is sent to Microsoft and then routed to HTTP endpoints that were previously registered with Microsoft in the Connectors portal.
- Each time a connector is configured for a channel, a unique URL for that connector instance is created. If that connector instance is deleted, the URL can no longer be used.
- Connector messages can't contain file attachments.
- The connector instance URL should be treated as secret/confidential: anyone who has that URL can post to it, like an email address. Therefore, there's some risk of spam or links to phishing or malware sites. If that were to happen, team owners can delete the connector instance.
- If the service that sends connector messages were to become compromised and start sending spam/phishing/malware links, a tenant administrator can prevent new connector instances from being created and Microsoft can block them centrally.

NOTE

It's not currently possible to know which connectors support actionable messages (REPLYTO_CONNECTOR_MESSAGE permission).

Outgoing webhooks

Outgoing webhooks are created on the fly by team owners or team members. They aren't capabilities of Teams apps; this information is included for completeness.

Required permissions

RECEIVE_MESSAGE, REPLYTO_MESSAGE. Can receive messages from users and reply to them.

Optional permissions

None

Considerations

- Outgoing webhooks are similar to bots but have fewer privileges. They must be explicitly mentioned, just like bots.
- When an outgoing webhook is registered, a secret is generated, which allows the outgoing webhook to verify that the sender is Microsoft Teams as opposed to a malicious attacker. This secret should remain a secret; anyone who has access to it can impersonate Microsoft Teams. If the secret is compromised, the outgoing webhook can be deleted and re-created, and a new secret will be generated.
- Although it's possible to create an outgoing webhook that doesn't validate the secret, we recommend against it.

- Other than receiving and replying to messages, outgoing webhooks can't do much: they can't proactively send messages, they can't send or receive files, they can't do anything else that bots can do except receive and reply to messages.

Admin settings for apps in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

The Microsoft Teams admin center is gradually replacing the Skype for Business admin center, and we're migrating Teams settings to it from the Microsoft 365 admin center. If a setting has been migrated, you'll see a notification and then be directed to the setting's location in the Teams admin center. For more information, see [Manage Teams during the transition to the Teams admin center](#).

Apps provide out-of-the-box tools for your organization to get more out of Teams. These apps combine the functionality of tabs, messaging extensions, connectors, and bots provided by Microsoft, built by a third-party, or by developers in your organization.

You manage apps for your organization in **Teams apps** in the admin center. (See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.) For example, you can allow or block apps at the org level, set policies to control what apps are available to Teams users, and customize Teams by pinning the apps that are most important for your users.

We're continually improving the app experience in Teams and adding features and functionality. Over time, we'll be building additional app management capabilities, so check back for the most up-to-date information on app policies.

Manage apps

Use the **Manage apps** page to view and manage all Teams apps in your organization's app catalog. You can see the org-level status and properties of apps, block or allow apps at the org level, upload new custom apps to your tenant catalog, and manage org-wide app settings.

The **Manage apps** page gives you a view into all available apps in your tenant catalog, providing you with the information you need to decide which apps to allow or block across your organization. You can then use [app permission policies](#), [app setup policies](#), and [custom app policies and settings](#) to configure the app experience for specific users in your organization.

To learn more, see [Manage apps in Teams](#).

App permission policies

With app permission policies, you can control what apps are available to specific users in your organization. You can allow or block all apps or specific apps published by Microsoft, third-parties, and your organization.

For example, you can use app permission policies to:

- Gradually roll out new third-party or custom built apps to specific users.
- Simplify the user experience, especially when you start rolling out Teams across your organization.

To learn more, go to [Manage app permission policies in Teams](#).

App setup policies

App setup policies let you customize the app experience for your users. You choose the apps that you want to pin to the app bar in the Teams clients and the order in which they appear, on web, desktop, and mobile clients.

Here's some examples of how you can use app setup policies:

- Drive awareness and adoption of core apps. For example, pin a custom recruiting and talent management app for users on your HR team.
- Selectively pin core Teams features, such as Chat, Teams, and Calling. Doing so can help ensure users are engaged in specific activities within Teams.

To learn more, check out [Manage app setup policies in Teams](#).

Custom app policies and settings

Teams allows developers in your organization to build, test, and deploy custom apps to other users. Custom apps can be added to Teams by uploading an app package in a .zip file directly to a team or in the personal context. You can use app setup policies to control who in your organization can upload custom apps. You can also set org-wide settings to control whether users can interact with specific custom apps.

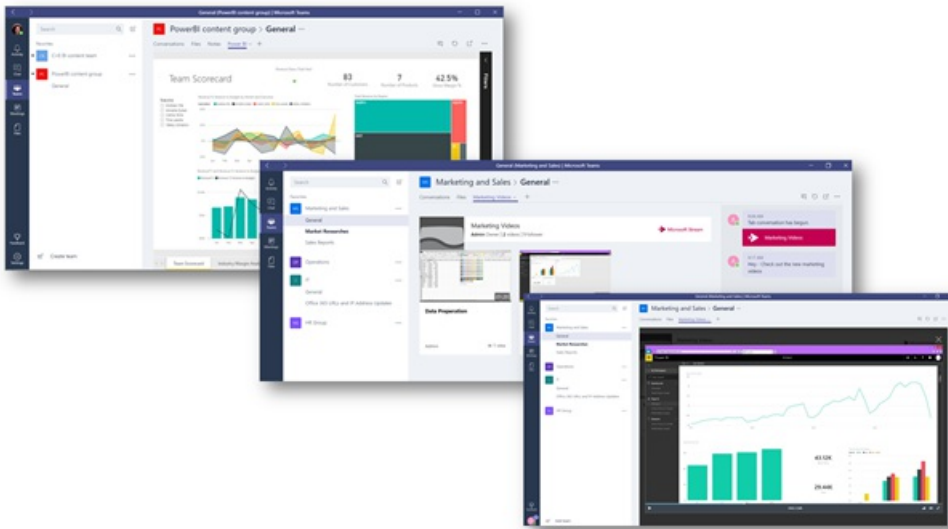

To learn more, go to [Manage custom app policies and settings in Teams](#).

Use built-in and custom tabs in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Tabs allow team members to access services and content in a dedicated space within a channel or in a chat. This lets the team work directly with tools and data, and have conversations about the tools and data, all within the context of the channel or chat.

Owners and team members can add tabs to a channel, private chat, and group chat to help integrate their cloud services. Tabs can be added to help users easily access and manage the data they need or interact with the most. This can be a Power BI report, a dashboard, or even a [Microsoft Stream](#) video channel where you publish training videos.

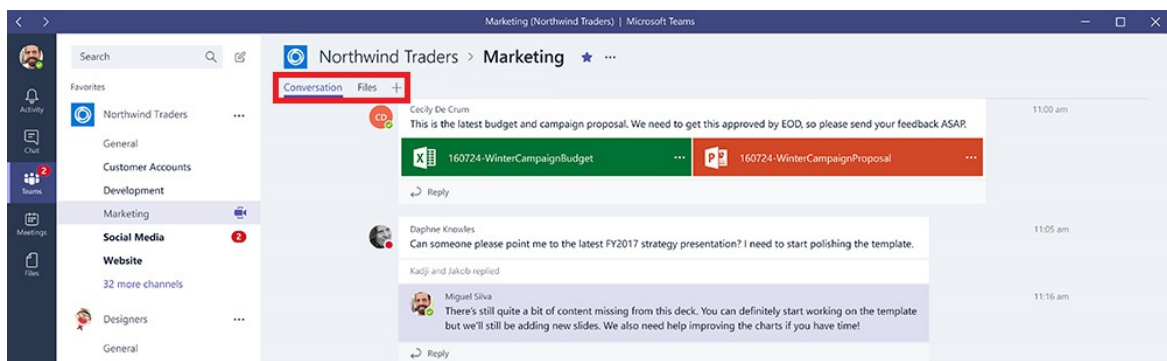

NOTE

The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch you'll be able to opt-in to this experience, in November you'll have to opt-out if you want to continue using Stream, and some time in early 2021 we'll require all customers to use OneDrive for Business and SharePoint for new meeting recordings.

Work with tabs

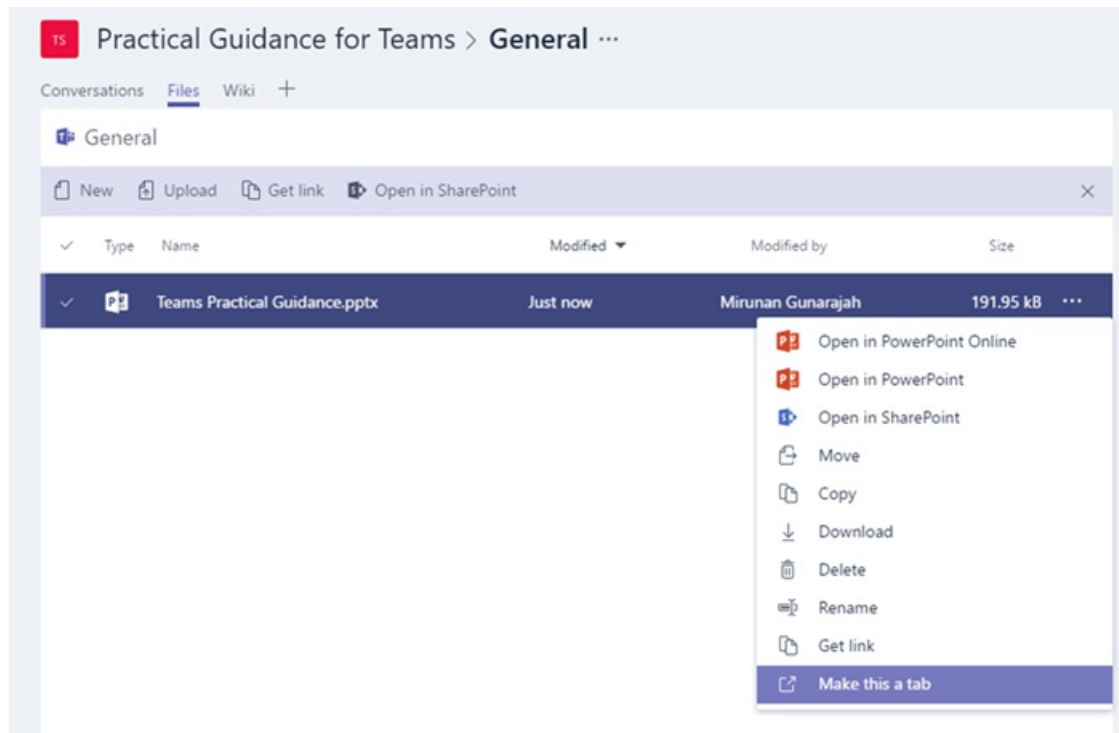

- With every new channel, two tabs are provisioned by default: Conversations and Files.

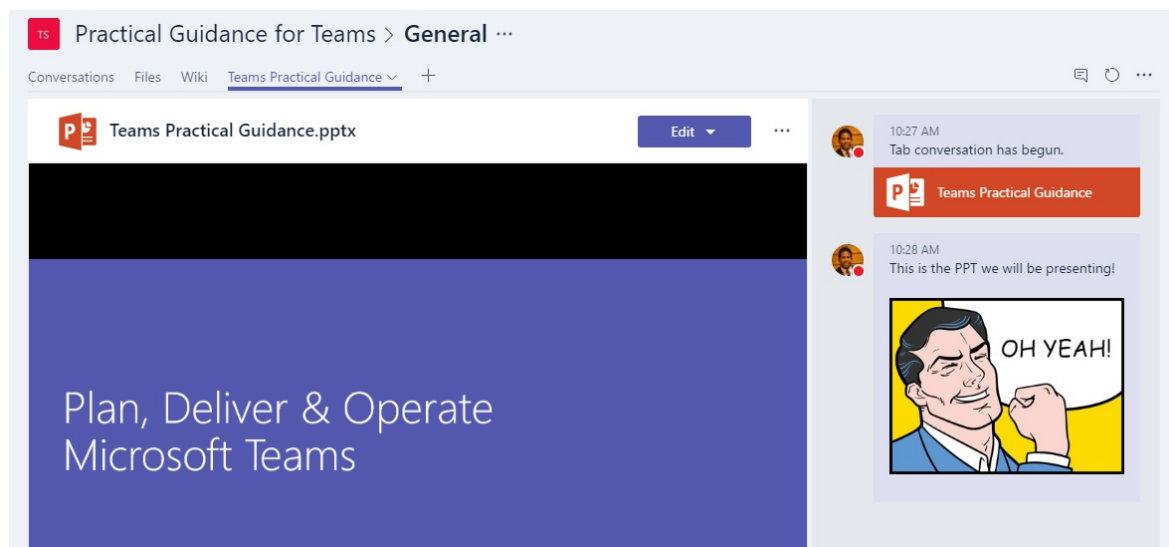

- With every private chat, four tabs are provisioned by default: Conversations, Files, Organization, and Activity.

- Owners and team members can add more tabs to a channel or chat by clicking **Add a tab**  at the top of the channel or chat.
- Excel, PowerPoint, Word, and PDF files must be uploaded to the **Files** tab before they can be converted to tabs. Any existing uploaded file can be converted to a tab with a single click, as shown below.

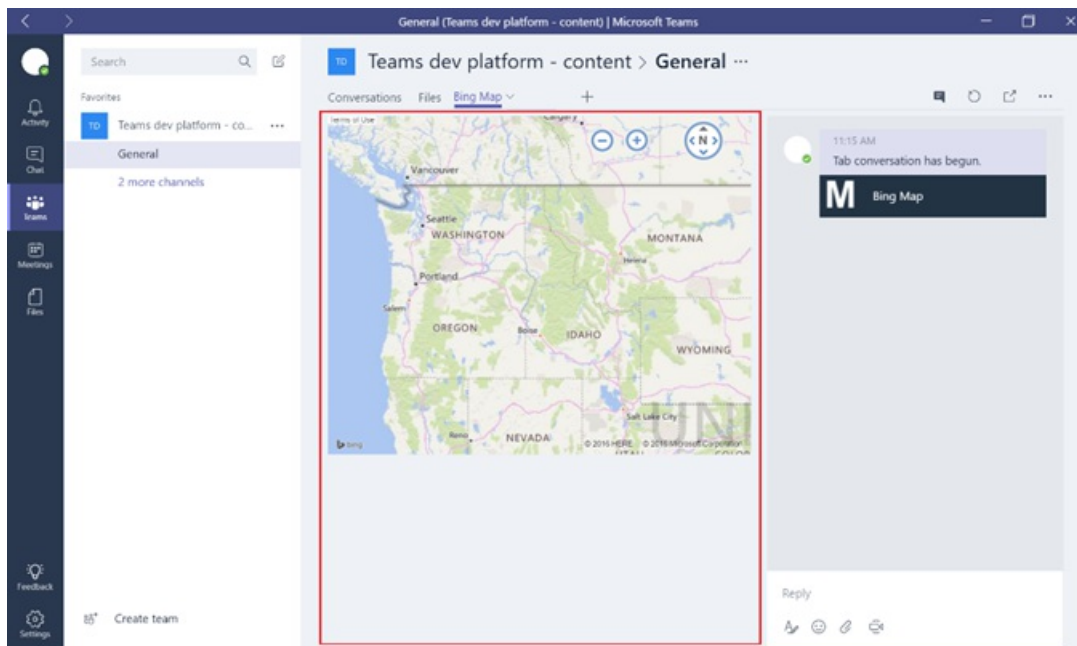

- To add a website, the URL must start with an **https** prefix so information that's exchanged remains secure.
- Detailed instructions are provided when a team member tries to add a custom tab to their channel or chat. When a custom tab is added to a channel, a **Tab conversation** is created that allows team members to have focused discussions about the content.

Develop custom tabs

In addition to the built-in tabs, you can design and develop your own tabs to integrate to Teams or share with the rest of the community. See our [developer documentation](#) for more information.

Use Microsoft 365 and custom connectors in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Connectors keep your team current by delivering frequently used content and service updates directly into a channel. With connectors, your Microsoft Teams users can receive updates from popular services such as Trello, Wunderlist, GitHub, and Azure DevOps Services within the chat stream in their team.

Any member of a team can connect their team to popular cloud services with the connectors if the team permissions allow, and all team members are notified of activities from that service. Connectors will continue to function even after the member who has initially setup the connector has left. Any team member with the permissions to add\remove can modify connectors setup by other members.

Microsoft 365 connectors can be used with both Microsoft Teams and Microsoft 365 groups, making it easier for all members to stay in sync and receive relevant information quickly. Both Microsoft Teams and Exchange use the same connector model, which allows you to use the same connectors within both platforms. It is worth noting, however, that disabling connectors for the Microsoft 365 group that a team is dependent upon will disable the ability to create connectors for that team as well.

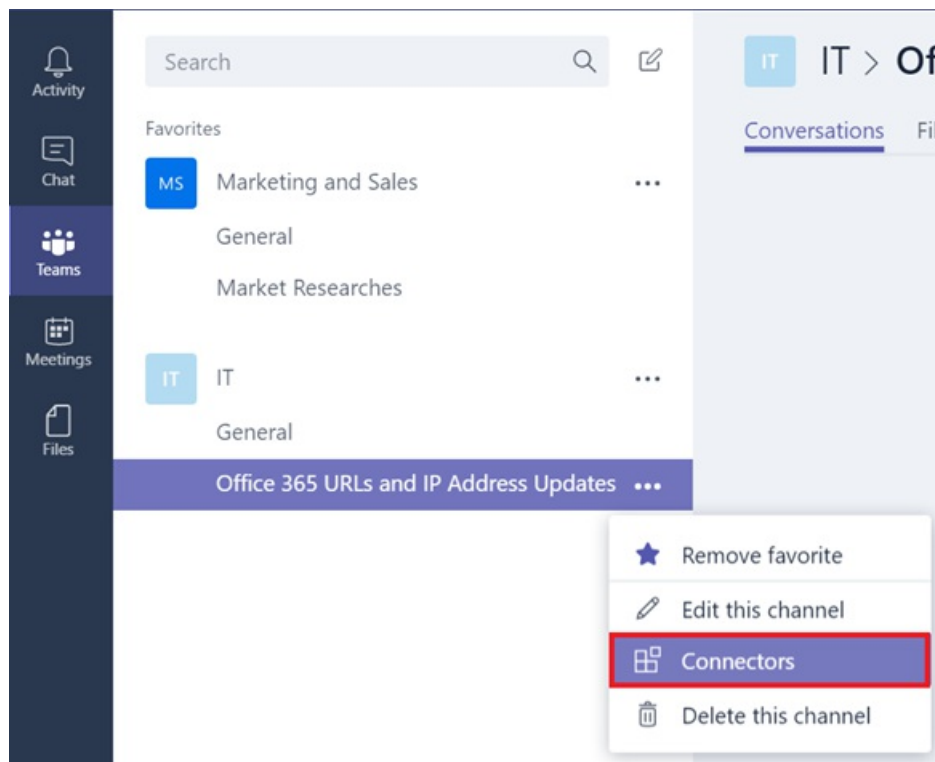

NOTE

Connectors are disabled by default in the Government Cloud Community (GCC) environments. If you need to enable them, set the `ConnectorsEnabled` or `ConnectorsEnabledForTeams` parameters to `$true` with the `SetOrganizationConfig` cmdlet. You need to connect to the [Exchange Online PowerShell](#).

Add a connector to a channel

Currently, you can add connectors by using Microsoft Teams desktop and web clients. However, information posted by these connectors can be viewed in **all clients** including mobile.

1. To add a connector to a channel, click the **ellipses (...)**, on the right of a channel name, then click **Connectors**.

2. You can select from a variety of available connectors, and then click **Add**.

Connectors for "Office 365 URLs and IP Address Updates" channel in "IT" team

Keep your group current with content and updates from other services.

All
Sort by: Popularity ▾

MANAGE		Visual Studio Team Services Collaborate on and manage software projects online.	Add

3. Fill in the required information of the selected connector and click **Save**. Each connector requires a diverse set of information to function properly, and some may require you to sign in to the service using the links provided on the connector configuration page.

Connectors for "Office 365 URLs and IP Address Updates" channel in "IT" team

RSS

[Send feedback](#)

The RSS connector sends periodic updates from an RSS feed. To set up a connector, enter a link that contains the address for a feed that you want to receive updates from.

Enter a name for your RSS connection.

Address for RSS feed

Digest frequency

Choose how often you would like to receive your digest.

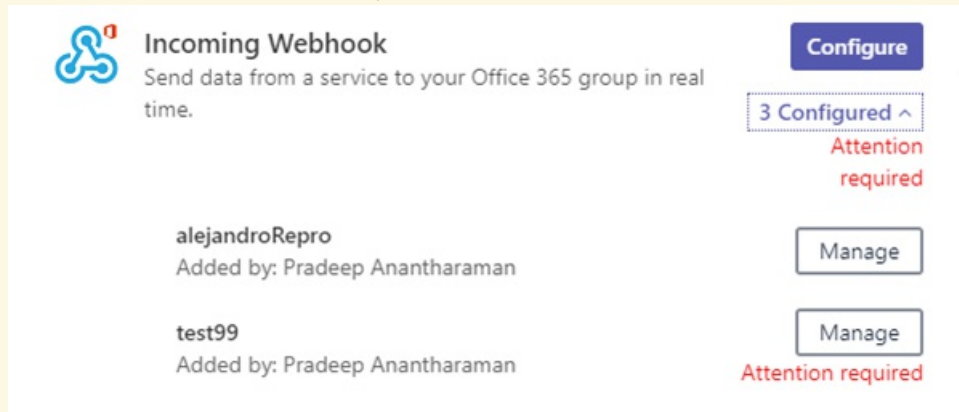

4. Data provided by the connector is automatically posted to the channel.

IMPORTANT

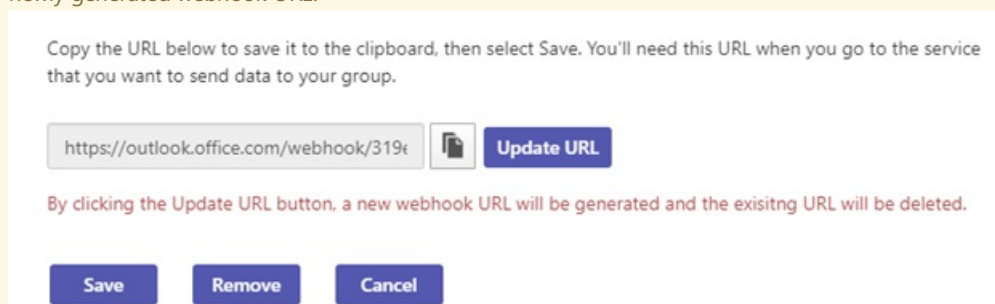

Connector URL update notification

The Teams connectors are transitioning to a new URL to enhance security. During the course of this transition, you will receive certain notifications to update your configured connector to use the new URL. It is strongly recommended that you update your connector immediately to prevent any disruption to connector services. The following steps need to be followed to update the URL:

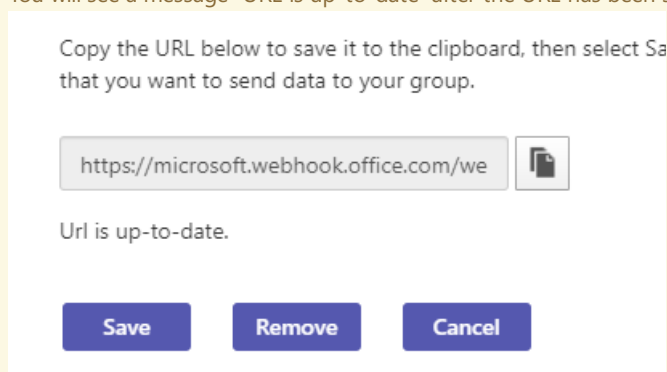

1. In the connectors configuration page, an "Attention Required" message will be displayed under the "Manage" button for the connections that need to be updated.

2. For incoming webhook connectors, users can recreate the connection by simply selecting **Update URL** and using the newly generated webhook URL.

3. For other connector types, the user would need to remove the connector and recreate the connector configuration.
4. You will see a message "URL is up-to-date" after the URL has been successfully updated.

Develop custom connectors

You can also build custom connectors, as well as incoming and outgoing webhooks. See our [developer documentation](#) for more information.

Microsoft Teams apps behavior for non-standard users

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes how apps in Teams behave when guest, external (federated), and anonymous users are present in a Teams context.

- A **guest user** is someone who isn't an employee, student, or member of your organization. They don't have a school or work account with your organization.
- An **external (federated) user** belongs to another domain and has no access to your organization's teams or team resources.

NOTE

For a more detailed comparison of guest versus external users, [see communicate with users from other organizations](#).

- An **anonymous user** is a concept in Teams meetings where the user has joined the meeting via a link. The user hasn't logged in with their Microsoft or organization's account.

Guest users

Install, update, and delete for guest users

Guests can't install, update, or delete apps into a shared context, such as a chat, channel, or meeting, but they can to their personal scope using message extensions and direct links. Guests don't have access to the Teams app store from the Teams desktop application, but they can access it with a direct link.

Usage behavior and policy for guest users

Guests can use an app if the app was installed by a native user.

Bots installed to a channel

Bots can proactively message guest users, but guests can't interact with the bot. Guests can't message the bot one-to-one, mention the bot, or interact with adaptive cards that communicate with the bot.

Personal bots installed with policies

- Guests will adhere to global and org-wide permission policies set for the host tenant for any app. If an app is blocked for the whole host organization, then guests can't use the app either.
- Any bot included in the global default app setup policy will also be installed for guests.
- After a bot is installed, bots can proactively communicate with guests and guests can communicate back with bots.
- You can't remove a guest from the global default app setup policy.
- To avoid guest from accessing bots, you can create more app setup policies, assign them to internal users, and install bots with the custom policies.

External (Federated) users

Install, update, and delete for external users

External users can't install, update, or delete apps into any context, such as a personal, chat, channel, or meeting.

They don't have access to the Teams app store of the hosting organization.

Usage behavior and policy for external users

- People from other organizations adhere to the hosting organization's global (org-wide default) policy
- Users in the hosting organization can add apps in meeting chats with people from other organizations. People from other organizations cannot add apps in meeting chats but can interact with bots, tabs and message extensions once added to the chat.
- After a bot is installed in a meeting chat, it can proactively communicate with people from other organizations in that chat and those people can communicate with bot.
- The data policies of the hosting organization, as well as the data sharing practices of any third-party apps shared by that user's organization, are applied.

Anonymous users

Install, update, and delete for anonymous users

Anonymous users can't install, update, or delete apps in meetings.

Usage behavior and policy for anonymous users

Anonymous users can't directly use apps in meetings. Native users can continue to use meetings apps if anonymous users are present. If an app sends an adaptive card in the chat, anonymous users can interact with the card. For more information, read [Allow anonymous users to join meetings](#).

Anonymous users will inherit the user-level global default permission policy. They can interact with apps in Teams meetings if the user-level permission policy has enabled the app. Anonymous users can only interact with apps that are already available in a meeting and can't acquire and/or manage these apps.

[Manage app setup policies in Microsoft Teams](#)

Manage app permission policies in Microsoft Teams

12/7/2021 • 7 minutes to read • [Edit Online](#)

As an admin, you can use app permission policies to control what apps are available to Microsoft Teams users in your organization. You can allow or block all apps or specific apps published by Microsoft, third-parties, and your organization. When you block an app, users who have the policy are unable to install it from the Teams app store. You must be a global admin or Teams service admin to manage these policies.

You manage app permission policies in the Microsoft Teams admin center. You can use the global (Org-wide default) policy or create and assign custom policies. Users in your organization will automatically get the global policy unless you create and assign a custom policy. After you edit or assign a policy, it can take a few hours for changes to take effect.

Global

Description

Microsoft apps

Choose which Teams apps published by Microsoft or its partners can be installed by your users.

✓ Allow all apps

Third-party apps

Choose which Teams apps published by a third-party that can be installed by your users.

✓ Allow all apps

Custom apps

Choose which custom apps can be installed by your users.

✓ Allow all apps

Save

Cancel

NOTE

Org-wide app settings override the global policy and any custom policies that you create and assign to users.

If your organization is already on Teams, the app settings you configured in **Tenant-wide settings** in the Microsoft 365 admin center are reflected in org-wide app settings on the [Manage apps](#) page. If you're new to Teams and just getting started, by default, all apps are allowed in the global policy. This includes apps published by Microsoft, third-parties, and your organization.

Say, for example, you want to block all third-party apps and allow specific apps from Microsoft for the HR team in your organization. First, you would go to the [Manage apps](#) page and make sure that the apps that you want to

allow for the HR team are allowed at the org level. Then, create a custom policy named HR App Permission Policy, set it to block and allow the apps that you want, and assign it to users on the HR team.

NOTE

If you deployed Teams in a Microsoft 365 Government Community Cloud High (GCCH) and Department of Defense (DoD) environment, see [Manage org-wide app settings for Microsoft 365 Government](#) to learn more about third-party app settings that are unique to GCCH and DoD.

Create a custom app permission policy

If you want to control the apps that are available for different groups of users in your organization, create and assign one or more custom app permission policies. You can create and assign separate custom policies based on whether apps are published by Microsoft, third-parties, or your organization. It's important to know that after you create a custom policy, you can't change it if third-party apps are disabled in org-wide app settings.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Permission policies**.
2. Click **Add**.

Add app permission policy

Description

Microsoft apps
Choose which Teams apps published by Microsoft or its partners can be installed by your users.

✓ Allow all apps

Third-party apps
Choose which Teams apps published by a third-party that can be installed by your users.

✓ Allow all apps

Custom apps
Choose which custom apps can be installed by your users.

✓ Allow all apps

Save Cancel

3. Enter a name and description for the policy.
4. Under **Microsoft apps**, **Third-party apps**, and **Custom apps**, select one of the following:
 - Allow all apps
 - Allow specific apps and block all others
 - Block specific apps and allow all others
 - Block all apps
5. If you selected **Allow specific apps and block others**, add the apps that you want to allow:
 - a. Select **Allow apps**.

- b. Search for the apps that you want to allow, and then click **Add**. The search results are filtered to the app publisher (**Microsoft apps**, **Third-party apps**, or **Custom apps**).
 - c. When you've chosen the list of apps, click **Allow**.
6. Similarly, if you selected **Block specific apps and allow all others**, search for and add the apps that you want to block, and then click **Block**.
7. Click **Save**.

Edit an app permission policy

You can use the Microsoft Teams admin center to edit a policy, including the global policy and custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Permission policies**.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. From here, make the changes that you want. You can manage settings based on the app publisher and add and remove apps based on the allow/block setting.
4. Click **Save**.

Assign a custom app permission policy to users

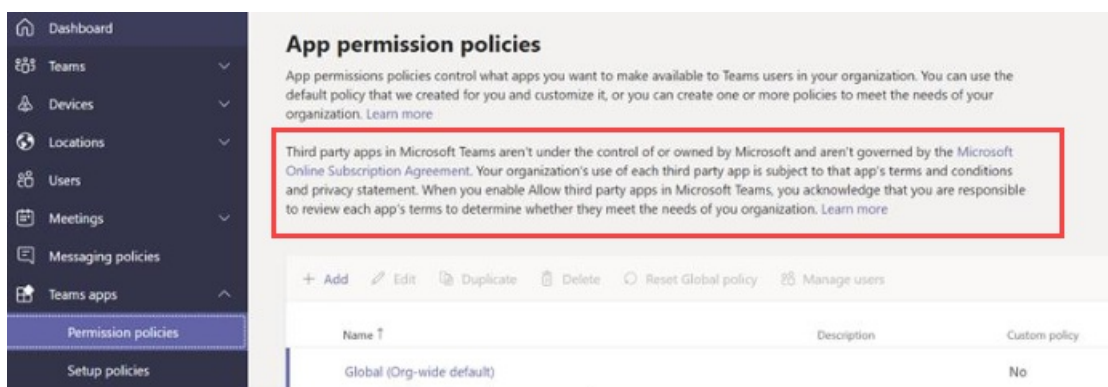

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Manage org-wide app settings for Microsoft 365 Government

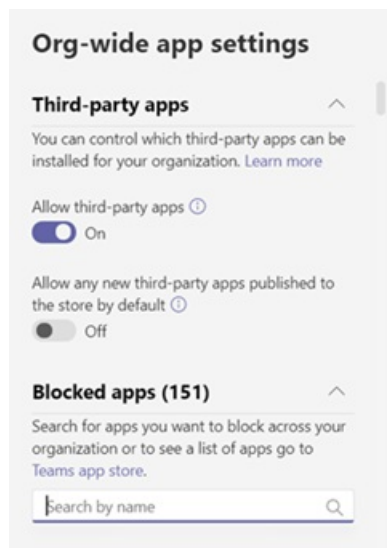

In a Microsoft 365 Government - GCCH and DoD deployment of Teams, it's important to know the following about third-party app settings, which are unique to GCCH and DoD.

In GCCH and DoD, all third-party apps are blocked by default. Additionally, you'll see the following note about managing third-party apps on the app permission policies page in the Microsoft Teams admin center.

Use org-wide app settings to control whether users can install third-party apps. Org-wide app settings govern the behavior for all users and override any other app permission policies assigned to users. You can use them to control malicious or problematic apps.

1. On the **Permission policies** page, select **Org-wide app settings**. You can then configure the settings you want in the panel.

2. Under **Third-party apps**, turn off or turn on these settings to control access to third-party apps:
 - **Allow third-party apps**: This controls whether users can use third-party apps. If you turn off this setting, your users won't be able to install or use any third-party apps. In a Microsoft 365 Government - GCCH and DoD deployment of Teams, this setting is off by default.
 - **Allow any new third-party apps published to the store by default**: This controls whether new third-party apps that are published to the Teams app store become automatically available in Teams. You can only set this option if you allow third-party apps.
3. Under **Blocked apps**, add the apps you want to block across your organization. In a Microsoft 365 Government - GCCH and DoD deployment of Teams, all third-party apps are added to this list by default. For any third-party app you want to allow in your organization, remove the app from this blocked apps list. When you block an app org-wide, the app is automatically blocked for all your users, regardless of whether it's allowed in any app permission policies
4. Click **Save** for org-wide app settings to take effect.

As mentioned earlier, to allow third-party apps, you can either edit and use the global (Org-wide default) policy or create and assign custom policies.

FAQ

Working with app permission policies

What app interactions do permission policies affect?

Permission policies govern app usage by controlling installation, discovery, and interaction for end users. Admins can still manage apps in the Microsoft Teams admin center regardless of the permission policies assigned to them.

Can I control line of business (LOB) apps?

Yes, you can use app permission policies to control the rollout and distribution of custom (LOB) apps. You can create a custom policy or edit the global policy to allow or block custom apps based on the needs of your organization.

How do app permission policies relate to pinned apps and app setup policies?

You can use app setup policies together with app permission policies. Pre-pinned apps are selected from the set of enabled apps for a user. Additionally, if a user has an app permission policy that blocks an app in their app setup policy, that app won't appear in Teams.

Can I use app permission policies to restrict uploading custom apps?

You can use org-wide settings on the **Manage apps** page, or app setup policies to restrict uploading custom apps for your organization.

To restrict specific users from uploading custom apps, use custom app policies. To learn more, see [Manage custom app policies and settings in Teams](#).

Does blocking an app apply to Teams mobile clients?

Yes, when you block an app, that app is blocked across all Teams clients.

User experience

What does a user experience when an app is blocked?

Users can't interact with a blocked app or its capabilities, such as bots, tabs, and messaging extensions. In a shared context, such as a team or group chat, bots can still send messages to all participants of that context. Teams indicates to the user when an app is blocked.

For example, when an app is blocked, users can't do any of the following:

- Add the app personally or to a chat or team
- Send messages to the app's bot
- Perform button actions that send information back to the app, such as actionable messages
- View the app's tab
- Set up connectors to receive notifications
- Use the app's messaging extension

The legacy portal allowed controlling apps at the organization level, which means when an app is blocked, it's blocked for all users in the organization. Blocking an app on the [Manage apps](#) page works exactly the same way.

For app permission policies assigned to specific users, if an app with bot or connector capability was allowed and then blocked, and if the app is then allowed only for some users in a shared context, members of a group chat or channel that don't have permission to that app can see the message history and messages that were posted by the bot or connector, but can't interact with it.

Related topics

[Admin settings for apps in Teams](#)

[Assign policies to your users in Teams](#)

Manage app setup policies in Microsoft Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

As an admin, you can use app setup policies to install and pin apps to promote the most used apps in your organization, and to decide if you want users to upload custom apps to Teams.

- **Pin apps:** app setup policies let you choose apps to pin, set the order they show up in for your users, and control whether or not users can pin their own apps to the Teams app bar. For more information, see [Pin apps](#).
- **Install apps:** app setup policies let you install apps on behalf of users when they start Teams and during meetings. For more information, see [Install apps](#).
- **Upload custom apps:** app setup policies let you allow users to upload custom apps to Teams. For more information, see [Upload custom apps](#).

Pin apps

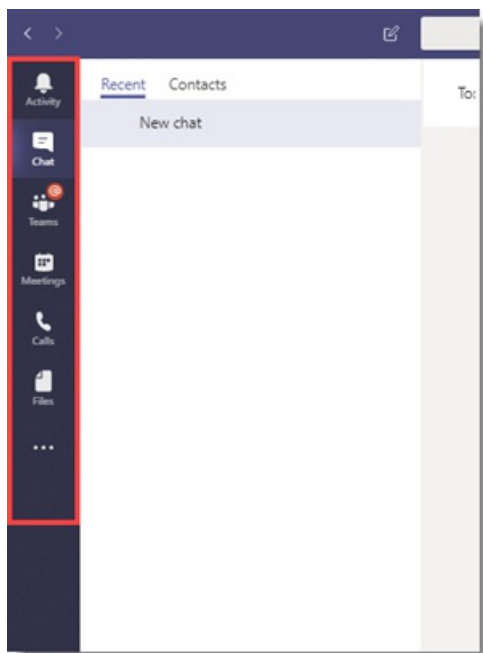

Pinning apps lets you showcase apps that users in your organization need, including apps built by third parties or by developers in your organization.

Using an app setup policy, you can do the following tasks:

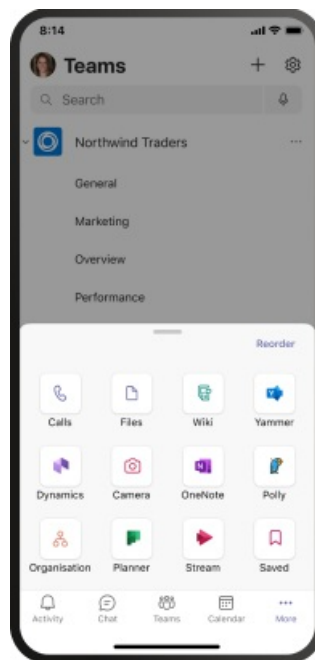

- Customize Teams to highlight the apps that are most important for your users. You choose the apps to pin and set the order that they appear.
- Control whether users can pin apps to Teams.

Apps are pinned to the app bar, which is the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients (iOS and Android).

TEAMS DESKTOP CLIENT

TEAMS MOBILE CLIENT

NOTE

If you have Teams for Education, it's important to know that the Assignments app is pinned by default in the global policy even though currently, you don't see it listed in the global policy. It will be the fourth app in the list of pinned apps on Teams clients.

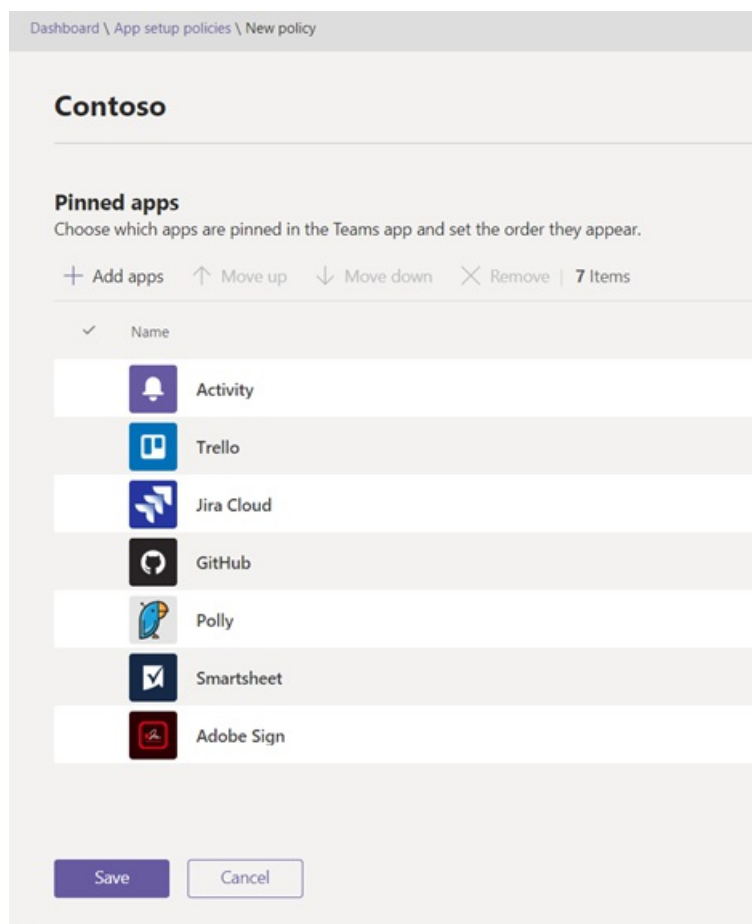

To create an app setup policy to pin apps, do the following steps:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**.
2. Select **Add**.
3. Enter a name and description for the policy.
4. Turn on or turn off **User pinning**, depending on whether you want to let users personalize their app bar by pinning apps to it.

NOTE

The **User pinning** setting is available in the Teams admin center in Microsoft 365 Government Community Cloud (GCC) environments (GCC, GCC High and DoD), but currently it has no effect.

5. Under **Pinned apps**, select **Add apps**.
6. In the **Add pinned apps** pane, search for the apps you want to add, and then select **Add**. You can also filter apps by app permission policy.
7. Select **Add**.
8. Arrange the apps in the order that you want them to appear in Teams.

9. Select **Save**.

Install apps

You can choose which apps are installed by default for users in their personal Teams environment, install apps as [messaging extensions](#), and designate apps to be installed in meetings.

Using an app setup policy, you can do the following tasks:

- Install apps for users in their personal Teams environment
- Install apps for users as messaging extensions
- Install apps in meetings for meeting organizers

NOTE

Users can still install apps themselves if the [app permission policy](#) that's assigned to them allows it.

To create an app setup policy to install apps, do the following steps:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**.
2. Select **Add**.
3. Enter a name and description for the policy.
4. Under **Installed apps**, select **Add apps**.
5. In the **Add installed apps** pane, search for the apps you want to automatically install for users. You can also filter apps by app permission policy.
6. Select **Add**.

Installed apps

Choose which apps and messaging extensions you want installed in your users' personal Teams environment, and in meetings they create. Users can install other available apps from the Teams app store. [Learn more](#)

+ Add apps ✕ Remove 2 items		
✓	Name	App ID Publisher
	 Breakthru	693aa4f0-e16c-11ea-ab9b-11514b3de7ae Breakthru
✓	 Polly	1542629c-01b3-4a6d-8f76-1938b779e48d Polly

IMPORTANT

Users can't uninstall apps that are installed by admins.

Upload custom apps

You can use the Microsoft Teams admin center to create a custom policy that allows users to upload custom apps to Teams.

To create an app setup policy to allow users to upload custom apps to Teams, do the following steps:

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**.
2. Select **Add**.

3. Enter a name and description for the policy.
4. Turn on or turn off **Upload custom apps**, depending on whether you want to let users upload custom apps to Teams.

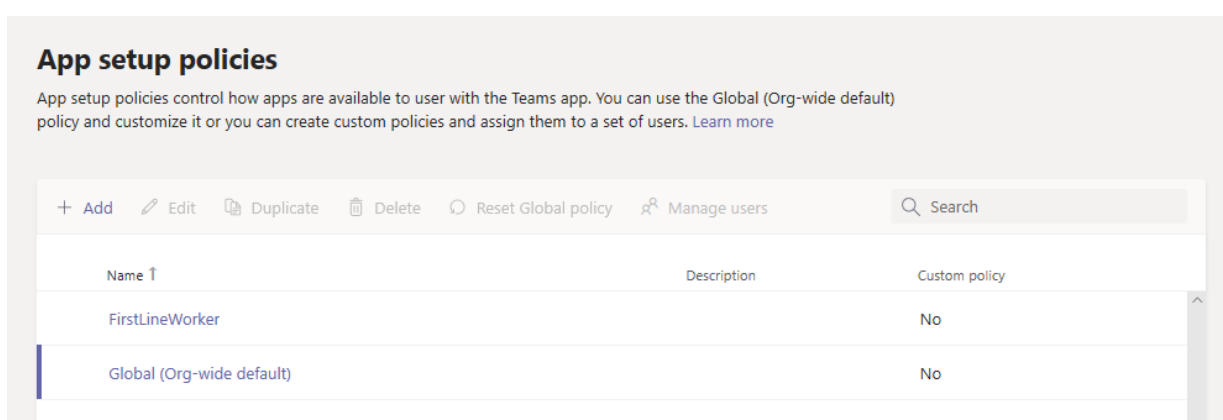

NOTE

You can't change this setting if **Allow third-party apps** is turned off in [org-wide app settings](#).

Manage app setup policies

You manage app setup policies in the Microsoft Teams admin center. Use the global (Org-wide default) policy or create and assign custom policies. Users in your organization will automatically get the global policy unless you create and assign a custom policy. You must be a global admin or Teams service admin to manage these policies.

You edit the settings in the global policy to include the apps that you want. To customize Teams for different groups of users in your organization, create and assign one or more custom policies.

Edit an app setup policy

You can use the Microsoft Teams admin center to edit a policy, including the global (Org-wide default) policy and custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**.
2. Choose the policy you want to edit and then select **Edit**.
3. Make the changes that you want.
4. Select **Save**.

Assign a custom app setup policy to users

For more information on assigning policies to your users, see [Assign policies to users and groups](#).

FAQ

Working with app setup policies

Can I assign an app setup policy to a group

App setup policies can be assigned to groups using PowerShell. For more information on assigning policies to groups using PowerShell, see [Assign policies to users and groups](#).

What built-in app setup policies are included in the Microsoft Teams admin center

- **Global (Org-wide default):** This default policy applies to all users in your organization unless you assign another policy. Edit the global policy to pin apps that are most important for your users.

- FrontlineWorker:** This policy is for Frontline Workers. You can assign it to Frontline Workers in your organization. It's important to know that like custom policies that you create, you have to assign the policy to users for the settings to be active. For more information, go to the [Assign a custom app setup policy to users](#) section of this article.

Why can't I find an app in the Add pinned apps pane

Not all apps can be pinned to Teams through an app setup policy. Some apps may not support this functionality. To find apps that can be pinned, search for the app in the **Add pinned apps** pane. Tabs that have a personal scope (static tabs) and bots can be pinned to the Teams desktop client and these apps are available in the **Add pinned apps** pane.

Keep in mind that the Teams app store lists all Teams apps. The **Add pinned apps** pane includes only apps that can be pinned to Teams through a policy.

I'm a Teams for Education admin. What do I need to know about app setup policies in Teams for Education

The Calling app isn't available in Teams for Education. When you create a new custom app setup policy, the Calling app is displayed in the list of apps. However, the app isn't pinned to Teams clients and Teams for Education users won't see the Calls app in Teams.

How many pinned apps can be added to a policy

A minimum of two apps must be pinned to the Teams mobile clients (iOS and Android). If a policy has fewer than two apps, the mobile clients won't reflect the policy settings and instead will continue to use the existing configuration.

There's no limit on the number of pinned apps you can add to a policy.

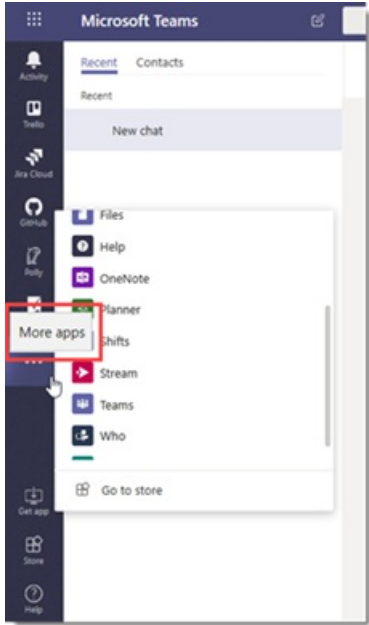

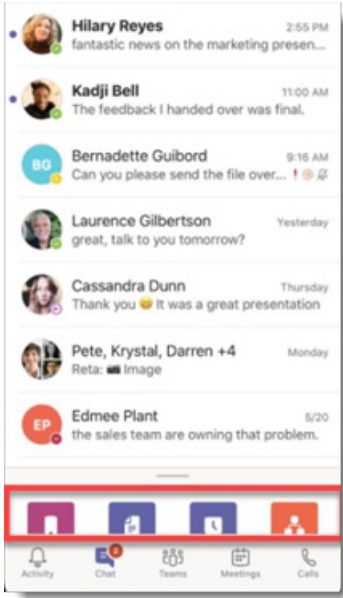

How long does it take for policy changes to take effect

After you edit or assign a policy, it can take a few hours for changes to take effect.

User experience

How can users see all their pinned apps in Teams

To view all apps that are pinned for a user, users might have to do the following depending on the number of installed apps and the size of their Teams client window.

TEAMS DESKTOP CLIENT	TEAMS MOBILE CLIENT
In the app bar on the side of Teams, select ... More apps .	In the app bar near the bottom of Teams, swipe up.
	

What do I need to know about the Teams mobile experience

The Teams mobile clients (iOS and Android) support personal apps with static tabs. Apps pinned to the Teams desktop client will appear in the Teams mobile clients. Personal bots will appear in Chat on mobile clients.

Third-party apps (which can be downloaded from Teams Store) need to be approved before they show up on mobile. If an admin pins an app, which is unapproved by Microsoft for Mobile, it will show up on the Teams Desktop, but not show up on mobile. See [Mobile clients](#) for more information.

With the Teams mobile clients, users will see core Teams apps such as Activity, Chat, and Teams, and you can pin some first-party apps from Microsoft, such as Shifts.

Can users change the order of apps pinned through a policy

Users can change the order of their pinned apps on Teams desktop and mobile clients if the **User pinning** option is turned on. Users can't change the order of their pinned apps on Teams web clients.

Does user pinning take precedence

Admin pins always take precedence. If the **User pinning** option is turned on, then users will retain their pinned apps below admin pinned apps. If the **User pinning** option is turned off, then users will lose their pre-existing pins, and only admin-pinned apps will be present in the app bar.

Custom Teams apps

My organization built a custom Teams app and published it, either to AppSource or the tenant app catalog, but the app icon isn't displayed as expected when the app is pinned to the app bar in Teams. How do I fix it

Make sure that you follow the logo guidelines before you submit the app. To learn more, see [Checklist for Seller Dashboard submission](#).

Manage custom app policies and settings in Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

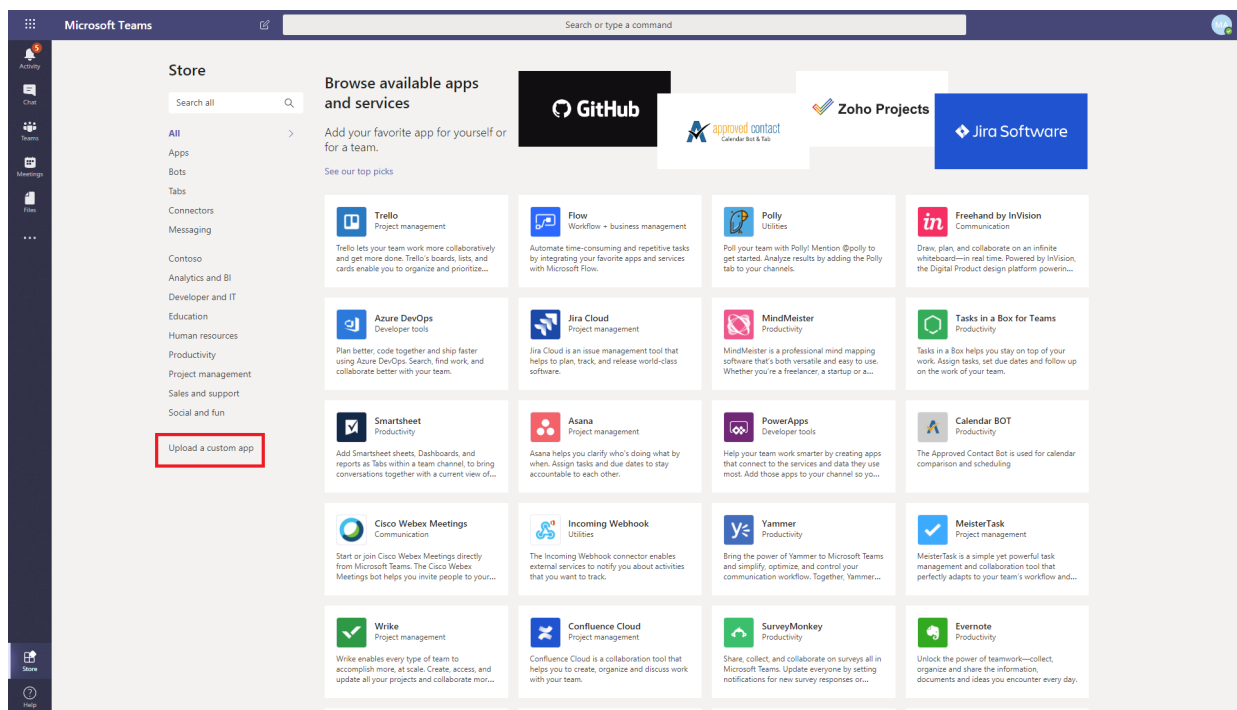

NOTE

To use App Studio see [Get started on the Microsoft Teams platform with C#/ .NET and App Studio](#). The last step is not working yet, so you will need to download the zip and install it the old way at [Upload an app package to Microsoft Teams](#).

As an admin, you can use custom app policies and settings to control who in your organization can upload custom apps to Microsoft Teams. Admins decide which users can upload custom apps, and admins and team owners can determine whether specific teams in your organization allow custom apps to be added to them. After you edit the custom app policy, it can take a few hours for changes to take effect. You must be a global admin or Teams service admin to manage these policies.

Overview of custom apps

Users can add a custom app to Teams by uploading an app package (in a .zip file) directly to a team or in the personal context. This is different from how apps are added through the Teams app store. Adding a custom app by uploading an app package, also known as sideloading, lets you test an app as it's being developed, before it's ready to be widely distributed. It also lets you build an app for internal use only and share it with your team without submitting it to the Teams app catalog in the Teams app store.

Custom app policy and settings

Three components determine whether a user can upload a custom app to a team, giving you granular control over who can add custom apps to a team and which teams custom apps can be added to:

- [User custom app policy](#)

- [Team custom app setting](#)
- [Org-wide custom app setting](#)

These settings don't affect the ability to block third-party apps.

User custom app policy

As part of [app setup policies](#), admins can use a policy setting, **Upload custom apps**, to control whether a user can upload custom apps to Teams.

If this setting is turned off:

- The user can't upload a custom app to any team in your organization or in the personal context.
- The user can interact with custom apps, depending on the org-wide custom app setting.

If this setting is turned on:

- The user can upload custom apps to teams that allow it and to teams for which they are owners, depending on the org-wide custom app setting.
- The user can upload custom apps to the personal context.
- The user can interact with custom apps, depending on the org-wide custom app setting.

You can edit the settings in the global app setup policy to include the apps that you want. If you want to customize Teams for different groups of users in your organization, create and assign one or more custom app setup policies.

Set a user custom app policy

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**.
2. Click **Add**.
3. Turn on or turn off **Upload custom apps**.
4. Choose any other settings that you want to for the policy.
5. Click **Save**.

Team custom app setting

Admins and team owners can control whether a team allows for custom apps to be added to it. This setting, **Allow members to upload custom apps**, together with a user's custom app policy determines who can add custom apps to a particular team.

If this setting is turned off:

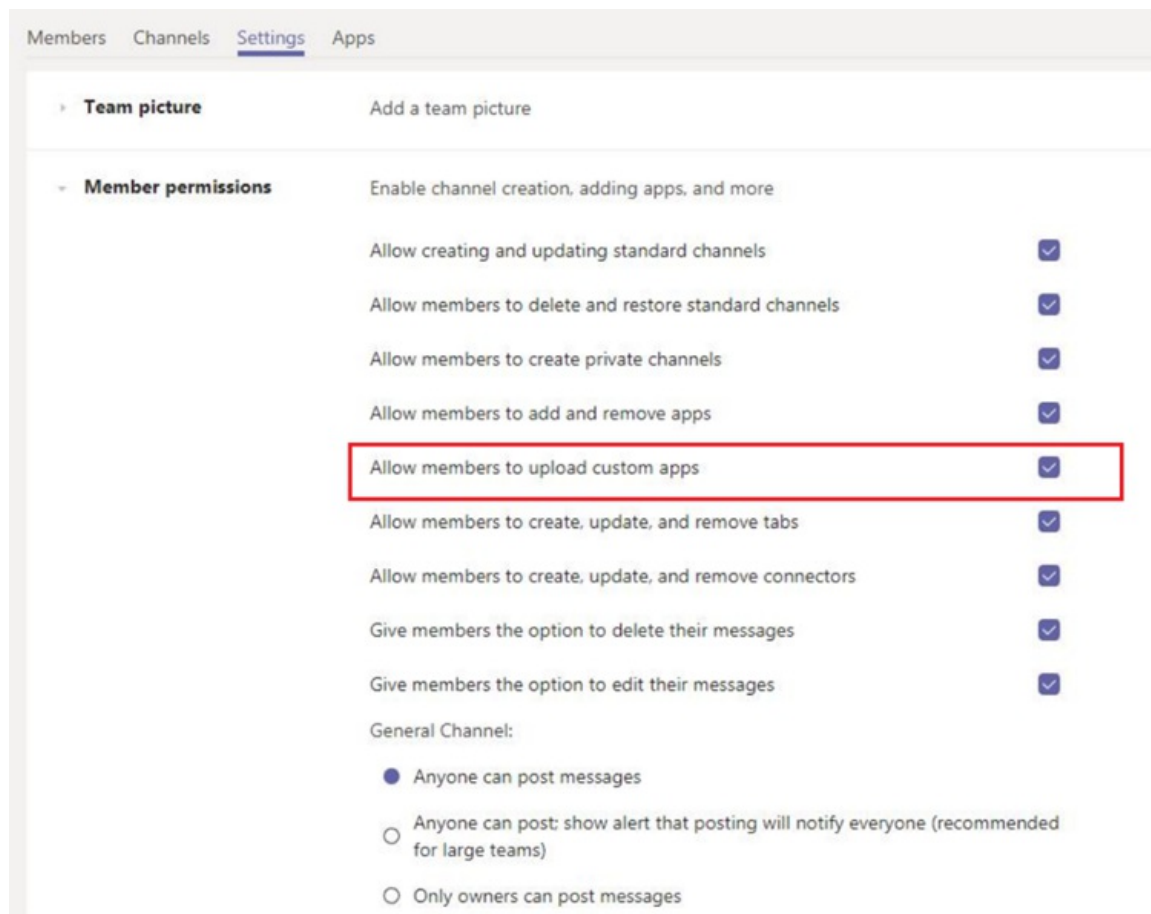

- Team owners can add custom apps, if their custom app policy allows it.
- Team members who aren't team owners can't add custom apps to the team.

If this setting is turned on:

- Team owners can add custom apps, if their custom app policy allows for it.
- Team members who aren't team owners can add custom apps, if their custom app policy allows for it.

Configure the team custom app setting

1. In Teams, go to the team, click **More options**  > **Manage team**.
2. Click **Settings**, and then expand **Member permissions**.
3. Select or clear the **Allow members to upload custom apps** check box.

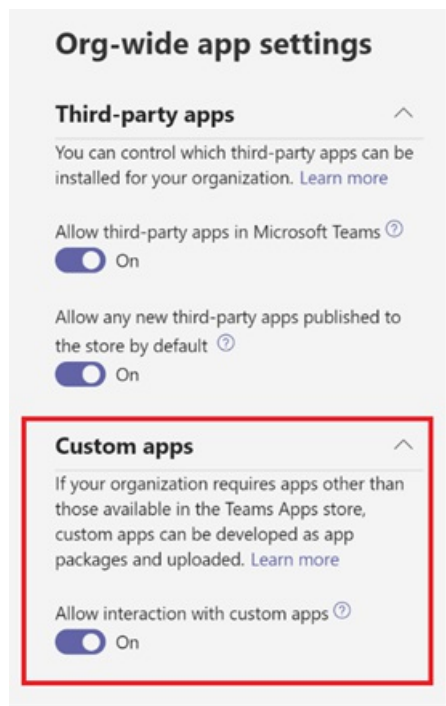

Org-wide custom app setting

The **Allow interaction with custom apps** org-wide custom app setting on the [Manage apps](#) page applies to everyone in your organization and governs whether they can upload or interact with custom apps. This setting acts as a master on/off switch for the user and team custom app policy settings. It's intended to serve as a master on/off switch during security events. As such, user and team custom app policy settings will not take effect unless the org-wide custom app setting is enabled even if user and team custom app policy settings are enabled.

Configure the org-wide custom app setting

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. Click **Org-wide app settings**.
3. Under **Custom apps**, turn on or turn off **Allow interaction with custom apps**.

How custom app policies and settings work together

This table summarizes the custom app policy and settings, how they work together, and their combined effect on controlling who in your organization can upload custom apps to Teams.

Say, for example, you want to allow only team owners to upload custom apps to specific teams. You would set the following:

- Turn on the **Allow interaction with custom apps** setting in the Microsoft Teams admin center.
- Turn off the **Allow members to upload custom apps** for every team to which you want to restrict access.
- Create and assign a custom app setup policy in the Microsoft Teams admin center with the **Upload custom apps** setting turned on, and assign it to the team owners.

ORG-WIDE CUSTOM APP SETTING	TEAM CUSTOM APP SETTING	USER CUSTOM APP POLICY	EFFECT
Off	Off	Off	Interaction with all custom apps is blocked for your organization. Custom apps can't be uploaded by anyone except a Teams Service Admin or a Global admin. You can use PowerShell to remove the custom app.
Off	Off	On	Interaction with all custom apps is blocked for your organization. Custom apps can't be uploaded by anyone except a Teams Service Admin or a Global admin. You can use PowerShell to remove the custom app.

ORG-WIDE CUSTOM APP SETTING	TEAM CUSTOM APP SETTING	USER CUSTOM APP POLICY	EFFECT
Off	On	Off	Interaction with all custom apps is blocked for your organization. Custom apps can't be uploaded by anyone except a Teams Service Admin or a Global admin. You can use Windows PowerShell to delete custom apps.
Off	On	On	Interaction with all custom apps is blocked for your organization. Custom apps can't be uploaded by anyone except a Teams Service Admin or a Global admin. You can use PowerShell to remove the custom app.
On	Off	Off	The user can't upload custom apps.
On	Off	On	If the user is a team owner, they can upload custom apps to the team. If the user isn't a team owner, they can't upload custom apps to the team. The user can upload custom apps in the personal context.
On	On	Off	The user can't upload custom apps.
On	On	On	The user can upload custom apps to the team, regardless of whether the user is a team owner. The user can upload custom apps in the personal context.

Customize apps in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Microsoft Teams provides app customization to enhance the Teams experience. Some app developers allow an app to be customized by the Teams admin. The admin can customize or rebrand the app properties based on the organizational needs using the Teams admin center **Manage apps** page. The details you can customize are:

- Short name
- Short description
- Full description
- Privacy policy URL
- Website URL
- Terms of use URL
- Color icon
- Outline icon
- Accent color

See the [Teams Manifest schema](#) for details about the fields that you can customize.

NOTE

Customizing apps isn't supported in Government Community Cloud High (GCCH) or Department of Defense (DoD) at this time. Currently, this feature is not available for sideloaded Microsoft Teams apps.

Customize the app's details

To start customizing an app, complete the following steps:

1. Sign in to the Teams admin center.
2. Expand **Teams Apps** and select **Manage apps**.
3. Check the **Customizable** column of the apps list and sort by apps that are customizable.

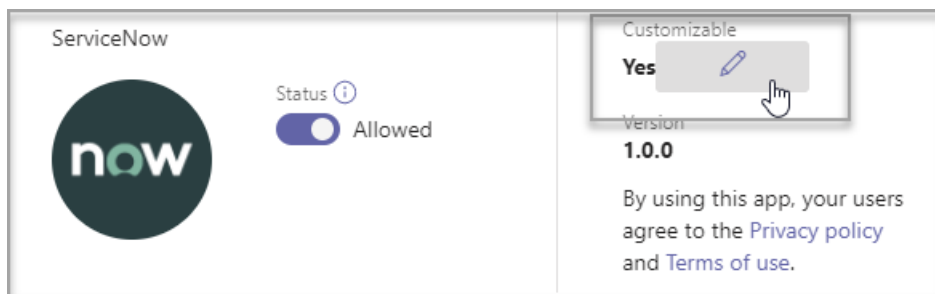

Name	Status	Permissions	Customizable	Categories	Version
 Now Virtual Agent	Allowed	--	Yes	Productivity	1.0.0

There are three entry points to access the customize feature:

- Select next to the app that you want to customize, and then select **Customize**.

+ Upload	✓ Allow	⊘ Block	 Customize	⊞ Add to team	1 item selected	✕
✓	Name	Publisher	Status	Permissions	Customizable	
✓	 Now Virtual Agent	ServiceNow	Allowed	--	Yes	

- Select the app name and then **Customizable**.

- Select the app name, and then select **Customize** from the **Actions** dropdown.

4. Expand the **Details** section and customize the following fields:

- Short name
- Short description
- Full description
- Website
- Privacy policy URL
- Terms of use URL

Customize

Now Virtual Agent

Details

Short name ⓘ

Now Virtual Agent

Short description ⓘ

Find answers, file requests and complete ...

Privacy policy URL ⓘ

<https://www.servicenow.com/service-priv...>

Website URL ⓘ

<https://www.servicenow.com/>

Terms of use URL ⓘ

<https://www.servicenow.com/terms-of-us...>

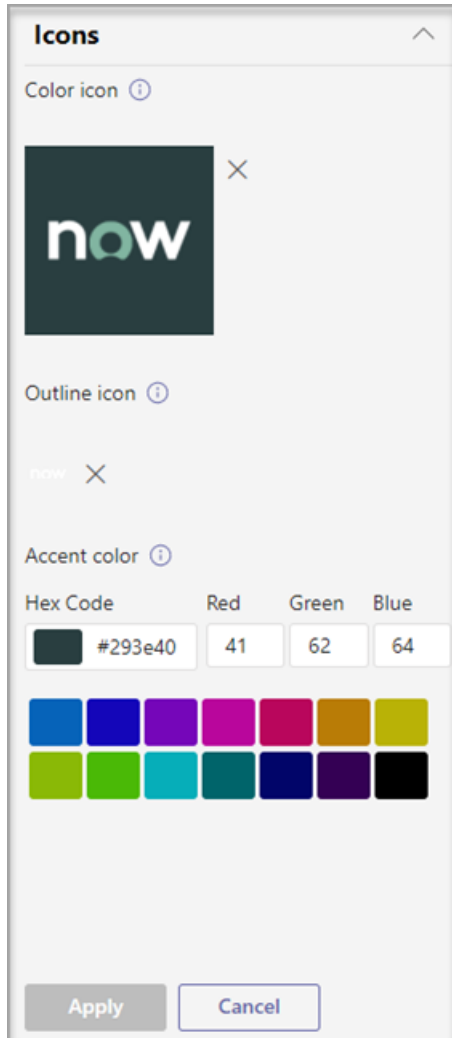

Full description ⓘ

The Now Virtual Agent allows you to perform routine ServiceNow tasks directly in Teams, so you can work more

NOTE

Only the fields that the app developer has assigned as customizable will be visible.

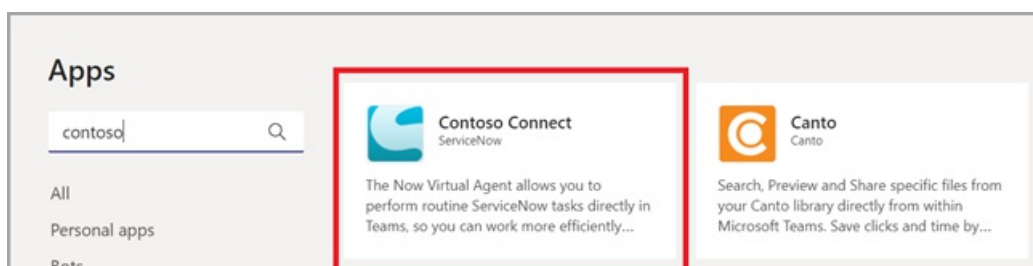

5. Expand the **Icon** section.
 - a. Upload an icon. Use one full-color icon (192x192) pixel in PNG format.
 - b. Choose an icon outline color. Use one transparent outline (32x32) pixel in PNG format.
 - c. Select an app accent color that matches the icon.

6. Once your app has been customized, select **Apply**.
7. Select **Publish** to publish the customized app.

The customized app is now listed in your **Manage apps** page. You'll have only one version of the app, since customizing the app features doesn't create a copy of the app.

Now your Teams end users can open their Teams client to see the customized app.

Special considerations for customizing an app

The following note includes important details about customizing an app.

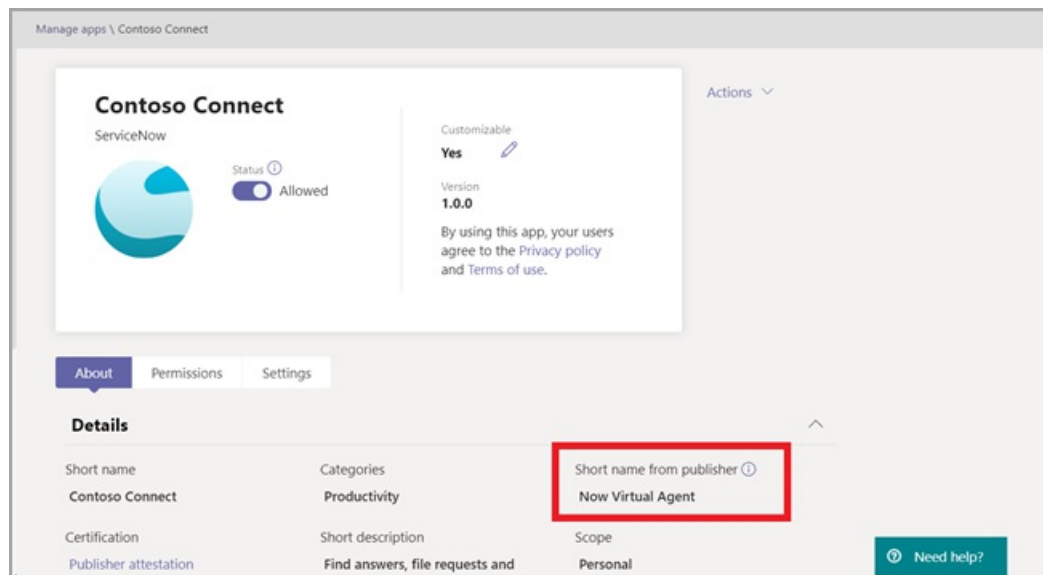

NOTE

- When you customize apps, and any description related to an app, ensure that you follow any customization guidelines if provided by the app publisher in their documentation or terms of use. You're also responsible for respecting the rights of others regarding any third-party images you might use.
- Admin-provided customization data is stored in the nearest region.
- You are responsible for ensuring that links to terms of use or privacy policy are valid.
- In case the app publisher no longer allows a field to be customizable, a message appears on the app details page notifying the admin about the fields that can't be customized any longer. All the changes made to that field will be reverted to the original values.
- We recommend testing app customization changes in a Teams test tenant before making these changes in your production environment.
- Changes to branding might require up to 24 hours for the users to see the changes.

Review app details

You might want to see the app details to review the information.

1. Sign in to the Teams admin center.
2. Expand **Teams apps** and select **Manage apps**.
3. Select the app name.
4. View the app details, including the original app name **Short name from publisher**.

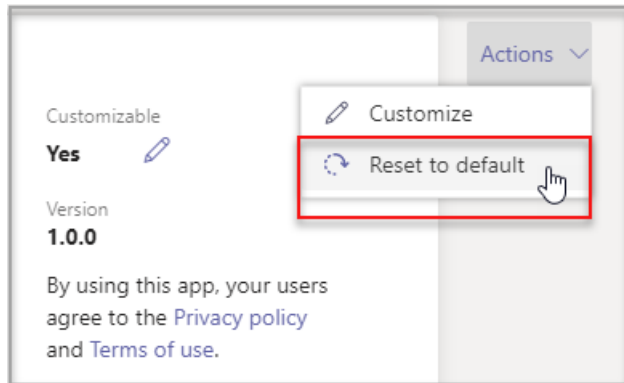

The **Short name from publisher** field is only visible if you've changed the app's short name.

Reset app details to default

At any time, you can reset the app details to the original settings.

1. Sign in to the Teams admin center.
2. Expand **Teams Apps** and select **Manage apps**.
3. Select the app name.

4. Select **Reset to default** from the **Actions** dropdown.

Frequently asked questions

How long will it take for my users to see the customized app?

Although the admin can immediately see the changes in Teams Admin Center, it might take up to 24 hours for the end users to see the changes.

Can the app provider customize the app for its customers?

No, the admin of a tenant needs to customize the app for their tenant using the Teams Admin Center.

Will the customized app automatically get deployed to replace my current custom app in a tenant?

No, the tenant admins will have to manually remove any custom app and publish the customized version of the app. If you have customized an app and published it as a custom app, the new app customized using the app customization feature won't replace the current custom app.

Will the app usage report also show the customized values such as customized short name?

No, the app usage report will still show the original name of the app sent from the publisher.

Which apps can I customize using the app customization feature?

You can only customize apps that have been allowed to be customizable by the app publisher. The app publisher will need to opt in to allow its customers to customize the app.

Will the customized properties show up on the graph permission consent screen?

No, the permission consent screen will still show the original value sent by the publisher.

Update apps in Microsoft Teams

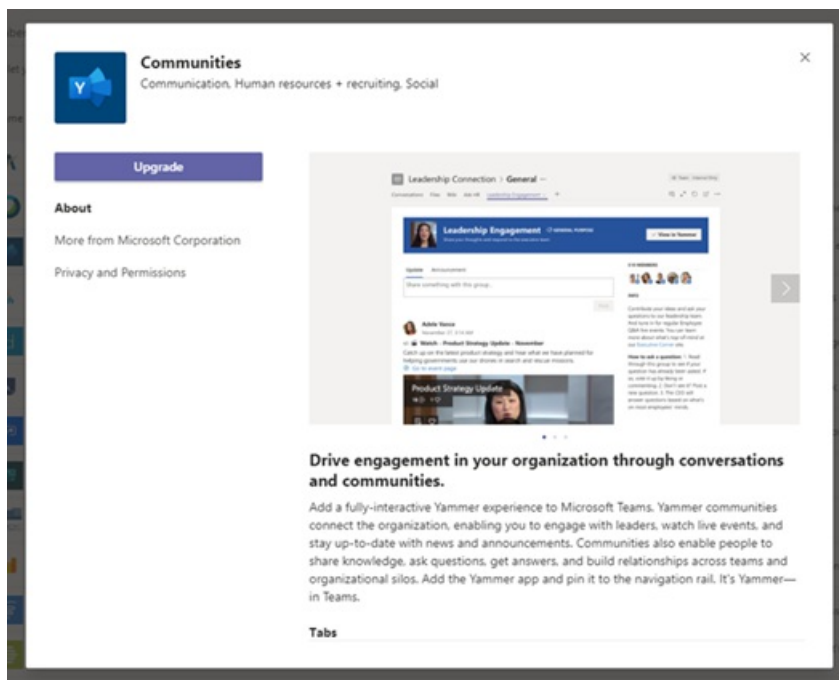

12/7/2021 • 2 minutes to read • [Edit Online](#)

In most cases, after app developers publish an app update, the new version automatically appears for users. However, there are some updates to the [Microsoft Teams manifest](#) that require user acceptance to complete:

- A bot was added or removed
- An existing bot's "botId" property changed
- An existing bot's "isNotificationOnly" property changed
- A bot's SupportsCalling, SupportsVideo, and SupportsFiles capability was added
- A messaging extension was added
- A new connector was added
- Properties inside "webApplicationInfo" changed

The screenshot shows the 'Apps' tab in Microsoft Teams. At the top, there are navigation links: Members, Pending Requests, Channels, Settings, Analytics, and Apps. Below these links is a header bar with the text 'Apps let you complete tasks, receive updates, and communicate at the same time. To get started @mention a bot or add a tab in a team channel.' and a 'More apps' button. The main content area is a table with two columns: 'Name' and 'Description'. The table lists various apps, including Calendar BOT, Cisco Webex Meetings, Communities, Crewhu, Decisions, DocHawk, Flow, Forms, Glossary, Google Analytics, Guidance, HunchBuzz, Incoming Webhook, and Intune Helpdesk (Custom app). The 'Communities' app is highlighted with a red box. Its description reads: 'Add a fully-interactive Yammer experience to Microsoft Teams. Yammer communities connect the organization, enabling you to engage with leaders, watch live events, and stay up-to-date... A new version of this app is available and needs new permissions. Click here to upgrade.' At the bottom of the page, there are two links: 'Build your own apps with the Teams developer platform. Learn More' and 'Create an outgoing webhook | Upload a custom app'.

Manage the Shifts app for your organization in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Effective June 30, 2020, Microsoft StaffHub has been retired. We're building StaffHub capabilities into Microsoft Teams. Today, Teams includes the Shifts app for schedule management and additional capabilities will roll out over time. StaffHub stopped working for all users on June 30, 2020. Anyone who tries to open StaffHub is shown a message directing them to download Teams. To learn more, see [Microsoft StaffHub has been retired](#).

Overview of Shifts

The Shifts app in Microsoft Teams keeps frontline workers connected and in sync. It's built mobile first for fast and effective time management and communication for teams. Shifts let frontline workers and their managers use their mobile devices to manage schedules and keep in touch.

- Managers create, update, and manage shift schedules for teams. They can send messages to one person ("there's a spill on the floor") or the entire team ("the regional GM is arriving in 20 minutes"). They can also send policy documents, news bulletins, and videos.
- Employees view their upcoming shifts, see who else is scheduled for the day, request to swap or offer a shift, and request time off.

It's important to know that Shifts currently don't support guests. This means that guests on a team can't be added to or use shift schedules when Guest access is turned on in Teams.

NOTE

For details about Shifts capabilities on different platforms, see [Teams features by platform](#).

Availability of Shifts

Shifts is available in all Enterprise SKUs where Teams is available.

Location of Shifts data

Shifts data is currently stored in Azure in data centers in North America, Western Europe, and Asia Pacific. For more information about where data is stored, see [Where is my data?](#)

Set up Shifts

Enable or disable Shifts in your organization

Shifts is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. In the list of apps, do one of the following actions:

- To turn off Shifts for your organization, search for the Shifts app, select it, and then select **Block**.
- To turn on Shifts for your organization, search for the Shifts app, select it, and then select **Allow**.

Enable or disable Shifts for specific users in your organization

To allow or block specific users in your organization from using Shifts, make sure Shifts be turned on for your organization on the [Manage apps](#) page. Then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Use the FirstLineWorker app setup policy to pin Shifts to Teams

App setup policies let you customize Teams to highlight the apps that are most important for users in your organization. The apps set in a policy are pinned to the app bar—the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients—where users can quickly and easily access them.

Teams includes a built-in FirstLineWorker app setup policy that you can assign to frontline workers in your organization. By default, the policy includes the Activity, Shifts, Chat, and Calling apps.

To view the FirstLineWorker policy, in the left navigation of the Microsoft Teams admin center, go to **Teams app** > **Setup policies**.

Assign the FirstLineWorker app setup policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Search the audit log for Shifts events

(in preview)

You can search the audit log to view Shifts activity in your organization. To learn more about how to search the audit log and to see a list of [Shifts activities](#) that are logged in the audit log, see [Search the audit log for events in Teams](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). To learn more, see [Turn audit log search on or off](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Virtual visits with Microsoft Teams and the Bookings app

12/7/2021 • 4 minutes to read • [Edit Online](#)

Overview

The [Bookings app](#) in Microsoft Teams gives organizations a simple way to schedule and manage virtual appointments for staff and attendees. Use it to schedule virtual appointments such as healthcare visits, financial consultations, interviews, customer support, virtual shopping experiences, education office hours, and more.

The Bookings app makes it easy to manage complex scheduling demands of any organization. Schedulers can manage multiple department and staff calendars, as well as communications with internal and external attendees, from a single experience.

The virtual visits are held through Microsoft Teams meetings, which offers robust video conferencing capabilities. For example, a doctor can share their screen and review test results with a patient. Or, a banking advisor can request electronic signatures on documents, allowing them to close transactions remotely.

Each virtual appointment includes a Teams meeting link that's sent to attendees in email where they can easily join from a web browser or in Teams on any device. Automated email reminders help reduce no-shows and enhance customer and client engagement.

With Bookings, you get an experience that's tailored to your industry. Here's a few examples of how you can use it in your organization:

INDUSTRY	EXAMPLES
Financial services	Virtual visits for remote sales and service Schedule and manage virtual appointments for bank relationship managers, financial advisors, and claims adjusters, just to name a few, to serve your customers with increased efficiency and convenience.
Healthcare	Virtual visits for patient care Schedule and manage virtual visits for your care team members to meet with patients or other healthcare providers to discuss medical care.
Retail	Virtual shopping experiences Schedule and manage appointments for your sales associates, product experts, and design consultants to conduct virtual shopping experiences with customers.

This article gives you an overview of how to use the Bookings app in Teams to schedule, manage, and conduct virtual visits.

Before you get started

If you're an admin, see [Manage the Bookings app in Teams](#) to learn about the prerequisites for using the Bookings app in Teams, how to control access to Bookings in your organization, and recommended policy and admin settings.

Remember that only schedulers in your organization need to have the Bookings app installed in Teams. Staff who conduct or participate in virtual appointments don't need the app. They join appointments from their Teams or Outlook calendar or by using the meeting link in their booking confirmation email.

Set up a new booking calendar

Create the booking calendar

In Teams, go to **Bookings > Get started**, and then select **New booking calendar**. Complete the form and be sure to choose the relevant business type for your organization.

Add a new booking calendar

The business name you enter will be used to create the email address for sending booking invites (e.g., businessname@domain.com)

Business or department name *

Contoso

Business type *

Select business type

Healthcare

Financial services

Education

IT Support

Sales

Recruiting

Other

If you're a larger organization, consider creating more than one booking calendar if you want attendees to receive a booking email from a specific department rather than your overall organization. To learn more, see [Create a Bookings calendar](#).

NOTE

If this isn't your first time in the Bookings app or if you want to work in an existing booking calendar, in Bookings, select the dropdown arrow next to your organization name, and then choose **Existing booking calendar**. From here, you can search for the one you want.

Add staff

In the booking calendar, go to **More options (...)** > **Settings**, and then select **Staff**. Add staff members and assign a role to each person you add.

The Bookings app integrates with Outlook. After you add staff, you'll be able to view that person's calendar availability and schedule bookings for them. To learn more, see [Add staff and view a Bookings calendar](#).

Create appointment types

Create specific appointment types to represent the services offered by your organization and to tailor the booking experience.

In the booking calendar, go to **More options (...)** > **Appointment types**, and then select **New appointment type**. Enter a name—for example, Account opening, Prescription renewal, Loan consultation, Tax preparation—and any other information and settings you want.

The information and links that you add are included in the email confirmation that's sent to attendees every time this type of appointment is booked. You can even set email reminders and other options such as whether attendees can [join from a mobile browser](#) without having to download Teams. To learn more, see [Create an appointment type](#).

Schedule a virtual visit

In the booking calendar, select **New booking**. Select an appointment type, and then fill out the relevant information.

This includes attendee contact information, the staff member who will be providing the service, internal notes that only staff can see, email reminders, and whether the attendee can join from a mobile browser. To learn more, see [Schedule a booking in the Teams Bookings app](#).

The email confirmation sent to the attendee includes the meeting link and an attachment so that they can add the virtual appointment to their calendar. Staff also receive an email confirmation and meeting invite.

Conduct a virtual visit

In your Teams or Outlook calendar, go to the booking, and then select **Join** or the Teams meeting link. Check your audio and video settings, and then select **Join now**. To learn more, see [Conduct a Bookings appointment](#).

Additional capabilities with the Bookings web app

The Bookings web app gives you additional capabilities. For example, you can publish a self-serve online booking page where people can schedule appointments with your staff. To access the Bookings web app, go to **More options (...)** > **Open Bookings web app**.

To learn more, see [Microsoft Bookings](#).

[Get started with Teams for healthcare organizations](#)

[Bookings app in Teams help documentation](#)

Manage the Bookings app in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

The Bookings app in Microsoft Teams offers a simple way to schedule in-person and virtual appointments, such as healthcare visits, financial consultations, interviews, customer support, education office hours, and much more. To learn more, see [Virtual visits with Teams and the Bookings app](#).

Schedulers can manage multiple department and staff calendars, as well as communications with internal and external attendees, from a single experience. The virtual appointments themselves are held via Microsoft Teams meetings, which offers robust videoconferencing capabilities.

NOTE

Only schedulers need to have the Bookings app installed in Teams. Staff who conduct or participate in virtual appointments don't need the app. They can simply join appointments from their Outlook or Teams calendar or from the Teams meeting link in their booking confirmation email.

Prerequisites for using the Bookings app in Teams

- The Exchange mailbox must be in Exchange Online. On-premises Exchange Server mailboxes aren't supported.
- Microsoft Bookings must be turned on for the organization.
- Users must have an appropriate license. Office 365 A3, A5, E3, E5, F1, F3, Microsoft 365 A3, A5, E3, E5, F1, F3, and Business Standard are supported.
- All users of the Bookings app and all staff participating in meetings must have a license that supports Teams meeting scheduling.
- Your systems must meet all [software and browser prerequisites](#).

Availability of Bookings in Teams

Microsoft Bookings app for Teams is available on the desktop and web. It can be found under [Apps in Teams](#) and under **Manage Apps** in the Teams admin center.

Control access to Bookings within your organization

There are several ways to control who has access to the Bookings app and to specific features of the app.

To learn how to turn Microsoft Bookings on or off in the Microsoft 365 admin center and how to create a Bookings app policy to allow selected users to create Bookings calendars, see [Get access to Microsoft Bookings](#).

You can also [create a Teams app setup policy to pin the Bookings app for select users](#).

Recommended meeting policy settings

To enable the best experience for Bookings, create a Teams meeting policy to automatically admit **Everyone in your organization** and assign the policy to your staff. Doing this allows staff to join the appointment automatically and enable the lobby experience for external attendees. Learn more about how to [automatically admitting people to meetings](#).

Optional staff approvals setting

As an extra privacy setting, you can choose to require staff to opt in before their schedule availability information is shared through Bookings and before they can be booked for an appointment.

To enable this setting, go to **Microsoft 365 admin center** > **Settings** > **Settings**, and then select **Bookings**.

With this setting turned on, staff will receive an email in which they're asked to approve membership to a booking calendar.

This feature is gradually being rolled out worldwide to Microsoft 365 and Office 365 customers. If all options aren't yet available in your environment, check back soon.

Changing your default domain when setting up Bookings mailboxes

When setting up a Bookings mailbox, the default email domain of your Microsoft 365 or Office 365 organization is used. However, this can cause problems when sending meeting invites to external recipients; your invite might be flagged as spam and moved to the recipient's junk folder, so the recipient might never see your invite.

We recommend that you change the default domain before you create your Bookings mailbox. For information on how to do this, see the [Domains FAQ](#).

If you need to change the default domain after your Bookings mailbox has already been created, you can do so with PowerShell:

```
Set-Mailbox -identity business@domain.onmicrosoft.com -WindowsEmailAddress business@domain.com -  
EmailAddresses business@domain.com
```

For more information, see the PowerShell documentation for the [Set-Mailbox](#) cmdlet.

NOTE

If you're using an Exchange hybrid configuration, we recommend that you thoroughly test mail flow between on-premises Exchange and Exchange Online when changing the default domain.

Sending feedback

We welcome your feedback on:

- User experience or ease of use
- Feature gaps or missing functionality
- Bugs or issues

To send feedback, select the **Help** button near the bottom of the Teams left navigation bar, and then select **Report a Problem** for ALL issues. Indicate at the beginning of your feedback report that you're sending feedback about "Bookings" so we can easily identify Bookings issues.

Get started with Teams for healthcare organizations

12/7/2021 • 8 minutes to read • [Edit Online](#)

Microsoft Teams offers a number of telemedicine features useful for hospitals and other Healthcare organizations. Teams features are under development to aid hospitals with:

- Virtual visits and Electronic Healthcare Record (EHR) integration
- Teams policy packages
- Secure messaging
- Teams templates
- Care coordination and collaboration

This functionality is part of Microsoft Cloud for Healthcare. Learn more about using this solution, which brings together capabilities from Azure, Dynamics 365, and Microsoft 365 at [Microsoft Cloud for Healthcare](#).

Watch the following video to learn more about using the healthcare collection to enhance health team collaboration in Teams.

NOTE

The content in this section assumes that you've already deployed Teams in your organization. If you haven't yet rolled out Teams, start by reading [How to roll out Microsoft Teams](#).

The following scenarios are available for healthcare organizations:

SCENARIO	DESCRIPTION	REQUIREMENTS
Virtual visits with Electronic Healthcare Record (EHR) integration	Schedule, manage, and conduct virtual visits with patients. This scenario connects Teams and the Cerner or Epic platform to support virtual visits.	Active subscription to Microsoft Cloud for Healthcare or subscription to Microsoft Teams EHR connector standalone offer. Users must have an appropriate Microsoft 365 or Office 365 license that includes Teams meetings*. Organizations must have Cerner version November 2018 or later or Epic version November 2018 or later. Details for Cerner EHR and Epic EHR requirements
Virtual visits with Microsoft Bookings and the Bookings app	Schedule, manage, and conduct virtual visits with patients. This scenario relies on Microsoft Bookings to support virtual visits.	Microsoft Bookings must be turned on for the organization. All users of the Bookings app and all staff participating in meetings must have a license that supports Teams Meeting scheduling*. Details for Bookings requirements

SCENARIO	DESCRIPTION	REQUIREMENTS
Teams policy packages	Ensure that clinical workers, information workers, and patient room devices have the appropriate access to Teams functionality.	Users must have an appropriate license*.
Secure messaging	Get quicker attention to urgent messages and have confidence that the message was received and read.	Users must have an appropriate license*.
Teams templates	Create teams that include a predefined template of settings, channels, and pre-installed apps for communication and collaboration within a ward, pod, or department, or between multiple wards, pods, and departments within a hospital.	Users must have an appropriate license*.
Care coordination and collaboration	Clinicians and staff can collaborate internally on schedules, documents, tasks, and so on.	Users must have an appropriate license*.

*Office 365 A3, A5, E3, E5, F1, F3, Microsoft 365 A3, A5, E3, and E5, Business Standard are supported. For more information about general Teams licensing, see [Manage user access to Teams](#).

Virtual visits and Electronic Healthcare Record (EHR) integration

Use the complete meetings platform in Teams to schedule, manage, and conduct virtual visits with patients.

- If your organization already uses Electronic Health Records, or EHR, you can integrate Teams for a more seamless experience. Teams Electronic Health Record (EHR) connector makes it easy for clinicians to launch a virtual patient visit or consultation with another provider in Teams directly from the EHR system. To learn more, see [Virtual visits with Teams - Integration into Cerner EHR](#) and [Virtual visits with Teams - Integration into Epic EHR](#).
- If you aren't using a supported EHR, you can use Microsoft Bookings and the Bookings app in Teams. To learn more, see [Virtual visits with Teams and the Bookings app](#).

Virtual visits with Microsoft Teams

EHR integration

-  Providers/staff can schedule in your EHR. Patients can request appointments through patient portal.
-  Start the visit from your EHR.
-  Visits run as meetings in Teams, inside your EHR with all Teams functionality.

Microsoft Bookings

-  Providers/staff can schedule from Bookings. Patients can also request appointments in Bookings.
-  Start the visit from Microsoft Teams.
-  Visits run as meeting in Teams, with all Teams functionality.

Teams policy packages

Apply Teams policy packages to define what different roles can do in Teams. For example, specify policies for:

- Clinical workers, such as registered nurses, charge nurses, physicians, and social workers, so that they can have full access to chat, calling, shift management, and meetings.

- Information workers in your healthcare organization, such as IT personnel, informatics staff, finance personnel, and compliance officers, can have full access to chat, calling, and meetings.
- Patient rooms, to control settings for patient room devices.

To learn more, see [Teams policy packages for healthcare](#).

Secure messaging

Secure messaging supports collaboration within health teams, including several new features:

- A message sender can set a special priority for their message, so the recipient is repeatedly notified until they read the message.
- A message sender can request a read receipt, so they are notified when a message they sent was read by the message recipient.

Together, these features allow quicker attention to urgent messages and confidence that the message was received and read. New health teams using these features can be created on a per-patient basis. These features are policy-based, and can be assigned to individuals or entire Teams.

To learn more, see [Get started with Secure Messaging policies for Healthcare organizations](#).

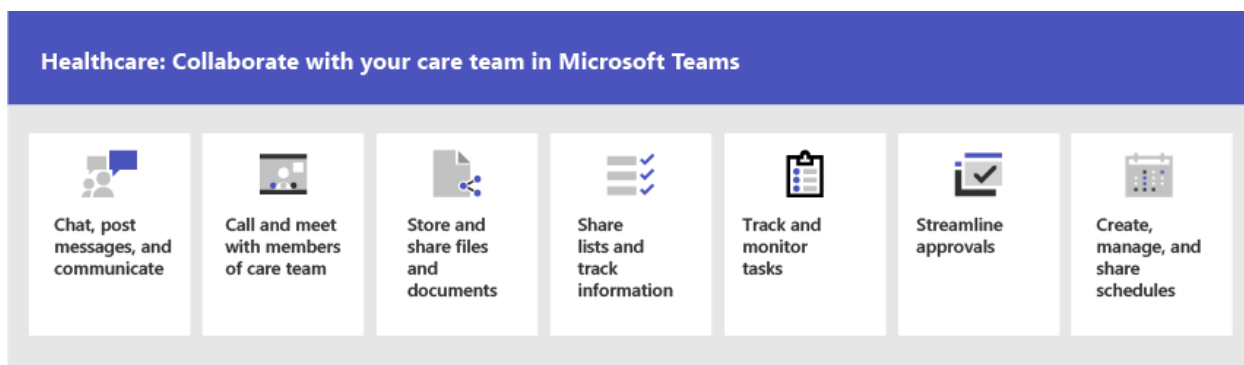

Also related to secure messaging is the ability to have other tenants federated by Healthcare organizations, allowing richer inter-tenant communication. (See [Manage external access \(federation\) in Microsoft Teams](#)).

Teams templates for healthcare organizations

New templates for creating Teams were developed to apply to a Hospital setting, and more are expected soon. This makes it easier to create teams that Healthcare workers use to coordinate care for patients in various departments or wards. To learn more, see [Get started with Teams templates for Healthcare organizations](#). Teams can be started for internal departments such as cardiology, or for care wards, and more templates are in development.

Care coordination and collaboration

Bring your health team together to coordinate care and collaborate with Teams.

Teams enables physicians, clinicians, nurses, and other staff to collaborate efficiently with included collaboration features in Teams, such as:

- Set up teams and channels for your health teams and information workers. Use channels with tabs as a way to structure their work, with additional help from tabs to which they can pin information sources.
- Chat, post messages, and communicate. Your team can have persistent conversations about different patients needing attention.
- Call and meet with members of the health team. Set up individual meetings, or use channel meetings to manage daily meetings, both with the power of Teams audio, video, screen sharing, recording, and

transcription features.

- Store and share files and documents. Your health team is part of a single virtualized team that works and collaborates on Office documents.

In addition, your team can use apps in Teams to:

- Share lists and track information with the Lists app
- Track and monitor tasks with the Tasks app
- Streamline approvals with the Approvals app
- Create, manage, and share schedules with the Shifts app

Share lists and track information with the Lists app

NOTE

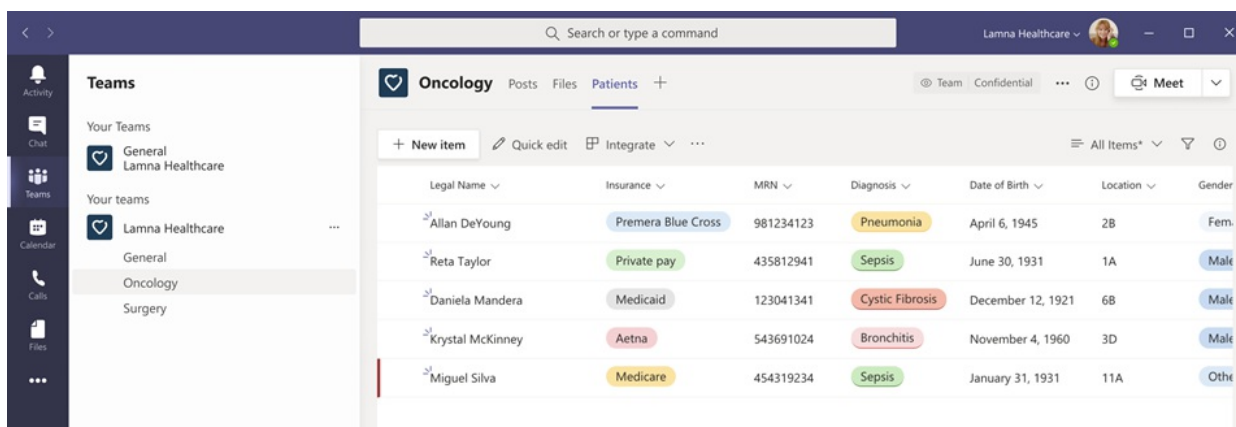

Effective October 30, 2020, the Patients app has been retired and replaced by the [Lists app](#) in Teams. With Lists, care teams in your healthcare organization can create patient lists for scenarios ranging from rounds and interdisciplinary team meetings to general patient monitoring.

The Lists app in Teams helps teams track information and organize work. The app is pre-installed for all Teams users and is available as a tab in every team and channel. Lists can be created from scratch, from predefined templates, or by importing data to Excel.

Health teams can use the Patients template to get started. They can create lists to track the needs and status of patients. Existing patient data on Excel spreadsheets can be brought in to create a list in Teams. These lists can be used for scenarios such as rounds and patient monitoring to coordinate care.

For example, a charge nurse creates a patient list in a team that includes all health team members. During rounds, the health team access Teams on their mobile devices and update patient information in the list, which everyone on the team can view to stay in sync. At rounding sessions where the health team gathers to discuss and evaluate key health performance metrics to ensure a patient is on the right glide path to discharge, they can share this information using Teams on a large display screen. health team members who aren't on site can join remotely.

Here's an example list which was set up for patient rounding.

Legal Name	Insurance	MRN	Diagnosis	Date of Birth	Location	Gender
Allan DeYoung	Premiera Blue Cross	981234123	Pneumonia	April 6, 1945	2B	Fem.
Reta Taylor	Private pay	435812941	Sepsis	June 30, 1931	1A	Male
Daniela Mandera	Medicaid	123041341	Cystic Fibrosis	December 12, 1921	6B	Male
Krystal McKinney	Aetna	543691024	Bronchitis	November 4, 1960	3D	Male
Miguel Silva	Medicare	454319234	Sepsis	January 31, 1931	11A	Other

To learn more, see [Manage the Lists app for your organization in Teams](#).

Track and monitor tasks with the Tasks app

Use [Tasks](#) in Teams to track to do items for your whole health team. Your health team can create, assign, and schedule tasks, categorize tasks, and update status at any time, from any device running Teams. IT pros and admins can also publish tasks to specific teams for your organization. For example, you could publish a set of tasks for new safety protocols or a new intake step to be used across a hospital.

To learn more, see [Manage the Tasks app for your organization in Microsoft Teams](#)

Streamline approvals with the Approvals app

Use [Approvals](#) to streamline all of your requests and processes with your team. Create, manage, and share approvals directly from your hub for teamwork. Start an approval flow from the same place you send a chat, in a channel conversation, or from the Approvals app itself. Just select an approval type, add details, attach files, and choose approvers. Once submitted, approvers are notified and can review and act on the request.

You can allow the Approvals app for your organization and add it to your teams. To learn more, see [Teams Approvals app availability](#).

Create, manage, and share schedules with the Shifts app and Frontline Worker integration

Teams integrates with the Shifts app and Frontline Worker, which can be used to coordinate shift staffing features and more. For example, in Shifts, Nurse managers can set up and coordinate schedules for their staff, and nurses can check schedules and swap shifts. Teams includes a built-in Frontline Worker app setup policy that you can assign to Frontline Workers in your organization. By default, the policy includes the Activity, Shifts, Chat, and Calling apps. This policy controls behavior for these apps, for example, pinning the Shifts app to the app bar so the team can quickly access it.

To learn more, see [Manage the Shifts app for your organization in Microsoft Teams](#).

Help your clinical and information workers get going with Teams

There are many resources available to help all of the users in your organization get comfortable with using Teams:

- Visit the [Teams adoption center](#) for advice on rolling out Teams if you are just starting your organization's journey with Teams, or expanding Teams into more areas of your organization.
- Consider setting up custom [learning pathways](#) for your users to cover just the tasks they need to do.
- Get help and training for your users on how to perform basic tasks in Teams on the [Teams support site](#), including [quick training videos](#). This site also has help and training for the Teams apps, including [Lists](#), [Tasks](#), [Approvals](#), [Bookings](#), and [Shifts](#).

Virtual visits with Teams – Integration into Cerner EHR

12/7/2021 • 6 minutes to read • [Edit Online](#)

The Microsoft Teams Electronic Health Record (EHR) connector makes it easy for clinicians to launch a virtual visit with a patient or consult with another provider in Microsoft Teams directly from the Cerner EHR system. Built on the Microsoft 365 cloud, Teams enables simple, secure collaboration and communication with chat, video, voice, and healthcare tools in a single hub that supports compliance with HIPAA, HITECH certification, and more.

The communication and collaboration platform of Teams makes it easy for clinicians to cut through the clutter of fragmented systems so they can focus on providing the best possible care. With the Teams EHR connector, you can:

- Conduct Teams virtual visits from your Cerner EHR system with an integrated clinical workflow.
- Enable patients to join Teams virtual visits from email or SMS notifications.
- View consumption data reports and customizable Call Quality information for EHR-connected visits.

This article describes how to set up and configure the Teams EHR connector to integrate with the Cerner platform. It also gives you an overview of the Teams virtual visits experience from the Cerner EHR system.

Before you begin

NOTE

Make sure you talk to your Cerner representative and review your Cerner integration guide before you enable the integration.

Prerequisites

Before you integrate the Teams EHR connector in your healthcare organization, you must have the following:

- An active subscription to Microsoft Teams EHR connector standalone offer (only enforced while testing in a production EHR environment).
- An appropriate Microsoft 365 or Office 365 license that includes Teams meetings.
- Teams is adopted and used in your healthcare organization.
- Your systems meet all [software and browser requirements](#) for Teams.
- Cerner version November 2018 or later

Set up the Teams EHR connector

The connector setup requires that you:

- [Launch the EHR connector configuration portal](#)
- [Enter configuration information](#)
- [Enable SMS notifications \(optional\)](#)
- [Review and finish the configuration](#)

IMPORTANT

These steps must be completed by the Microsoft 365 global admin in your organization.

Launch the EHR connector configuration portal

To get started, your Microsoft 365 admin launches the [EHR connector configuration portal](#) and signs in using their Microsoft credentials.

Your Microsoft 365 admin can configure a single department or multiple departments to test the integration. Configure the test and production URL in the configuration portal. Make sure to test the integration from the Cerner test environment before moving to production.

Enter configuration information

Next, to set up the integration, your Microsoft 365 admin adds a Fast Health Interoperability Resources (FHIR) base URL from Cerner and specifies the environment. Configure as many FHIR base URLs as needed, depending on your organization's needs and the environments you want to test.

The screenshot shows the 'Microsoft Teams EHR connector' configuration page for Cerner. The left sidebar has a 'Configuration information' section with links to 'SMS configuration' and 'Review and finish'. The main content area is titled 'Microsoft Teams and Cerner configuration' and includes instructions on creating and managing virtual visits. Below this, there is a section 'Add FHIR base URL' with a note stating that a FHIR base URL is needed and that the user must be a Microsoft 365 global admin. A table with one row shows a FHIR base URL and an environment. The FHIR base URL is 'https://fhir-ehr-code.cerner.com/r4/ec2458f2-1e24-41c8-b71b-0e701af7583d' and the environment is 'Testing'. There are 'Add FHIR base URL' and '0 item' buttons above the table. At the bottom right of the table are 'Done' and 'Cancel' buttons.

FHIR base URL	Environment
https://fhir-ehr-code.cerner.com/r4/ec2458f2-1e24-41c8-b71b-0e701af7583d	Testing

- The FHIR base URL is a static address that corresponds to your server FHIR API endpoint. An example URL is `https://lamnahealthcare.org/fihr/auth/connect-ocurprd-oauth/api/FHDST`.
- You can set up the integration for test and production environments. For initial setup, we encourage you to configure the connector from a test environment before moving to production.

After the FHIR base URL is validated and the environment is selected, choose **Done**. Then, add more FHIR base URLs for other environments, as needed.

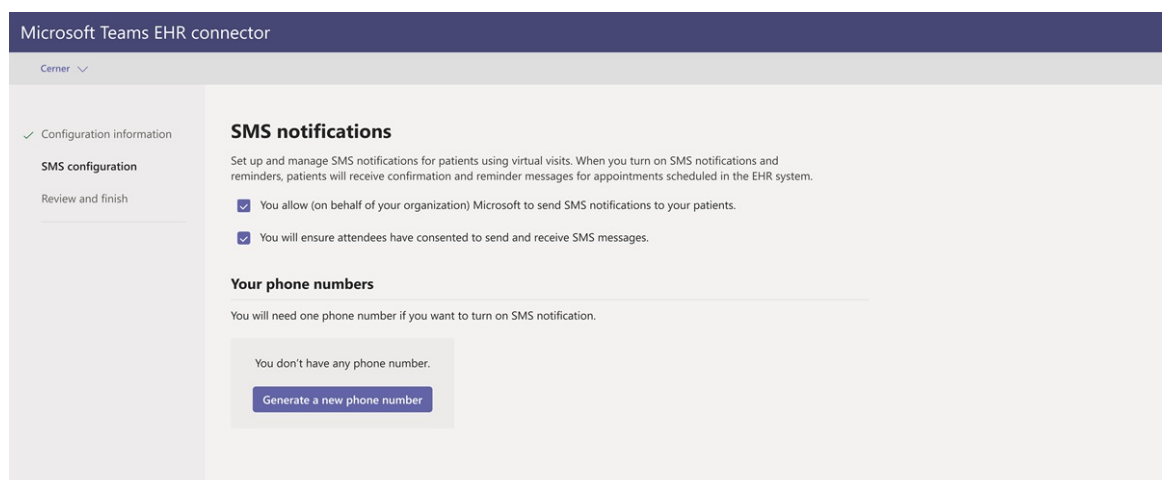

Select **Next** to go to the next step.

Enable SMS notifications (optional)

Complete this step if your organization wants Microsoft to manage SMS notifications for your patients. When you enable SMS notifications, your patients will receive confirmation and reminder messages for scheduled virtual visits.

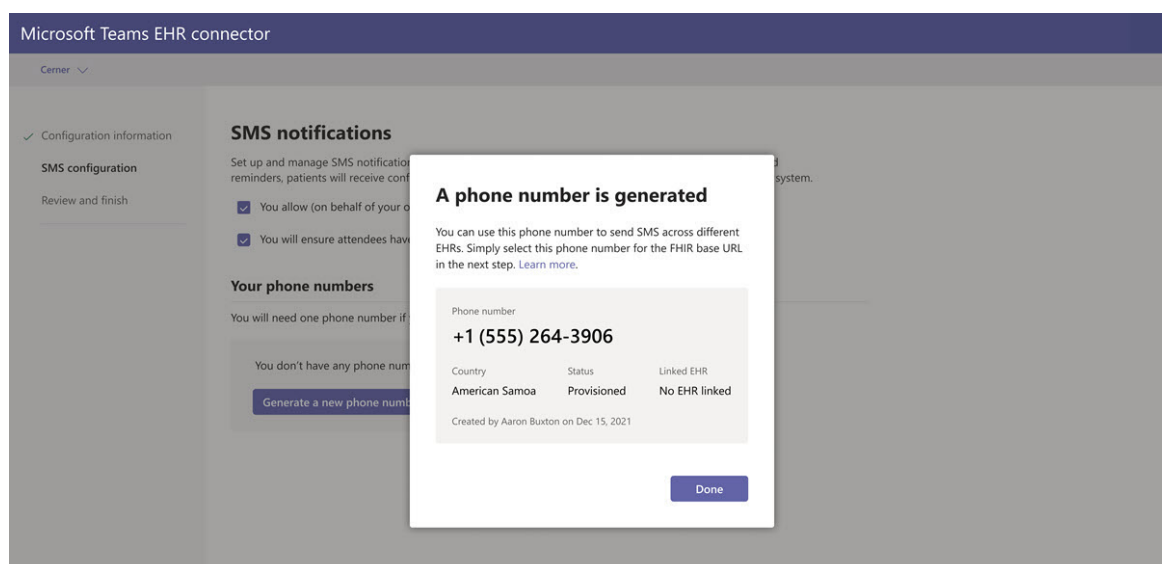

To enable SMS notifications, your Microsoft 365 admin does the following:

1. On the SMS notifications page, select both consent checkboxes to:
 - Allow Microsoft to send SMS notifications to patients on behalf of your organization.
 - Acknowledge that you'll ensure attendees have consented to send and receive SMS messages.

2. Under **Your phone numbers**, select **Generate a new phone number** to generate a phone number for your organization. Doing this starts the process to request and generate a new phone number. This process might take up to 2 minutes to complete.

After the phone number is generated, it's displayed on the screen. This number will be used to send SMS confirmations and reminders to your patients. The number has been provisioned but isn't linked to the FHIR base URL yet. You do that in the next step.

Choose **Done**, and then select **Next**.

3. To link the phone number to a FHIR base URL, under **Phone number** in the **SMS configuration** section, select the number. Do this for each FHIR base URL for which you want to enable SMS notifications.

Microsoft Teams EHR connector

Cerner

reminders, patients will receive confirmation and reminder messages for appointments scheduled in the EHR system.

✓ Configuration information

SMS configuration

Review and finish

Your phone numbers

Generate and delete phone number. You will need one phone number if you want to turn on SMS notification.

+ Generate new | 1 phone number

Phone number	Country	Linked EHR	Created by	Date created	Status	
+1 (555) 235-2355	American Samoa	No linked EHR	Aaron Buxton	Dec 15, 2021	Provisioned	...

SMS configuration

You can turn SMS notifications on or off for each FHIR issuer URL. This allows you to control the type of message you want to send and the frequency of the messages.

FHIR base URL	Environment	Phone number	
https://lanmahealthcare.org/fhir/auth/connect-ocurprd-oauth/api/QLMAW	Testing	Link a phone number	SMS setup
https://lanmahealthcare.org/fhir/auth/connect-ocurprd-oauth/api/FHDST	Production	+1 (555) 235-2355 Linked with Cerner	SMS setup

If this is the first time you're configuring the connector, you'll see the FHIR base URL that was entered in the earlier step. The same phone number can be linked to multiple FHIR base URLs, which means that patients will receive SMS notifications from the same phone number for different organizations and/or departments.

Select **Next**.

Review and finish the configuration

You'll be presented with integration records for patient and provider launch. These records are necessary to complete the virtual visit configuration in Cerner. For more information, see the Cerner-Microsoft Teams Telehealth Integration guide.

NOTE

At any time, your Microsoft 365 admin can sign in to the configuration portal to view integration records and change configuration settings, if needed.

Launch Teams virtual visits

After completing the EHR connector steps and Cerner configuration steps, your organization is ready to support video visits with Teams.

Virtual visits prerequisites

- Your systems must meet all [software and browser requirements](#) for Teams.
- You completed the integration setup between the Cerner organization and your Microsoft 365 organization.

Provider experience

Healthcare providers in your organization can join virtual visits using Teams from the PowerChart portal. The provider must navigate to the patient board where the Teams option is available.

From there, the provider can view virtual visit information, join virtual visits, and send the meeting link. After the one-time sign-in, the provider is taken directly to the virtual appointment in Teams.

Key features of the provider experience:

- Providers can join virtual visits using supported browsers or the Teams app.
- Providers can use all supported Teams meeting features, including screen sharing, custom background, and recording.
- Providers can see real-time updates of patients connecting to a virtual visit for a given appointment in

PowerChart.

- Provider information isn't visible to patients during the virtual visit.

Patient experience

The connector supports patients joining virtual visits through a link in the SMS text message. At the time of the appointment, patients can start a virtual visit by tapping the link in the SMS text message.

Key features of the patient experience

- Patients can join virtual visits from modern web browsers on desktop and [mobile without having to install the Teams app](#).
- Patients can join virtual visits with a single click and no other account or sign-in is required.
- Patients aren't required to create a Microsoft account or sign in to launch a virtual visit.
- Patients are placed in a lobby until the provider joins the appointment and admits them to the virtual visit.
- Patients can test their video and microphone in the lobby before joining the virtual visit.

Privacy and location of data

Teams integration into EHR systems optimizes the amount of data that's used and stored during integration and virtual visit flows. The solution follows the overall Teams privacy and data management principles and guidelines outlined in Teams Privacy.

The Teams EHR connector doesn't store or transfer any identifiable personal data or any health records of patients or healthcare providers from the EHR system. The only data that the EHR connector stores is the EHR user's unique ID, which is used during Teams meeting setup.

The EHR user's unique ID is stored in one of the three geographic regions described in [Where your Microsoft 365 customer data is stored](#). All chats, recordings, and other data shared in Teams by meeting participants are stored according to existing storage policies. To learn more about the location of data in Teams, see [Locations of data in Teams](#).

Virtual visits with Teams – Integration into Epic EHR

12/7/2021 • 6 minutes to read • [Edit Online](#)

Microsoft Teams Electronic Health Record (EHR) connector makes it easy for clinicians to launch a virtual patient visit or consultation with another provider in Teams directly from the EHR system. Built on the Microsoft 365 cloud, Microsoft Teams enables simple, secure collaboration and communication with chat, video, voice, and healthcare tools in a single hub that supports compliance with HIPAA, HITECH certification, and more. The communication and collaboration platform of Teams makes it easy for clinicians to cut through the clutter of fragmented systems so they can spend time providing the best possible care. Microsoft Teams Electronic Health Record (EHR) connector can:

- Launch Teams virtual visits from the provider EHR system with an integrated clinical workflow.
- Enable patients to join Teams virtual visits from within the patient portal.
- Write metadata back to the EHR system regarding Teams virtual visits to record when attendees connect and disconnect and enable automatic auditing and record keeping.

Watch the video of [How to manage virtual visits from the EHR portal](#).

Before you begin

You'll need to make sure you have the following prerequisites before you can integrate the EHR connector:

- Access to use the Microsoft Teams app in [Epic's App Orchard marketplace](#).
- Active subscription to Microsoft Cloud for Healthcare or subscription to Microsoft Teams EHR connector standalone offer (only enforced during production testing).
- Users must have an appropriate Microsoft 365 or Office 365 license that includes Microsoft Teams meetings.
- Microsoft Teams should be adopted and used inside the organization.
- Organizations must have with Epic version November 2018 or later.
- Your systems must meet all [software and browser prerequisites](#).

You'll also need information from the following people in your organization:

- Microsoft 365 administrator
- Epic customer analyst

NOTE

Review the [Epic-Microsoft Teams Telehealth Integration Guide](#) with your Epic technical specialist. Make sure that all prerequisites are completed.

Connector setup

The connector setup requires that you:

- [Launch the EHR connector configuration portal](#)
- [Configuration information](#)
- [Approve or view configuration](#)
- [Review and finish the configuration](#)

Launch the EHR connector configuration portal

Configuring your healthcare organization to launch virtual visits with Microsoft Teams starts by launching the EHR connector configuration portal. You configure a single or multiple organizations to test the integration. Configure the test and production URL in the configuration portal. Test the integration from Epic's test environment before moving to production.

- EHR connector configuration URL: <https://ehrconnector.teams.microsoft.com>

The Microsoft 365 admin and Epic customer analyst from your organization must complete the information and integration steps in the configuration portal. For Epic configuration steps, contact the Epic technical specialist resource assigned to your organization.

Configuration information

This step is to be completed by the **Microsoft 365 administrator**. The Microsoft 365 administrator must launch the connector configuration portal and sign in with Microsoft credentials to start the configuration process.

To complete this step, the Microsoft 365 administrator must receive a valid Fast Health Interoperability Resources (FHIR) base URL from your Epic technical specialist and the username of the Epic customer analyst who will be approving the configuration. The Microsoft 365 administrator must launch the connector configuration page and sign in with Microsoft credentials to start the configuration process.

- The FHIR base URL is a static address corresponding to your server FHIR API endpoint. An example URL is `https://lamnahealthcare.org/fhir/auth/connect-ocurprd-oauth/api/FHDST`.
- Configuration approver name is the name of the Epic customer analyst who will be responsible for approving the configuration in the next step. The Epic customer analyst is a person in your organization with sign-in access to Epic.

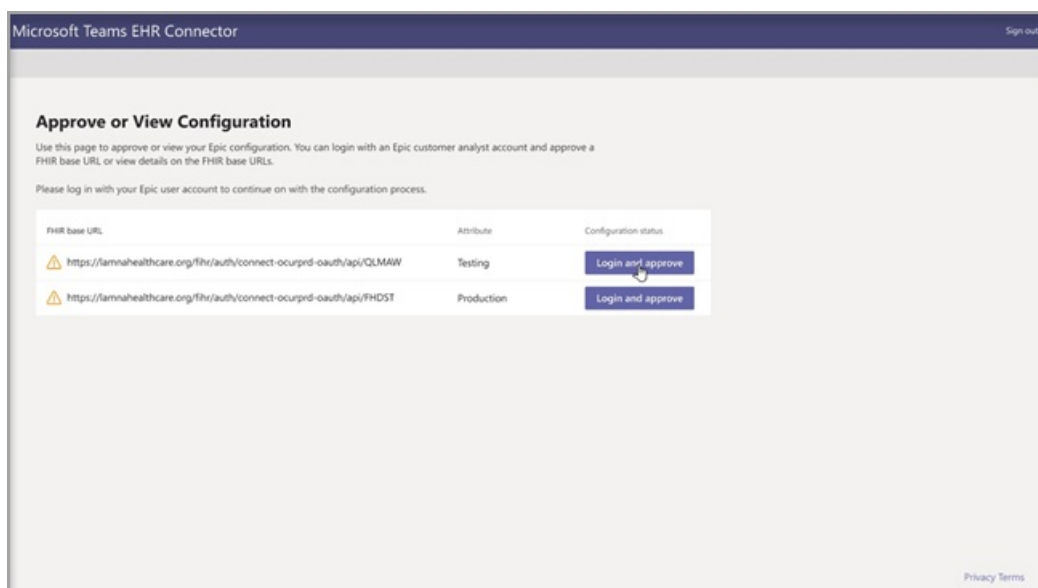

The screenshot shows the 'Microsoft Teams EHR Connector' configuration portal. The main heading is 'Microsoft Teams and Epic configuration'. Below this, there's a description: 'Create and manage virtual visits configuration between Microsoft Teams and your electronic health record (EHR) system. Once you set up an Epic configuration, patients and providers can launch Teams meetings from Epic online health appointments.' A section titled 'Add FHIR base URL and Epic customer analyst approver' explains that a FHIR base URL is needed from the Epic customer analyst. A table with two rows is shown, with columns for 'FHIR base URL', 'Environment', and 'Epic customer analyst'. The first row is for 'Testing' and the second for 'Production'. A dropdown menu for 'Needs Approval (1)' is open, showing a list of Epic customer analysts: Aaron Buxton (abuxto...), Ava Lewis (alewis), Alex Miller (amiller), and Anthony Naidoo (anal...). The 'Next' button is at the bottom left.

Approve or view configuration

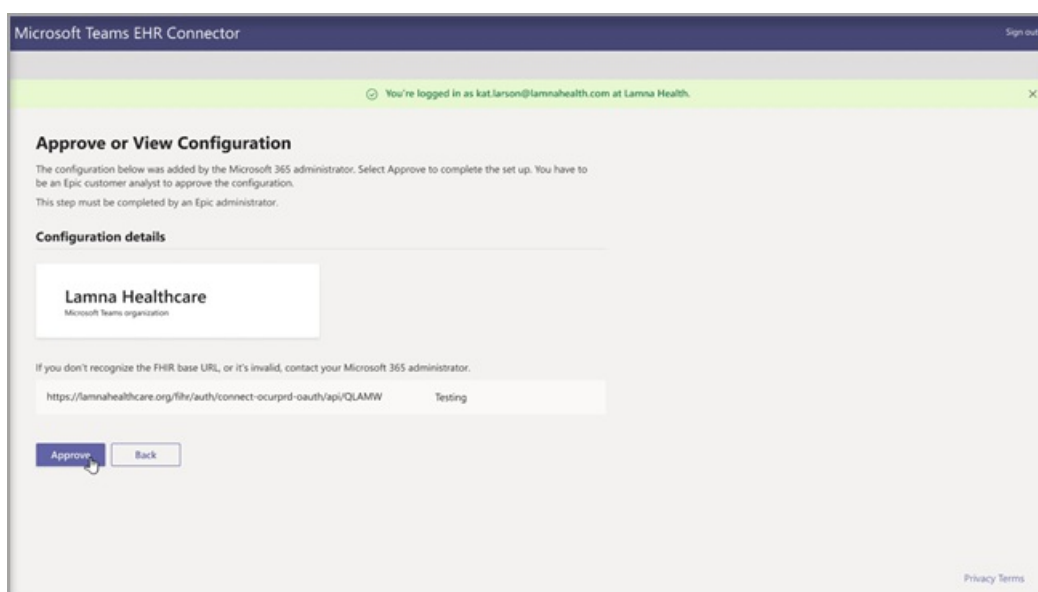

The Epic customer analyst for your healthcare organization who was added as an approver must now use the same EHR connector URL from the previous step to sign in using their Microsoft 365 credentials. After successful validation, the approver is going to be asked to sign in using their Epic credentials to validate the Epic organization.

NOTE

The Microsoft 365 admin and Epic customer analyst in your organization can be the same person. In that case, add your own username as approver. You'll still need to sign in to Epic to validate your access. The Epic sign in is only used to validate your FHIR base URL. Microsoft won't store credentials or access EHR data with this sign in.

After a successful Epic sign in, the Epic customer analyst **must** approve the configuration. If the configuration isn't correct, the Microsoft 365 admin will have the ability to modify the original configurations by signing in to the Microsoft EHR connector portal again.

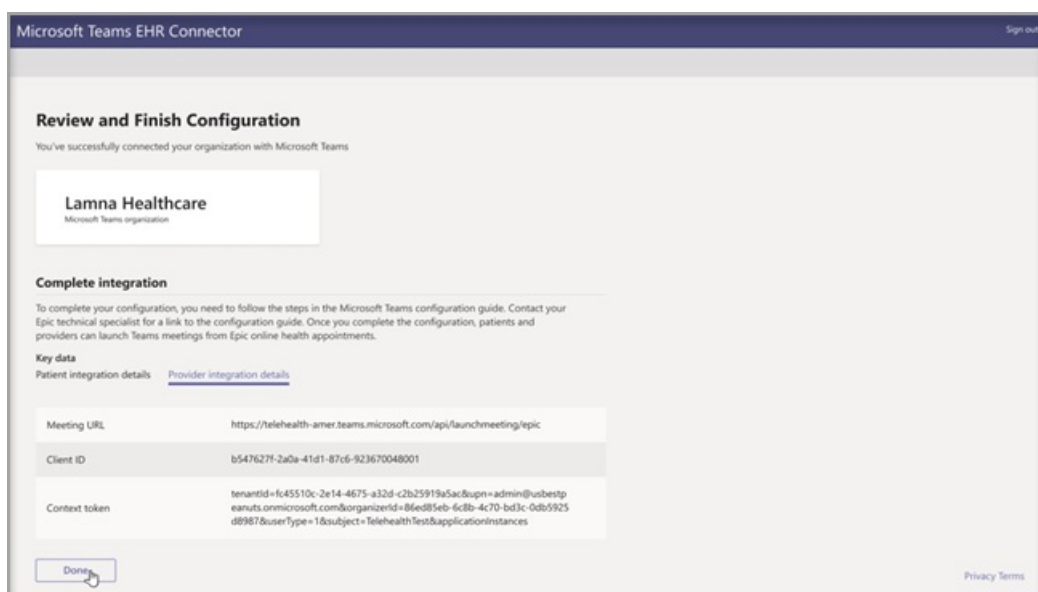

Review and finish the configuration

When the configuration information is approved by the Epic administrator, you'll be presented with integration records for patient and provider launch. These records are necessary to complete the virtual visit configuration in Epic. Refer to the Epic-Microsoft Teams Telehealth Integration guide for more details.

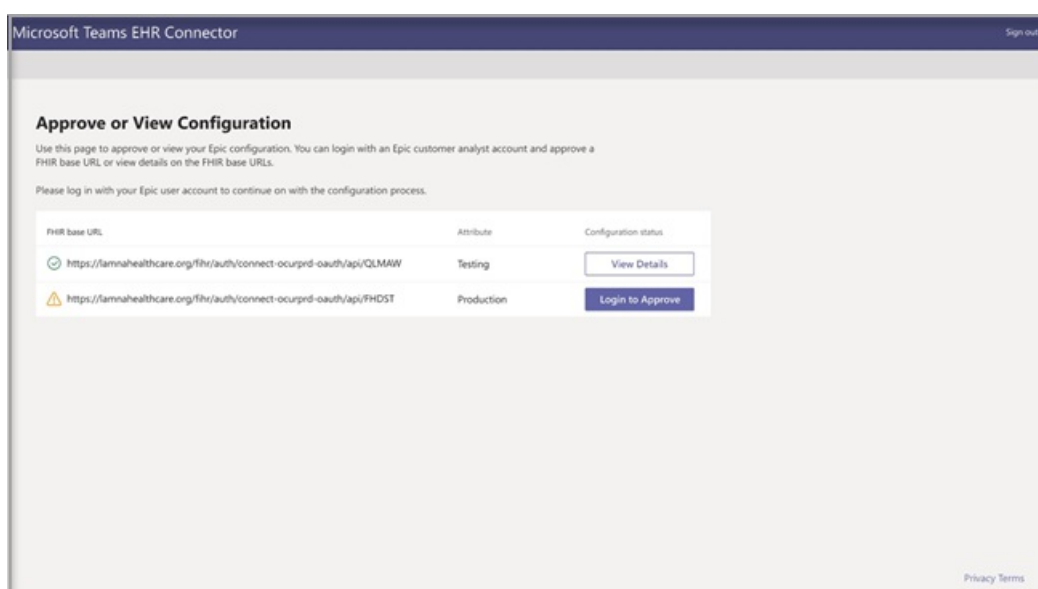

NOTE

At any time the Microsoft 365 or Epic customer analyst can sign in to the configuration portal to view integration records and modify organization configuration, if needed.

NOTE

The approval process must be completed by the Epic customer analyst for every FHIR URL configured by the Microsoft admin before.

Launch Teams virtual visits

After completing the EHR connector steps and Epic configuration, your organization is ready to support video visits with Microsoft Teams.

Virtual visit prerequisites

- Your systems must meet all [software and browser prerequisites](#).
- Healthcare organization must have completed the setup between the Epic organization and Microsoft 365 organization.

Provider experience

Healthcare providers from your organization can also join virtual visits with Microsoft Teams from their Epic provider applications (Hyperspace, Haiku, Canto). The **Begin virtual visit** button is embedded in the provider flow.

Key features of the provider experience:

- Providers can join virtual visits using supported browsers or the Microsoft Teams application.
- Providers must do a one-time sign-in with their Microsoft 365 account when joining a virtual visit for the first time.
- After the one-time sign-in, the provider will be taken straight to the virtual appointment in Microsoft Teams. (Provider must be signed-in to Microsoft Teams).
- Provider can see real-time updates of participants connect and disconnect for a given appointment. The provider can see when the patient is connected to a virtual visit.

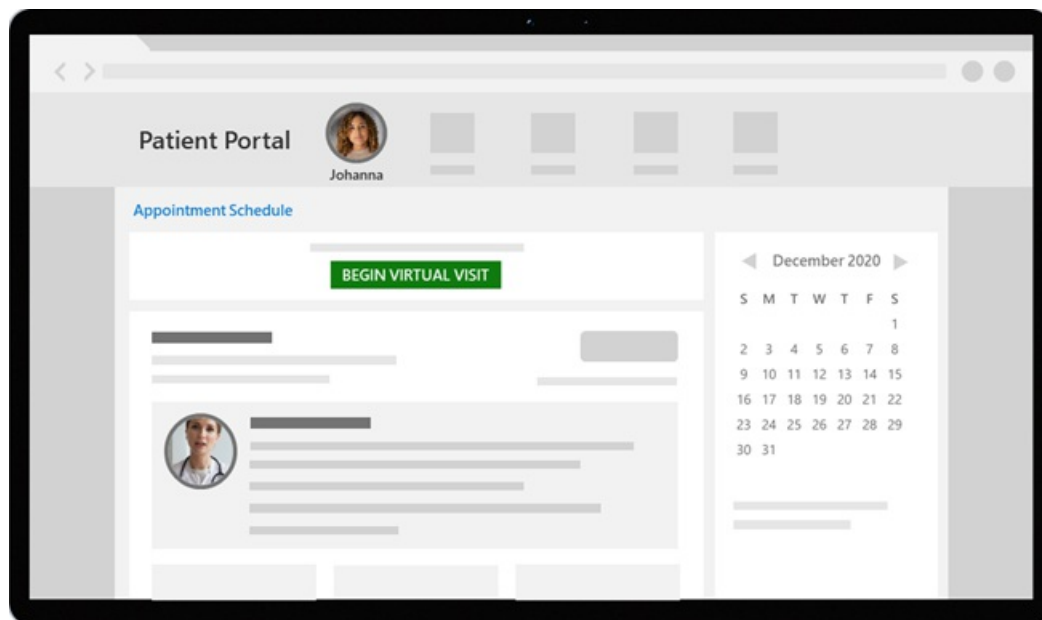

Patient experience

The connector supports patients joining virtual visits through MyChart web and mobile. At the time of the appointment, patients can start a virtual visit from MyChart using the **Begin virtual visit** button.

Key features of the patient experience:

- Patients can join virtual visits from modern web browsers on desktop and [mobile without app installation](#).
- Patients can join virtual visits with a single click and there is no other account or sign-in required.
- Patients aren't required to create a Microsoft account or sign in to launch a virtual visit.
- Patients will be placed in a lobby until the healthcare provider joins the appointment and admits them to the virtual visit.
- Testing of the video and microphone is available in the lobby before joining the virtual visit.

NOTE

Epic, MyChart, Haiku, and Canto are trademarks of Epic Systems Corporation.

Privacy and location of data

Teams integration into EHR systems optimizes the amount of data being used and stored during integration and virtual visit flows. The solution follows the overall Teams privacy and data management principles and guidelines outlined in Teams Privacy.

The Microsoft Teams EHR connector doesn't store nor transfer any identifiable personal data or any health records of patients or healthcare providers from the EHR system. The only data that is stored by the EHR connector is the EHR user's unique ID, which is used during Teams meeting setup. The EHR user's unique ID is stored in one of the three geographic regions described in [Where your Microsoft 365 customer data is stored](#). All chat, recordings, and other data entered into Teams by the meeting participants are stored according to existing storage policies. If you want to learn more information on the location of data in Microsoft Teams, visit [Locations of data in Teams](#).

Virtual visits with Microsoft Teams and the Bookings app

12/7/2021 • 4 minutes to read • [Edit Online](#)

Overview

The [Bookings app](#) in Microsoft Teams gives organizations a simple way to schedule and manage virtual appointments for staff and attendees. Use it to schedule virtual appointments such as healthcare visits, financial consultations, interviews, customer support, virtual shopping experiences, education office hours, and more.

The Bookings app makes it easy to manage complex scheduling demands of any organization. Schedulers can manage multiple department and staff calendars, as well as communications with internal and external attendees, from a single experience.

The virtual visits are held through Microsoft Teams meetings, which offers robust video conferencing capabilities. For example, a doctor can share their screen and review test results with a patient. Or, a banking advisor can request electronic signatures on documents, allowing them to close transactions remotely.

Each virtual appointment includes a Teams meeting link that's sent to attendees in email where they can easily join from a web browser or in Teams on any device. Automated email reminders help reduce no-shows and enhance customer and client engagement.

With Bookings, you get an experience that's tailored to your industry. Here's a few examples of how you can use it in your organization:

INDUSTRY	EXAMPLES
Financial services	Virtual visits for remote sales and service Schedule and manage virtual appointments for bank relationship managers, financial advisors, and claims adjusters, just to name a few, to serve your customers with increased efficiency and convenience.
Healthcare	Virtual visits for patient care Schedule and manage virtual visits for your care team members to meet with patients or other healthcare providers to discuss medical care.
Retail	Virtual shopping experiences Schedule and manage appointments for your sales associates, product experts, and design consultants to conduct virtual shopping experiences with customers.

This article gives you an overview of how to use the Bookings app in Teams to schedule, manage, and conduct virtual visits.

Before you get started

If you're an admin, see [Manage the Bookings app in Teams](#) to learn about the prerequisites for using the Bookings app in Teams, how to control access to Bookings in your organization, and recommended policy and admin settings.

Remember that only schedulers in your organization need to have the Bookings app installed in Teams. Staff who conduct or participate in virtual appointments don't need the app. They join appointments from their Teams or Outlook calendar or by using the meeting link in their booking confirmation email.

Set up a new booking calendar

Create the booking calendar

In Teams, go to **Bookings > Get started**, and then select **New booking calendar**. Complete the form and be sure to choose the relevant business type for your organization.

Add a new booking calendar

The business name you enter will be used to create the email address for sending booking invites (e.g., businessname@domain.com)

Business or department name *

Contoso

Business type *

Select business type

Healthcare

Financial services

Education

IT Support

Sales

Recruiting

Other

If you're a larger organization, consider creating more than one booking calendar if you want attendees to receive a booking email from a specific department rather than your overall organization. To learn more, see [Create a Bookings calendar](#).

NOTE

If this isn't your first time in the Bookings app or if you want to work in an existing booking calendar, in Bookings, select the dropdown arrow next to your organization name, and then choose **Existing booking calendar**. From here, you can search for the one you want.

Add staff

In the booking calendar, go to **More options (...)** > **Settings**, and then select **Staff**. Add staff members and assign a role to each person you add.

The Bookings app integrates with Outlook. After you add staff, you'll be able to view that person's calendar availability and schedule bookings for them. To learn more, see [Add staff and view a Bookings calendar](#).

Create appointment types

Create specific appointment types to represent the services offered by your organization and to tailor the booking experience.

In the booking calendar, go to **More options (...)** > **Appointment types**, and then select **New appointment type**. Enter a name—for example, Account opening, Prescription renewal, Loan consultation, Tax preparation—and any other information and settings you want.

The information and links that you add are included in the email confirmation that's sent to attendees every time this type of appointment is booked. You can even set email reminders and other options such as whether attendees can [join from a mobile browser](#) without having to download Teams. To learn more, see [Create an appointment type](#).

Schedule a virtual visit

In the booking calendar, select **New booking**. Select an appointment type, and then fill out the relevant information.

This includes attendee contact information, the staff member who will be providing the service, internal notes that only staff can see, email reminders, and whether the attendee can join from a mobile browser. To learn more, see [Schedule a booking in the Teams Bookings app](#).

The email confirmation sent to the attendee includes the meeting link and an attachment so that they can add the virtual appointment to their calendar. Staff also receive an email confirmation and meeting invite.

Conduct a virtual visit

In your Teams or Outlook calendar, go to the booking, and then select **Join** or the Teams meeting link. Check your audio and video settings, and then select **Join now**. To learn more, see [Conduct a Bookings appointment](#).

Additional capabilities with the Bookings web app

The Bookings web app gives you additional capabilities. For example, you can publish a self-serve online booking page where people can schedule appointments with your staff. To access the Bookings web app, go to **More options (...)** > **Open Bookings web app**.

To learn more, see [Microsoft Bookings](#).

Manage the join experience for Teams virtual visits on mobile browsers

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Teams makes it easy for people to join appointments on their mobile devices without having to download Teams. For a more seamless experience, attendees can join appointments such as healthcare visits, financial consultations, educator office hours, and so on, from a mobile browser. Attendees don't need to install the Teams mobile app on their Android or iOS mobile devices.

With mobile browser join, when an attendee joins an appointment from a mobile device, they aren't prompted to download Teams. Instead, Teams opens in a mobile browser, where the attendee can select **Join now** to join. With this feature, keep in mind that if Teams is already installed on an attendee's mobile device, Teams will open in a mobile browser and not in the app.

Currently, mobile browser join is available for appointments that are scheduled through the following:

- [The Bookings app](#)
- Microsoft Teams Electronic Health Records (EHR) connector
 - Integration with [Cerner EHR](#)
 - Integration with [Epic EHR](#)

Set up mobile browser join

Appointments scheduled through the Bookings app

Schedulers in your organization can turn on this feature for specific appointment types and for individual appointments in the Bookings app.

After this feature is turned on, the confirmation email or SMS text that's sent to attendees will contain a meeting join link that opens Teams in a mobile browser. On Android mobile devices, Teams opens in Chrome. On iOS mobile devices, Teams opens in Safari.

Turn on mobile browser join for an appointment type

In Bookings, go to **Settings > Appointment types**, select an [appointment type](#), and then turn on **Allow attendees to join from a mobile browser**. Doing this enables mobile browser join for all appointments of this type.

Edit appointment type

Fields with * are required

Title *

Virtual visit

Confirmation message ⓘ

B *I* U Paragraph

Add links or info to include in the invite for this appointment type

Attendee options

☒ Allow attendees to join from a mobile browser

Turn on mobile browser join for an individual appointment

In Bookings, select **New booking**, and then turn on **Allow attendees to join from a mobile browser**.

Appointments scheduled through the Teams EHR connector

No set up is needed by you or your staff!

Integration with Cerner EHR: The Teams EHR connector supports patients joining virtual visits through mobile. At the time of the appointment, patients can join a virtual visit by tapping the link in the SMS text message. The patient chooses the browser they want, and then Teams opens in that browser.

Integration with Epic EHR: The Teams EHR connector supports patients joining virtual visits through MyChart web and mobile. At the time of the appointment, patients can start a virtual visit from MyChart by using the **Begin virtual visit** button. The patient chooses the browser they want, and then Teams opens in that browser.

Supported mobile browsers

Here are the mobile browsers that are currently supported. We support the latest version plus two previous versions, unless otherwise indicated.

PLATFORM	CHROME	SAFARI	EDGE (CHROMIUM)
Android	✓		
iOS		✓ ¹	
macOS		✓ ²	

¹ iOS apps on Safari can't select microphone and speaker devices. For example, Bluetooth devices. This is a limitation of the operating system, which controls the default device selection.

² Safari 14+ and macOS 11+ is needed for outgoing video support.

Things to consider

The staff member who conducts the virtual visit can share their screen from their Teams desktop, mobile, or web client with an attendee who joins from a mobile browser. However, attendees can't share their screen from a mobile browser.

NOTE

We're adding more capabilities to the meeting join experience in future releases of Teams, so check back for the most up-to-date information. To stay on top of upcoming Teams features, check out the [Microsoft 365 Roadmap](#).

Teams policy packages for healthcare

12/7/2021 • 4 minutes to read • [Edit Online](#)

Overview

A [policy package](#) in Microsoft Teams is a collection of predefined policies and policy settings that you can assign to users who have similar roles in your organization. Policy packages simplify, streamline, and help provide consistency when managing policies. You can customize the settings of the policies in the package to suit the needs of your users. When you change the settings of policies in a policy package, all users who are assigned to that package get the updated settings. You can manage policy packages by using the Microsoft Teams admin center or PowerShell.

Policy packages pre-define policies for the following, depending on the package:

- Messaging
- Meetings
- Calling
- App setup
- Live events

Teams currently includes the following healthcare policy packages.

PACKAGE NAME IN THE MICROSOFT TEAMS ADMIN CENTER	BEST USED FOR	DESCRIPTION
Healthcare clinical worker	Clinical workers in your healthcare organization	Creates a set of policies and policy settings that give clinical workers such as registered nurses, charge nurses, physicians, and social workers full access to chat, calling, shift management, and meetings.
Healthcare information worker	Information workers in your healthcare organization	Creates a set of policies and policy settings that give information workers such as IT personnel, informatics staff, finance personnel, and compliance officers, full access to chat, calling, and meetings.
Healthcare patient room	Patient room devices	Creates a set of policies and policy settings that apply to patient rooms in your healthcare organization.

Policy packages

A policy package is a collection of predefined policies and settings that can be customized and applied to a group of users that have similar roles within your organization. The definitions in these policy packages aren't meant to assist with regulatory compliance, rather they are provided for your convenience and can be customized based on your own regulatory requirements. [Learn more](#)

Manage users		
<input checked="" type="checkbox"/>	Name	Description
	Education (Higher education student)	This policy package is designed to create a set of policies and apply those settings to higher education students in your organization.
	Education (Primary school student using remote learn...	This policy package is designed to create a set of policies that apply to primary students to maximize student safety and collaboration wh
	Education (Primary school teacher using remote learn...	This policy package is designed to create a set of policies that apply to primary teachers to maximize student safety and collaboration wh
	Education (Primary school student)	This policy package is designed to create a set of policies and apply those settings to primary students in your organization.
	Education (Secondary school student)	This policy package is designed to create a set of policies and apply those settings to secondary students in your organization.
	Education (Teacher)	This policy package is designed to create a set of policies and apply those settings to teachers in your organization.
	Firstline manager	The policy package is designed to create a set of policies and apply those settings to managers of firstline workers in your organization.
	Firstline worker	This policy package is designed to create a set of policies and apply those settings to firstline workers in your organization.
	Healthcare clinical worker	This policy package is designed to create a set of policies and apply those settings to clinical workers in your healthcare organization.
	Healthcare information worker	This policy package is designed to create a set of policies and apply those settings to information workers in your healthcare organization
	Healthcare patient room	This policy package is designed to create a set of policies and apply those settings to patient rooms in your healthcare organization.
	Public safety officer	This policy package is designed to create a set of policies and apply those settings to public safety officers in your organization.
	Small and medium business user (Business Voice)	This policy package is designed to set an app setup policy that includes the app for a business voice experience for Teams users.

Each individual policy is given the name of the policy package so you can easily identify the policies that are linked to a policy package. For example, when you assign the Healthcare clinical worker policy package to clinicians in your organization, a policy named Healthcare_ClinicalWorker is created for each policy in the package.

Healthcare clinical worker

This policy package is designed to create a set of policies and apply those settings to clinical workers in your healthcare organization. [Learn more](#)

Assigned policies

Messaging policy	Healthcare_ClinicalWorker
Meeting policy	Healthcare_ClinicalWorker
App setup policy	Healthcare_ClinicalWorker

Get started with policy packages

To get you started with Healthcare policy packages, on the Microsoft Admin Center onboarding hub, select **Healthcare**, and then select **Assign policy settings by role**. Once you're ready to get started, decide which policy packages you'd like to assign individuals in your organization to.

Select **View policy details** to learn more about the specific policies in a package and their respective settings. These [can be customized](#) after assignment in the Teams Admin Center.

Choose one or multiple packages to assign and then click **Next**. You can search for and add people to the policy package best suited for their role. An individual can't be assigned to more than one policy package at one time.

Once you've added people to the right policy package, **Finish** finalizes your selections. You can continue to customize and manage policy packages in the Microsoft Teams admin center.

Manage policy packages

View

View the settings of each policy in a policy package before you assign a package. In the left navigation of the Microsoft Teams admin center, go to **Policy packages**, select the package name, and then select the policy name.

Decide whether the predefined values are appropriate for your organization or whether you need to customize them to be more restrictive or lenient based on your organization's needs.

Customize

Customize the settings of policies in the policy package, as needed, to fit the needs of your organization. Any changes you make to policy settings are automatically applied to users who are assigned the package. To edit the settings of a policy in a policy package, in the left navigation of the Microsoft Teams admin center, go to **Policy packages**, select the policy package, select the name of the policy you want to edit, and then select **Edit**.

Keep in mind that you can also change the settings of policies in a package after you assign the policy package. To learn more, see [Customize policies in a policy package](#).

Assign

Assign the policy package to users. If a user has a policy assigned, and then later you assign a different policy, the most recent assignment will take priority.

NOTE

Each user will require the Advanced Communications add-on in order to receive a custom policy package assignment. For more information, see [Advanced Communications add-on for Microsoft Teams](#).

Assign a policy package to one or several users

To assign a policy package to one or multiple users, in the left navigation of the Microsoft Teams admin center, go to **Policy packages**, and then select **Manage users**.

The screenshot shows the Microsoft Teams admin center interface. On the left is a navigation pane with various options, including 'Policy packages' which is currently selected. The main area displays a list of policy packages under the 'Manage users' heading. The list includes packages for different roles like 'Education (Higher education student)', 'Education (Primary school student using remote learn...', 'Education (Primary school teacher using remote learn...', 'Education (Primary school student)', 'Education (Secondary school student)', 'Education (Teacher)', 'Firstline manager', 'Firstline worker', 'Healthcare clinical worker' (which is highlighted), 'Healthcare information worker', 'Healthcare patient room', and 'Public safety officer'. Each entry has a description. To the right, a 'Manage users' dialog box is open, showing a search bar with 'Amos Marble' entered and a dropdown menu displaying 'AM Amos Marble'. Below the search bar is an information icon and a note: 'To add users, search by their display or username.' At the bottom of the dialog are 'Apply' and 'Cancel' buttons.

To learn more, see [Assign a policy package](#).

If a user has a policy assigned, and then later you assign a different policy, the most recent assignment will take priority.

Assign a policy package to a group

This feature is in private preview

Policy package assignment to groups let you assign multiple policies to a group of users, such as a security group or distribution list. The policy assignment is propagated to members of the group according to precedence rules. As members are added to or removed from a group, their inherited policy assignments are updated accordingly. This method is recommended for groups of up to 50,000 users but will also work with larger groups.

To learn more, see [Assign a policy package to a group](#).

Assign a policy package to a large set (batch) of users

Use batch policy package assignment to assign a policy package to large sets of users at a time. You use the [New-CsBatchPolicyPackageAssignmentOperation](#) cmdlet to submit a batch of users and the policy package that you want to assign. The assignments are processed as a background operation and an operation ID is generated for each batch.

A batch can contain up to 5,000 users. You can specify users by their object Id, UPN, SIP address, or email address. To learn more, see [Assign a policy package to a batch of users](#).

Secure Messaging for healthcare organizations

12/7/2021 • 4 minutes to read • [Edit Online](#)

Messaging policies are used to control which chat and channel messaging features are available to users in Microsoft Teams, and are part of the overall deployment of Secure Messaging for healthcare organizations like Hospitals, clinics, or doctor's offices, where having a message picked up and acted upon in a timely manner is crucial, as is knowing when crucial messages are read.

You can use the global (Org-wide default) policy or create one or more custom messaging policies for people in your organization. Users in your organization will automatically get the global policy unless you create and assign a custom policy. After you create a custom policy, assign it a user or groups of users in your organization. For example, you may choose to only allow certain job roles to use these features (perhaps doctors and nurses only) and other workers (like the janitorial or kitchen staff) to get a more limited set of features. Decide for yourself what needs your organization has, the guidance here is at most a suggestion.

Policies can be easily managed in the [Microsoft Teams admin center](#) by logging in with administrator credentials and choosing **Messaging policies** in the left navigation pane.

Messaging policies

Messaging policies are used to control what chat and channel messaging features are available to users in Teams. You can use the Global (Org-wide default) policy or create one or more custom messaging policies for people in your organization. [Learn more](#)

The following settings are of special interest for Healthcare applications, and should be considered when designing a custom policy used in the Healthcare field:

Read receipts

Read receipts allows the sender of a chat message to know when their message was read by the recipient in 1:1 and group chats 20 people or less. Use this setting to specify whether read receipts are user controlled, on for everyone, or off for everyone. Message read receipts are important in Healthcare organizations because they remove uncertainty about whether a message was read.

For Healthcare applications, choose either **User controlled** or **On for everyone**. Be aware that when using the **On for everyone** setting, the only way to set receipts for the whole tenant is either to have only one messaging policy for the whole tenant (the default policy named "Global (Org-wide Default)") or to have all messaging policies in the tenant use the same settings for receipts. The read receipts feature is most effective when the feature is enabled to **On for everyone**.

Usage example without read receipts: Jakob Roth, a high risk patient, is admitted to the hospital. Sofia Krause is a nurse working as part of the inter-disciplinary team (IDT) of medical workers, including different specialists, is assigned as the primary care coordinator in charge of this patient. Sofia sends emails and other instant messages to a groups of nurses and doctors who use a variety of messaging clients and apps, and often gets no response or indication whether a message was read by team members. Due to tangled communication processes, Jakob's medication is misapplied and his hospital stay is extended.

Usage example with read receipts: Jakob Roth, a high risk patient, is admitted to the hospital. Sofia Krause is a nurse working as part of the inter-disciplinary team (IDT) of medical workers, including different specialists, is

assigned as the primary care coordinator in charge of this patient. Sofia starts a group chat with a set of doctors and other nurses who will be working with the patient to coordinate care and starts an emergency triage. The nurses and doctors communicate and collaborate over the patient's care plan throughout the care coordination process. Important and urgent messages are sent through 1:1 and group chat conversations. Sofia uses the read receipts functionality to determine if messages sent requesting support are delivered and read by the targeted physicians or nurses. Jakob's patient outcomes are near-optimal and he goes home sooner because his health team communicates smoothly.

Send urgent messages using priority notifications

A user can mark a message as *urgent* when sending chat messages to other users. This feature helps hospital staff alert one another when a critical incident requires their attention. Unlike regular *important* messages, [priority notifications](#) notify users every two minutes for up to 20 minutes or until the message is picked up and read by the recipient, maximizing the likelihood that the message is acted upon in a timely manner.

An admin can enable or disable the ability for users assigned this policy to send priority notifications. This feature is on by default. The recipient of the priority message might not have the same messaging policy, and will not have an option to disable receiving priority messages. For Healthcare applications, we recommend enabling the feature for at least some users, but you'll need to determine which ones.

Usage example: Sofia Krause is readmitting a high-risk patient, Jakob Roth. Manuela Carstens, a physician, is the primary care doctor for this patient. Sofia sends a message to Manuela using a priority notification asking for immediate help with triage of Jakob. Manuela's phone receives the message but Manuela didn't feel the phone vibration and does not reply. Teams re-notifies Manuela and will continue to persistently re-notify until she reads the message. If read receipts are also enabled, Sofia can be aware that the message was read by Manuela, even before Manuela decides how to respond.

Message delegation

12/7/2021 • 2 minutes to read • [Edit Online](#)

A user can already explicitly set their status to Away or Do not Disturb, and provide custom text. The message delegation feature works as follows:

1. A user @username mentions another user in part of a text status message, suggesting that while they are unavailable people who want to contact them instead contact the @username mentioned user.
2. The person who has been assigned as a delegate is notified that they were nominated to be a delegate.
3. Someone trying to contact the first user can then hover over the nominated delegate and easily message the delegate instead.

This is a user-initiated process in the client, and no Admin involvement is required to enable the feature.

Delegation use scenario in Healthcare

Usage example without setting delegates: Dr. Franco Piccio is on-call at the radiology department. He receives an urgent personal call and has to step away for the next couple of hours. He asks one of his peers in the radiology department, Dr. Lena Ehrle, to cover for him while he is gone. He informally hands over his pager to Dr. Ehrle, who is listening for urgent messages and pings on the pager and responds to them on behalf of Dr. Piccio in addition to her current responsibilities. Others on the team may not realize the informal delegation happened, and confusion ensues with a patient's care.

Usage example with setting delegates: Dr. Franco Piccio is on-call at the radiology department. He receives an urgent personal call and has to step away for the next couple of hours. He asks one of his peers in the radiology department, Dr. Lena Ehrle to cover for him while he is gone. He changes his custom status message to say something similar to "I am unavailable for the next few hours. Please contact @DrEhrle for any emergencies." Others on the team realize the delegation happened as they're attempting to contact Dr. Piccio, so they now know to contact Dr. Ehrle in the meantime. Little to no confusion ensues with a patient's care.

Impact of co-existence modes on user status in the Teams client

Admins should be aware that status notes and delegation mention behaviors will depend partly on a user's co-existence mode. This matrix shows the possibilities:

CO-EXISTENCE MODE	EXPECTED BEHAVIOR
TeamsOnly	Users can set a note only from Teams. User's Teams note is visible in Teams & SfB.
Islands	User's note set in Teams visible only in Teams. User's note set in SfB visible only in SfB
SfB* modes	Users can set a note only from SfB. User's SfB note is visible in SfB & Teams.

A user can only set a note in Teams if their mode is TeamsOnly or Islands.

Displaying notes set in Skype for Business

There is no visual indication that a note was set from Skype for Business.

Skype for Business doesn't enforce a character limit on status notes. Microsoft Teams will only display the first 280 characters of a note set from Skype for Business. An ellipse (...) at the end of a note indicates truncation.

Skype for Business doesn't support expiry times for notes.

Migration of notes from Skype for Business to Teams is not supported when a user is upgraded to TeamsOnly mode.

Use healthcare team templates

12/7/2021 • 4 minutes to read • [Edit Online](#)

Team templates in Microsoft Teams allow you to quickly and easily create teams by providing a predefined team structure of settings, channels, and pre-installed apps.

For healthcare organizations, team templates can be especially powerful, as they help you to quickly deploy consistent teams across your organization. Templates also help staff to get oriented with how to effectively use Teams.

Teams includes templates designed specifically for healthcare organizations. Use these pre-built templates to quickly create teams for staff to communicate and collaborate on patient care or operational needs. In this article, we introduce you to each of these templates and recommend how to use them.

How you manage and work with team templates depends on whether you're an admin or developer.

IF YOU'RE:	THEN, YOU:
An admin or IT pro	Manage team templates in the Teams admin center . View team templates and apply templates policies to control which templates your staff can use in Teams for creating teams.
A developer	Use Microsoft Graph to create teams from team templates.

Manage team templates in the Teams admin center

As an admin, you can manage team templates in the Microsoft Teams admin center. Here, you can view details about each template. You can also [create and assign templates policies](#) to your staff to control which templates they see in Teams for [creating teams](#).

To learn more about team templates in general, see [Get started with team templates in the Teams admin center](#).

We currently offer the following pre-built healthcare team templates. To view them, in the left navigation of the Teams admin center, go to **Teams > Team templates**.

Patient care

This template is meant for communication and collaboration within a ward, pod, or department. You can use this template to facilitate patient management and the operational needs of a ward. For example, post ward announcements in the *Announcements* channel and manage shifts in the *Staffing* channel.

Use team templates with Microsoft Graph

Developers can use Microsoft Graph to create teams from pre-built team templates. To learn more about using team templates with Microsoft Graph, see [Get started with team templates using Microsoft Graph](#), [Microsoft Teams API overview](#), and [teamsTemplate resource type](#).

Here are the pre-built healthcare team templates.

Ward

The ward template is meant for communication and collaboration within a ward, pod, or department. The template can be used to facilitate patient management and operational needs of a ward. For example, ward announcements can be posted in the *Announcements* channel and shifts can be managed in *Staffing*. If you're looking to streamline your ward operations, then this template is for you.

TEMPLATE TYPE	TEMPLATEID	TEMPLATE CHANNELS
Healthcare - Ward	<code>https://graph.microsoft.com/beta/teamsTemplates('healthcareWard')</code>	General Announcements ² Huddles ² Rounds ² Staffing ² Training ²

²Auto-favorited channels

Hospital

The hospital template is meant for communication and collaboration between multiple wards, pods, and departments within a hospital. This template includes several operational channels such as *Announcements*, *Custodial*, and *Pharmacy*. We also provide a script that you can use to extend the template with additional departments or specialty channels. You can edit it to fit your needs.

For example, if you have an *Endocrinology* department, but don't need a channel for *Ophthalmology*, the script can be adapted to include an *Endocrinology* channel and remove the *Ophthalmology* channel. We recommend that these specialty or ward-modeled channels not be auto-favorited to avoid notification saturation. Users generally favorite any channels that they find relevant.

TEMPLATE TYPE	TEMPLATEID	TEMPLATE CHANNELS
Healthcare - Hospital	<code>https://graph.microsoft.com/beta/teamsTemplates('healthcareHospital')</code>	General Announcements ² Compliance ² Custodial Human Resources Pharmacy

²Auto-favorited channels

How to use team templates with Microsoft Graph

To use these templates, change the 'template@odata.bind' property in the request body from 'standard' to the TemplateIds above. For more information on how to deploy team templates, see the Microsoft Graph article on how to [create a team](#).

NOTE

The channels in the template will be automatically created under the **General** tab.

Example: Hospital template extension script

```
{
  "template@odata.bind": "https://graph.microsoft.com/beta/teamsTemplates('healthcareHospital')",
  "DisplayName": "Contoso Hospital",
  "Description": "Team for all staff in Contoso Hospital",

Manage the Lists app for your organization in Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

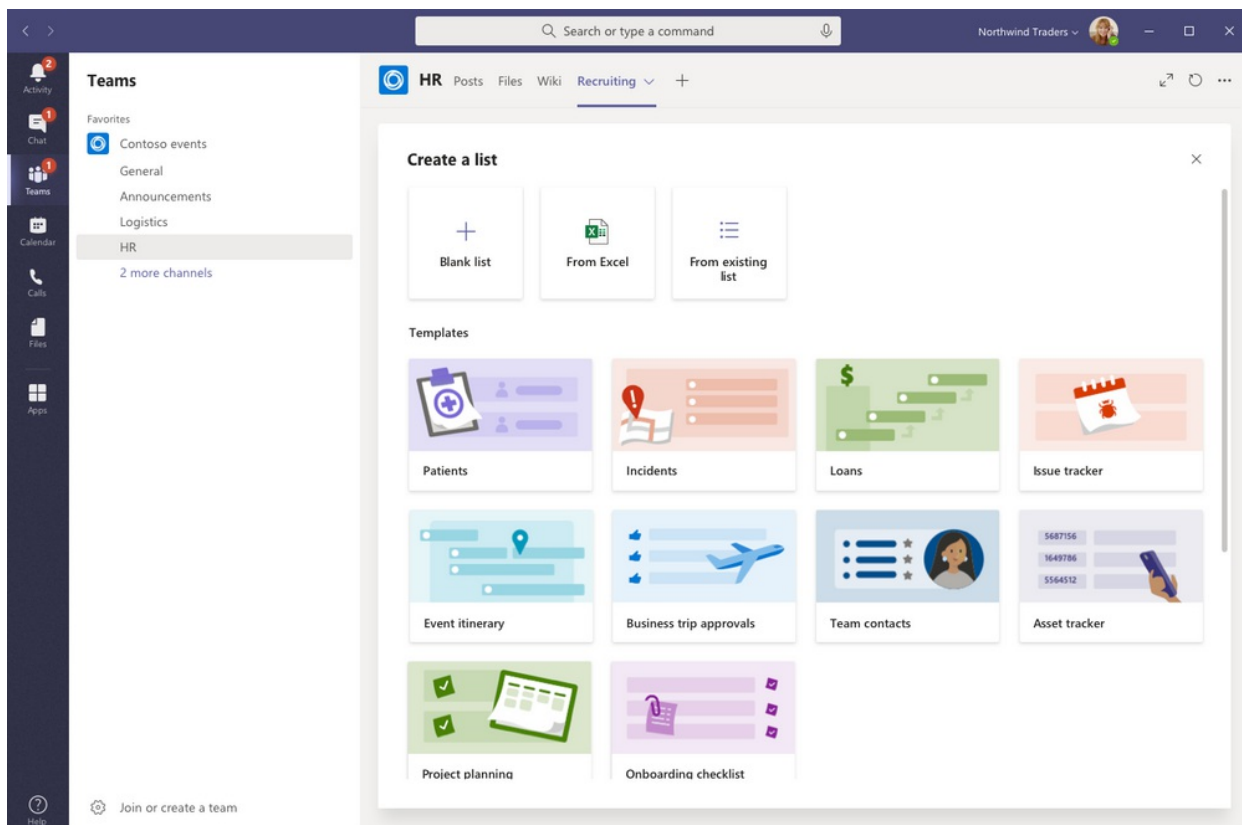

Overview of Lists

The Lists app in Microsoft Teams helps users in your organization track information, organize work, and manage workflows. With Lists, users can track data such as issues, assets, routines, contacts, inventory, incidents, loans, patients, and more using customizable views, rules, and alerts to keep everyone on the team in sync.

In Teams, users access Lists as a tab in a channel. Click + to open the tab gallery and add a new Lists app tab instance to a channel to get started.

Users can create new lists or pin existing lists from within the same team or from a different SharePoint site that they have access to. New lists can be created from scratch, from built-in templates, based on the structure of an existing list, or by importing data from an Excel workbook. The Lists app is available in Teams desktop, web, and mobile clients.

Templates

Templates in Lists are tailored to common information tracking scenarios for users. Each template comes with a predefined list structure, form layouts, and formatting options at both a list view and a details view level to help users get started quickly. After selecting a template, users get a preview of what the list will look like, along with some sample data. Here's some examples of how teams in your organization can use the predefined templates in Lists:

- Track issues and bring them to closure using the Issue tracker template.
- Organize all your event details with the Event itinerary template.
- Use the Patients template to record the needs and status of patients for health teams in your healthcare organization to monitor and coordinate care.
- Track the status of loan applications with the Loans template.

Example scenario

A local post office is responsible for sorting and delivering mail in their district. Each morning, the post office has a team huddle to review daily goals, share announcements, and discuss known incidents.

After the huddle, mail carriers pick up their mail and start their delivery route. Incidents can occur along a route, for example, a vehicle accident, dog-related issue, or social unrest protest. When mail carriers encounter an incident, they use Teams on their mobile devices to record the incident details, which are tracked in a list in the team channel. Everyone on the team, including mail carriers in the field, can see this information and stay informed.

Before moving to Teams, mail carriers had to go back to the post office to complete a hard-copy form to report an incident which was entered in an Excel spreadsheet. Teams gives mail carriers a mobile first, experience where they can use Lists to report incidents in the field as they happen, share incident details with team members, have conversations about them on the channel, and drive incidents to resolution.

What you need to know about Lists

Lists is available in every team and channel

Lists is pre-installed for all Teams users and is available directly in the tab gallery of every team and channel. This means that users don't have to go to the Teams app store to install it.

Lists and SharePoint

Lists data is stored in the SharePoint Online team site. To learn more about how SharePoint Online interacts with Teams, see [How SharePoint Online and OneDrive for Business interact with Teams](#).

Permissions set in SharePoint apply to lists created in the Lists app. By default, lists inherit permissions from the site to which they belong. These permissions govern the types of actions that users can do, such as whether they can create or edit lists. To learn more, see [Permission levels in SharePoint](#) and [User permissions and permission levels in SharePoint Server](#).

In certain scenarios, you may want restrict what actions users can do in lists. For example, a person on a team edits a list view, which changes it for all team members, and you want to allow only the team owner or certain team members to edit list views. To learn more, see [Customize permissions for a SharePoint list or library](#).

NOTE

At this point, owner and member permissions in a team aren't linked in any way to permissions in the team site that govern the behavior of lists or the Lists App. However, based on customer feedback and usage, this will be considered for a future iteration of the product.

Limitations

With Lists, users get a desktop, web, and mobile experience. It's important to know that users can't create new lists or pin existing lists using Lists on the Teams mobile client. To view or edit a list on the Teams mobile client, a list must first be created or added using Lists on the Teams desktop or web client.

Guests can't create or delete a list. They can add list items to existing lists, start new conversations about list items, and reply to existing conversations about list items.

Lists and the SharePoint app

If users in your organization created lists using the SharePoint app, those lists will be automatically moved to Lists without any action needed from the user. To get the best and richest lists integration experience in Teams, use the Lists app and pin your existing lists.

Set up Lists

Enable or disable Lists in your organization

Lists is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. Do one of the following:
 - To turn off Lists for your organization, search for the Lists app, select it, and then click **Block**.
 - To turn on Lists for your organization, search for the Lists app, select it, and then click **Allow**.

Enable or disable Lists for specific users in your organization

To allow or block specific users in your organization from using Lists, make sure Lists is turned on for your organization on the [Manage apps](#) page, and then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Search the audit log for list events

Lists are enabled with enterprise-level auditing so you can search for lists and list item events in the audit log in the Security & Compliance Center. To learn more, see [Search the audit log in the Security & Compliance Center](#).

For a list of audit events that are relevant to the Lists app in Teams, see [SharePoint list activities](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Power Automate, Power Apps, and Graph API

Lists supports [Power Automate](#) for workflows and [Power Apps](#) for list forms. Developers can use the [Lists API](#) to connect list data as a source through Microsoft Graph.

Give feedback or report an issue

To send us feedback or report an issue, click **Help** near the bottom of the left navigation in Teams, and then select **Report a problem**. Select **Lists**, and then enter your feedback or details about the issue you're experiencing.

Manage the Tasks app for your organization in Microsoft Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

Overview of Tasks

The Tasks app brings a cohesive task management experience to Microsoft Teams, integrating individual tasks powered by [Microsoft To Do](#) and team tasks powered by Planner in one place. Users can access Tasks as an app on the left side of Teams and as a tab in a channel within individual teams. **My tasks** and **Shared plans** in Tasks let users view and manage all their individual and team tasks and prioritize their work. Tasks is available in Teams desktop, web, and mobile clients.

NOTE

As we roll out the Tasks experience on Teams desktop clients, the app name will initially appear as **Planner** to users. The name will then temporarily change to **Tasks by Planner and To Do**, and later on, it will be renamed to **Tasks**. On Teams mobile clients, users will always see the app name as **Tasks**. There may be a short delay in the availability of the mobile experience after the desktop experience is available.

For organizations who want to streamline task management for Frontline Workers, Tasks also includes capabilities that enable you to target, publish, and track tasks at scale across your Frontline Workforce. For example, corporate and regional leadership can create and publish task lists targeted to relevant locations, such as specific retail stores, and track progress through real-time reports. Managers can assign tasks to their staff and direct activities within their locations, and Frontline Workers have a prioritized list of their assigned tasks on mobile or desktop. To enable [task publishing](#), you'll first need to set up a team targeting hierarchy for your organization, which defines how all teams in the hierarchy are related to each other.

What you need to know about Tasks

Tasks is available as an app and as a tab in a channel. Keep in mind that the app comprises both individual tasks from To Do and team tasks from Planner whereas the tab shows only team tasks.

With Tasks, users get a desktop, web, and mobile experience. If Tasks is installed on the Teams desktop client, users will also see it on their Teams web and mobile clients. The exception is guest users. It's important to know that guests can only access Tasks as an app from the Teams mobile client. Guests will see Tasks tabs on both Teams desktop and web clients.

My tasks shows a user's individual tasks. **Shared plans** show tasks that the whole team is working on and includes any task list that's added as a Tasks tab to a channel. Note the following:

- Task lists that a user creates in the Tasks app will also appear in To Do clients for that user. Similarly, task lists that a user creates in To Do will appear in **My tasks** in Tasks for that user. The same is true for individual tasks.
- Any Tasks tab that's added to a channel will also appear in Planner clients. When a user creates a plan in Planner, the plan won't show in the Tasks or Planner app unless it's added as a tab to a channel. When a user adds a new Tasks tab, they can create a new list or plan or choose an existing one.

Set up Tasks

IMPORTANT

Settings and policies that you configured for Planner will also apply to Tasks.

Enable or disable Tasks in your organization

Tasks is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. In the list of apps, do one of the following:
 - To turn off Tasks for your organization, search for the Tasks app, select it, and then click **Block**.
 - To turn on Tasks for your organization, search for the Tasks app, select it, and then click **Allow**.

NOTE

If you can't find the Tasks app, search for the names in the first note of this article. The app could still be in the process of being renamed.

Enable or disable Tasks for specific users in your organization

To allow or block specific users in your organization from using Tasks, make sure Tasks is turned on for your organization on the [Manage apps](#) page, and then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Use an app setup policy to pin Tasks to Teams

App setup policies let you customize Teams to highlight the apps that are most important for users in your organization. The apps you set in a policy are pinned to the app bar—the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients—where users can quickly and easily access them.

To pin the Tasks app for your users, you can edit the global (Org-wide default) policy or create and assign a custom app setup policy. To learn more, see [Manage app setup policies in Teams](#).

A user's My tasks is visible if the user is licensed for Exchange Online

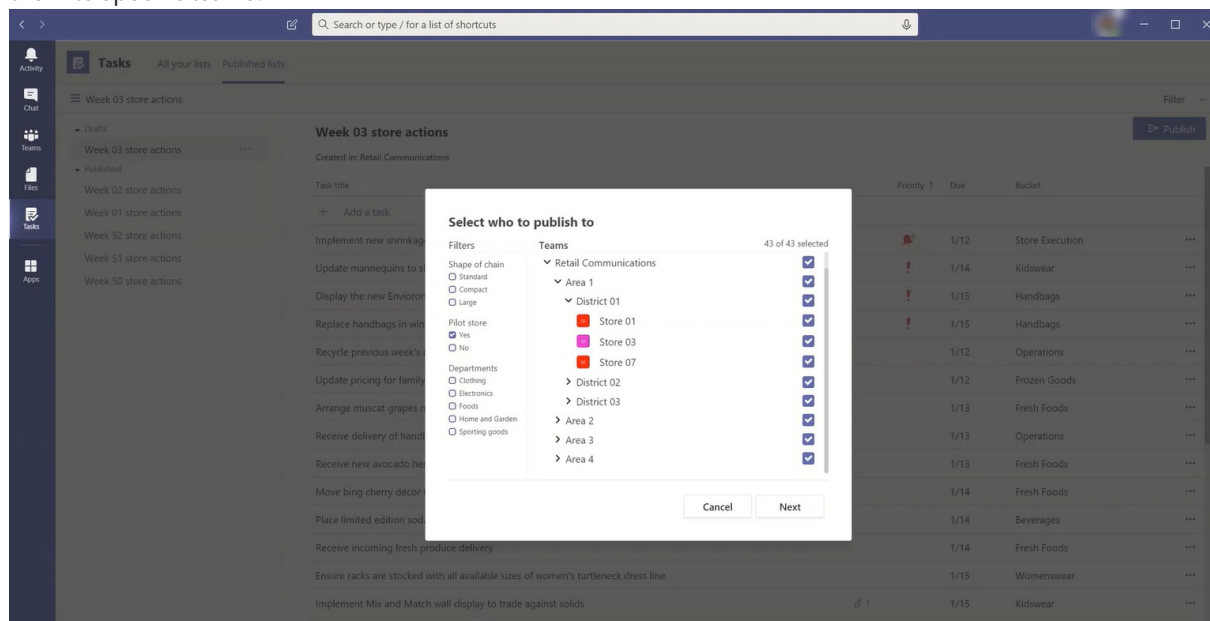

If you don't want a user to see **My tasks**, you can hide it. To do this, [remove the user's Exchange Online license](#). It's important to know that after you remove an Exchange Online license, the user no longer has access to their mailbox. Mailbox data is held for 30 days, after which the data will be removed and can't be recovered unless the mailbox is placed on [In-Place Hold or Litigation Hold](#).

We don't recommend this for information workers, but there may be some scenarios where this could apply, such as for Frontline Workers who don't depend on email.

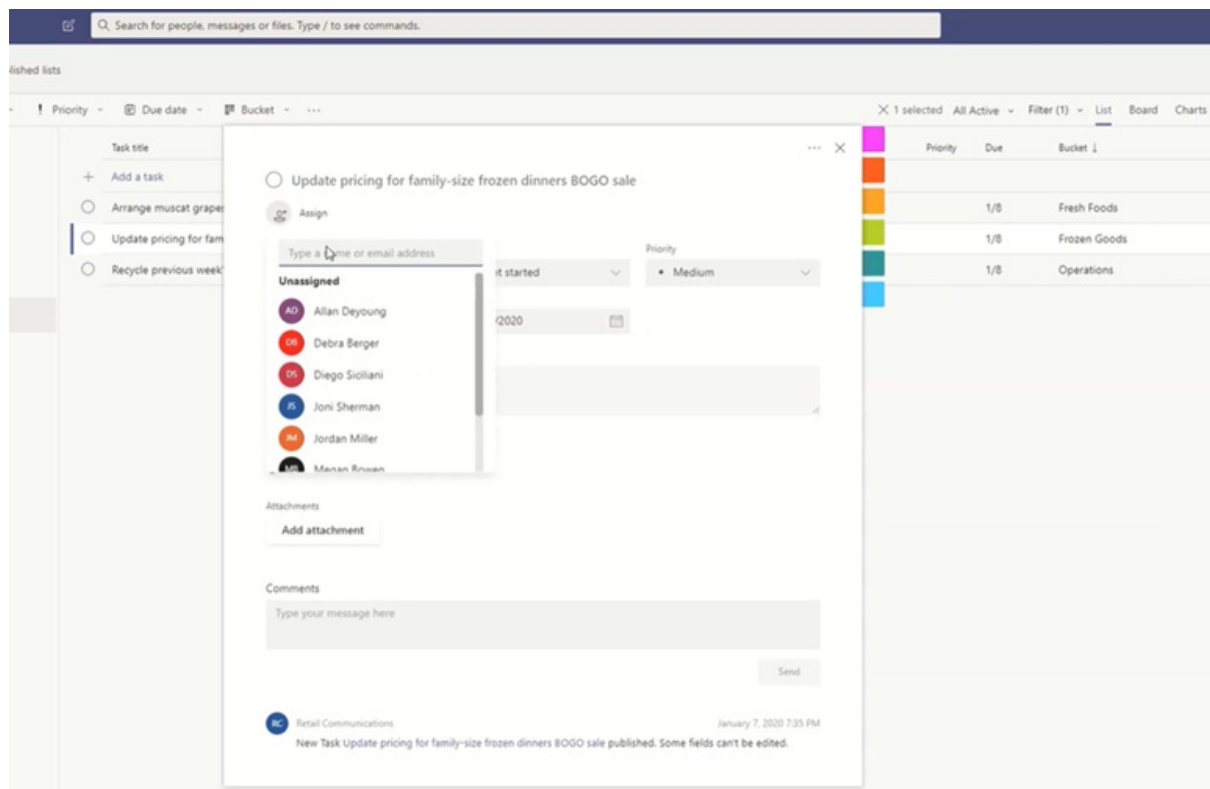

Task publishing

With task publishing, your organization can publish task lists targeted to specific locations (teams) across your organization to define and share a work plan to be completed at those locations.

- People on the publishing team, such as corporate or regional leadership, can create task lists and publish them to specific teams.

- Managers on the recipient teams can review the published task lists and assign individual tasks to team members.

- Frontline Workers have a simple mobile experience to see tasks assigned to them. They can attach photos to show their work when appropriate and mark their tasks as completed.
- Publishers and managers can view reports to see assignment and completion status of tasks at each level, including by location (team), task list, and individual task.

Task title	Priority	Due	Bucket	Assigned	Completed
Implement new shrinkage prevention protocol ASAP	High	1/12	Store Execution	16%	12%
Update mannequins to showcase new semi-plaid kidswear apparel	Medium	1/14	Kidswear	12%	9%
Display the new Environmental Stewardship signage	Medium	1/15	Handbags	19%	12%
Replace handbags in window display with the newest releases	Medium	1/15	Handbags	19%	12%
Recycle previous week's circular ads and place this week's ads by entrance	Medium	1/12	Operations	14%	9%
Update pricing for family-size frozen dinners BOGO sale	Medium	1/12	Frozen Goods	19%	12%
Arrange muscat grapes next to persimmons, matching attached layout	Medium	1/13	Fresh Foods	19%	12%
Receive delivery of handbag promotional décor and signage	Medium	1/13	Operations	14%	9%
Receive new avocado hero display and pricing placards	Medium	1/13	Fresh Foods	16%	12%
Move bing cherry decor to backstage storage for later reuse	Medium	1/14	Fresh Foods	19%	12%
Place limited edition soda flavors on aisle 12 as indicated	Medium	1/14	Beverages	19%	14%
Receive incoming fresh produce delivery	Medium	1/14	Fresh Foods	19%	12%
Ensure racks are stocked with all available sizes of women's turtleneck dress line	Medium	1/15	Womenswear	5%	0%
Implement Mix and Match wall display to trade against solids	Medium	1/15	Kidswear	12%	9%

Users create, manage, and publish task lists on the **Published lists** tab in the Tasks app. This tab only shows for a user if your organization [set up a team targeting hierarchy](#) and the user is on a team that's included in the hierarchy. The hierarchy determines whether the user can publish or receive task lists and view reporting for received lists.

Example scenario

Here's an example of how task publishing works.

Contoso is rolling out a new food takeout and delivery promotion. To maintain a consistent brand experience, they need to coordinate consistent execution of the rollout across over 300 store locations.

The Marketing team shares the promotion details and the corresponding list of tasks with the Retail Communications Manager. The Retail Communications Manager, who serves as the gatekeeper for stores,

reviews the information, creates a task list for the promotion, and then creates a task for each unit of work that needs to be performed by each of the affected stores. When the task list is complete, she needs to select the stores that must complete the work. In this case, the promotion only applies to stores in the United States that have an in-store restaurant. In Tasks, she filters the store list based on the in-store restaurant attribute, selects the matching United States locations in the hierarchy, and then publishes the task list to those stores.

Store managers at each location receive a copy of the published tasks and assign those tasks to their team members. Managers can use the Tasks experience to understand all the work required across their store. They can also use the available filters to focus on a specific set of work, such as work due today or work in a particular area.

Frontline Workers at each store location now have a prioritized list of their work in Tasks on their mobile device. When they finish a task, they mark it complete. Some may even choose to upload and attach a photo to the task to show their work.

Contoso headquarters and intermediate managers can view reporting to see the assignment and completion status of tasks at each store and across stores. They can also drill down to a specific task to see the status within different stores. As the launch date gets closer, they can spot any abnormalities and check in with their teams as needed. This visibility allows Contoso to improve the efficiency of the rollout and provide a more consistent experience across their stores.

Set up your team targeting hierarchy

To enable task publishing in your organization, you have to first set up your team targeting schema in a .CSV file. The schema defines how all the teams in your hierarchy are related to each other and the attributes used to filter and select teams. After you create the schema, upload it to Teams to apply it to your organization. Members of the publishing team, such as the Retail Communications Manager in the example scenario, can then filter teams by hierarchy, attributes, or a combination of both to select the relevant teams that should receive the task lists, and then publish the task lists to those teams.

For steps on how to set up your team targeting hierarchy, see [Set up your team targeting hierarchy](#).

Power Automate and Graph API

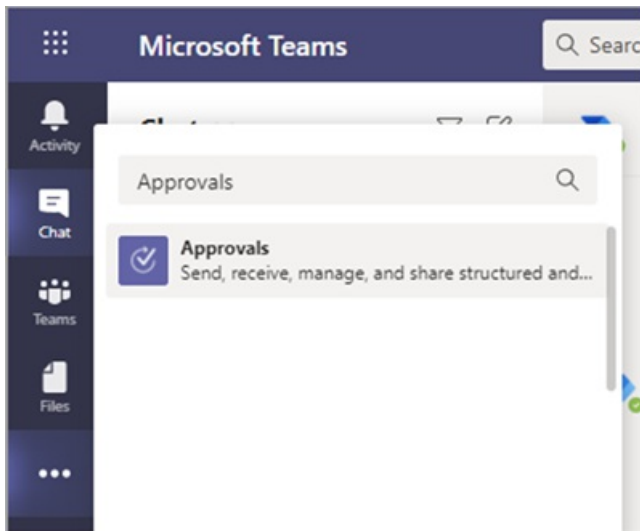

Tasks supports Power Automate for To Do and Graph APIs for Planner. To learn more, see:

- [Planner tasks and plans API overview](#)
- [Using Microsoft To Do with Power Automate](#)

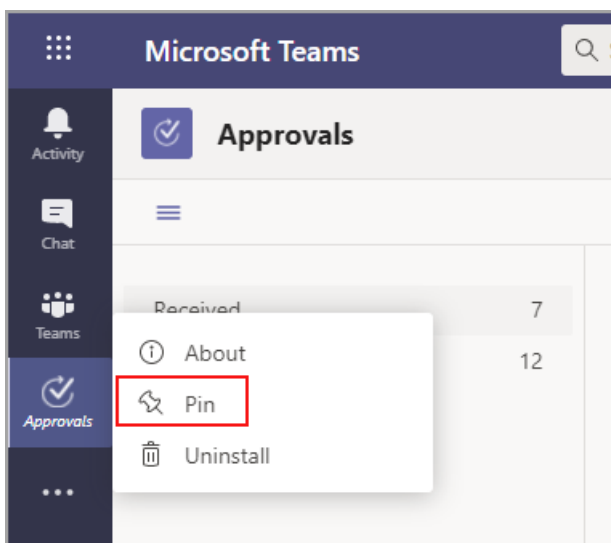

Teams Approvals app availability

12/7/2021 • 6 minutes to read • [Edit Online](#)

The Approvals app is available as a personal app for all Microsoft Teams users. The Approvals app provides a simple way to bring auditing, compliance, accountability, and workflows to both structured and unstructured Approvals in Teams.

Users can pin the Approvals app to save it to the menu bar.

The first approval created from the Approvals app will trigger the provisioning of the Approval Solution in the default Common Data Service (CDS) environment. Approvals created from the Approvals app will be stored in the default CDS environment.

This article describes the Approvals app requirements and roles.

NOTE

This feature hasn't been released to Government Community Cloud (GCC), Government Community Cloud High (GCCH), and Department of Defense (DOD) users yet.

Required permissions and licenses

To deploy the Approvals app, you need permission for the following items:

- Permissions to create a Microsoft CDS database.
- An account on flow.microsoft.com
- Administrator Role in the target environment.
- License for [Power Automate](#), Office 365, or Dynamics 365.
- License for Microsoft Forms is required for users to set up new approval templates.

To use the Approvals app, you need a license for Power Automate, and your account will be added automatically to the Approvals User role in the target environment on your first approval assignment.

Storage with CDS

The Common Data Model (CDM) is the shared data language used by business and analytical applications in the CDS. It consists of a set of a standardized, extensible data schemas published by Microsoft and our partners that enables consistency of data and its meaning across applications and business processes. Learn more about the [Common Data Model of the Microsoft Power Platform](#).

Learn more about the [Approval workflow](#).

Approvals that are created from a template still store data in CDS, such as their title, details, template ID, and more. Responses that are submitted on the approval request are stored in Forms. Learn more about [Data storage for Microsoft Forms](#).

NOTE

If you delete the Form template on the Microsoft Forms site, it will break your Approval template and users will not be able to start the request. Users will get an error "CDB TableNotFound" when trying to open an Approval template that has been deleted on Microsoft Forms.

Org-scoped templates share the same lifetime of the tenant and team-scoped templates share the same lifetime of the team. So, permanently deleting the team deletes the related templates.

Approvals Teams app permissions

The Approvals Teams app lets you access the following features:

- Receive messages and data that you provide to it.
- Send you messages and notifications.
- Render personal apps and dialogs without a Teams-provided header.
- Access your profile information such as your name, email address, company name, and preferred language.
- Receive messages and data that team members provide to it in a channel.
- Send messages and notifications in a channel.
- Access your team's information:
 - team name
 - channel list
 - roster (team member's names and email addresses).

- Use the team's information to contact them.

Approval Template Permissions

- All team owners can create an approval template for teams that they own.
- When an Admin creates a template for their entire organization for the first time, it will automatically create a new Azure Active Directory(AAD) group for all admins of the tenant, including the global and Team's service admins. These admins will be added as owners of the group, so they can co-manage organizational templates. Admins that are new to the organization after the team has been created need to be manually added as group owners so they have the same permissions to manage organization-wide templates.

NOTE

If an admin deletes the group, you have one month to restore it within the Azure Active Directory (AAD) portal to restore all related data. After one month, or if the admin deletes this group within the recycle bin, you will lose all related data.

Disable the Approvals app

The Approvals app is available by default. You can disable the app in the Teams admin center.

1. Sign in to the Teams admin center.
2. Expand **Teams apps** and select **Manage apps**.
3. Search for the Approvals app.

4. Select Approvals.
5. Select the toggle to disable the app for your organization.

Retention policy

Approvals created from the Approvals App are stored in the default CDS environment, which doesn't support backups at this time. Learn more about how to [Back up and restore environments - Power Platform | Microsoft Docs](#).

Data stored in Forms will not be deleted until the team owners clean it up from the **deleted forms** tab in the Microsoft Forms web app.

Data limitations

Each team can contain at most 400 approvals templates, and each template can collect a maximum of 50,000 requests based on the current capability in Microsoft Forms.

Auditing

The Approvals App logs audit events within the Microsoft 365 Security and Compliance Center. You can view the audit log.

1. Go to the Microsoft 365 Compliance Site.
2. Select the **Audit** section.
3. Search for activities under **Microsoft Teams approvals activities**.

You can search for the following activities:

- Create new approval request
- View approval request details
- Approved approval request
- Rejected approval request
- Canceled approval request
- Shared approval request
- File attached to approval request

- Reassigned approval request
- Added e-signature to approval request
- Viewed e-signature request details
- Reviewed e-signature request
- Canceled e-signature request
- Create a new template
- Edit an existing template
- Enable/disable a template
- Viewed template

For access to more auditing approvals within Flow, enable and configure auditing in the default environment for the primary approval entities Approval, Approval Request, and Approval Response. Create, update, and delete operations are auditable events for Approval records. Learn more about [Audit data and user activity for security and compliance - Power Platform | Microsoft Docs](#).

Auditing can be customized further in the [Microsoft 365 Security and Compliance Center](#).

1. To use the preconfigured reports, sign in to Microsoft 365 Security and Compliance.
2. Select **Search & investigation**.
3. Search the Audit log and select the **Dynamics 365 activities** tab.

Learn more about [Microsoft Dataverse and model-driven apps activity logging - Power Platform](#).

Security

From the Teams Approvals app, users have access to create new Approvals and view Approvals that they have sent and received. Users won't have access to Approvals that are created by others unless they're either a responder or a viewer of the request.

NOTE

A user will be given a viewer role of a request if they are part of the chat or channel where the approval was created. They won't have the ability to take action on the request if they weren't given that role when the approval was created.

Approvals e-signature integration

E-signature approvals created from the Approvals app are stored in the selected provider's cloud environment. For further information about storage around the e-signature agreement, view the selected provider's storage documentation.

To use the Approvals app e-signature feature, you need the following items:

- License for the specific e-signature provider you're choosing to use. In order to obtain a license for your organization, you'll need to go to the provider's site.

For the Approvals e-signature functionality, third-party signature partners will appear in the Teams Approvals app by default. You can disable specific e-signature providers by accessing app settings in the Teams admin center.

1. In the Teams admin center, under **Manage apps**, select the **Approvals app** and choose **Settings**.

2. Each e-signature provider has a toggle next to it that is in the on position (right) by default. Slide the toggle to the left to disable a specific e-signature provider. If a Teams admin disables a provider, end users won't see the provider when creating an approval. End users will also be unable to view any e-signature requests that were made with that provider.

E-signature Approvals created from the Approvals App are stored in the selected provider's cloud. You will therefore need to go to the provider's site in order to export any data about e-signatures. Refer to the provider's documentation about export and retention of these agreements.

Shifts for Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams gives frontline workers in your organization the tools they need to communicate and collaborate effectively. See the following resources to learn more about how to set up and manage Shifts, the schedule management tool in Teams.

Set up and manage Shifts for your organization

	Manage Shifts in your organization		Shifts Help for frontline workers
---	--	---	---

Shifts extensions

	Shift Graph APIs Shifts Graph APIs allow you to integrate Shifts data with external workforce management systems. You'll have the flexibility to build custom Shifts experiences in the back end, while giving users a rich, front-end experience in Teams.
	Workforce management integrations If you're using third-party workforce management systems, such as Kronos and JDA, for scheduling, time, and attendance, you can integrate directly with Shifts through Shifts Graph APIs and SDK with open source integrations.
	Shifts + Power Automate Shifts + Power Automate lets you take info from Shifts and create custom workflows with other apps and perform operations at scale. Automate key processes with little to no code. The triggers and templates support a variety of scenarios such as enabling auto-approvals for shift requests when a manager's approval isn't needed.

Manage the Shifts app for your organization in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Effective June 30, 2020, Microsoft StaffHub has been retired. We're building StaffHub capabilities into Microsoft Teams. Today, Teams includes the Shifts app for schedule management and additional capabilities will roll out over time. StaffHub stopped working for all users on June 30, 2020. Anyone who tries to open StaffHub is shown a message directing them to download Teams. To learn more, see [Microsoft StaffHub has been retired](#).

Overview of Shifts

The Shifts app in Microsoft Teams keeps frontline workers connected and in sync. It's built mobile first for fast and effective time management and communication for teams. Shifts let frontline workers and their managers use their mobile devices to manage schedules and keep in touch.

- Managers create, update, and manage shift schedules for teams. They can send messages to one person ("there's a spill on the floor") or the entire team ("the regional GM is arriving in 20 minutes"). They can also send policy documents, news bulletins, and videos.
- Employees view their upcoming shifts, see who else is scheduled for the day, request to swap or offer a shift, and request time off.

It's important to know that Shifts currently don't support guests. This means that guests on a team can't be added to or use shift schedules when Guest access is turned on in Teams.

NOTE

For details about Shifts capabilities on different platforms, see [Teams features by platform](#).

Availability of Shifts

Shifts is available in all Enterprise SKUs where Teams is available.

Location of Shifts data

Shifts data is currently stored in Azure in data centers in North America, Western Europe, and Asia Pacific. For more information about where data is stored, see [Where is my data?](#)

Set up Shifts

Enable or disable Shifts in your organization

Shifts is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. In the list of apps, do one of the following actions:

- To turn off Shifts for your organization, search for the Shifts app, select it, and then select **Block**.
- To turn on Shifts for your organization, search for the Shifts app, select it, and then select **Allow**.

Enable or disable Shifts for specific users in your organization

To allow or block specific users in your organization from using Shifts, make sure Shifts be turned on for your organization on the [Manage apps](#) page. Then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Use the FirstLineWorker app setup policy to pin Shifts to Teams

App setup policies let you customize Teams to highlight the apps that are most important for users in your organization. The apps set in a policy are pinned to the app bar—the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients—where users can quickly and easily access them.

Teams includes a built-in FirstLineWorker app setup policy that you can assign to frontline workers in your organization. By default, the policy includes the Activity, Shifts, Chat, and Calling apps.

To view the FirstLineWorker policy, in the left navigation of the Microsoft Teams admin center, go to **Teams app** > **Setup policies**.

Assign the FirstLineWorker app setup policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Search the audit log for Shifts events

(in preview)

You can search the audit log to view Shifts activity in your organization. To learn more about how to search the audit log and to see a list of [Shifts activities](#) that are logged in the audit log, see [Search the audit log for events in Teams](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). To learn more, see [Turn audit log search on or off](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Get started with Microsoft Teams for remote learning

12/7/2021 • 18 minutes to read • [Edit Online](#)

For an overview of making the transition to remote learning and resources to help you get started, see our [remote learning home page](#).

Resources to assist educators and students with remote learning are available in [Remote teaching and learning in Office 365 Education](#).

This article covers the actual steps to take in order to get your educational institution set up for remote learning.

NOTE

For details about remote learning capabilities on different platforms, see [Teams features by platform](#).

NOTE

If you're an educator, educational leader, or IT professional, these resources may help:

- Get your entire educational institute up and running on Teams quickly with the [Getting Started one-pager](#).
- Download [How to get started with Teams](#): A guide for IT professionals with helpful practices for security and change management.
- A collection of articles written for educators including how-to guidance for the most important [first steps in teaching in Teams](#).
- A 1-hour online course in the Microsoft Educator Center shows how educators use Teams in their professional lives. [Transform Learning with Microsoft Teams](#).
- A 1-hour online course in the Microsoft Educator Center leads educators through teaching in Class Teams. [Crafting a Collaborative Learning Environment with Class Teams](#).
- If you're an educator, student, or a parent or guardian, get more guidance on [teaching and learning remotely with Office 365](#).
- Parents and guardians can also go to our [Parent Support Page](#) for help with remote learning.

Don't miss the March 4, 2020 blog, [How schools can ramp up remote learning programs quickly with Microsoft Teams](#).

Learning online can be just as personal, engaging and socially connected as learning in a classroom. Students and educators can stay in touch and help each other using conversations, and can feel like they are meeting in person using live meetings. Educators can track student progress in their daily work using Assignments. No one needs to feel out of touch. Many students who learn online say they feel they have more of a voice, and they feel more connected to their educators and peers than they did in the classroom. And, just like in a classroom, educators can use the apps and functions of Teams to support how they work best.

Microsoft Teams is a digital hub that brings conversations, content, assignments, and apps together in one place, letting educators create vibrant learning environments. Build collaborative classrooms, connect in professional learning communities, and connect with colleagues – all from a single experience.

Within Teams, educators can quickly converse with students, share files and websites, create a OneNote Class Notebook, and distribute and grade assignments. Built-in OneNote Class Notebooks and end-to-end assignment management allow educators to organize interactive lessons and provide effective and timely

feedback. Educational institute administrators and staff can stay up-to-date and collaborate using Staff Teams for announcements and topical conversations. Educators can share instructional material using Professional Learning Communities.

Use the best practices in this article to start using Teams for your educational needs to enable remote learning capabilities. Class Teams can be used to create collaborative class spaces, provide a virtual meeting platform, facilitate learning with assignments and feedback, and lead live calls with students.

Teams has [clients](#) available for desktop (Windows, Mac, and Linux), web, and mobile (Android and iOS) to make sure all your staff and students can stay connected.

Learn more about Teams usage scenarios at the [Teams for education webinar series](#).

User accounts, licenses, and identity security

Teams leverages Microsoft 365 capabilities to authenticate users and provide services. Staff, instructors, and students should have identities established to facilitate collaboration. If identities do not already exist, follow this process to establish them.

[Licenses need to be assigned to the users](#) before they can use Teams capabilities. Teams relies on additional Microsoft 365 capabilities such as [Microsoft 365 groups](#), [Exchange](#), [SharePoint](#) and [OneDrive](#) to enable collaborative scenarios. Users receive the best Teams experience if all these services are also enabled. [Teams is supported for users who have email hosted by Google](#).

Microsoft Teams is included in Office 365 A1, which is free for educational institutions. For IT guidance on how to deploy Office 365 and get your entire educational institution started on Teams, check out [this page](#). For support, you can file a ticket [here](#) and for trainings on Teams, visit your local Microsoft Store to speak with a Specialist.

NOTE

Please review [Updated Guidance for M365 EDU Deployment during COVID-19](#) for our latest information on EDU deployments.

Easily set up Teams

These are the two things you need to do to get up and running with Teams:

1. Allow users to create teams

Students and educators will get the most out of Teams when they can use it with minimal barriers and have the flexibility to tailor it to their needs. One way users can tailor their Teams experience is by having the ability to create teams that meet their needs. **By default, everyone can create Microsoft 365 groups and Teams.** There are times when this capability may not be appropriate; for example, some customers may want to restrict primary-secondary students from creating Teams. If needed, Microsoft 365 group and Team creation can be [restricted to certain security groups](#) within your environment.

Higher education institutions benefit when you let everyone, including students, create teams for classes, research, group projects, and study groups. Primary-secondary schools may want to restrict students from creating Teams to make sure that all student to student communications are happening within a forum that include an adult. In this case, Microsoft 365 group and Team creation can be restricted to all educators and staff.

For a walkthrough of how to create Teams, check out: [Create a class team in Microsoft Teams](#).

2. Configure user experiences using policies

IMPORTANT

You can run the [Teams for Education Policy Wizard](#) to easily apply policies for your students, educators and staff. The tool adjusts the Global (Org-wide default) policy definition of a core set of policies with settings that we recommend for student safety and applies it to students. The tool also creates and assigns a set of custom policies to educators and staff. If you already used the wizard to apply policies for your students, educators and staff, use this article as a reference or *only* if you want to manually create and manage policies for your students, educators and staff.

NOTE

To learn more about the actions you must take to protect students, you can check out the [Keeping students safe in Teams for distance learning](#). If you want to deep dive into our admin EDU policy recommendations, you should go to [Teams policies and policy packages for Education](#).

Teams policies provide the ability to control the options available for specific users or groups of users. Policies can be applied to define who should be allowed to use private chat, private calling, meeting scheduling, content types that can be shared, and more.

Higher education staff, educators, and students benefit from the capabilities included with the default (global) policies. Some additional policy settings can be enabled to add more functionality to Teams, including [enabling translate capabilities in the messaging policy](#) and [allowing for automatic meeting transcription](#) in the meeting policy.

Primary-secondary school students may need restricted capabilities provided to students. Policies set boundaries on what the students can do. Because the student population is often the largest set of users and they often receive the most restrictive settings, it is recommended that student policy changes be made to the 'Global (Org-wide default)' policies.

IMPORTANT

For meeting policies assigned to any users, we recommend setting the "Automatically admit people" setting to "Everyone in your organization". This setting will ensure that non-authenticated users must be admitted from the lobby before they can join Teams meetings. For more information, check out [Manage meeting policies in Teams](#).

Primary school staff and educators should be assigned policies that grant the core capabilities that may be restricted for students. Create new policies that allow the for private chat and meeting scheduling (the default settings for a new policy). [Assign these policies in bulk to your staff and educators](#).

Start using Teams

Create class teams for secure classroom use

Microsoft Teams for Education offers [specific team types](#) for educational use. The [Class team type](#) is designed for classroom use and comes with specific features that support classroom needs including:

- Assignments
- Grades
- OneNote classroom notebook
- [Class Materials folder](#) for securing read-only content for students
- [Insights](#) to provide real-time data regarding student's engagement, assignments, and well-being for each classroom.
- [Early educator access](#) to set up the class before students are added
- The ability to mute disruptive students and other special permissions

There are a few ways in which class teams can be created, and Teams for Education has a unique set of deployment tools to make it as easy as possible.

- [Automatic team creation using SDS](#)
- [Educator-led team creation from Office 365 class groups](#)
- [PowerShell script using Graph APIs](#)
- [Manual team creation](#)

We'll step through various options to help you choose the right deployment path that best fits your needs.

Automatic team creation using SDS

Automating team creation saves both IT admins and educators time. It ensures that educators have all their class teams created and ready to set up upon sign in. [School Data Sync \(SDS\)](#) is a free Office 365 Education tool that reads the data from an educational institution's system of record, for example a Student Information System (SIS) or Learning Management system (LMS). SDS uses the data to enrich Office 365 setup in many ways, including creating class teams in bulk and staying in sync with your information system to keep your instructor and student membership updated as enrollment changes. SDS can import data from any system of record and has built-in connectors to many of the world's existing [SIS vendors](#). We highly recommend using SDS, as it provides the following benefits.

Benefits

- Automatic creation and maintenance of class teams – educators will be able to sign in to Teams and immediately start teaching.
- Membership sync with SIS/LMS to maintain student membership changes.
- EDU Customer Success Team available for free deployment assistance.
- [Early educator access](#): Educators have time to prepare their team before admitting students.
- Optionally creates users and applies Office 365 licenses.
- Creates security groups for use across Office 365 including Teams policy.
- Creates Administrative Units for scoped administrative delegation and [Teacher Password Reset](#).
- Built-in error and retry handling, throttling backoff, and session stability for large scale processing to reduce work on admins.
- Built-in cleanup capabilities to rename and archive groups and teams once they are obsolete.
- [Grade Sync](#): Educators can do all their grading in Teams and have it automatically write grades from Teams back to the SIS gradebook.
- [Student Data Protection](#): Prevent students from using non-Microsoft apps and to track and manage parent consent.
- Imported data is used to enrich Education Insights with user roles, organizations (schools) and other important data.

Considerations

SDS creates teams in two steps. The first step creates a Microsoft 365 group in Azure Active Directory (Azure AD) and the second step automatically turns that group into a team. The second step of creating teams is optional in SDS. An admin may not want to automatically create teams depending on deployment time and the number of unused teams that may result. We recommend institutions with 500,000 teams or more to turn off the automatic team creation toggle in SDS and use the [educator-led team creation method](#).

Get started

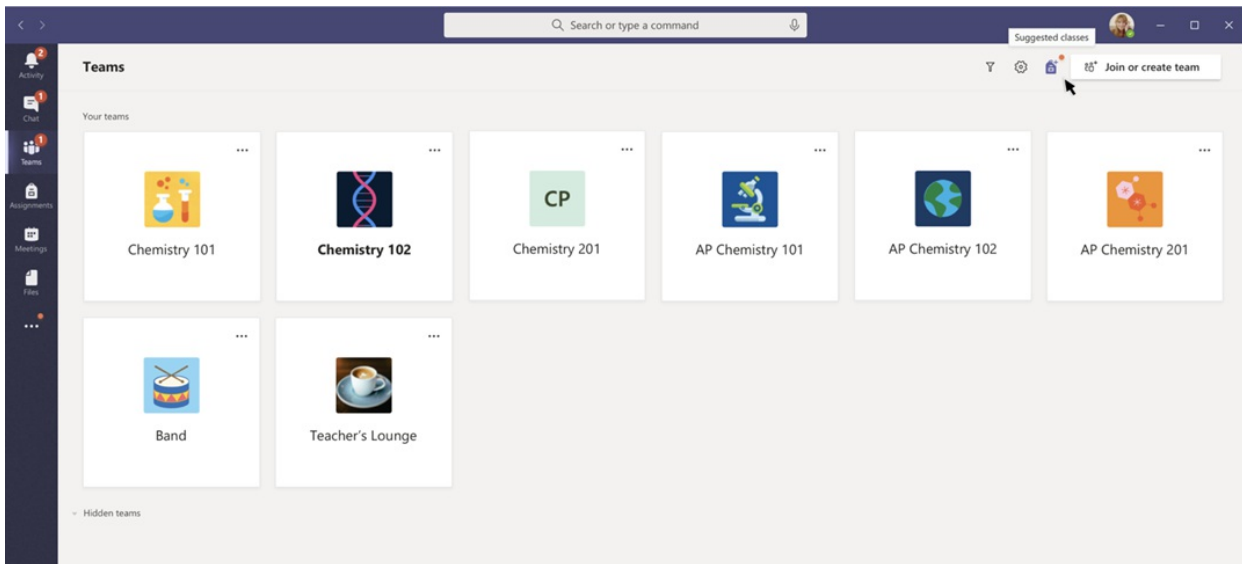

To get started, go to [School Data Sync \(SDS\)](#) and contact <https://aka.ms/sdssupport> deployment assistance.

Educator-led team creation from Office 365 class groups

Educator-led team creation is a great deployment option if you want to make it easy for educators to quickly create the classes they need. We also recommend that institutions with more than 500,000 teams use this method to minimize the number of extraneously-created teams.

This hybrid approach allows you to either use SDS to create groups for each class (recommended) or use [Graph](#)

[API](#) to create them on your own. After class groups are prepared, educators can convert their groups into teams by using the **Suggested classes** icon.

Benefits

- **Early educator access:** Educators have time to prepare their team before admitting students.
- Reduces the number of unused and unnecessary teams. The classes are prepared and suggested but not created unless the teacher intends to use them. We recommend this option for large institutions that have more than 500,000 teams to reduce clutter.
- SDS
 - Membership sync with SIS/LMS to maintain student membership changes.
 - EDU Customer Success Team available for free deployment assistance.
 - Optionally creates users and applies Office 365 licenses.
 - Creates security groups for use across Office 365 including Teams policy.
 - Creates Administrative Units for scoped administrative delegation and [Teacher Password Reset](#).
 - Built-in error and retry handling, throttling backoff, and session stability for large scale processing to reduce work on admins.
 - Built-in cleanup capabilities to rename and archive groups and teams once they are obsolete.
 - **Grade Sync:** Educators can do all their grading in Teams and have it automatically write grades from Teams back to the SIS gradebook.
 - **Student Data Protection:** Prevent students from using non-Microsoft apps and to track and manage parent consent.
 - Imported data is used to enrich Education Insights with user roles, organizations (schools) and other important data.
- Graph API
 - Additional flexibility and control.
 - Doesn't require integration with SDS.

Considerations

- Not fully automated and requires some educator action.
- Educators who don't have permission to create teams can still create teams from existing groups as shown [here](#).
- Graph API requires a high level of technical expertise and time to create and run the script and fix any issues when creating class groups.

Get started

To get started with the SDS method, go to [School Data Sync \(SDS\)](#) and contact <https://aka.ms/sdssupport> deployment assistance.

To use the Graph API method, see [Graph API](#) and [Create a class team](#).

NOTE

To use this method with SDS, you'll need to turn the automatic team creation toggle off in your SDS profile. You can also use a combination of automatic and educator-led team creation for required and optional class teams by using two SDS profiles.

PowerShell script using Graph APIs

With PowerShell, you can write a script to create teams, channels and configure settings automatically. It requires the admin to first create the group, add educators and students, and then create the team as outlined [here](#). You can also use the Microsoft Graph API to create, configure, clone, and archive teams. For more information, see [Use the Microsoft Graph API to work with Microsoft Teams](#), [Microsoft Teams PowerShell](#) and [Create a class team](#). Using Graph APIs is a great way to have more control and flexibility, however, it requires a high level of technical expertise and takes more time to set up initially.

Benefits

- Additional flexibility and control.
- Option to create early educator access teams or immediate student access to teams.
- If you [create teams from groups](#), educators will have early access and student membership changes to the Azure AD group will be synced.

Considerations

- Requires a high level of technical expertise and time to create and run the script and fix any issues when creating class groups.
- No built-in error handling or retry logic.
- Membership changes are not synced with SIS.

NOTE

Class teams require hidden group membership so only educators and students within the class can see the members of that class. To create an Office 365 class group, see [Create a class team](#) to meet the same privacy requirements.

Manual team creation

Students and educators will get the most out of Teams when they can use it with minimal barriers and have the flexibility to tailor it to their needs. One way users can tailor their Teams experience is by having the ability to create teams. Educators set up their own class type team and invite students as shown [here](#). Educators can invite students by [adding students to the team](#), [sharing a join code](#), or [sharing a link to the team](#). If possible, it's best to have educators add their students to the team to ensure the students get access and are notified that they've been added to a team.

Benefits

- Additional flexibility for educators.
- Immediate team creation and access.

Considerations

- Requires educator action and time.
- Student membership is not synced with SIS and requires manual management.
- Doesn't give educators early access to their teams. Students will gain immediate access.

Recommended best practices

- Deploy early! Deploy early to ensure everything is working reliably and ready for the first day of school.
- If you have more than 500,000 teams, we recommend using the [educator-led team creation method](#). It reduces unused teams and clutter by only creating class teams that are relevant and needed.

- If there are any issues (for example, classes are missing) with SDS automatic team creation and educators need them immediately, then they can use the [educator-led team creation method](#) to retry. [Manual team creation](#) is another solution, however, it won't keep your team membership updated.
- The tenant team limit is 500,000 teams. Therefore, admins should proactively try to reduce the number of unused teams to avoid hitting these limits and extending their setup time. For more information about limits, see [Limits and specifications for Microsoft Teams](#).

Early access to class teams

Early Access Class Teams allows educators access to their class teams before their students can view it and begin participating. This allows educators time to set up, add files, and get organized before granting access to their students. When they are ready for students to access the team, they can easily [activate their class](#). As an admin, you also have additional control and capabilities around creating and setting up Early Access Class Teams.

How do I create class teams that allow educators early access to set up a team before admitting students?

Teams created from groups (through SDS, educator-led or Graph API) automatically create early access teams by default. To create your own early access teams using Graph API, you'll need to [create a class](#) and [create the team from a group](#).

How do I check if a class is activated?

In the [team resource type](#), we added a new property, `isMembershipLimitedToOwners`, to determine whether a class is activated. Use the [Get Team API](#) to query the `isMembershipLimitedToOwners` property for a specific class. If the team is activated, it will return a value of false. If the team hasn't been activated by the team owner, it will return a value of true.

How do I activate a class for an educator?

Use the [Update Team API](#) and set the `isMembershipLimitedToOwners` property to false to activate the team on your educator's behalf. Note that after a team is activated, it can't be reversed.

Create staff teams for staff communication and collaboration

[Staff type teams](#) are designed for educational institute administrators and staff to easily share information and work together on institute-wide initiatives, including making announcements, settings up meetings, sharing content, and bringing in external apps, like [Planner for task tracking](#). Educational institute administrators can add staff members to the team via the team creation wizard, [adding members after the team is created](#), or by [sharing a join code or link to the team](#). [Creating channels](#) is a great way to organize conversation and files by workstream or subject. [The Go-to guide for team owners](#) is an excellent place to learn about team owner duties and capabilities.

Teams meeting scenarios

Collaborative meetings for virtual classes

[Microsoft Teams meetings](#) support up to 250 concurrent attendees, including the ability to have audio, video, [content sharing](#), whiteboards, and shared notes. Meetings can be scheduled within the Teams client for [meeting within a private space or within a team channel](#), so all team members know about it. Meetings can be recorded and saved for attendees to review later. These recordings can also be [transcribed to easily find content](#) that had been discussed. A laptop or mobile phone webcam, microphone, and speaker can be used for meetings, and you can get premium audio/video quality from [Microsoft Teams optimized devices](#).

In Teams, meeting organizers can end a meeting for all participants. With this capability, educators can ensure that students don't stay in a meeting unsupervised after a class is finished.

District/University events or updates

Some instruction needs larger audiences and additional production capabilities. These meetings often have defined presenters, producers, and moderated Q&A. Teams supports these sessions using [Microsoft Teams live events](#). Live Events can be used for scenarios, such as district or university-wide updates, leadership addresses, and for instruction to large classes or student groups, or extend to your community. Learn more about

conducting live sessions at: [plan and schedule a live event](#), [produce a live event](#), [attend a live event](#), and [moderating a Q&A](#).

Recommended Tips & Tricks

You can learn more about how Teams is used in Education at: [Microsoft Teams for Education](#).

NOTE

Some key Teams features are not specific to education. Tips and tricks for core Teams capabilities can be found at: [Teams Help and Learning](#).

Prevent users from changing their profile photo

Teams honors the [Outlook on the web mailbox policy](#) setting that's configured by tenant admins to control whether users can change their profile picture. If the `-SetPhotoEnabled` setting is turned off, users can't add, change, or remove their profile picture. To prevent students or staff from changing or removing their profile picture, turn off this setting in the Outlook on the web mailbox policy that's assigned to them.

For example, if a student uploads a profile picture that's approved by your educational institute's IT or HR department, no action is needed. However, if a student uploads a picture that's inappropriate, change the picture according to your educational institute's internal policies.

Adoption content

Microsoft has developed [adoption content](#) and strategy guidance for deploying Teams. The [Teams adoption guide](#) provides a good overview of available content and the [Teams Customer Success Kit](#) provides many templates that can be used for Teams awareness. The Microsoft Educator Center provides education specific training on how [Microsoft Teams](#) and [OneNote](#) are used in the classroom.

Additional adoption resources include:

- ["You can in :90" quick tip videos](#)
- [Teams for Education video playlist](#)
- [BLOG: See how this school uses Teams for distance learning](#)

Support Readiness

IT professionals and support staff can get up to speed with Teams architecture and underlying use of Microsoft 365 capabilities with the [Teams IT architecture posters](#) and [admin technical training](#).

Additional support resources include:

- [Teams Troubleshooting](#)
- [Troubleshoot Microsoft Teams installation and update issues](#)
- [File a support ticket \(can be used by educators and staff\)](#)
- [Support and Help center for educators using Teams](#)
- [Student Help center](#)
- [Teams for Virtualized Desktop Infrastructure](#)
- [How to quickly optimize Office 365 traffic for remote staff](#)
- [Monitor and manage call quality](#)

Teams policies and policy packages for Education

12/7/2021 • 10 minutes to read • [Edit Online](#)

IMPORTANT

You can run the [Teams for Education Policy Wizard](#) to easily apply policies for your students, educators and staff. The tool adjusts the Global (Org-wide default) policy definition of a core set of policies with settings that we recommend for student safety and applies it to students. The tool also creates and assigns a set of custom policies to educators and staff. If you already used the wizard to apply policies for your students, educators and staff, use this article as a reference or *only* if you want to manually create and manage policies for your students, educators and staff.

NOTE

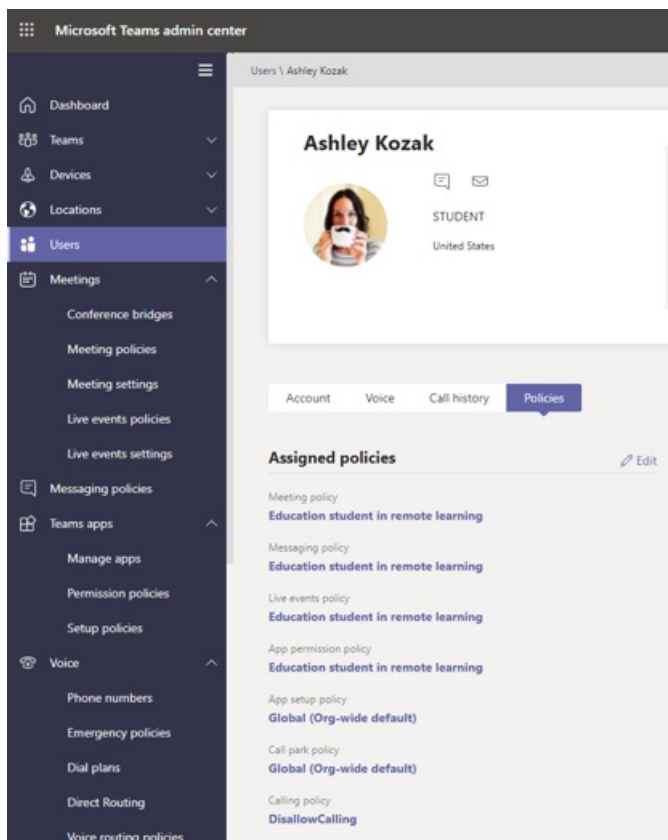

For the larger story on policies in Microsoft Teams, please review [Assign policies to your users in Microsoft Teams](#).

Admins: Getting started with Microsoft Teams policy management

Microsoft Teams allows users to do things like attend online meetings or live events, chat, make calls, and use apps. Setting the right Microsoft Teams admin policies is a critical step in ensuring that Teams is a safe learning environment for students. As an admin, you can use policies to control the Teams features that are available to users in your educational institute. In most cases, policies must be adjusted for both students and educators to keep the environment safe.

Here's a list of the main policy areas you will find in Microsoft Teams. To learn more about the policies in each area and the capabilities they control, use the links below:

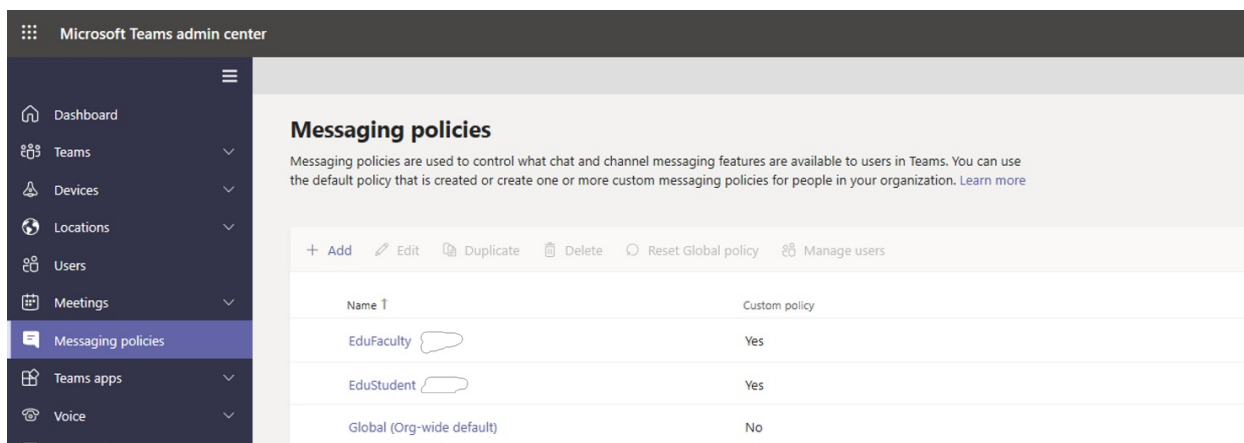

- [Meetings](#)
- [Live events](#)
- [Calling](#)
- [Messaging](#)
- [Teams](#)
- [App permissions](#)

You can manage all Teams policies in the [Microsoft Teams admin center](#) by signing in with your admin credentials.

Where to find Microsoft Teams policies

Once you've logged into the Teams admin center, you'll be able to go to the policy settings for any area of Teams you need to manage, by clicking on the policy option in the left hand navigation of the Teams admin center. We've included a screenshot of the location of the messaging policies.

How to create and update a policy definition

Before you assign policies to your users, you need to first add and create your policy definitions for each capability area with Teams.

NOTE

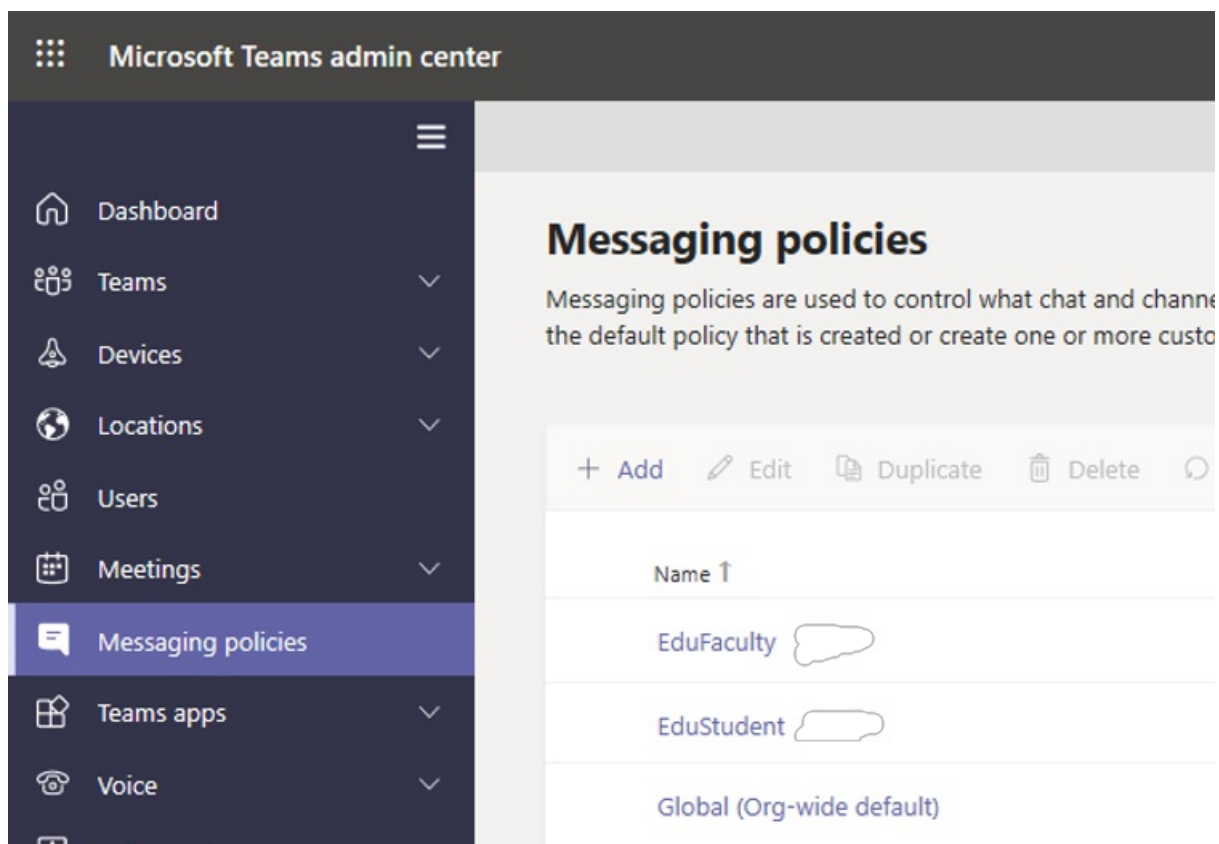

We recommend that you set different policy definitions for your students and educators.

By default, every new user (student or educator) will be assigned the Global (Org-wide default) policy definition for each capability area. We recommend that you use the Global (Org-wide default) for your strictest set of policy definitions. In most cases, this stricter policy set will be more appropriate for students. Using your Global

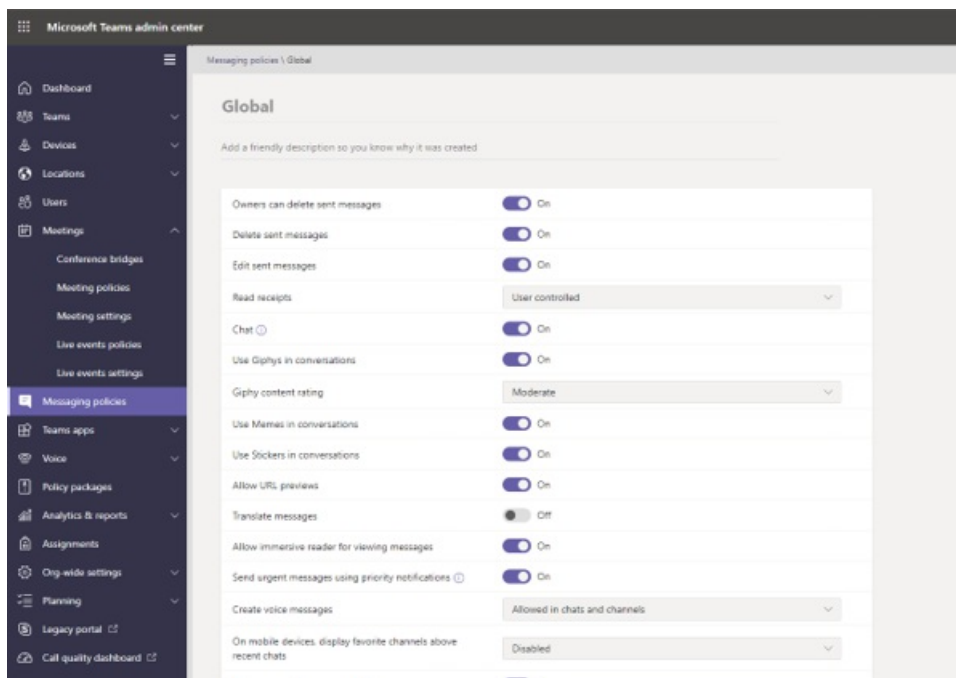

(Org-wide default) policy definition in this way will ensure that new users will have the tightest restrictions when they are added to your tenant. To adhere to this guidance, we recommend you follow these steps:

1. Create a custom policy definition for each Teams capability area with policy values that are fitting for your educators' needs (without this, educators will have the same restricted access as your students as defined within the Global (Org-wide default) policy definition).
2. Assign these new custom policy definitions to your educators.
3. Edit the Global (Org-wide default) policy definitions for each capability area with values that are appropriate for your students.
4. The Global (Org-wide default) policy definitions will be applied to your students as long as they have no other policy definitions assigned.

To create or edit policy definitions, go to the policy capability area you want to work in (for example, Messaging policies). Select **Add** to create a new custom policy definition. To change an existing policy definition, select **Edit**.

Whether you choose to add or edit a policy definition, you're brought to a view that lists all the policy options related to this policy area. Use this list to select what values you want set in your policy definition.

IMPORTANT

Don't forget to select **Save** before you leave the page.

Assigning policy definitions

There are multiple methods you can use to assign policy definitions to your users. Each method has its own advantages and disadvantages, which will differ depending on your institution's unique needs.

In most cases, we recommend that you use group policy assignment to assign policies to your users. This method allows for faster and more seamless policy application. When a user is added to a group that has a policy definition assigned to it, the new user automatically inherits the policies of the group. This allows for easier policy management when large numbers of users are added and removed to the environment, for example at the beginning and ending of a school term.

For large organizations, we also recommend batch policy assignment, which is tailored for cases where you need to assign policies to large sets of users. To learn more about these application methods, refer to [Assign policies to large sets of users in your school](#).

If you have a smaller institution or have a need to update an individual student or educator's policy settings, follow the instructions below.

IMPORTANT

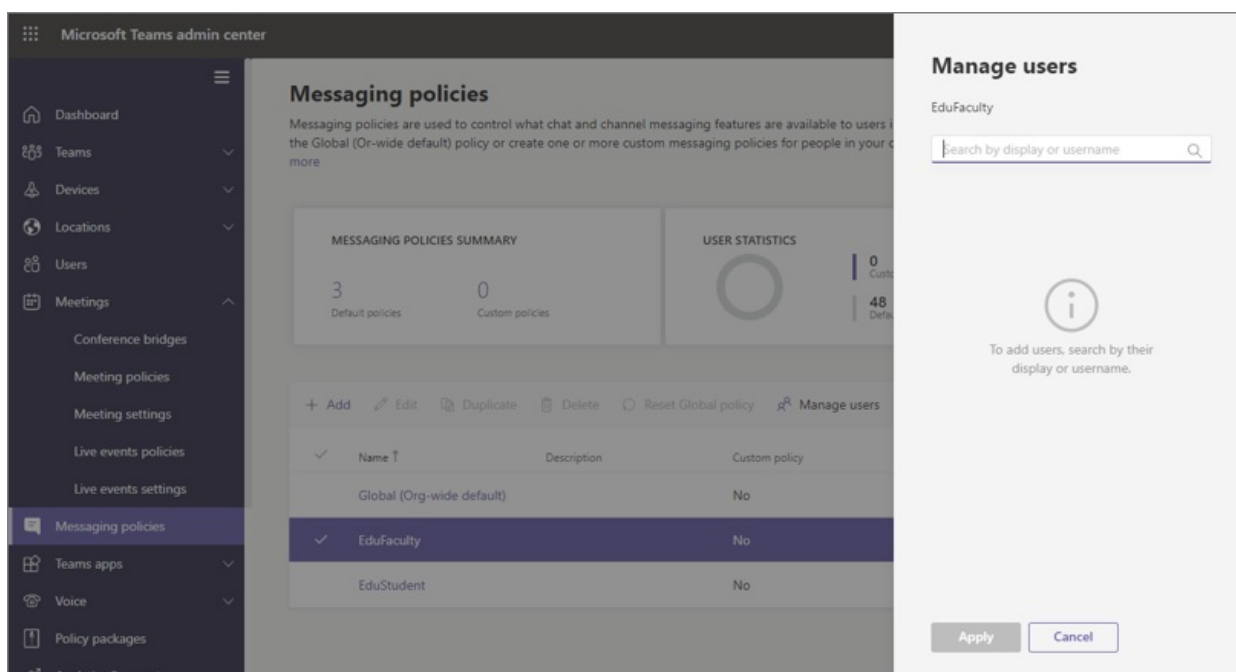

Policy assignments given at the individual user level override any group policies assigned to the user. Ensure that you are only using individual policy assignments when you desire to override group policy settings.

How to assign a policy definition to a user

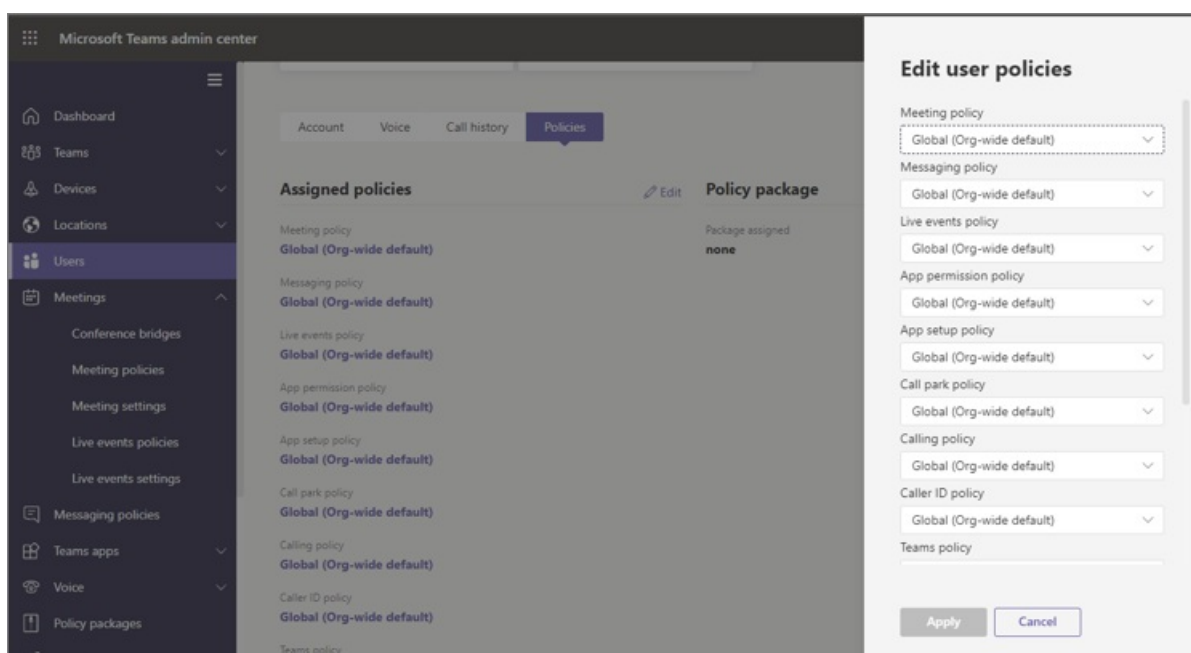

NOTE

Assigning a policy definition may take a while to propagate out to all the users and clients. You might want to do this when the user accounts are first created in Azure/M365, and whenever a new student joins the educational institute.

Once your policy definition is created or updated, you can assign it to a user by selecting **Manage users** on the policy page, searching for the desired user, then applying the policy.

You can also assign a policy to a user by navigating to **Users**, selecting the user you wish to update policies for, selecting **Policies**, then **Edit**. From there, you can select the policy definition you'd like to assign to the user for each capability area.

Policy packages in Microsoft Teams

NOTE

For more reading, you can check out [Manage policy packages in Microsoft Teams](#) for step by step guidance on assigning single users a package, assigning packages in bulk to up to 5000 users, and managing and updating the policies linked to each package.

A policy package in Teams collects predefined policies and policy settings that you learned about outlined above, and assigns them to users with similar roles in your institution. Policy packages simplify, streamline, and help provide consistency when managing policies. In normal practice, you assign each of your users a policy package, and redefine the policies in each package as needed to suit the needs of that user group. When you update settings in a package, all users assigned to that package are changed as a bulk update.

Educational institutions in general have many users with unique needs, depending partly on the age and

maturity of the students. For example, you may want to grant educators and staff full access to Microsoft Teams, but want to limit Microsoft Teams capabilities for students to encourage a safe and focused learning environment. You can use policy packages to tailor settings based on the needs of different cohorts in your educational institute community.

IMPORTANT

Our primary recommendation is that you use the Global (Org-wide default) policy definition for students instead of a policy package. This ensures that new users in your organizations always have the strictest set of policies appropriate for students. If this recommendation does not meet the needs of your institution, one of the student policy packages below may be a good alternative.

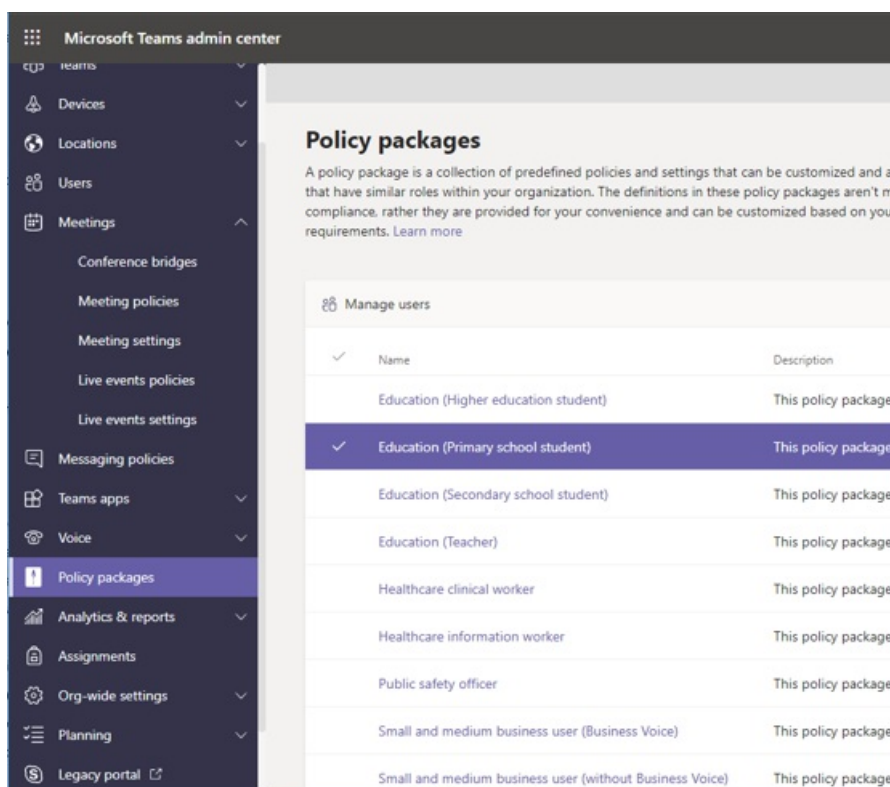

Just like the policy list earlier in this article, policy packages predefine policies for:

- Meetings
- Live events
- Calling
- Messaging
- App permissions

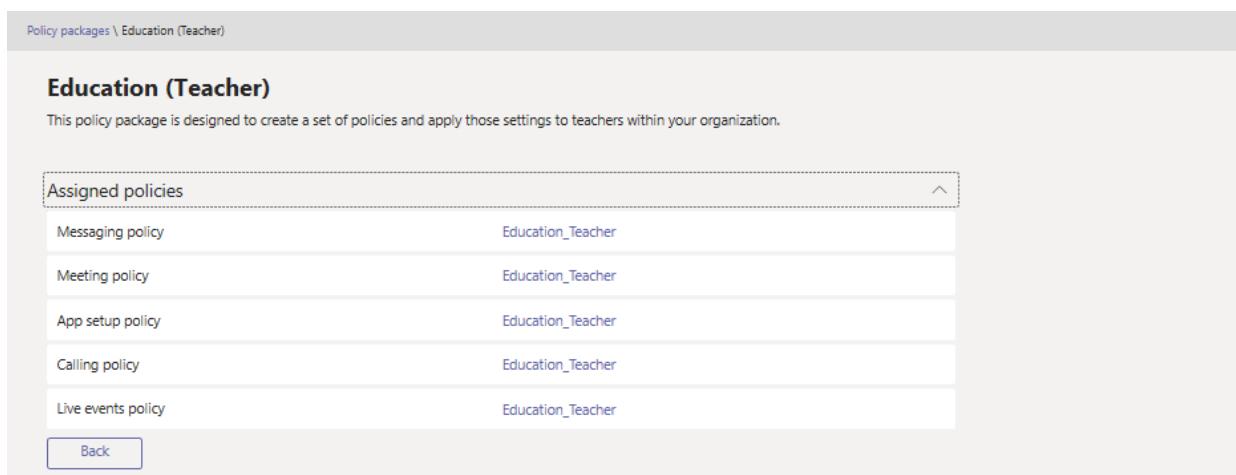

Microsoft Teams currently includes the following policy packages:

PACKAGE NAME LISTED IN MICROSOFT TEAMS ADMIN CENTER	BEST USED FOR	DESCRIPTION
Education_Teacher	Educators and staff	Use this set of policies and policy settings to grant educators and staff within your organization full access to chat, calling and meetings through Microsoft Teams.
Education_PrimaryStudent	Primary school aged students	Younger, primary school aged students within your institution may need more limits within Microsoft Teams. Use this set of policies and policy settings to limit capabilities like meetings creation and management, chat management, and private calling.
Education_SecondaryStudent	Secondary school aged students	Secondary school aged students within your institution may need more limits within Microsoft Teams. Use this set of policies and policy settings to limit capabilities like meetings creation and management, chat management, and private calling.
Education_HigherEducationStudent	Higher education students	Higher education students within your institution may need fewer limits than younger students, but some limitations may be recommended. You can use this set of policies and policy settings to give access to chat, calling, and meetings within your organization, but limit how your students use Microsoft Teams with external participants.

PACKAGE NAME LISTED IN MICROSOFT TEAMS ADMIN CENTER	BEST USED FOR	DESCRIPTION
Education_PrimaryTeacher_RemoteLearning	Educators and staff	Creates a set of policies that apply to primary teachers to maximize student safety and collaboration when using remote learning.
Education_PrimaryStudent_RemoteLearning	Primary school aged students	Creates a set of policies that apply to primary students to maximize student safety and collaboration when using remote learning.

Each individual policy is given the name of the policy package so you can identify policies linked to a policy package. For example, when you assign the Education_Teacher policy package to educators in your educational institution, a policy named Education_Teacher is created for each policy in the package.

NOTE

If you decide that educators and administrative support staff need different policies, you can repurpose an existing package: identify a package you aren't currently using and change the settings to be appropriate for that group. You might have to make a note to yourself which group has which package, but that's the only impediment to repurposing a package.

Manage policy packages

View

View the settings of each policy in a policy package before you assign a package. In the left navigation of the Microsoft Teams admin center, select **Policy packages**, select the package name, and then select the policy name.

Decide whether the predefined values are appropriate for your organization or whether you need to customize them to be more restrictive or lenient based on your organization's needs.

Customize

Customize the settings of policies in the policy package, as needed, to fit the needs of your organization. Any changes you make to policy settings are automatically applied to users who are assigned the package. To edit the settings of a policy in a policy package, in the Microsoft Teams admin center, select the policy package, select the name of the policy you want to edit, and then select **Edit**.

Keep in mind that you can also change the settings of policies in a package after you assign the policy package. To learn more, see [Customize policies in a policy package](#).

Assign

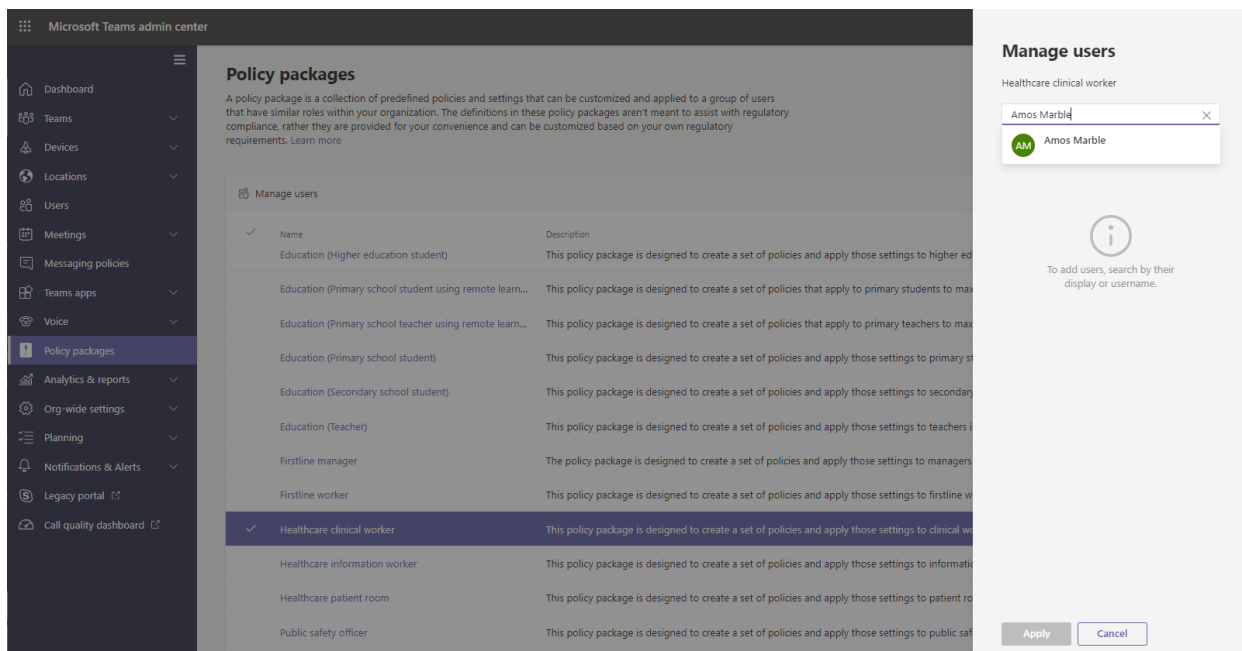

Assign the policy package to users. If a user has a policy assigned, and then later you assign a different policy, the most recent assignment will take priority.

NOTE

Each user will require the Advanced Communications add-on in order to receive a custom policy package assignment. For more information, see [Advanced Communications add-on for Microsoft Teams](#).

Assign a policy package to one or several users

To assign a policy package to one or multiple users, in the left navigation of the Microsoft Teams admin center, go to **Policy packages**, and then select **Manage users**.

To learn more, see [Assign a policy package](#).

If a user has a policy assigned, and then later you assign a different policy, the most recent assignment will take priority.

Assign a policy package to a group

This feature is in private preview

Policy package assignment to groups let you assign multiple policies to a group of users, such as a security group or distribution list. The policy assignment is propagated to members of the group according to precedence rules. As members are added to or removed from a group, their inherited policy assignments are updated accordingly. This method is recommended for groups of up to 50,000 users but will also work with larger groups.

To learn more, see [Assign a policy package to a group](#).

Assign a policy package to a large set (batch) of users

Use batch policy package assignment to assign a policy package to large sets of users at a time. You use the [New-CsBatchPolicyPackageAssignmentOperation](#) cmdlet to submit a batch of users and the policy package that you want to assign. The assignments are processed as a background operation and an operation ID is generated for each batch.

A batch can contain up to 5,000 users. You can specify users by their object Id, UPN, SIP address, or email address. To learn more, see [Assign a policy package to a batch of users](#).

Policies that should be assigned for student safety

For more information on the steps you need to take to protect students in your environment, carefully review [Keeping students safe while using Teams for distance learning](#).

Assign policies to large sets of users in your school

12/7/2021 • 11 minutes to read • [Edit Online](#)

IMPORTANT

You can run the [Teams for Education Policy Wizard](#) to easily apply policies for your students, educators and staff. The tool adjusts the Global (Org-wide default) policy definition of a core set of policies with settings that we recommend for student safety and applies it to students. The tool also creates and assigns a set of custom policies to educators and staff. If you already used the wizard to apply policies for your students, educators and staff, use this article as a reference or *only* if you want to manually create and manage policies for your students, educators and staff.

NOTE

For the larger story on assigning policies in Microsoft Teams, see [Assign policies to your users in Teams](#).

Overview

Do you need to give your students and educators access to different features in Microsoft Teams? You can quickly identify the users in your organization by license type and then assign them the appropriate policy. This tutorial shows you how to assign a meeting policy to large sets of users in your school. You can assign policies using the Microsoft Teams admin center and PowerShell and we'll show you both ways.

You can assign a meeting policy to a security group that the users are members of or directly to users at scale through a batch policy assignment. You'll learn how to:

- Use [policy assignment to groups](#) to assign a meeting policy to a security group **(recommended)**. This method lets you assign a policy based on group membership. You can assign a policy to a security group or distribution list. As members are added to or removed from the group, their inherited policy assignments are updated accordingly. We recommend you use this method because it reduces the time to manage policies for new users or when users' roles change. This method works best for groups of up to 50,000 users but will also work with larger groups.
- Use [batch policy assignment](#) to assign a meeting policy directly to users in bulk. You can assign a policy for up to 5,000 users at a time. If you have more than 5,000 users, you can submit multiple batches. With this method, when you have new users, you'll need to re-run the batch assignment to assign the policy to those new users.

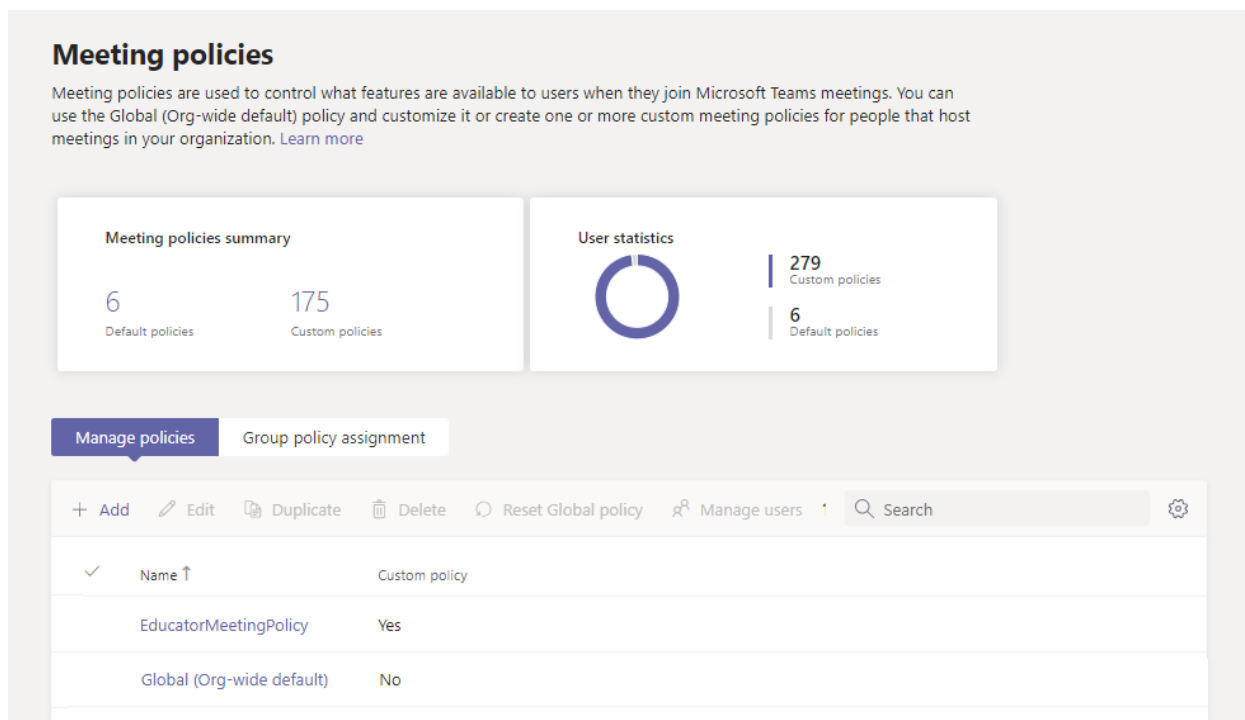

Remember that in Teams, users automatically get the Global (Org-wide default) policy for a Teams policy type unless you create and assign a custom policy. Because the student population is often the largest set of users and they often receive the most restrictive settings, we recommend that you do the following:

- Create a custom policy that allows core capabilities such as private chat and meeting scheduling and assign the policy to your staff and educators.
- Assign the custom policy to your staff and educators.
- Edit and apply the Global (Org-wide default) policy to restrict capabilities for students.

Keep in mind that the Global policy will apply to all users in your school until you create a custom policy and assign it to your staff and educators.

In this tutorial, students will get the Global meeting policy and we'll assign a custom meeting policy named

EducatorMeetingPolicy to staff and educators. We assume that you've edited the Global policy to tailor meeting settings for students and [created a custom policy](#) that defines the meeting experience for staff and educators.

Assign a policy to a group

Follow these steps to create a security group for your staff and educators, and then assign a custom meeting policy named EducatorMeetingPolicy to that security group.

Before you get started

IMPORTANT

When you assign a policy to a group, the policy assignment is propagated to members of the group according to precedence rules. For example, if a user is directly assigned a policy (either individually or through a batch assignment), that policy takes precedence over a policy that's inherited from a group. This also means that if a user has a meeting policy that was directly assigned to them, you'll have to remove that meeting policy from the user before they can inherit a meeting policy from a security group.

Before you get started, it's important to understand [precedence rules](#) and [group assignment ranking](#). **Make sure that you read and understand the concepts in [What you need to know about policy assignment to groups](#).**

You'll need to complete all these steps for your staff and educators to inherit a meeting policy from a security group.

1. [Create security groups](#).
2. [Assign a policy to a security group](#).
3. [Remove a policy that was directly assigned to users](#).

Create security groups

First, create a security group for your staff and educators.

With [School Data Sync \(SDS\)](#), you can [easily create security groups educators and students](#) in your school. We recommend that you use SDS to create the security groups you need to manage policies for your school.

If you're unable to deploy SDS within your environment, use [this PowerShell script](#) to create two security groups,

one for all staff and educators who have a Faculty license assigned and another for all students who have a Student license assigned. You'll need to run this script routinely to keep the groups fresh and up to date.

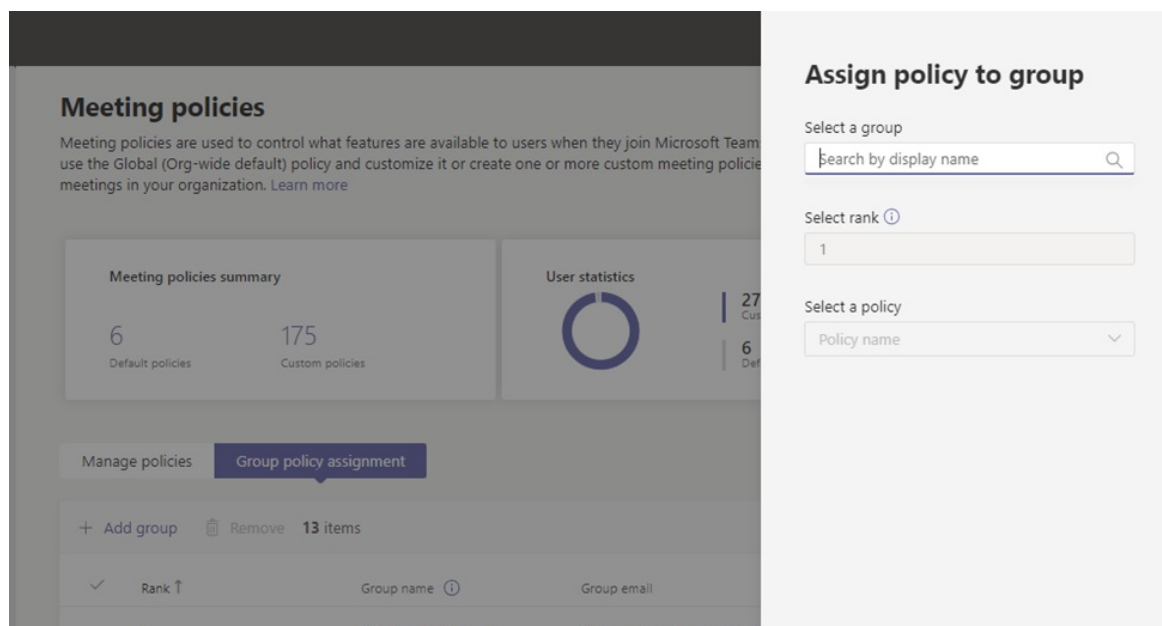

Assign a policy to a security group

Using the Microsoft Teams admin center

NOTE

Currently, policy assignment to groups using the Microsoft Teams admin center is only available for Teams calling policy, Teams call park policy, Teams policy, Teams live events policy, Teams meeting policy, and Teams messaging policy. For other policy types, use PowerShell.

1. In the left navigation of the Microsoft Teams admin center, go to **Meetings > Meeting policies**.
2. Select the **Group policy assignment** tab.
3. Select **Add group**, and then in the **Assign policy to group** pane, do the following:

- a. In the **Select a group** box, search for and add the security group that contains your staff and educators.
- b. In the **Select rank** box, enter 1.
- c. In the **Select a policy** box, select **EducatorMeetingPolicy**.
- d. Select **Apply**.

To remove a group policy assignment, on the **Group policy assignment** tab of the policy page, select the group assignment, and then select **Remove**.

To change the ranking of a group assignment, you have to first remove the group policy assignment. Then, follow the steps above to assign the policy to a group.

Using PowerShell

NOTE

Currently, policy assignment to groups using PowerShell isn't available for all Teams policy types. See [New-CsGroupPolicyAssignment](#) for the list of supported policy types.

Install and connect to the Microsoft Teams PowerShell module

Run the following to install the [Teams PowerShell module](#) (if it's not already installed). Make sure you install version 1.0.5 or later.

```
Install-Module -Name MicrosoftTeams
```

Run the following to connect to Teams and start a session.

```
Connect-MicrosoftTeams
```

When you're prompted, sign in using your admin credentials.

Assign a policy to a group

Run the following to assign the meeting policy named EducatorMeetingPolicy to the security group that contains your staff and educators and set the assignment ranking to 1. You can specify a security group by using the object Id, Session Initiation Protocol (SIP) address, or email address. In this example, we use an email address (staff-faculty@contoso.com).

```
New-CsGroupPolicyAssignment -GroupId staff-faculty@contoso.com -PolicyType TeamsMeetingPolicy -PolicyName "EducatorMeetingPolicy" -Rank 1
```

Remove a policy that was directly assigned to users

Remember that if a user was directly assigned a policy (either individually or through a batch assignment), that policy takes precedence. This means that if a user has a meeting policy that was directly assigned to them, you'll have to remove that meeting policy from the user before they can inherit a meeting policy from a security group.

To learn more, see [What you need to know about policy assignment to groups](#).

Follow these steps to remove the meeting policy that was directly assigned to your staff and educators.

Install and connect to the Microsoft Teams PowerShell module

Run the following to install the [Teams PowerShell module](#) (if it's not already installed). Make sure you install version 1.0.5 or later.

```
Install-Module -Name MicrosoftTeams
```

Run the following to connect to Teams and start a session.

```
Connect-MicrosoftTeams
```

When you're prompted, sign in using the same admin credentials you used to connect to Azure AD.

Unassign a policy that was directly assigned to users

Run the following to remove a meeting policy from users who were directly assigned that policy. You can specify users by email address or object ID.

In this example, the meeting policy is removed from users specified by their email address.

```
$users_ids = @("reda@contoso.com", "nikica@contoso.com", "jamie@contoso.com")  
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsMeetingPolicy -PolicyName $null -Identity $users_ids -  
OperationName "Unassign meeting policy"
```

In this example, the meeting policy is removed from the list of users in a text file named user_ids.txt.

```
$user_ids = Get-Content .\users_ids.txt
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsMeetingPolicy -PolicyName $null -Identity $users_ids -
OperationName "Unassign meeting policy"
```

Get policy assignments for a group

Run the following to see all the policies assigned to a specific security group. Note that groups are always listed by their group ID even if its SIP address or email address was used to assign the policy.

```
Get-CsGroupPolicyAssignment -GroupId staff-faculty@contoso.com
```

Get the policies assigned to a user

Run the following to see all the policies that are assigned to a specific user. The following example shows you how to get the policies that are assigned to reda@contoso.com.

```
Get-CsUserPolicyAssignment -Identity reda@contoso.com
```

Assign a policy to a batch of users

Follow these steps to assign a custom meeting policy named EducatorMeetingPolicy directly to your staff and educators in bulk.

Using PowerShell

Connect to the Azure AD PowerShell for Graph module and the Teams PowerShell module

Before you perform the steps in this article, you'll need to install and connect to the Azure AD PowerShell for Graph module (to identify users by their assigned licenses) and the Microsoft Teams PowerShell module (to assign the policies to those users).

Install and connect to the Azure AD PowerShell for Graph module

Open an elevated Windows PowerShell command prompt (run Windows PowerShell as an administrator), and then run the following to install the Azure Active Directory PowerShell for Graph module.

```
Install-Module -Name AzureAD
```

Run the following to connect to Azure AD.

```
Connect-AzureAD
```

When you're prompted, sign in using your admin credentials.

To learn more, see [Connect with the Azure Active Directory PowerShell for Graph module](#).

Install and connect to the Microsoft Teams PowerShell module

Run the following to install the [Teams PowerShell module](#) (if it's not already installed). Make sure you install version 1.0.5 or later.

```
Install-Module -Name MicrosoftTeams
```

Run the following to connect to Teams and start a session.

```
Connect-MicrosoftTeams
```

When you're prompted, sign in using the same admin credentials you used to connect to Azure AD.

Identify your users

First, run the following to identify your staff and educators by license type. This tells you what SKUs are in use in your organization. You can then identify staff and educators that have a Faculty SKU assigned.

```
Get-AzureAdSubscribedSku | Select-Object -Property SkuPartNumber,SkuId
```

Which returns:

SkuPartNumber	SkuId
M365EDU_A5_FACULTY	e97c048c-37a4-45fb-ab50-922fbf07a370
M365EDU_A5_STUDENT	46c119d4-0379-4a9d-85e4-97c66d3f909e

In this example, the output shows that the Faculty license Skuld is "e97c048c-37a4-45fb-ab50-922fbf07a370".

NOTE

To see a list of Education SKUs and SKU IDs, see [Education SKU reference](#).

Next, we run the following to identify the users that have this license and collect them all together.

```
$faculty = Get-AzureADUser -All $true | Where-Object {($_.assignedLicenses).SkuId -contains "e97c048c-37a4-45fb-ab50-922fbf07a370"}
```

Assign a policy in bulk

Now, we assign the appropriate policies to users in bulk. The maximum number of users for which you can assign or update policies is 5,000 at a time. For example, if you have more than 5,000 staff and educators, you'll need to submit multiple batches.

Run the following to assign a custom meeting policy named EducatorMeetingPolicy to your staff and educators.

```
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsMeetingPolicy -PolicyName EducatorMeetingPolicy -Identity $faculty.ObjectId
```

NOTE

To assign a different policy type in bulk, like TeamsMessagingPolicy, you'll need to change `PolicyType` to the policy that you're assigning and `PolicyName` to the policy name.

Get the status of a bulk assignment

Each bulk assignment returns an operation ID, which you can use to track the progress of the policy assignments or identify any failures that might occur. For example, run the following:

```
Get-CsBatchPolicyAssignmentOperation -OperationId 3964004e-caa8-4eb4-b0d2-7dd2c8173c8c | fl
```

To view the assignment status of each user in the batch operation, run the following. Details of each user are in the `UserState` property.

```
Get-CsBatchPolicyAssignmentOperation -OperationId 3964004e-caa8-4eb4-b0d2-7dd2c8173c8c | Select -  
ExpandProperty UserState
```

Assign a policy in bulk if you have more than 5,000 users

First, run the following to see how many staff and educators you have:

```
$faculty.count
```

Instead of providing the whole list of user IDs, run the following to specify the first 5,000, and then the next 5,000, and so on.

```
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsMeetingPolicy -PolicyName EducatorMeetingPolicy -  
Identity $faculty[0..19999].ObjectId
```

You can change the range of user IDs until you reach the full list of users. For example, enter `$faculty[0..4999]` for the first batch, use `$faculty[5000..9999]` for the second batch, enter `$faculty[10000..14999]` for the third batch, and so on.

Get the policies assigned to a user

Run the following to see all the policies that are assigned to a specific user. The following example shows you how to get the policies that are assigned to hannah@contoso.com.

```
Get-CsUserPolicyAssignment -Identity hannah@contoso.com
```

FAQ

I'm not familiar with PowerShell for Teams. Where can I learn more?

For an overview of using PowerShell to manage Teams, see [Teams PowerShell overview](#). For more information about the cmdlets used in this article, see:

- [New-CsGroupPolicyAssignment](#)
- [Get-CsGroupPolicyAssignment](#)
- [New-CsBatchPolicyAssignmentOperation](#)
- [Get-CsBatchPolicyAssignmentOperation](#)
- [Get-CsUserPolicyAssignment](#)

PowerShell script sample – Create security groups for educators and students in your school

12/7/2021 • 6 minutes to read • [Edit Online](#)

Use this PowerShell script to create the security groups that you need to manage Microsoft Teams policies in your school. The [policy assignment to groups](#) feature in Teams lets you assign a policy to a group of users, such as a security group. The policy assignment is propagated to members of the group according to precedence rules. As members are added to or removed from a group, their inherited policy assignments are updated accordingly.

This PowerShell script creates two security groups, one for staff and educators and another for students in your school, based on license type. You can then assign policies to the security groups that you created. For more information about using this script, see [Assign policies to large sets of users in your school](#).

This script does the following:

- Identifies staff and educators who are assigned a Faculty SKU, creates a security group, and then adds staff and educators to the group.
- Identifies students who are assigned a Student SKU, creates a security group, and then adds the students to the group.
- Updates the membership of each security group to add or remove staff, educators, and students based on whether they have a license.

You'll need to run this script regularly to keep the security groups fresh and up to date.

IMPORTANT

It's important to understand [precedence rules](#) and [group assignment ranking](#) when assigning policies to groups. Make sure that you read and understand the concepts in [What you need to know about policy assignment to groups](#).

Before you start

Download and install the [Skype for Business Online PowerShell module](#), and then restart your computer if prompted.

To learn more, see [Manage Skype for Business Online with Office 365 PowerShell](#) and [Teams PowerShell overview](#).

Sample script

```
<#
Script Name:
CreateOrUpdate_SecurityGroup_Per_LicenseType.ps1
Synopsis:
This script is designed to perform following operations:
1. Create a security group for faculty and student members based on the assigned license SKU and add the members accordingly.
2. Update the security group to add/remove teachers and students so that only users who have a valid teacher/student license are present in the group.
The output of the script is written in a log file present at location: C:\results\log.txt
Written By:
Mihir Roy

Help for low-bandwidth situations for Teams for EDU

12/7/2021 • 4 minutes to read • [Edit Online](#)

There are numerous network elements when it comes to working with Microsoft Teams that can affect performance. Low bandwidth is one of the situations that can feel entirely out of your control. Consider the following situations:

- A low-speed internet connection for the school.
- A low-speed internet connection for one or more students.
- Times of the day when there's low bandwidth because of network usage in an area.
- Low-bandwidth periods because of outages local to neither the school nor to students, but, which affect performance nonetheless.
- Non-bandwidth issues (for example, issues with hardware) that masquerade as low-bandwidth issues.

This article will give you best practices to follow for various Teams activities when you're faced with a low-bandwidth issue.

IMPORTANT

There's information here on [How Microsoft Teams uses memory](#), because in addition to low bandwidth problems, you may be having resource issues on your device. If you're looking for network guidance for Microsoft Teams, review [Prepare your organization's network for Microsoft Teams](#).

Resolving low-bandwidth issues for Admins

The important thing to remember, as an IT Admin, is that while you have solutions for low-bandwidth issues that are wide-spread that will resolve problems quickly, solutions should be considered carefully. Some issues may be able to resolve with a more narrow focus taken at the educator or even the student/parent level.

In short, if the low-bandwidth issue occurs for a wide group of students, taking action as an IT Admin makes sense, and it also makes sense if the actions taken at the student/educator level haven't been helpful.

NOTE

If you've got the time to invest, the [Quality of Experience Review Guide](#) is a worthwhile read (this is not EDU-specific, but it will still have valuable information). This guide will allow experienced IT Admins to go in-depth on the experience for their educators and students.

Meetings and video

A primary focus for low-bandwidth issues is meetings; specifically, video in meetings. An IT Admin should consider the actions below when dealing with issues reported by students or educators in regard to having the best meeting experience in an educational setting.

Meeting policies

Regarding meetings, one of the most concerning areas for low-bandwidth situations has to do with videos. In addition to Teams being able to scale to detected bandwidth automatically, you as an IT Admin have policy options you can set at the per-organizer and/or per-user level. These options allow you to give everyone the best experience in light of the bandwidth they have to work with at a given time.

Some of the things you can set via policy include:

- Disabling video altogether, so no one could enable it.
- Media bit rate (this setting is set per-user).

To learn more about your options, and to walk through the specifics of what policies you'd need to set for meetings and video, check out [Meeting policy settings in Teams: Audio and video](#).

Screen sharing policies

In other cases, educators may be sharing their entire screen to students, when sharing should be limited to an application relevant to the lesson being taught. This setting can also be set via policy, if that's a more desirable way to do it than to have educators making that choice individually.

For a good idea of what you can do about limiting screen sharing via policy settings, check out [Meeting policy settings in Teams: Audio and video](#).

Dial-in number for meetings

It may be easier for some students to attempt to dial in to some classroom sessions. You can provide a dial-in number for Teams meetings, so students with issues can phone in as an alternative to attending a video meeting.

For more information on this, you can read [Set the phone numbers included on invites in Microsoft Teams](#).

Low-bandwidth scenarios as an educator

Educators should feel empowered to take steps to resolve low-bandwidth issues, and may be a superior choice to IT Admin action in the following situations:

- If the problem is intermittent, or relatively transitory.
- If there is a specific time of the day you can anticipate there being an issue, or the low bandwidth period has some predictability to it.

In these situations, you can take some actions.

For more information, check out [Use Teams for schoolwork when bandwidth is low](#).

Low-bandwidth scenarios as a parent or student

There are also situations, and you should proactively discuss them with your educators, where the bandwidth problem may be on the student's side (for example, a large number of students are able to watch the video lessons without issue, but a small number of students have difficulties).

It's not reasonable to expect many parents to be able to troubleshoot these issues. Low-bandwidth issues may be out of a student or parent's control (their home may not have access to high bandwidth, they may have numerous people in their immediate area consuming bandwidth and affecting what they can do, there may be internet instability, and so on).

We've put together guidance in our [Use Teams for schoolwork when bandwidth is low](#) article for parents and students as well, you can review and try these recommendations if you're having any problems.

Use the Teams for Education Policy Wizard to easily apply policies for a safe learning environment

12/7/2021 • 15 minutes to read • [Edit Online](#)

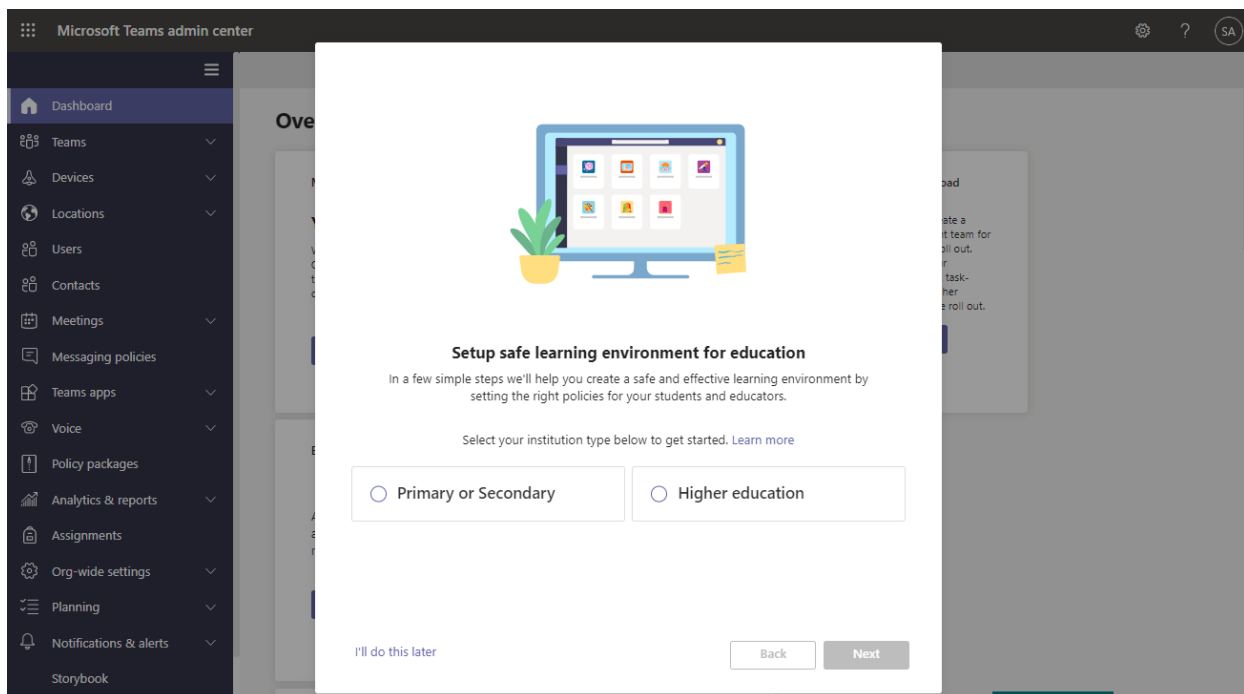

Overview

The Microsoft Teams for Education Policy Wizard simplifies managing policies for your students and educators. Use it to easily and quickly apply the most important set of policies relevant to creating a safe and productive learning experience.

Policies in Teams let you control how Teams behaves in your environment and what features are available to users. For example, there are calling policies, meeting policies, and messaging policies, to name a few, and each policy area can be customized to meet your organization's needs.

To maintain a safe and focused learning environment, it's important to set policies to control what students can do in Teams. For example, you can use policies to control who can use private chat and private calling, who can schedule meetings, and what content types can be shared. You can also use policies to turn on Teams features that enrich the learning experience.

Policies must be adjusted for both students and educators to keep the learning experience safe. Policies for students need to be more restrictive to reduce their risk of receiving inappropriate levels of access. Educators and staff need a separate set of policies that can be more permissive to enable them to be successful. For example, allow educators to schedule meetings and restrict students from doing so.

This article walks you through how to run the wizard.

IMPORTANT

The policies applied by the wizard will satisfy the needs of the majority of Teams for Education customers. The wizard adjusts the Global (Org-wide default) definition of a core set of policies with settings that we recommend for student safety and applies it to students. The wizard also creates and assigns a set of custom policies to educators and staff. Most Teams for Education customers won't need to use other policy assignment methods after running this wizard. Use other policy assignment methods *only* if you want to manually create and manage policies for your students, educators and staff.

Teams for Education Policy Wizard

The wizard applies a set of core policy definitions to students and a separate set of core policy definitions to educators and staff, with settings that are appropriate for each. Here's what happens when you run the wizard.

The wizard sets up policies based on educational institution type (**Primary or Secondary or Higher education**). You select your institution type, and the wizard does the following:

- **Students:** The wizard adjusts the Global (Org-wide default) policy definition of each policy area covered by the wizard with new default settings that are appropriate to keep your students safe. This ensures that your current students and all new students get the most restrictive set of policies.
- **Educators and staff:** The wizard creates a set of custom policy definitions for each policy area covered by the wizard with settings tailored to the needs of educators and staff. Then, it assigns the policy definitions to the group of educators and staff that you choose. In this way, your educators and staff get a more permissive set of policies to enable them to be successful.

You only need to run the wizard one time. New students automatically get the Global (Org-wide default) policy definitions applied by the wizard and new staff that you add to the group you selected are automatically assigned the custom policies.

Also, whenever a new feature is added to Teams, the appropriate EDU relevant default value of the policy for that feature will be automatically added to the Global (Org-wide default) without requiring any admin intervention. This helps to ensure that the right policies are in place to keep students secure and engaged.

NOTE

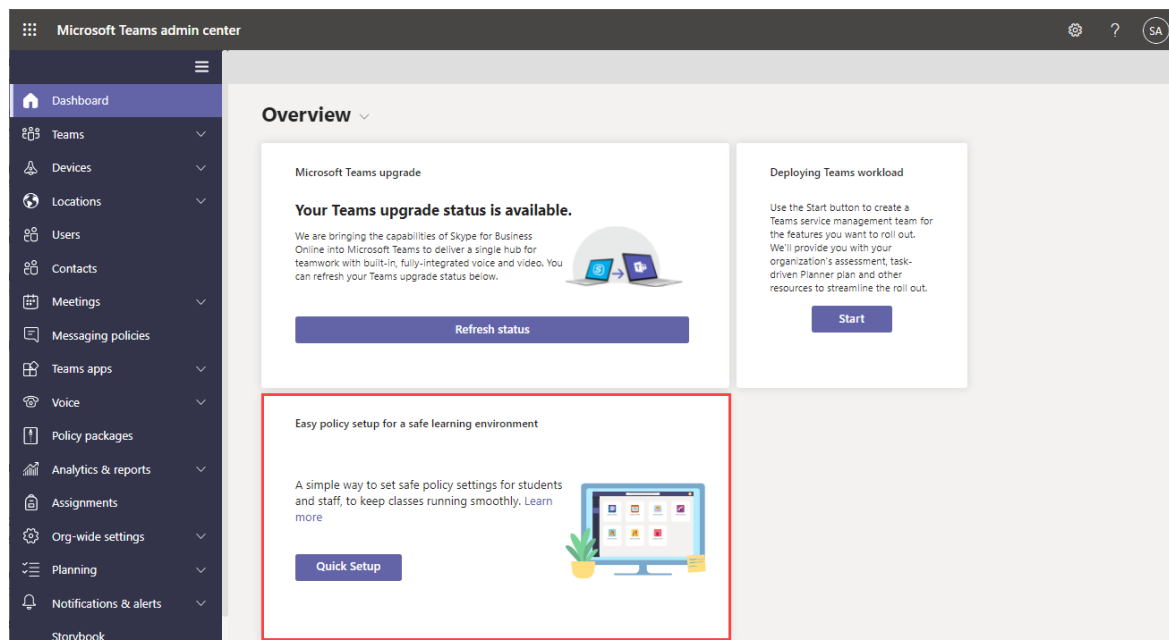

See [Policies applied by the wizard](#) for a detailed list of policy definitions applied by the wizard.

Now, let's get started!

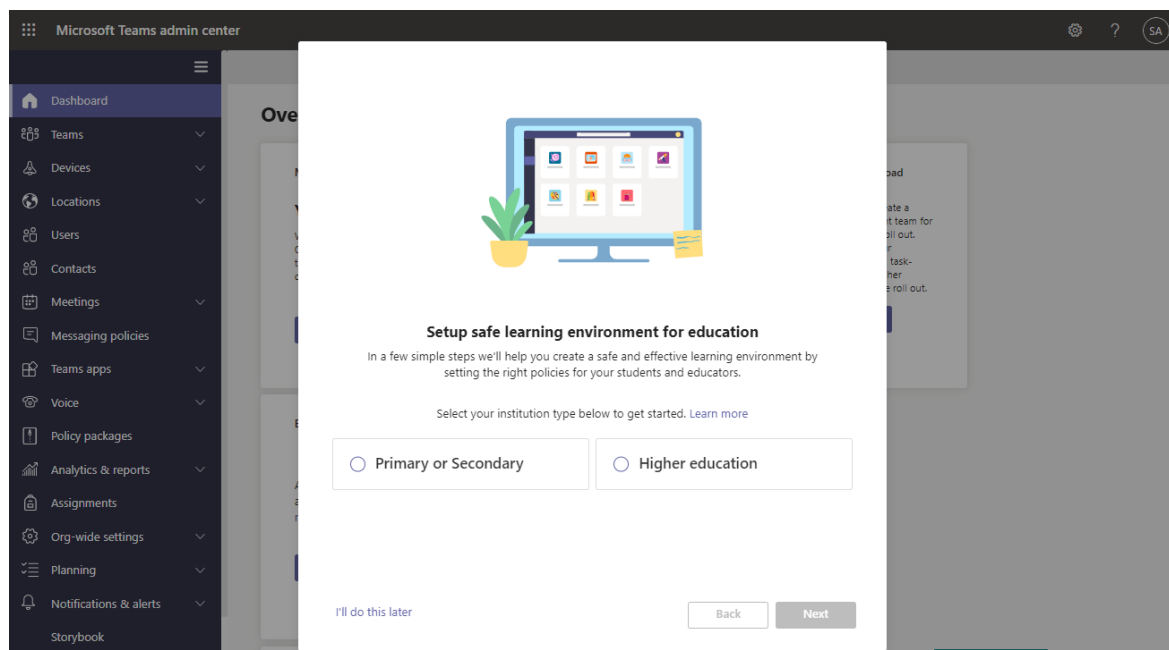

Run the wizard

Follow these steps to run the wizard.

1. If you're new to Teams, the wizard automatically starts. Otherwise, you can start the wizard any time from the dashboard. In the left navigation of the Microsoft Teams admin center, go to **Home**, and then in the **Easy policy setup for a safe learning environment** tile, select **Quick setup**.

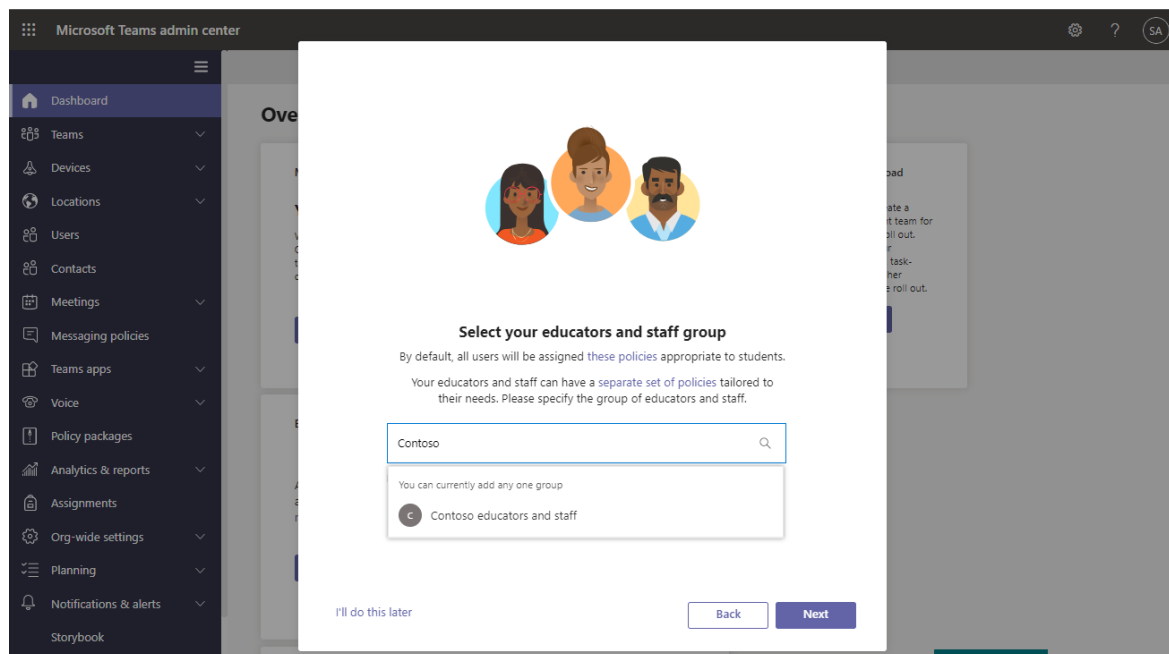

2. Select your educational institution type (**Primary or Secondary** or **Higher education**), and then select **Next**.

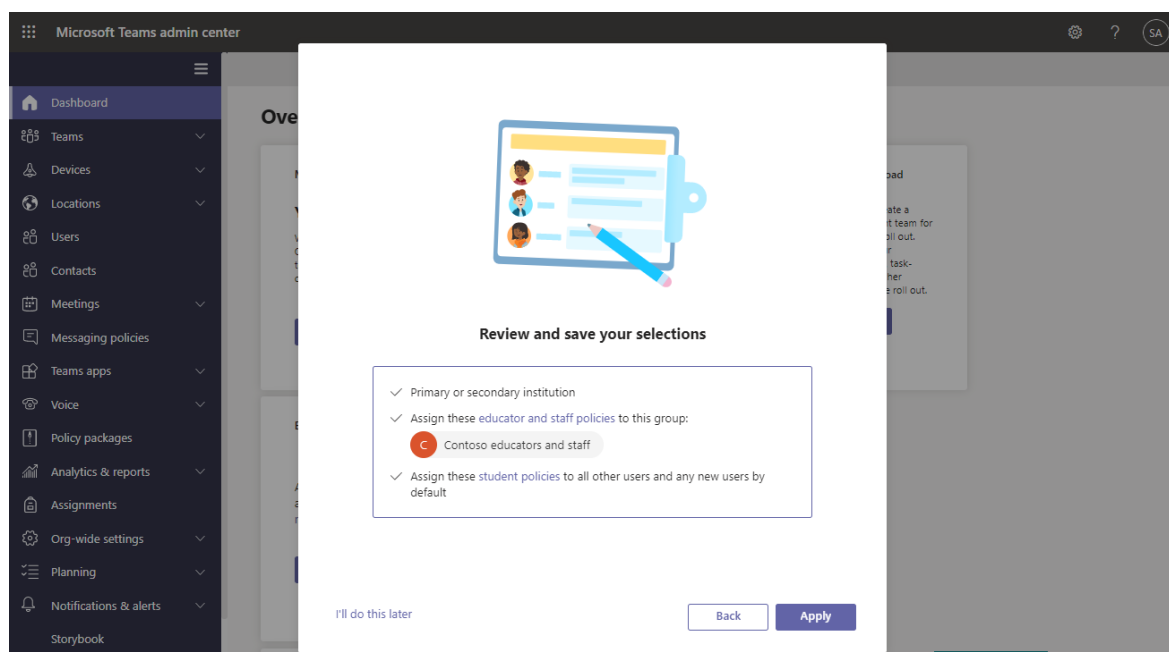

3. Search for and select a group that contains your educators and staff, and then select **Next**. If you don't have any groups set up yet for your educators and staff, [create a group](#), and then re-run the wizard.

Currently, you can only select one group. Educators and staff in the group you select will be assigned [a set of custom policies](#) tailored to their needs. Remember that this set of policies is separate from the policies applied to students.

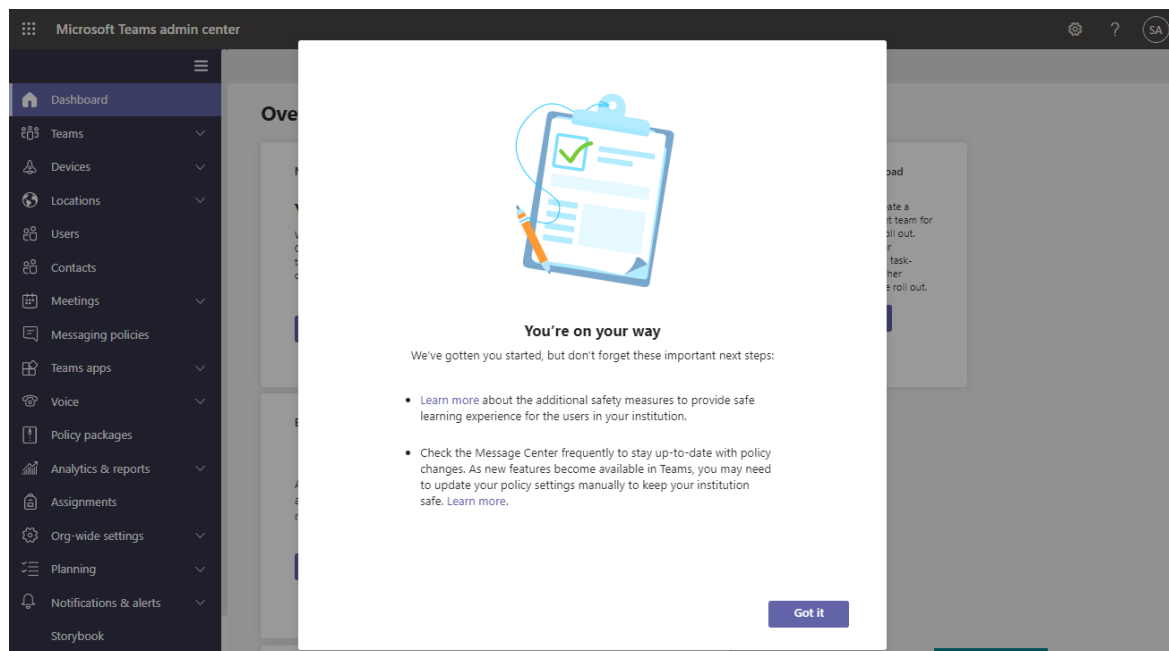

4. Review your selections.

5. Select **Apply** to apply your changes. This may take a few minutes to complete.

The Global (Org-wide default) policy definitions are immediately applied to students. For your educators and staff, it could take few hours for the custom policies to be assigned to each member of the group you selected, depending on the size of the group. This happens in the background, after you successfully complete this step.

6. You're on your way but you're not done yet! There's a few more things to consider. Next, check out the steps in the [What to do after running the wizard](#) section of this article.

What to do after running the wizard

Step 1: Remove existing policy assignments that conflict with policies applied by the wizard

IMPORTANT

Complete this step only if you have existing policies assigned to students or educators and staff *before* you ran the wizard. If you're new to Teams and don't have any existing policies other than the policies created by the wizard, skip this and go to step 2.

In Teams, for a given policy area, a policy can be applied to a user in the following ways:

- Direct assignment to the user
- Assignment to a group the user is a member of
- If the user isn't directly assigned a policy or isn't a member of any group that's assigned a policy, the user automatically gets the Global (Org-wide default) policy

If more than one of these policy assignments exist for a user, Teams uses the following order to determine which policy assignment takes effect. For more info, see [Which policy takes precedence](#) or [Precedence rules for groups](#).

POLICY ASSIGNMENTS OF A USER	POLICY THAT TAKES EFFECT
Policy assigned to group: No Policy assigned directly to user: No	Global (Org-wide) default policy
Policy assigned to group: No Policy assigned directly to user: Yes	Policy assigned directly to user
Policy assigned to group: Yes Policy assigned directly to user: Yes	Policy assigned directly to user
Policy assigned to group: Yes Policy assigned directly to user: No	Policy assigned to group If the user is a member of multiple groups and each group is assigned a policy of the same policy area, the policy that has the highest group assignment ranking takes effect.

Because of this order, the policies created by the wizard won't take effect if a user has existing direct assignments or group assignments. This means that you'll have to remove the existing policy assignments from the user so the policy applied by the wizard takes effect.

For each [policy area applied by the wizard](#), do the following:

- Remove all existing direct assignments and group assignments from your students so that the Global (Org-wide default) policy definition applied by the wizard takes effect.
- Remove any conflicting direct assignments for your educators and staff so that the custom policy definition created by the wizard takes effect. Use the above table to determine the scenarios that apply to you.

Keep in mind that the wizard assigns policies to your educators and staff group using a [group assignment ranking](#) of 1, which is the highest ranking. If your educators and staff group has an existing policy of the same policy area assigned to it, that existing policy is moved to a lower ranking and the policy assigned by the wizard takes effect.

[Learn more](#) about how to remove policies that are directly assigned to users.

For example, you assigned a meeting policy directly to educators and your students have the Global (Org-wide default) meeting policy. In this scenario, remove the meeting policy that you directly assigned to educators so that the custom policy definition for the meeting policy created by the wizard will take effect. You don't have to do anything with the existing Global (Org-wide default) meeting policy for students because no other meeting policies conflict with it.

Step 2: Check for additional measures that you can take for student safety

The wizard automatically adjusts and applies [these policies](#). There are few additional measures, which you may want to take based on the needs of your institution to stay safe.

See [Keeping students safe while using Teams for distance learning](#) for additional safety recommendations.

Step 3: Check Message Center for policy updates

Currently, the wizard applies our recommended policies when you run it. It's important to know that as new policies become available in Teams, the Global (Org-wide default) settings for student safety are automatically updated by the wizard.

But do check the [Message Center](#) (in the Microsoft 365 admin center) frequently to stay up to date on new features and their policies and policy settings in Teams.

Make changes in the wizard

If you need to make changes after you run the wizard, you can re-run it and change your selections.

1. In the left navigation of the Microsoft Teams admin center, go to **Home**, and then in the **Easy policy setup for a safe learning environment** tile, select **Change**.
2. From here, continue through each page of the wizard to make your changes. You can change your institution type, the group of educators and staff to which you want to assign policies, or both.

The following table summarizes what happens when you make a change in the wizard.

TYPE OF CHANGE	POLICY BEHAVIOR
----------------	-----------------

TYPE OF CHANGE	POLICY BEHAVIOR
Change both the educational institution type and the educators and staff group	<ul style="list-style-type: none"> • Students: The Global (Org-wide default) policy definitions based on the new educational institution type are applied to students. • Educators and staff: A set of custom policy definitions based on the new educational institution type is created and assigned to the new educator and staff group. The previous custom policy definitions are removed from the previous educators and staff group.
Change only the educational institution type	<ul style="list-style-type: none"> • Students: The Global (Org-wide default) policy definitions based on the new educational institution type are applied to students. • Educators and staff: A set of custom policy definitions based on the new educational institution type is created and assigned to the educators and staff group. The custom policy definitions created for the previous educational institution type are removed from the educators and staff group.
Change only the educators and staff group	<ul style="list-style-type: none"> • Students: No change to the Global (Org-wide default) policy definitions applied to students. • Educators and staff: The custom policy definitions are assigned to the new educators and staff group and removed from the previous educators and staff group.

Policies applied by the wizard

Policy areas

Here's the policy areas and corresponding policy names covered by the wizard. To find these policies, go to the Microsoft Teams admin center, and then in the left navigation, go to each policy area page.

- [Students](#)
- [Educators and staff](#)

POLICY AREA	PRIMARY OR SECONDARY POLICY NAME	HIGHER EDUCATION POLICY NAME
Teams policy	Global (Org-wide default)	Global (Org-wide default)
Meeting policy	Global (Org-wide default)	Global (Org-wide default)
Live events policy	Global (Org-wide default)	Global (Org-wide default)
App setup policy	Global (Org-wide default)	Global (Org-wide default)
App permission policy	Global (Org-wide default)	Global (Org-wide default)
Messaging policy	Global (Org-wide default)	Global (Org-wide default)

POLICY AREA	PRIMARY OR SECONDARY POLICY NAME	HIGHER EDUCATION POLICY NAME
Calling policy	Global (Org-wide default)	Global (Org-wide default)

Policy settings

Here's a summary of the settings applied by the wizard for each policy area.

- [Students](#)
- [Educators and staff](#)

Here's a list of the Global (Org-wide default) policy definitions adjusted by the wizard and applied to students.

POLICY AREA	SUB-AREA	POLICY SETTING	PRIMARY OR SECONDARY	HIGHER EDUCATION
Teams policy		Create private channels	Off	On
Meetings policy	General	Meet now in channels	Off	On
		Outlook add-in	Off	On
		Channel meeting scheduling	Off	On
		Private meeting scheduling	Off	On
		Meeting registration	On	On
		Who can register	Everyone in the organization	Everyone in the organization
	Audio & video	Transcription	On	On
		Cloud recording	Off	On
		Mode for IP audio	Outgoing and incoming audio enabled	Outgoing and incoming audio enabled
		Mode for IP video	Outgoing and incoming video enabled	Outgoing and incoming video enabled
		IP video	On	On
		Allow NDI streaming	Off	Off
		Media bit rate (Kbs)	50,000	50,000
	Content sharing	Screen sharing mode	Entire screen	Entire screen

POLICY AREA	SUB-AREA	POLICY SETTING	PRIMARY OR SECONDARY	HIGHER EDUCATION
		Allow a participant to give or request control	On	On
		Allow an external participant to give or request control	On	On
		PowerPoint sharing	On	On
		Whiteboard	On	On
		Shared notes	On	On
	Participants & guests	Let anonymous people start a meeting	Off	On
		Roles that have presenter rights in meetings	EveryoneUserOverride	EveryoneUserOverride
		Automatically admit people	EveryoneInCompany	EveryoneInCompany
		Allow dial-in users to bypass the lobby	Off	Off
		Meet now in private meetings	Off	On
		Live captions	Disabled but user can override	Disabled but user can override
		Chat in meetings	On	On
Live events policy		Live events scheduling	Off	Off
		Transcription for attendees	On	On
		Who can join scheduled live events	Everyone in organization	Everyone in organization
		Who can record an event	Always	Always
Messaging policy		Owners can delete sent messages	Off	On
		Delete sent messages	Off	On

POLICY AREA	SUB-AREA	POLICY SETTING	PRIMARY OR SECONDARY	HIGHER EDUCATION
		Edit sent messages	Off	On
		Read receipts	User controlled	User controlled
		Chat	Off	On

Purchase, configure, and enable Career Coach for Microsoft Teams

12/7/2021 • 12 minutes to read • [Edit Online](#)

Career Coach is a Microsoft Teams for Education app powered by LinkedIn that provides personalized guidance for higher education students to navigate their career journey. Career Coach offers educational institutions a unified career solution for students to discover their career path, grow real-world skills, and build their network all in one place.

Supported languages

Career Coach is localized in the following languages:

- Chinese (Simplified, Mainland China)
- Chinese (Traditional, Taiwan)
- English (US)
- English (UK)
- French (Canada)
- French (France)
- German (Deutschland)
- Japanese (Japan)
- Portuguese (Brazil)
- Spanish (Spain)
- Spanish (Mexico)

Learn more about [Career Coach](#).

TIP

Use the best practices and helpful tips in this guide to enable the capabilities of Career Coach for students, faculty, and staff. See the [Quick planning guide](#) article.

Review the requirements

To enable Career Coach for your educational institution, review what you need to get the app up and running.

Technical requirements

- Office 365 tenant with Azure Active Directory.
- Microsoft Teams.
- LinkedIn account connections in Azure Active Directory.

Licenses

- Faculty
- Students

IMPORTANT

A Career Coach Faculty license must be assigned to the IT admin completing the configuration.

Data and files from your educational institution

- Educational institution's logo and graphical assets in the required format.
- Course catalog data.
- List of fields of study offered.
- Educational institution's [LinkedIn page](#).
- Educational institution's privacy policy URL.
- Educational institution links to career-related resources such as career services and student job postings (optional).
- LinkedIn Learning campus subscription (preferred).

Purchase the Career Coach licenses

Career Coach is available worldwide (except China and Russia) for qualified higher education institutions as an add-on license through Enrollment for Education Solutions (EES), Cloud Service Providers (CSP), and Microsoft 365 admin center (web direct). As a Microsoft Teams app, customers must have Microsoft 365 A3/A5 or Office 365 A1/A3/A5 in order to purchase the add-on Career Coach license.

Assign app licenses to users

For step-by-step instructions, see [Assign licenses to users](#).

Turn on LinkedIn account connections

Career Coach **requires** your educational institution's users to have the ability to connect their Microsoft 365 account to their LinkedIn account that is facilitated within Career Coach.

1. Sign in to the [Azure AD admin center](#) with an account that's a global admin for the Azure AD organization.
2. Select **Users**.
3. On the **Users** page, select **User settings**.
4. **LinkedIn account connections** must be set to **Yes** or **Selected group** for Career Coach to be properly configured.

NOTE

No data is shared until users consent to connect their accounts.

- Select **Yes** to enable the service for all users in your educational institution.
- Select **Selected group** to enable the service for only a group of selected users in your educational institution.

For more information, see [LinkedIn account connections in Azure Active Directory](#).

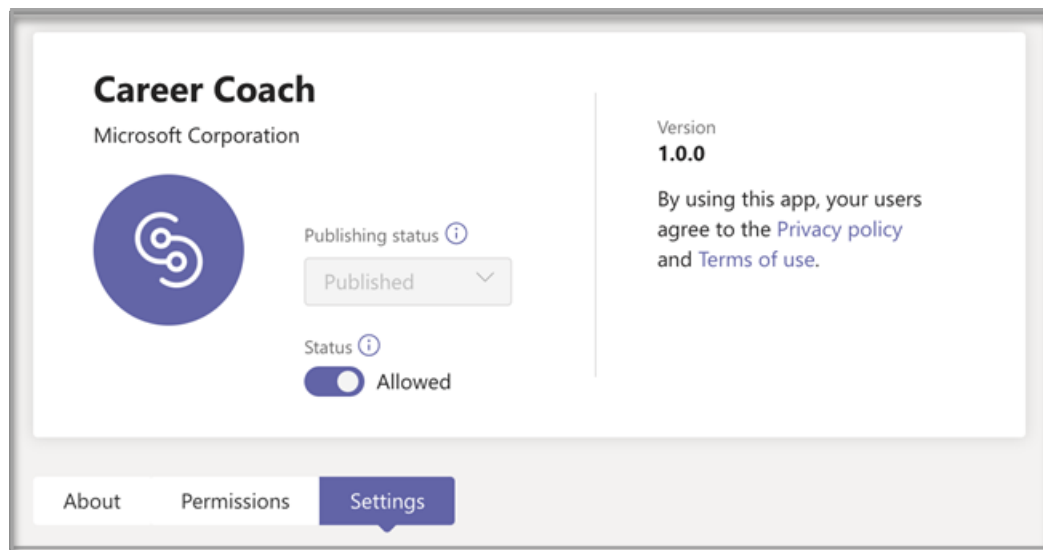

Access the Career Coach app settings

Use Microsoft Teams admin center to configure Career Coach for your educational institution and enable it for users.

IMPORTANT

You must be a global admin or Teams service admin to access the page.

1. Sign in to the [Teams admin center](#).
2. In the left navigation, select **Teams apps** > [Manage apps](#).
3. Search or browse for **Career Coach**.
4. Select **Career Coach**, and then select **Settings**.

Configure the Career Coach app settings

Career Coach has five configuration categories:

- [Brand and preferences](#) - required
- [LinkedIn connection](#) - required
- [Course catalog](#) - required
- [Fields of study](#) - required
- [Customization](#)

IMPORTANT

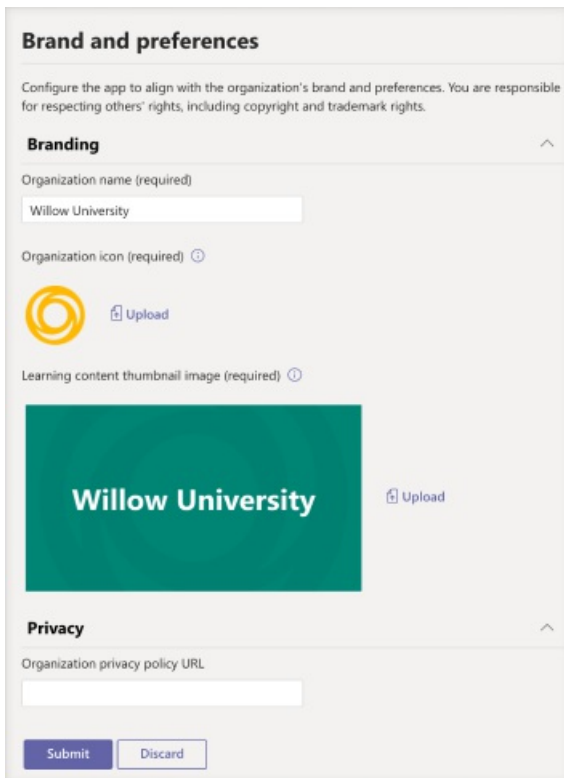

Brand and preferences, LinkedIn configuration, Course catalog, and Fields of study are **required** to effectively enable the app for students, faculty, and staff.

Brand and preferences

Customize Career Coach to match your educational institution's brand. You are responsible for respecting others' rights, including copyright and trademark rights.

IMPORTANT

This is a required section - Career Coach can not be enabled without the Brand and preferences submitted.

Brand and preferences

Configure the app to align with the organization's brand and preferences. You are responsible for respecting others' rights, including copyright and trademark rights.

Branding

Organization name (required)
Willow University

Organization icon (required) ⓘ
Upload

Learning content thumbnail image (required) ⓘ
Willow University Upload

Privacy

Organization privacy policy URL
Submit Discard

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Manage apps** > **Career Coach** > **Brand and preferences**.
3. Upload the **educational institution icon**. The icon is used throughout Career Coach to identify content unique to your educational institution, course catalog resources throughout the app, and on the real-world experiences section of the dashboard. The icon is best formatted as:
 - A transparent PNG
 - Aspect ratio of 1:1
 - Maximum size of 64 px x 64 px
4. Upload the **educational institution thumbnail**. The thumbnail will be used for course catalog resources throughout the app when a specific image isn't available for a course. The thumbnail is best formatted as:
 - A PNG
 - Aspect ratio of 16:9
 - Maximum size of 360 px x 200 px
5. Add the **educational institution's privacy policy URL**. If added, the institution's privacy policy will be available for students to review in the Career Coach app.
6. Select **Submit**.

LinkedIn connection

The LinkedIn configuration connects Career Coach with public alumni data from LinkedIn.

IMPORTANT

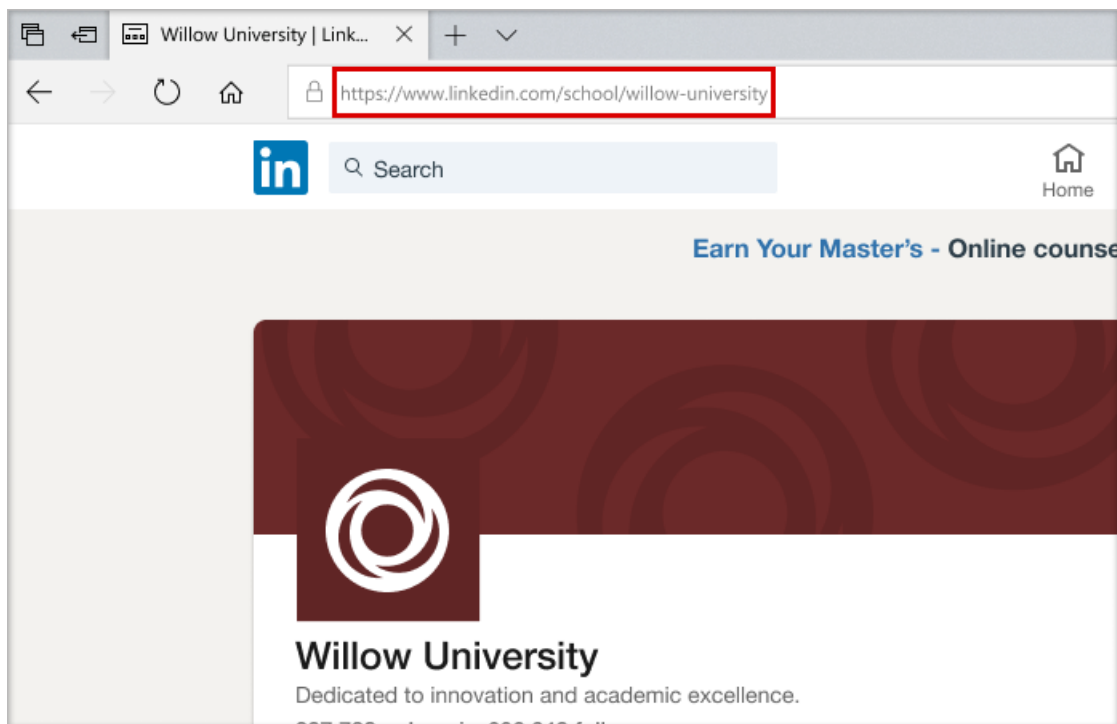

This is a required section - Career Coach can not be enabled without the LinkedIn page connection verified.

Add the LinkedIn page

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Manage apps** > **Career Coach** > **LinkedIn connection**.
3. Find the LinkedIn page by searching on LinkedIn and selecting the **School** filter. Or connect with a career services staff member to determine the correct LinkedIn school page to use. For more information, see [How to identify LinkedIn pages](#).

4. Add the LinkedIn school page URL. The URL must be a school page and not a company page and are typically formatted as `https://www.linkedin.com/school/willow-university/`.

5. Select **Submit**.

Verify the LinkedIn page

IMPORTANT

The verification must be completed by your educational institution's LinkedIn page super admin.

1. If successfully submitted, the page will be updated to show the **Verification link** and **Verification link expiration**. The verification link expires after 30 days.

LinkedIn connection

Career Coach is powered by LinkedIn. These settings allow the app to leverage data from LinkedIn and your organization's alumni. Connect the app with your organization's LinkedIn page. This enables the job roles and networking experiences within the app. This URL will be shared with LinkedIn for URL verification.

Organization LinkedIn page

Connect the app with your organization's LinkedIn page. This enables the job roles and networking experiences within the app. [Learn more.](#)

LinkedIn page URL (required) ⓘ

Verification link

Verification link expiration

2. Copy the verification link and share it with your educational institution's LinkedIn page super admin. [Learn more about the LinkedIn page super admin role in the LinkedIn page admin documentation.](#)
3. The LinkedIn page super admin will use the unique verification link to associate Career Coach with your school's page. See [Additional documentation about LinkedIn page verification](#) for more information.

DEVELOPERS Products Docs and tools ▾ Resources ▾ My apps ▾  

Verify responsibility for an app

Hi Konstantyn, verify that your page **Willow University** is responsible for the app **Microsoft**.

Once the verification is complete, it can't be undone. [Learn more](#)

Microsoft
an app that would be associated with your company

Willow University
a LinkedIn Page that you manage
Higher Education - 606,649 followers

Course catalog

The course catalog represents the courses and classes offered to students by your educational institution.

IMPORTANT

This is a required section - Career Coach can not be enabled without a course catalog.

These courses are used within the app in two areas:

- Courses are returned as part of learning resources.

- Courses and course meta data, like descriptions, are used to help students identify their skills when they upload a transcript.

To create the course catalog, put together a list of all courses taught at your educational institution and upload it as a CSV file. The app draws from the course catalog to identify a student's skills from their transcript and to suggest courses to take.

Add the course catalog

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Manage apps** > **Career Coach** > **Settings** > **Course catalog**.
3. Upload courses in CSV format with the required columns: courseId, title, and sourceLink. Each row must include data for each of the required columns. *Including the recommended fields improves the experience for students by returning better search results and skill identification.*
4. Select **Submit**.

Course catalog

Your organization's course catalog helps students identify their skills based on their transcript. Courses from the course catalog will show up on the Learn page. Upload the course catalog document to make sure the catalog is available.

Course catalog document (required) ⓘ

Course catalog document format and schema

The document needs to be in CSV format with a maximum size of 18 MB. The document must contain the required fields **course title**, **course ID**, and **course URL**.

TIP

Start with the [sample course catalog](#) document to ensure proper formatting. *Including the recommended fields improves the experience for students by returning better search results and skill identification.*

The following table shows the items to include in the course catalog:

NAME	STATUS	TYPE	DESCRIPTION
courseId	Required	string	Usually the course id (Typically maps to what is generated in the transcript).
title	Required	string	Usually the course title.
sourceLink	Required	URL	Website link to the course page.

NAME	STATUS	TYPE	DESCRIPTION
description	Recommended	string	Introduction text for the course.
language	Recommended	string	Language of the course. Use standard language codes.
format	Recommended	string	Mode of teaching (online, video, in person).
thumbnailLink	Recommended	URL	Thumbnail link to the course image.
thumbnailAltText	Recommended	string	Accessibility alt text for the image
educationLevel	Recommended	string	Study level, ex. Undergraduate/Graduate.
topics	Recommended	string	Topics or tags that are associated with the skills the courses teach.

Fields of study

The fields of study are synonymous with major areas of interest, academic major, and degree. These titles are referenced by students when they start using the app and begin setting up their personalized profile.

IMPORTANT

This is a required section - Career Coach can not be enabled without a list of fields of study.

Add the fields of study

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Manage apps** > **Career Coach** > **Settings** > **Fields of study**.
3. Upload field of study in CSV format.
4. Select **Submit**.

Fields of study document format and schema

Add all fields of study available to students such as Engineering, English, Business, and so on. The list of fields lets students discover fields of study that may interest them and add their area of focus to their profile.

TIP

Start with the [sample field of study](#) document to ensure proper formatting.

The following table shows the items to include in the fields of study:

NAME	STATUS	TYPE	DESCRIPTION
------	--------	------	-------------

NAME	STATUS	TYPE	DESCRIPTION
fieldsOfStudy	Required	string	The name of the field of study

Customization

Career Coach can be customized to be unique to your educational institution. The customization supports adding experiences to the dashboard. It's recommended to add links to job boards, events, career services office, career-related events, student clubs, and any other resources that help students gain real-world experience.

Add customized experiences

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Manage apps** > **Career Coach** > **Settings** > **Customization**.
3. Add each title, URL, and short description.
4. Select **Submit**.

Making Career Coach available to your organization

Now that Career Coach has been configured for your organization. Follow these steps to ensure that Career Coach is available to organization in Microsoft Teams.

Enable the app

After you complete the configuration, enable the app for students and licensed users so they'll have access to Career Coach.

IMPORTANT

You must have Global or Teams admin role permissions.

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Manage apps** > **Career Coach**.
3. Move the Status toggle to **Allowed**.

NOTE

Allowed means that the app is available for users in your educational institution. **Blocked** means that the app isn't available to students.

Add Career Coach as an installed app

IMPORTANT

This step ensures that Career Coach is properly configured for your organization and that students find Career Coach.

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Setup policies** and select your preferred policy. If you are unsure which policy to use you can refer to the [Microsoft Teams Policy management documentation](#) or utilize the [Education Policy Wizard](#) to configure a policy for Microsoft Teams.
3. Under Installed apps, select **Add apps**.

4. In the Add installed apps pane, search for the apps you want to automatically install for users when they start Teams. You can also filter apps by app permission policy. When you've chosen your list of apps, select **Add**.
5. Select **Save**.

NOTE

Editing or assigning a policy can take a few hours for changes to take effect. The Career Coach app will not be available in Microsoft Teams until the changes are complete.

Pin the app

Pinning Career Coach will make the app more accessible and visible for students.

1. Sign in to the [Teams admin center](#).
2. Select **Teams apps** > **Setup policies** and select your preferred policy. If you are unsure which policy to use you can refer to the [Microsoft Teams Policy management documentation](#) or utilize the [Education Policy Wizard](#) to configure a policy for Microsoft Teams.
3. Under **Pinned apps**, choose **Add apps**.
4. Search for **Career Coach**, and then select **Add**.
5. Choose the order for the app to appear and select **Save**.

NOTE

Students will be notified in Microsoft Teams that Career Coach has been pinned.

Reference [Manage app setup policies in Microsoft](#) for more details.

Troubleshooting

- If you see "Career Coach is currently being set up for you to use soon" in the Career Coach app, **the required sections have not been completed**. The following **sections are required** to be complete before Career Coach can be used: [Brand and preferences](#), [LinkedIn connection](#), [Course catalog](#), and [Fields of study](#).
- CSVs for course catalog and field of study have required formats and a maximum size of 18 MB. Reference the Career Coach [course catalog document schema](#) and Career Coach [fields of study document schema](#) to ensure proper configuration.
- On settings pages with required fields, if the fields are not completed, the page will not submit. You will not see a warning message; the page will simply not submit.
- When first configuring Career Coach, an error banner may appear stating "We can't update the app's settings. Try again." This is likely due to the tenant provisioning the Career Coach app, which can take up to 15 minutes. If this happens, wait 15 minutes before submitting again.
- If the Career Coach app is not showing in Microsoft Teams, the policy changes may not have taken effect. Policy changes can take a few hours to update. The Career Coach app will not be available in Microsoft Teams until the changes are complete.

Removing your tenant data

Your tenant data includes information that's uploaded or generated as a part of application configuration. To delete all data within a Career Coach tenant, have your tenant's global administrator [open a support ticket](#) requesting that the tenant's data be permanently deleted. Be aware that this process isn't reversible. After the data removal is complete, the Career Coach application will return to its pre-configured, non-personalized state for all users and a Teams administrator will need to set up the application again to continue using it.

The following explains the process for deletion:

- A support ticket must be filed by a tenant global admin clearly stating the request for your tenant's data to be permanently deleted. **There's no ability to limit the data set or time window of the deletion.**
- Once filed, the support ticket will be addressed after one week to meet compliance's minimal retention policy. You can cancel the operation during this time.
- After one week, the Career Coach team ensures all data related to the tenant is deleted. Microsoft support monitors the ticket and will notify you once the deletion process is complete, **in no more than 30 days.**

Supervised chats in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Education institutions provide a safe and healthy digital space for students. The digital space includes emails, online meetings and calls, and messaging in Teams. To prevent inappropriate messaging behavior, many schools disable private chat in Teams. Unfortunately, disabling chat also blocks the opportunity for teachers to reach out to students privately for personalized learning. With chat disabled, students can't reach out to teachers when they prefer not to post the messages publicly in class teams.

Supervised chat allows designated educators to initiate chats with students and blocks students from starting new chats unless an appropriate educator is present. When chat supervision is enabled, supervisors aren't allowed to leave chats and other participants aren't allowed to remove them, ensuring that chats involving students are properly supervised.

These limitations are only applied to new private chats that are created after supervised chat has been fully enabled. They don't apply to existing private chats, meetings chats, or channels. To learn more about best practices for meeting chat, channel safety, and keeping students safe, view [Keeping students safe while using Teams](#).

NOTE

Supervised chat protects new chats created after the feature is enforced. It doesn't protect existing chats.

Review use cases for supervised chats

The following examples are descriptions of when a supervised chat is necessary.

- A 1:1 follow-up with an educator when students aren't comfortable sharing or asking questions publicly.
- Educators reaching out 1:1 to a student about an assignment, recent class interaction (or lack of), or other topic.
- Student group discussions monitored by an educator.
- Allow non-teaching staff to chat with student in a supervised environment.

Enable supervised chat

NOTE

Ensure that you set up chat permission roles and the role-based chat permission policies before enabling chat for your institution to avoid unwanted student access to unsupervised chats.

Define chat permission roles for each user in your environment

For supervised chat to work as expected each user within your environment needs to be assigned the correct chat permission role. There are three roles that a user can have assigned:

- *Full permissions* – This role is ideal for educators who should have full access to students and other staff members. They can start chats with any user within your environment. Users with full permissions are expected to supervise the chats they participate in. They can't leave or be removed from chats that they start or chats that they're supervising in federated tenants.

- *Limited permissions* – This role is ideal for staff members who should only have supervised access to students and have full access to other staff and educators. They can start chats with any full or limited users but can't start chats with restricted users. If a user with full permissions begins a chat with a restricted user, limited users can be brought into the conversation. This access happens because a user with full permissions is present to supervise collaboration between limited and restricted users.
- *Restricted permissions* – This role is ideal for students who need to be supervised. They can only start chats with users who have full permissions. They can participate in any conversation that a user with full permissions invites them to. In federated chat cases, restricted users can only be added to chats by a user with full permissions who is from the restricted user's tenant.

To set your users' chat permission role, use the **Chat permissions role** policy found within your Messaging policy options in the Teams admin portal. You can use PowerShell to define roles using the ChatPermissionRole policy with the values Full, Limited, or Restricted. This policy is under CsTeamsMessagingPolicy.

To learn more about setting Teams policies see Teams policies and policy packages for Education and Assign policies to large sets of users guides.

Roles can't be assigned to guests in your tenant. Guests are assigned the limited role.

Allow supervised chat

Supervised chat is disabled by default for your tenant. After you've set chat permission roles for your users, you can enable supervised chat within your tenant by going to **Teams > Teams settings** and setting **Role-based chat permissions** policy to *On*. You can also use PowerShell to enable Supervised Chat by setting AllowRoleBasedChatPermissions to True. This cmdlet is under CsTeamsClientConfiguration.

Supervised chat must be enabled for all users in the tenant and cannot be enabled for only a portion of your users.

Enable chat

Enable chat for all your users using the existing Chat policy available in Teams admin center.

Maintain supervised chats

After supervised chat is initially enabled, you'll need to do a few things to ensure that the chats in your environment remain supervised:

- Assign appropriate roles to any new users that join your tenant. By default, users will be assigned a restricted role.
- If a user with full permissions leaves or is removed from a tenant, the chats they were supervising will be left unattended. Before you remove the original user, ensure that another user with full permissions is added to these conversations so that the chat can remain supervised. Once the original supervisor is removed, new participants can't be added to the conversation, but current participants can continue to communicate.

IT Admin Guide to Education Insights in Microsoft Teams

12/7/2021 • 15 minutes to read • [Edit Online](#)

This document provides the steps required to get Education Insights in Microsoft Teams up and running and help educators and education leaders adopt the platform and successfully use the app.

Overview

Each student has unique experiences, skills, and voice.

Insights helps you understand your students and respond to their needs.

Insights provides real-time analytics of student progress and activity within their classes. With easily digestible visualizations, school communities can proactively and easily track student experiences. Educators and education leaders are presented with meaningful, reliable data to make informed decisions regarding their class teams. Guided by this data, educators have the information they need to ensure that their students' emotional, social, and academic needs are being met.

School communities can channel their efforts and achieve a more significant impact when educators know which strategies work for their students. With the timely data provided by Insights, educators and education leaders focus time and energy on taking actions that improve the learning environment, drive student success, and help learners thrive.

Who uses Insights?

Educators

An educator is anyone who owns a class team. Educators may include teachers, lecturers, and professors.

Educators access Insights at the class level. They see the activity of students assigned to their classes but cannot access data from other classes. Insights helps educators understand and support their students.

There are no prerequisites to using Insights, and educators just need to add the Insights to the left app bar or as a tab to each of their classes in Teams.

Educators are identified by faculty licenses. Educators must have a faculty license and be a class team owner to see the data in Insights.

Education leaders

Education leaders are all those roles in the institution that need an organizational view to understand their student engagement, progress, well-being, etc. Educators can also be education leaders when they own a class team and need more than their classes view, such as the head of a subject department.

Education leaders may include chief academic officers, heads of department, district leaders, school principals, head teachers, counselors, heads of a subject, program directors, social workers, and psychologists.

Education leaders get an organizational view that depends on the permissions assigned by the IT Admin. For example, school district administrators can see all the schools they access. In contrast, a school principal or a school supervisor only sees that school's grade levels and classes.

Assuming a supervisor also teaches, they are considered both an educator and an education leader and can access both views of Insights (for educators and education leaders). Here, Insights helps education leaders

support educators and students. At the organizational level, the IT admin needs to connect the student information system and assign permissions to each role to access the schools or departments relevant to them.

Education leaders are identified by faculty licenses, and they also need *explicit permissions* from the IT global admin to view their organization's Insights reports.

NOTE

Regarding students:

Insights collects data about student activity in Teams.

Students are members of a class team within Teams. They are identified by their license and **do not have access** to the Insights app or tab (even if they are the team owner).

Guests *cannot* be considered students.

Where do users find Insights?

Educators and education leaders have different ways to access Insights.

Educators

Educators can use these two methods:

- **Personal app** - an overview of all their active classes is available from Teams left app bar, with the ability to drill-down to class data.
- **Tabs** - Insights for specific classes they own are available in a tab from a class team's top navigation menu. This tab enables the educator to directly access the relevant data when they are in that class in Teams to see the data in the class context.

Insights surfaces activity data from all channels within a class team but can only be added as a tab to public channels. The tab reflects activity from everyone in the class team who isn't an owner (including educators who aren't owners of the class team).

In both views, an educator can access class data. Using the personal app, the educator needs to drill down to the class level, whereas the tab provides direct access to class data.

At the class level, if an educator owns a class Team, Insights is available without any other action on the part of the IT Admin.

Education leaders

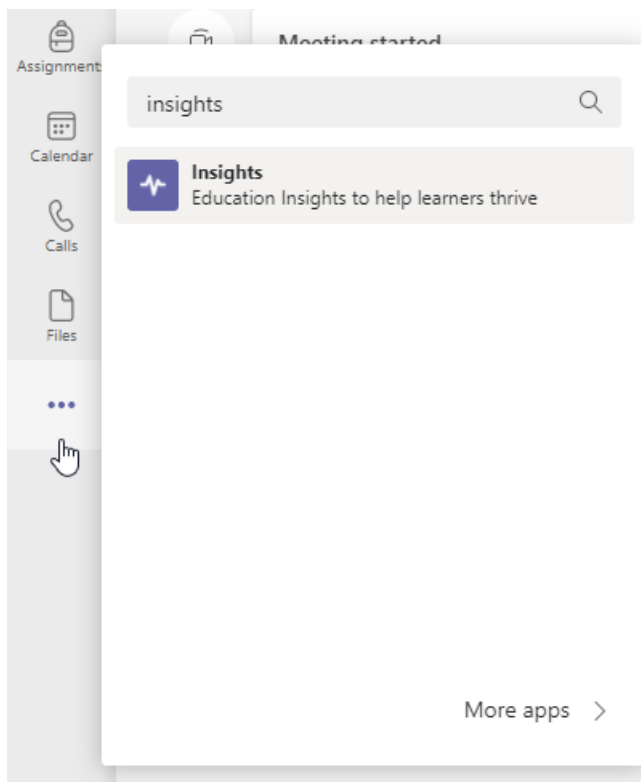

Education leaders can use Insights as a **personal app** available from Teams left app bar.

At the organizational level, the IT admin needs to connect the student information system and assign permissions to each role to access the schools or departments relevant to them.

For example, a principal sees only the classes in their school, or the head of a department sees only the department's classes. The student data is aggregated at the class, department, school, and district level, and we provide insights at each level (based on the permission of each user) Both educators and education leaders can zoom in and see the data for individual students.

To add the Insights app in Teams:

- Click "... " on the app bar.
- Search for **Insights** and select it.
- A description screen will open. Click **Add**.

- Right click on the Insights icon and select Pin.

TIP

You can also locate the Insights app through this link: <https://aka.ms/addInsights>

When is Insights used?

Insights supports learning communities throughout **the learning cycle**. With real-time metrics across multiple dimensions, Insights supports a continuous cycle of identification, reflection, discussion, and taking action amongst members of the school community.

- **Identify** how and when students engage with educators, course materials, and their peers, and how they perform on assignments.
- **Reflect** on how the inputs support the students to succeed, determine areas for growth, and where assistance is required.
- **Discuss** findings with students and the school community to strengthen relationships, goal setting, self-review, spark collaboration, and improve outcomes.
- **Take Action** to develop interventions, provide feedback on growth areas, modify teaching strategies, and identify additional support required.

How Insights works?

Insights produces powerful analytics to help educators deliver better learning outcomes. It does this by analyzing student activity within Teams and optionally leveraging the Student Information System (SIS) data that you provide to help contextualize and group that activity.

Before you start to deploy Insights for your institution, please take a quick look at how Insights works, our commitment to data ethics, and the required licensing.

Data collection

Data is collected for Insights from student and educator activity in Teams. Guest data is not collected.

Insights *does not* display data about educators. Analysis of the data provides actionable insights to aid in teaching and learning.

Currently, data is collected from the following areas in class teams:

TEAMS COMPONENT	DATA COLLECTED
Assignments	Opening, turning in, and grade on assignments.
Channel engagement	Visiting a channel, creating a post, replying to and liking a post (not including chat content).
Files	Uploading, downloading, accessing, modifying, commenting on, and sharing a file (not including file content).
OneNote Class Notebook	Editing a page or section in a notebook (not including page content).
Meetings	Attendance (not including meeting content).
Reading Progress	Accuracy rate, most challenging words, and words per minute.
Reflect	Check-ins (including values).

NOTE

Most of the collected data shows up in Insights within a few minutes. Attendance in class meetings (meetings associated with one of the class channels) appears a few hours after the end of the meeting, usually up to 24 hours later.

Privacy and security

The information collected and shown through Insights meets [more than 90 regulatory and industry standards](#), including [GDPR](#) and the Family [Education Rights and Privacy Act \(FERPA\)](#) for students and children's security and other, similar, privacy-oriented regulations.

The data belongs to the institution, and Microsoft only collects the data and stores it. Microsoft personnel cannot access the data or see it, except as allowed by compliance in an audited way to maintain the service, such as data recovery.

NOTE

Visit the [Microsoft Trust Center](#) to learn more about how Microsoft protects your data.

Performance and reliability

Insights is designed to handle a high volume of data collected from Teams with optimal performance and reliability. We cannot guarantee 100% availability, but we endeavor to be available as close as possible to that target.

The data collection process takes place on separate servers to the installation of the Insights tab in Teams. The Insights tab or personal app does not affect application performance or network bandwidth for educators and students using the rest of the Teams functionality.

TIP

For more details, read [Help for low-bandwidth situations for Teams for EDU](#).

Data storage

Insights is currently deployed in Europe and the United States. Data for European-based users is stored on servers in Europe. Data for Australian-based and US-based users is stored on servers in the United States. Data for users outside of Europe, Australia, or the United States, will be stored in one of our geographic regions.

Using data ethically

We are committed to using data responsibly and ethically. Insights follows our Microsoft principles for Responsible data and AI. This means that we are transparent about how the data is used, and we put the interests of educators and students first. We use the highest security and privacy standards, monitor for continuous reliability and accuracy, and ensure ongoing compliance for your institution.

Microsoft has built Insights from the ground up to ensure data protection. We are aware of the potential sensitivity of how this data can be used, and we care for your data and the privacy of individuals.

Data to support learning

Insights shines a spotlight on student learning and digital engagement. The data supports learning and shows the level of student engagement on the digital learning platform. While you can drill down to the individual level for class activities, Microsoft **does not assign any positive or negative value** assigned to these actions. The purpose of the data it collects is to support students and educators to achieve their best.

Educators know and understand their students best. The information presented in Insights is there to aid them in **providing support to students** in a digital learning scenario. It replicates the insights usually available in

an in-person experience. For example, suppose a student has not been active during a specific period or didn't complete all their assignments last week on-time. The data is surfaced to the educator to provide the right nudges or to check in on the student. It remains the educator's responsibility to interact with the student, or that student's family or guardians, to determine the underlying reason for any activity or inactivity detected.

Insights has been designed to support both students and educators in the digital learning environment framework. Insights **does not directly capture data about educators**. In addition to individual student data, it provides aggregations of student activity and outcomes for a specific educator to enable education leaders to support students and educators.

Licensing

To access Insights, users must have an A1, A3, or A5 faculty license for Microsoft 365.

Education Insights Premium is a paid upgrade which provides education leaders an organizational level view of Education Insights data as well as expanded access to historical data views for educators. Eligible educational institutions can purchase an *Education Insights Premium* add-on license through Enrollment for Education Solutions (EES), Cloud Service Providers (CSP), and Microsoft 365 admin center (web direct).

The Education Insights Premium add-on will be available for organizations based on purchasing licenses for all digitally active students in the tenant.

Student Information System (SIS) integration

The more data is fed into Insights, the better educators can support their students, and education leaders can support the educators.

To provide organization-level Insights, we must use [School Data Sync \(SDS\)](#) to connect to the Student Information System (SIS) so that Insights has the hierarchical structure of the educational system mapped correctly.

Viewing class-level Insights as the class educator *does not* require this because we use Teams' class structure and permissions.

To learn more, read [Sync Student Information System \(SIS\) data with Education Insights](#).

Manage permissions

As an IT admin you can provide permissions for education leaders, district leaders, school principals, head teachers, counselors, heads of learning areas, program directors, social workers, and psychologists. Educators are *automatically* given permission when they own a class team.

To learn more, read [Manage user access to Education Insights](#).

Manage the setup policy

As an IT Admin, you can use the app setup policy to install Insights by default for your educators and leaders when they start Teams. With the setup policy, you can customize Teams to highlight Insights and pin it on the apps bar.

If educators want direct access to each class, they can manually install the Insights tab on the top navigation menu. This tab enables the educator to directly access the relevant data when they are in that class in Teams to see the data in the class context.

In both views, an educator can access class data. Using the personal app, the educator needs to drill down to the class level, whereas the tab provides direct access to class data.

TIP

For more details, read [Teams Policies and Policy Packages for Education](#).

Encourage the adoption of Insights

Get your educational institution excited about using Insights.

Feel free to distribute the following material to your **educators**:

- Check the [Insights support page](#) for more help.
- Get up and running quickly – [get the Insights 1-pager PDF](#).
- Read the [complete guide PDF](#).
- Watch [step-by-step tutorials](#) on how to use Insights.
- Train yourself with the [free Insights course](#) at the Microsoft Educator Center
- And lastly, check out [this blog](#) dedicated to Insights.

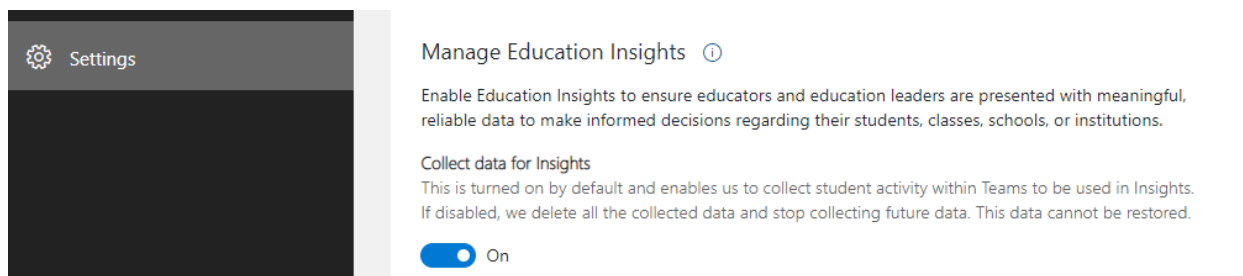

Material for **education leaders**:

- [Insights for education organizations support page](#).

Turn Insights on or off

By default, Insights is turned on, which enables us to collect analytics of students' activities within Teams, to be used in insights. You may decide to opt-out from Insights, in which case we *delete all the data collected* for Insights and stop collecting any future data. If you turn Insights back on, we start collecting data from the time it's re-enabled.

- To turn Insights on or off, open the [SDS Admin Center](#) and go to **Settings > Manage Education Insights**. Turn **Collect activity data for Insights** off or on to disable or enable Insights.

NOTE

If you've turned Insights off, the data that's been collected is deleted. The deleted data on opt-out cannot be restored at a later time, even if Insights is re-enabled.

Turn SDS for Insights on or off

School Data Sync (SDS) helps automate the import and synchronization of the Student Information System (SIS) data with Teams.

The use of Insights *does not* require the use of SDS. However, you may choose to opt-out from Insights at any time.

- To turn off Insights use of School Data Sync follow the instruction in [Disabling SDS for Insights](#).
- To turn it back on follow the instructions in [How to deploy SDS for Insights](#).

How to delete your data

Insights stores student and educator actions performed in the context of a class team. This data is considered a comingled data set and therefore isn't automatically deleted from the service once student or educator user accounts are deleted from your organization. Note: Deleting data harms Insights' ability to analyze class team engagement over time.

- [Open a support ticket](#). The support ticket must state clearly the request for a GDPR Delete DSR operation and contain the user object ID to be deleted. There is no ability to limit the data set or time window of the deletion.
- Once filed, the support ticket waits in the queue for one week to meet compliance's minimal retention policy. You have the opportunity to cancel the operation during this time.
- After one week, the Education Insights team ensures all data related to the user ID is deleted from the service. Microsoft support monitors the ticket and will notify you once the deletion process is complete, in no more than 28 days.

Troubleshooting

Why doesn't my institution see any data in Insights?

If it's a *new* tenant and you've *never* seen data in Insights, check that your tenant is **verified as an education tenant** to access Insights. Contact your Microsoft account manager and ask them to check that the tenant is configured correctly.

If you don't have an account manager, please open a ticket. Go to the [Office 365 Admin Center](#) > **Support** > **New Service Request**. In the title of the ticket, write: "Need assistance with education verification".

Also, verify that data collection for Insights is enabled. While it's on by default, IT Admin may have turned it off and therefore deleted all the data held by Insights.

To verify this, open the [SDS Admin Center](#) and go to **Settings** > **Manage Education Insights**. Check the status of 'Collect activity data for Insights'.

If it's turned off, turn it back on. Insights starts to collect data, but it may take up to 24 hours to see it in the reports.

Why do I see data for some students or classes, not all?

We only collect data for *licensed* students, so the most probable reason is that you have guest students attending classes, and their data is not collected. You might see their name but without any data.

Check the status of your students to ensure they all have student licenses.

Why don't educators see meeting data?

It takes up to 24 hours to see meeting data in Insights reports. So, check that enough time has passed.

Also, check that students did *not* [join the class meeting without a Teams account](#). In such a scenario, the student activity is not collected.

TIP

For those educators who want to track student attendance, you can recommend sending a message during the meeting asking students to reply. This registers their attendance within a few minutes.

NOTE

If your question is still unanswered, please [open a support ticket](#). Include the relevant screenshots representing the problem and the date the problem occurred. Add any additional data you think might help us to resolve the issue.

What licenses do I need to activate Education Insights Premium?

In order for Education Insights Premium to be enabled for your organization, the tenant must purchase licenses based on the number of the digitally active students in the organization's tenant. That is, for all students who use a Teams class as part of their school work for activities such as meetings, communication, chat, assignments, editing files, Class Notebook or Reflect.

Sync Student Information System (SIS) data with Education Insights

12/7/2021 • 6 minutes to read • [Edit Online](#)

The more data is fed into [Education Insights](#), the better educators can support their students, and education leaders can support the educators.

To provide organization-level Insights, we must use [School Data Sync \(SDS\)](#) to connect to the Student Information System (SIS) so that Insights has the hierarchical structure of the educational system mapped correctly.

Viewing class-level Insights as the class educator *does not* require this sync because we use Teams' class structure and permissions.

Plan your School Data Sync integration

The Microsoft School Data Sync (a.k.a SDS) provides the School Information System (a.k.a SIS) data and it's hierarchical structure of the educational system and maps which user is assigned where, as well as provides additional data on the student and organizational hierarchy.

Insights works best when using [SDS V2.1 file format](#) but also supports [SDS V2 file format](#) and [SDS V1 file format](#) *with limited functionality*.

Differences between SDS V1 and V2 file formats

DATA TYPE	V1	V2 AND V2.1
Users	Supports only 'educator' role, as a result org-level permissions for your education leaders need to be set manually	Supports multiple roles so that role-based permissions can be set
Orgs	Supports only 'schools', aggregation level. As a result, does not provide multiple aggregation levels and provide limited ability to compare different types of schools (e.g primary vs. secondary school, science vs. art school)	Supports multi-layer hierarchy, including district/institution, universities, colleges, faculties, campuses, regions, programs, etc. Allows for multiple aggregation levels and to easily compare between organizational units at each level, assign permissions to specific levels, set goals by org level, etc.
Additional optional information	None	V2.1 file format only <i>Academic Sessions</i> - timeframes of sessions (semesters, school years etc.) Demographics and student flags* - data like race, ethnicity, and gender, as well as special programs (IEP, 504)

NOTE

Customers will not be able on onboard file format v2 starting July 15th 2021, and will need to use the v2.1 format instead, all future upgrades and new capabilities will be done on the v2.1 format and it will be fully backward compatible to file format v1.

Best practices

The accurate mapping of the hierarchy and where everyone belongs within that hierarchy, enables Insights to provide accurate data and more precise and relevant insights for the different types of education leaders.

The more detail you provide, the better and more relevant the reports and spotlights will be.

File format version to use and data to sync

- Use file format V2.1 and sync the optional data used by Education Insights as described [here](#).

Users and Roles

- Make sure **all users are listed in the files** you provide and synced. This includes all students and staff that need to see data for the organizational units they cover.
- If you currently only have educators listed in your SIS, add all other users manually before uploading the files to SDS and syncing the data. The stats gathered by Insights will only be from the registered students, if some students are missing, that will make the data and conclusions misleading.
- If you use SDS for provisioning as well, make sure to **provide the first and last name of each user**. Otherwise, students will be referenced by their email address, resulting in a non-optimal experience.
- The grade/year level must be based on this [mapping list](#).
- Make sure to **add the year/grade level to all students**.
- Make sure to **assign each user to their relevant organizational unit**.
 - A student can be associated to more than one organizational unit, for example, students who are registered in a special program or two faculties. In case the student has more than one organizational unit, provide a line for each in the users file for that student.
 - IT admin can grant permissions based on organizational unit for staff. **Make sure staff members are associated with the correct unit level**, so they receive the permissions they need. For example, a counselor assigned to four schools needs to see all the grades in those schools; a principal needs to see all the classes in their school.
- **The role is vital**. Although this list is closed, try to match the role from [the list](#) to the real role of each user you upload. This will enable you to assign role-based permissions accordingly. For example, provide permissions for all principals to see the classes in their school, or for all professors to see their faculty.

Organizations

- Make sure to **reflect the real and full hierarchy of your organization**. In some cases, this hierarchy is not reflected in the SIS, in which case it needs to be added manually to the CSV file before syncing.
- Make sure that **all organization units down the organization tree include students or classes**. We recommend that students are on the lowest branch of the tree.

NOTE

For more details about SDS deployment, visit [Planning SDS](#).

Integrate SIS data using SDS

School Data Sync (SDS) is provided with Office 365 for Education. SDS reads the data from an educational institution's Student Information System (SIS) and integrates it with Microsoft applications like Teams to enable the automatic creation of online classrooms and users.

It also synchronizes the SIS data with Insights.

As an IT Admin, you can choose to use SDS for provisioning only, Insights only or for both.

To Sync your SIS information with Educations Insights follow the instructions in [How to deploy SDS for Insights](#).

Deploy SDS

If you already use SDS, we recommend you follow our [best practices](#).

If you don't use SDS yet, you now need to [deploy it](#).

During the deployment process, you can decide if you want to use SDS for provisioning users and classes to Teams or to use it only to provide user and organizational hierarchy to Insights as well.

NOTE

If it's the middle of the year and you already created teams manually, use SDS only to provide the user and organizational hierarchy data to Insights, and next year consider using SDS for provisioning users and classes for Teams as well.

Verify the sync process

To verify the sync status progress follow the instructions in [SDS for Insights Data Health and Monitoring](#).

IMPORTANT

If you run into any problems, [customer support](#) is there to help you.

Supported grade level values

In the SDS files, grade/year level defined as Enumerated values, which means you can only provide a selected set of values within the CSV file. Anything other than values specified will result in an error during sync processing.

The section below defines the supported values in the users file.

United States / worldwide grade levels

VALUE IN FILE (GRADE COLUMN)	LABEL IN INSIGHTS
IT	Infant
PR	Pre-school
PK	Pre-kindergarten
TK	Transitional Kindergarten

Manage user access to Education Insights

12/7/2021 • 3 minutes to read • [Edit Online](#)

This document provides the steps required to manage user access to [Education Insights in Microsoft Teams](#).

You need to provide permissions for education leaders, district leaders, school principals, head teachers, counselors, heads of learning areas, program directors, social workers, and psychologists. Educators are *automatically* given permission when they own a class team.

To provide organization-level Insights, you must [import data from the Student Information System \(SIS\)](#) so that Insights has the hierarchical structure of the educational system mapped correctly.

NOTE

Only Global Administrator can manage user access to Insights.

TIP

We recommend that you enable Insights for all your education leaders so that they have the data to understand each school, and the ability to quickly identify problems and provide support to their educators. Even if you're running a pilot, it may still be helpful to keep Insights enabled for all education leaders, but only target communications to the pilot group of users.

Manange permissions

- Open the Insights app, click **Settings**, and select **User permissions**

NOTE

When you provide permission for an organizational level, the user can see all the org units below it.

Only provide permission to those education leaders that need them and only to the organizational units they are responsible for. If you are unsure whether user permission for a specific organization is required, consult your institution's privacy subject matter experts, such as legal or HR personnel.

Role-based permissions

If you use [SDS V2.1 file format](#) or [SDS V2 file format](#), you can import all roles and the full hierarchy of schools within the education system. This complete mapping enables you to assign permissions to roles.

NOTE

When a user is assigned a role, they automatically receive the correct permissions to see the data relevant to them.

If a user is no longer in a role, their permission for that role is automatically revoked (though they may still have individual permissions).

- If required, click the **Role-based permissions** tab.

You'll see a list of the roles in your educational organization, the level in that hierarchy for each one, how many users are assigned that role, and the role's permission level.

Permissions			
Role based permissions (12/14)		Individual permissions (47)	
Role ↓	Organization level	Number of users	Role based permission
Advisor	District	15	● View data for their organization 
IT	District	16	● View data for their organization 
Nurse	School	47	● None 
Principal	District	6	● View data for their organization 
Principal	School	86	● View data for their organization 
Principal	Department	15	● View data for their organization 
Staff	School	89	● View data for their organization 
Teacher	School	1697	● None 

If there is a role at more than one org level, that role appears multiple times, once for each level. In the screenshot, we have principals at the school, district and department level, so there are three lines for 'principal'.

- For each role, click the pencil icon to select the permission level. The default is the role has no permission to see Insights.
- Select the permission level – **View data for their organization** or **None**.

Manage role based permission

For role

Principal

At organization level

School

Permission level

None

View data for their organization

None

Only provide permission to those education leaders that need them. If you are unsure whether user permission for a specific organization is required, consult your institution's privacy subject matter experts, such as legal or HR personnel.

25 users in this group

 Bowers, Anastasia	 Bay Head Elementary
 Anthony, Murray	 Bay Head Elementary
 Harrington, Sherri	 Bay Head Elementary
 Gilliam, Lynette	 Bay Head Elementary
 Bray, Anton	 Little Valley Elementary

If you see a user on the list who needs a more nuanced permission level, adjust their role and / or organization in the [imported data from your SIS](#) and [grant them individual permissions](#) (if needed).

- Click **Save changes**.

This permission level is now automatically assigned to any new user with this role and org level. The user will see the data for all org units at their level of the hierarchy and under it.

Individual permissions

Use individual permissions to adjust the permission for a user or to assign permissions for each user if you have not used SDS V2 to import SIS data for the organization.

- Click the **Individual permissions** tab.

You'll see the users in your educational organization granted individual permission.

Permissions

Role based permissions (12/14)

Individual permissions (47)

Grant individual permission

Full name ↓	Email	Modified	Individual permission
Anthony, Murray	antony.murray@contoso.edu	April 20, 2021	● All organization 
Bowers, Anastasia	bowers.anastasia@contoso.edu	April 10, 2021	● All organization 
Bray, Anton	bray.anton@contoso.edu	May 16, 2021	● All organization 
Dudley, Timothy	dudley.timothy@contoso.edu	April 20, 2021	● Bay Head Elementary 
Estrada, Bart	estrada.bart@contoso.edu	January 13, 2021	● Mason-Rice Elementary, +2 others 
Harrington, Sherri	harrington.sherri@contoso.edu	April 20, 2021	● Mason-Rice Elementary, +2 others 
Gilliam, Lynette	gilliam.lynette@contoso.edu	July 14, 2021	● All organization 

Grant individual permission to a user

- Click **Grant individual permission** at the top left of the screen.
- Enter the username or email address of each user.
- Select the permission level:
 - **All** means the user sees all the org units at all levels. This is very rarely used.
 - **Specific organization** means the user sees the selected org unit, and all the org units below it. Start typing and select the org unit from the list.
- Click **Grant permission** to save.

Change the individual permission of a user

- For the relevant user, click the pencil icon to select the individual permission level.
- Select the permission level:
 - **All** means the user sees all the org units at all levels. This is very rarely used.
 - **Specific organization** means the user sees the selected org unit, and all the org units below it. Start typing and select the org unit from the list.
 - **None** means that the user only sees the org units automatically assigned by their role (if any).

IT Admin Guide to Reflect in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This document provides information concerning [Reflect](#) – an integral part of [Education Insights in Microsoft Teams](#). Reflect helps students recognize and navigate their emotions by providing regular opportunities to share and be heard. Reflect can help broaden learners' emotional vocabulary and deepen empathy for their peers while also providing valuable feedback to educators for a healthy classroom community.

This check-in app uses emojis and research-backed emotional granularity to support educators in adding social and emotional learning into their already busy routine.

Privacy and Security

Reflect follows the same privacy and security standards as Education Insights to protect students' sensitive information.

The information collected and shown through Reflect meets [more than 90 regulatory and industry standards](#), including [GDPR](#) and the Family [Education Rights and Privacy Act \(FERPA\)](#) for students and children's security and other, similar, privacy-oriented regulations.

Students *never* see the names of other students, only how they responded. While they can see the distribution of responses, they *cannot* see names associated with each reflection.

NOTE

If less than five students respond, no data is shown to the students. This is to minimize the possibility of students identifying each other's responses.

Data collection and storage

The data belongs to the educational institution, and Microsoft only collects the data and stores it. Microsoft personnel cannot access the data or see it, except as allowed by compliance in an audited way to maintain the service, such as data recovery.

The data is stored in Education Insights. By default, Education Insights is turned on. When you opt-out, we **delete all the data collected for Reflect**. Turn Education Insights back on, and we start collecting data from the time it's re-enabled.

In the [IT Admin Guide to Education Insights](#), you can read how Education Insights works (including storage locations) and [how to turn Education Insights off or on](#) when you want to delete the data or enable the service.

Data is collected from student in Reflect, though guest data is not collected. **If a student is defined as a guest, their data is not collected.**

Enable Reflect

If you manage the app setup policy for your institution, ensure that Reflect is *allowed* in your tenant. You can also add Reflect to the relevant class teams from the Teams admin center.

To enable a user to install and interact with any app, you must allow the app at the org level on the **Manage apps** page and the **app permission policy** assigned to the user.

If you have previously defined that each app needs to be allowed, please go to the Manage apps page and 'allow' Reflect. **When you block an app, the app doesn't appear in Teams for any users in your organization.**

NOTE

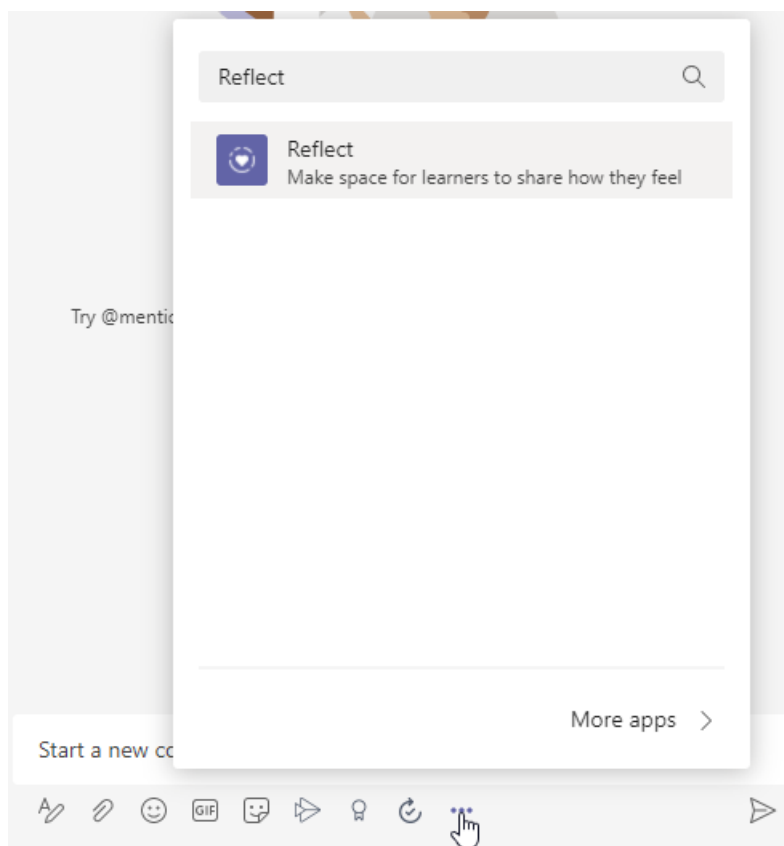

To have access to the Reflect app, you will need an A1, A3, or A5 license for Microsoft 365.

TIP

For more details, read [how to allow an app or to add it to a class team](#).

Where do educators find Reflect?

Once you have enabled Reflect, educators go to the class and select **New Conversation**. They then select '...' to bring up messaging extensions and enter **Reflect** in the search bar. The dialog box guides them through defining the question and who can see what.

They can right-click on the Reflect icon and select **Pin** for easy access.

TIP

You can also locate the Reflect app through this link: <https://aka.ms/getReflect>

TIP

For more details, visit [Reflect support page](#). This page provides guidelines for both educators and students and helps with how to create their first Reflect check-in.

Assignments in Teams for Education

12/7/2021 • 7 minutes to read • [Edit Online](#)

The Assignments and Grades features in Teams for Education allow educators to assign tasks, work, or quizzes to their students. Educators can manage assignment timelines, instructions, add resources to turn in, grade with rubrics, and more. They can also track class and individual student progress in the Grades tab.

[Learn more about Assignments and Grades in Teams for Education.](#)

NOTE

For details about Teams assignments on different platforms, see [Teams features by platform](#).

Assignments integrations in the Microsoft Teams admin center

Using the admin settings in the Microsoft Teams admin center, you can turn features on or off for educators within your organization and their students. The following are settings related to Assignments:

Weekly guardian email digest

Guardian emails are sent each weekend to parents or guardians. The email contains information about assignments from the previous week and for the upcoming week. The Parent and Guardian Sync can be setup using [School Data Sync](#).

1. Import parent contact information via Parent and Guardian Sync in SDS. For instructions on how to enable Parent and Guardian Sync, see [Enabling Parent and Guardian Sync](#).
2. Turn on the Guardian Setting in the Microsoft Teams admin center, as the setting is turned off by default. This will enable teachers to send out a weekly digest.

NOTE

Teachers can opt-out of the digest by deselecting the setting inside their own personal class team (**Assignment Settings** > **Parent/Guardian Emails**).

To verify that Parents will get the email, the following three items must be true:

- Email address attached to the student profile in SDS and tagged as *Parent* or *Guardian*. For details, see [Parent and Guardian Sync File Format](#).
- Students belong to at least one class in which e-mail is not disabled by the teacher in [assignment settings](#).
- The emails will contain information about assignments that have a due date from the previous week or in the upcoming week.

Default setting for this feature is - **Off**.

MakeCode

Microsoft MakeCode is a block-based coding platform that brings computer science to life for all students.

MakeCode is a Microsoft product that is subject to the Microsoft [terms of use](#) and [privacy](#) policies.

Default setting for this feature is - **Off**.

To enable MakeCode assignments in Teams, go to the **Teams Admin Center**, navigate to the **Assignments** section, and turn the MakeCode toggle option to **On**. Click **Save**. Allow a few hours for these settings to take effect.

For more information on how this feature works, watch this [video demonstration](#).

[Learn more about MakeCode](#).

Turnitin

Turnitin is an academic integrity service. This is a third-party service that is subject to its own terms and privacy policy. You are responsible for your use of any third-party products and services.

Default setting for this feature is - **Off**.

To enable Turnitin for your organization, you will need a Turnitin subscription. Then, you can input the following information, which can be found in your Turnitin admin console:

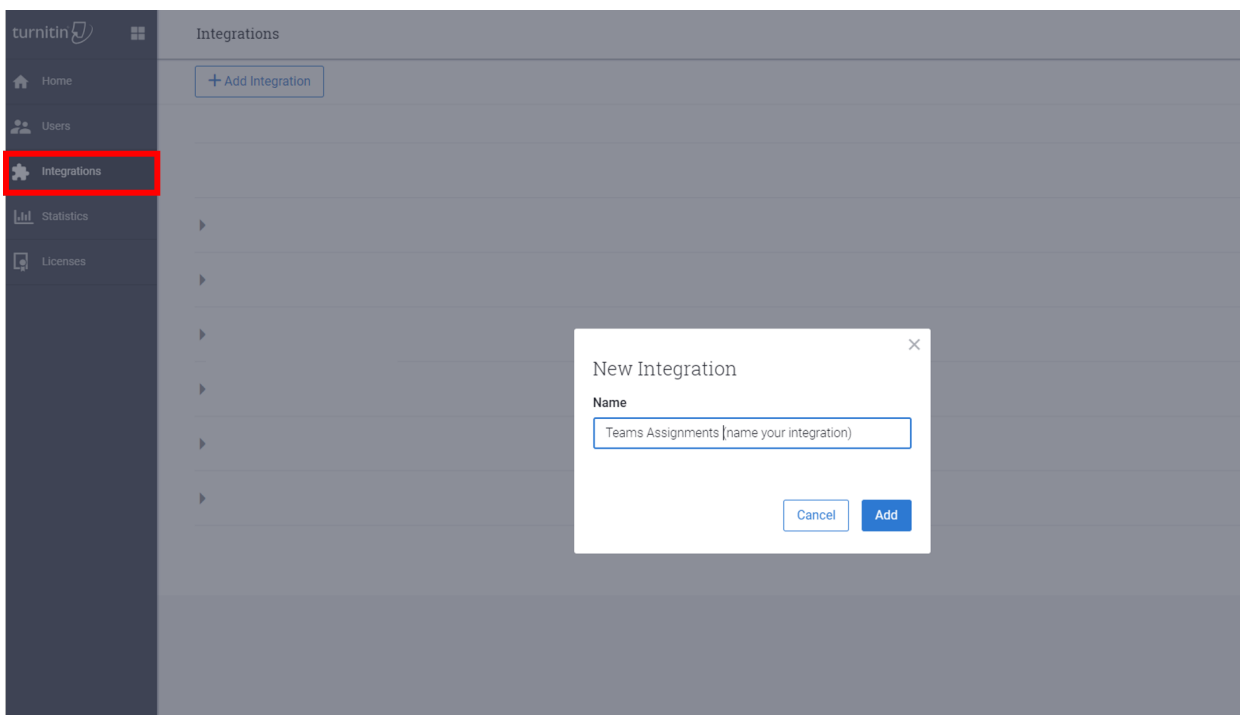

- **TurnitinApiKey**: This is a 32-character GUID found in the admin console under Integrations.
- **TurnitinApiUrl**: This is the HTTPS URL of your Turnitin admin console.

Here are some instructions to help you obtain this information.

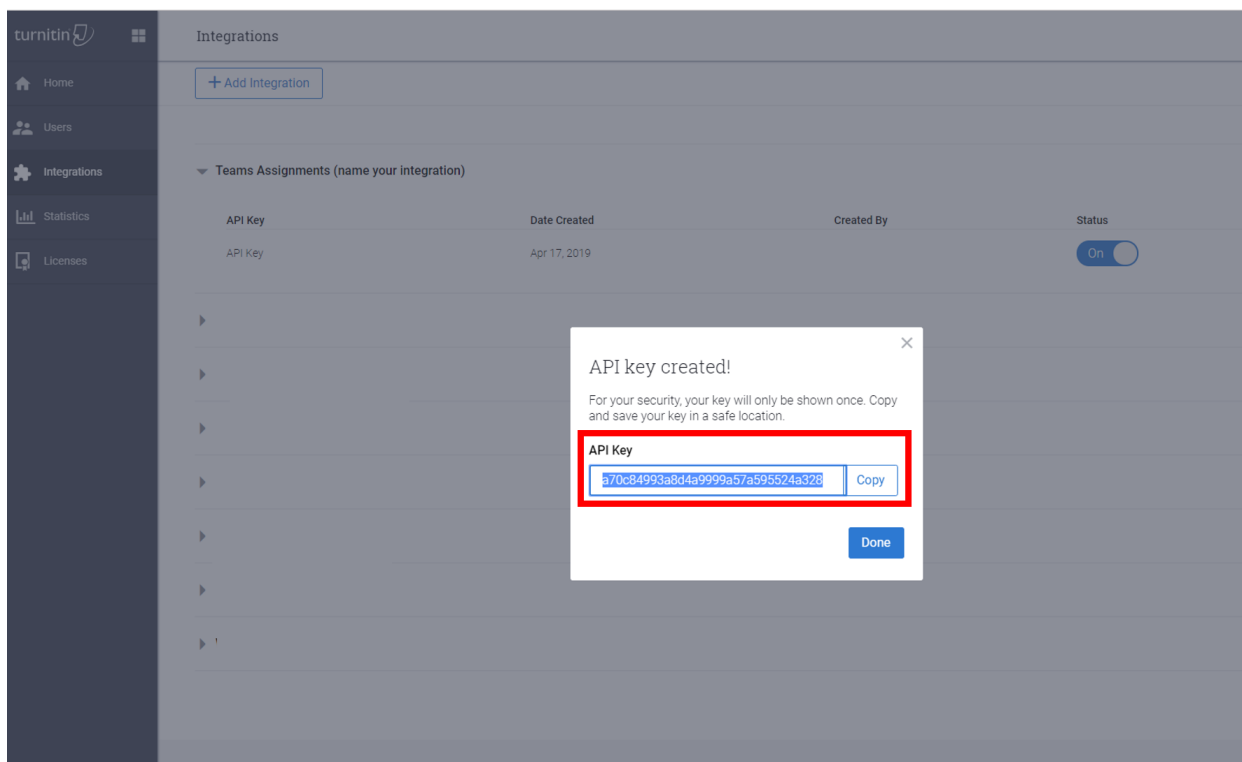

The **TurnitinApiUrl** is the host address of your admin console. Example: `https://your-tenant-name.turnitin.com`

The admin console is where you can create an integration and an API key associated with the integration.

Select **Integrations** from the side menu, then select **Add Integration** and give the integration a name.

The **TurnitinApiKey** will be given to you after you follow the prompts. Copy the API key and paste it into the Microsoft Teams admin center. This is the only time you can view the key.

Upon clicking the **Save** button in the admin center for this setting, allow a few hours for these settings to take effect.

Assignments data

Assignments stores information that is generated both by teachers and students. All the data is co-shared between teacher and the specific student for which the information is intended in class. There are two stores of this, SharePoint and outside of SharePoint.

NOTE

The same rules also apply to first-party integrations such as Reading Progress.

Assignments data in SharePoint document libraries

Students' files associated with a Submission for Assignment are stored in a document library (named: *Student Work*). Files associated with Assignments that are created by teachers and accessible by Students are stored in another document library (named: *Class Files*) in the corresponding Class Team SharePoint site. First-party integrations may also store Assignments data in the same corresponding Class Team SharePoint site (named: *Assignments title + time stamp*).

Files associated with the student

IT admins can use the Content Search tool to search for student files (*Student Work*, *Class Files*, or other 1st-party integration files) that are related to assignment submissions and files that are related to assignments. For example, an admin could search all SharePoint sites in the organization and use the student's name and class or assignment name in the search query to find data relevant to a data subject request (DSR).

Files associated with the teacher

IT admins can use the Content Search tool to search for teacher files (*Student Work*, *Class Files*, or other 1st-party integration files) that are related to assignments as well as files distributed to students by the teachers within a class on assignments. For example, an admin could search all SharePoint sites in the organization and use the teacher's name and class or assignment name in the search query to find data relevant to a DSR.

Assignments data outside of SharePoint document libraries

Some data related to Assignments isn't stored in the class team SharePoint site, which means it's not discoverable with Content Search. This includes:

- Student grades and feedback from the teacher
- The list of documents submitted for an assignment by each student
- Assignment details like Due Date, etc.
- First-party integration data like Reading Progress passages or student pronunciation data

For this type of data, an IT admin or data owner, such as a teacher, may have to go into the assignment in the class team to find data relevant to a DSR. The admin can add themselves as an owner to the class and view all the assignments for that class team.

NOTE

If a student is no longer part of the class, their data might still be present in the class as *no longer enrolled*. The student will have to provide the tenant admin the list of such classes that they were ever a part of.

Bulk Export assignment data outside of SharePoint document libraries

For a student

To bulk export a single student's data, before removing the student from the classes they're part of, [run the script](#) and provide the `userId`. If the student has been removed from the site, either the admin can add the student back to the class before running the script, or the admin can provide the `userId` and the `classId` that the student was ever a part of.

The data about the student submissions will be exported.

For a teacher

Bulk Export assignment data works the same way for a student, but all submissions that the teacher has access to will be exported.

Bulk Delete assignment data outside of SharePoint document libraries

For a student

To bulk delete a single student's data, before removing the student from the classes they're part of, [run the script](#) and provide the `userId`. If the student has been removed from the site, either the admin can add the student back to the class before running the script, or the admin can provide the `userId` and the `classId` that the student was ever a part of.

Providing a `ClassId` will allow the admin to only delete information about the student from a specific class.

For a teacher

Since an assignment's data for a teacher is shared across the class, there's no bulk delete option. Instead the admin can add themselves to the class, go to the app, and delete the assignment.

For more information, see [Configure assignments for Teams](#).

Removing Assignments and Grades

You can also use Teams policies to remove Assignments and Grades for a specific user or for your entire tenant.

To remove Assignments and Grades for an individual user, go to **Teams Admin Center** and navigate to **Teams apps > Permission policies** to create a new app permission policy definition. When creating the new policy definition, set the **Microsoft apps** policy to *Block specific apps and allow all others* and add **Assignments** to the list of blocked applications. Once your new policy definition is saved, assign it to the appropriate users.

To remove Assignments and Grades for your entire tenant, go to **Teams Admin Center**, navigate to **Teams apps > Manage apps**, and search for and select **Assignments** from the application list. Change the status

setting within the Assignment application settings page to *Blocked*.

Microsoft Teams resources for Education admins

Microsoft Education governance FAQ for admins

12/7/2021 • 6 minutes to read • [Edit Online](#)

TIP

Watch the following session to learn about more about management in Microsoft Teams: [Governance, management and lifecycle in Microsoft Teams](#)

How do I control team creation? I'm worried students are going to create inappropriate teams.

To avoid inappropriate or misleading names, or just to provide more structure for how teams are named, you can use the Microsoft 365 Groups naming policy (currently in preview):

- **Prefix-Suffix naming policy** You can use prefixes or suffixes to define the naming convention of teams (groups), for example, **GRP_US_My Group_Engineering**. The prefixes and suffixes can be fixed strings or user attributes (such as **[Department]**) that are added to the name based on the user who's creating the team.
- **Custom Blocked Words** You can upload a set of words that users in a specific organization are blocked from using in names of teams they create. For example, you can block the terms **CEO**, **Payroll**, and **HR** from being used in team names for groups they don't apply to.
- **Classification** You can create classifications that the users in your organization can set when they create a Microsoft 365 Group.

IMPORTANT

Using the Microsoft 365 Groups Naming Policy requires Azure Active Directory Premium P1 licenses or Azure AD Basic EDU licenses for each unique user that is a member of one or more Microsoft 365 groups.

For detailed instructions, see [Office groups naming policy](#).

NOTE

If teams are created automatically by using the input from another system (for example, School Data Sync), verify that the input data complies with the naming policy you've configured; if it doesn't, team creation will fail.

Can I see who created a team?

To find out who created a specific team, see [Search the audit log for events in Microsoft Teams](#).

Can I control who can create teams?

In general, we recommend against preventing anyone from creating teams. If everyone can create teams, Teams is more likely to be widely adopted. Faculty, teachers, or students can use Teams to create study groups or special interest groups. This will help Teams be accepted inside and outside of the classroom.

In our experience, user education helps ensure responsible Teams usage. As soon as users understand that creating teams isn't anonymous, they understand the implications of carelessly creating them and tend to shy

away from misusing the tool.

If you're sure you want to control who can create teams, see [Manage who can create Microsoft 365 Groups](#).

How do I automatically create a team for each course at the beginning of the semester or quarter?

At the start of each semester or quarter, you'll need a number of new teams. It might make sense to take an automated approach to create these teams automatically, populate them with the right users, and set the right permissions:

- School Data Sync can create Microsoft 365 Groups for Exchange Online and SharePoint Online, class teams for Microsoft Teams and OneNote Class notebooks, school groups for Intune for Education, and rostering and single sign-on (SSO) integration for many other third-party applications. Learn more at [Overview of School Data Sync](#).
- With PowerShell, you can create teams and channels, and configure settings automatically. See [Microsoft Teams PowerShell](#) for more information.
- You can use the Microsoft Graph API (currently in beta) to create, configure, clone, and archive teams. See [Use the Microsoft Graph API to work with Microsoft Teams](#) for more information.

TIP

School Data Sync creates a Microsoft 365 Group for each class synced and [enables hidden group membership](#) so only teachers and students within the class can see the members of that class. If using a different process to create class groups use the HiddenGroupMembershipEnabled parameter of the New-UnifiedGroup cmdlet to meet the same privacy requirements.

How do I deal with teams when the semester or quarter ends?

We recommend that you first think about how you want to handle Teams data when the school semester or quarter is over: whether to delete it or keep it available for students even after they've completed the course. You'll want to keep the school calendar in mind so any policies you set don't conflict with holidays. You can use the following tools to implement your strategy:

- **Retention policy:** Use this to delete all data older than an age you specify to make sure that old data is removed from chats (for all or some users) and channels. You can also configure Teams to retain content so it can't be deleted. For more information, see [Retention policies for Microsoft Teams](#).
- **Expiry policy:** Configure teams to expire after a certain number of days. Thirty days before expiration, all owners of a team are notified that their team needs to be renewed, otherwise it will be deleted (though an administrator can recover deleted teams for an additional 30 days). This setting is very useful for making sure unused teams are sunsetted. Learn more at [Microsoft 365 group Expiration Policy](#).
- **Archive team:** This setting puts teams into read-only mode. They can still be browsed and searched, but no one can add any new posts. [Archive or restore a team](#) describes how team owners can archive a team; Team owners can also use the [Graph API \(beta\)](#) to archive or restore a team.

IMPORTANT

Using the Microsoft 365 Groups Expiration Policy requires Azure Active Directory Premium P1 licenses for each unique user that is a member of one or more Microsoft 365 groups.

Are there team templates for my faculty members to use when

creating a team?

Yes. Users can select **Create Team from existing template** when creating a new team, and Teams owners can also use the [Graph API \(beta\)](#) to create a new team from the available templates.

What tasks can I automate via PowerShell or Graph?

The [Microsoft Graph API \(beta\)](#) can do the following:

- Create a team.
- Add members and owners.
- Add channels.
- Add apps.
- Shortcut those steps by cloning an existing team, and get its tabs too.
- Give the user a link to the team you just created.
- Remove members, owners, channels, and apps when you no longer need them.
- Archive the team when it's no longer active.
- Delete the team.
- Create a channel thread

[PowerShell](#) can do the following:

- Create a team.
- Add members and owners.
- Add channels.
- Remove members, owners, and channels when you no longer need them.
- Delete the team.

TIP

The Graph API and PowerShell cmdlets are constantly adding functionality. Make sure to check the [Microsoft Graph API \(beta\)](#) and [PowerShell](#) articles often for feature enhancements.

Can I control what Teams features my faculty and students have access to?

Yes. You can use policies to control specific messaging, meeting, calling, and live event features your users have access to. You can use tenant-wide settings to apply the same settings to all, or apply user-level policies if required.

For more details about Teams policies, see [Manage Microsoft Teams settings for your organization](#).

Can I control what external parties my faculty and students collaborate with?

You can use guest access to invite users from outside of your tenant, which can be useful for research collaboration or guest lectures:

- Use a domain allowlist to allow or block guests based on their domain.
- Turn guest access on and off for particular Microsoft 365 Groups and teams, to control which teams can (and can't) invite guests.
- Use the audit log to see which alerts were sent to invited guests.

For more information, see [Guest access in Microsoft 365 Groups](#).

What information can I review about existing teams?

You can check the audit logs to see:

- Who was invited as a guest to which team.
- Who created which team.

Teams evolves so quickly. How can I stay up-to-date?

We recommend the following resources to get the latest updates on Teams:

- [What's new in Microsoft Teams](#)
- [Microsoft Teams blog](#)

Installing the Moodle integration with Microsoft Teams

12/7/2021 • 10 minutes to read • [Edit Online](#)

[Moodle](#), the most popular and open-source Learning Management System (LMS) in the world, is now integrated with Microsoft Teams! This integration helps educators and teachers collaborate around Moodle courses, ask questions about their grades and assignments and stay updated with notifications -- right within Teams!

To help IT admins easily set this integration up, we have updated our open-source Moodle Plugin with the following capabilities:

- Auto-registration of your Moodle server with Azure AD.
- One-click deployment of your Moodle Assistant bot to Azure.
- Auto-provisioning of teams and auto-synchronization of team enrollments for all or select Moodle courses.
- Auto-installation of the Moodle tab and the Moodle Assistant bot into each synchronized team. (Coming soon)
- One-click publishing of the Moodle app into your private Teams App Store. (Coming soon)

To learn more about the functionality this integration provides, see [Installing the Moodle integration with Microsoft Teams](#).

Prerequisites

In order to install and configure this application you'll need:

1. Moodle administrator credentials
2. Azure AD administrator credentials
3. An Azure subscription you can create new resources in

Step 1: Install the Moodle Plugin

The Moodle integration in Microsoft Teams is powered by the open source [Moodle plugin set](#). To install the plugin in your Moodle server:

1. First, download the [Moodle plugin set](#) and save it to your local computer. You'll need to use version 3.5 or newer.
 - Installing the local_o365 plugin will also install the [auth_oidc](#) and [boost_o365Teams](#) plugins.
2. Sign in to your Moodle server as an administrator, and select **Site administration** from the left navigation panel.
3. Select the **Plugins** tab, and then click **Install plugins**.
4. Under the **Install plugin from ZIP file** section click the **Choose a file** button.
5. Select the **Upload a file** option from the left navigation, browse for the file you downloaded above and click **Upload this file**.
6. Select the **Site administration** option from the left navigation panel again to return to your admin dashboard. Scroll down to the **Local plugins** and click the **Microsoft Office 365 Integration** link. Keep this configuration page open in a separate browser tab as you'll be using it throughout the rest of this

process.

You can find more information on how to install Moodle plugins in the [Moodle documentation](#).

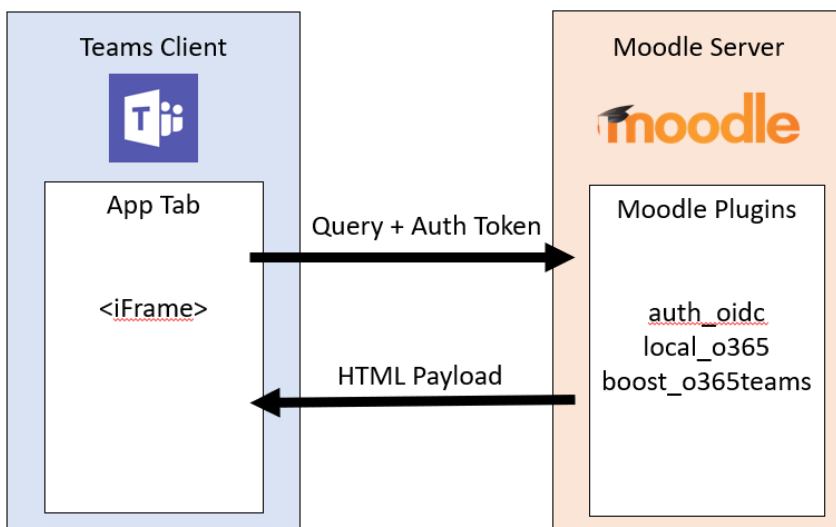

Important Note: Keep your Microsoft 365 or Office 365 Moodle Plugin configuration page open in a separate browser tab as you will be returning to this set of pages throughout this process.

Don't have a Moodle site already? You might want to check out our Moodle on Azure [repo](#) where you can quickly deploy a Moodle instance on Azure and customize it to your needs.

Step 2: Configure the connection between the Microsoft 365 or Office 365 plugin and Azure Active Directory

Next you'll need to register Moodle as an application in your Azure Active Directory. We've provided a PowerShell script to help you complete this process. The PowerShell Script provisions a new Azure AD application for your Microsoft 365 or Office 365 organization, which will be used by the Moodle Plugin. The script will provision the app for your Microsoft 365 or Office 365 tenant, set up all the required Reply URLs and Permissions for the provisioned app and return the AppID and Key. You can use the generated AppID and Key in your Moodle Plugin Setup Page to configure your Moodle server with Azure AD. If you want to see the detailed manual steps that the PowerShell script is automating, you can find them in the full [documentation for the plugin](#).

Moodle tab for Microsoft Teams information flow

1. From the Microsoft 365 or Office 365 Integration plugin page, select the **Setup** tab.
2. Click the **Download PowerShell Script** button and save it to your local computer.
3. You'll need to prepare the PowerShell script from the ZIP file. To do so:
 - Download and extract the `Moodle-AzureAD-Powershell.zip` file.
 - Open the extracted folder.
 - Right-click on the `Moodle-AzureAD-Script.ps1` file and select **Properties**.
 - Under the **General** tab of the Properties window, check the `Unblock` box next to the **Security** attribute at the bottom.
 - Click **OK**.
 - Copy the directory path of the extracted folder.
4. Next you'll run PowerShell as an administrator:
 - Click **Start**.
 - Type **PowerShell**.
 - Right-click **Windows PowerShell**.

- Click "Run as Administrator".
5. Navigate to the unzipped directory by typing `cd ...\. \Moodle-AzureAD-Powershell` where `...\. \` is the path to the directory.
 6. Execute the PowerShell script by:
 - Enter `Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Scope CurrentUser`.
 - Enter `.\Moodle-AzureAD-Script.ps1`.
 - Log in to your Microsoft 365 or Office 365 Administrator account in the pop-up window.
 - Enter the name of the Azure AD Application (Ex. Moodle/Moodle plugin).
 - Enter the URL of your Moodle server.
 - Copy the **Application ID** and **Application Key** generated by the script and save them.
 7. Next you'll need to add the Id and Key to the Moodle Plugin. Return to the plugin administration page (Site administration > Plugins > Microsoft 365 Integration).
 8. On the **Setup** tab add the **Application Id** and **Application Key** you copied previously, then click **Save changes**.
 9. Once the page refreshes you should now see a new section **Choose connection method**. Click the checkbox labeled **Default** and then click **Save changes** again.
 10. Once the page refreshes you will see another new section **Admin consent & additional information**.
 - Click the **Provide Admin Consent** link, enter your Microsoft 365 or Office 365 Global Administrator credentials, then **Accept** to grant the permissions.
 - Next to the **Azure AD Tenant** field click the **Detect** button.
 - Next to the **OneDrive for Business URL** click the **Detect** button.
 - Once the fields populate, click the **Save changes** button again.
 11. Click the **Update** button to verify the installation, then **Save changes**.
 12. Next you'll need to synchronize users between your Moodle server and Azure Active Directory. Depending on your environment, you may select different options during this stage. Note that the configuration you set here will run with each Moodle cron run (typically once a day) to keep everything in sync. To get started:
 - Switch to the **Sync Settings** tab
 - In the **Sync users with Azure AD** section, select the checkboxes that apply to your environment. Typically you would select at least:
 - Create accounts in Moodle for users in Azure AD
 - Update all accounts in Moodle for users in Azure AD
 - In the **User Creation Restriction** section you can set up a filter to limit the Azure AD users that will be synced to Moodle.
 - The **User Field Mapping** section will allow you to customize the Azure AD to Moodle User Profile field mapping.
 - In the **Teams Sync** section you can choose to automatically create Groups (i.e. Teams) for some, or all, of your existing Moodle courses.
 13. To validate the cron jobs (and run them manually if you wish to for the first run) click the **Scheduled tasks management page** link in the **Sync users with Azure AD** section. This will take you to the **Scheduled Tasks** page.
 - Scroll down and find the job **Sync users with Azure AD** job and click **Run now**.
 - If you chose to create Groups based on existing courses, you can also run the **Create user groups in Office 365** job.
 14. Return to the plugin administration page (Site administration > Plugins > Microsoft 365 Integration) and select the **Teams Settings** page. You'll need to configure some security settings to enable the Teams app integration.
 - To enable OpenID Connect, click the **Manage Authentication** link, and click the eye icon on the **OpenId Connect** line if it is greyed out.

- Next you'll need to enable frame embedding. Click the **HTTP Security** link, then click the checkbox next to **Allow frame embedding**.
- The next step is to enable web services which will enable the Moodle API features. Click the **Advanced Features** link, then make sure the checkbox next to **Enable web services** is checked.
- Finally you'll need to enable the external services for Microsoft 365 or Office 365. Click the **External services** link then:
 - Click **Edit** on the **Moodle Office 365 Webservice** row.
 - Mark the checkbox next to **Enabled**, then click **Save Changes**
- Next you'll need to edit your authenticated user permissions to allow them to create web service tokens. Click the **Editing role 'Authenticated user'** link. Scroll down and find the **Create a web service token** capability and mark the **Allow** checkbox.

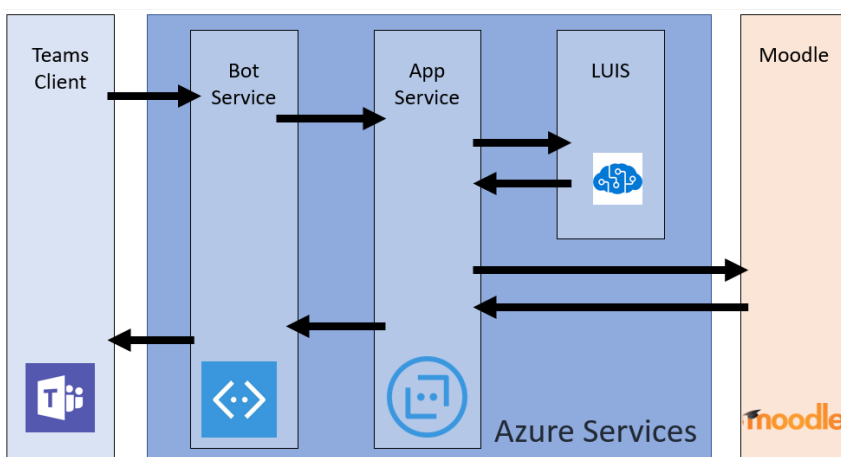

Step 3: Deploy the Moodle Assistant Bot to Azure

The free Moodle Assistant Bot for Microsoft Teams helps teachers and students answer questions about their courses, assignments, grades and other information in Moodle. The bot also sends Moodle notifications to students and teachers right within Teams. This bot is an open source project maintained by Microsoft, and is [available on GitHub](#).

NOTE

In this section you will deploy resources to your Azure subscription, and all resources will be configured using the **free** tier. Depending on the usage of your bot, you may need to scale these resources. If you want to just use the Moodle tab without the bot, skip to [step 4](#).

Moodle bot information flow

To install the bot, you'll first need to register it on the [Microsoft Identity Platform](#). This allows your Bot to authenticate against your Microsoft endpoints. To register your bot:

1. Return to the plugin administration page (Site administration > Plugins > Microsoft 365 Integration) and select the **Teams Settings** tab.
2. Click the **Microsoft Application Registration Portal** link and login with your Microsoft Id.
3. Enter a name for your app (Eg. MoodleBot) and click the **Create** button.
4. Copy the **Application Id** and paste it into the **Bot Application ID** field on the **Team Settings** page.
5. Click the **Generate New Password** button. Copy the generated password and paste it into the **Bot Application Password** field on the **Team Settings** page.

6. Scroll to the bottom of the form and click **Save Changes**.

Now that you've generated your Application Id and Password, it's time to deploy your bot to Azure. Click on the **Deploy to Azure** button and fill out the form with the necessary information (the Bot Application Id, Bot Application Password and the Moodle Secret are on the **Team Settings** page, and the Azure information is on the **Setup** page). Once you've got the form filled out, click the check box to agree to the terms and conditions then click the **Purchase** button (all Azure resources are deployed to the free tier).

Once the resources are finished deploying to Azure, you'll need to configure the Moodle plugin with its messaging endpoint. First, you'll need to get the endpoint from your Bot in Azure. To do that:

1. If you aren't already, log into the [Azure portal](#).
2. In the left pane select **Resource groups**.
3. From the list select the resource group you just used (or created) while deploying your Bot.
4. Select the **WebApp Bot** resource from the list of resources in the group.
5. Copy the **Messaging Endpoint** from the **Overview** section.
6. In Moodle, open the **Team Settings** page of your Moodle Plugin.
7. In the **Bot Endpoint** field paste the URL you just copied and change the word *messages* to *webhook*. The URL should now look like `https://botname.azurewebsites.net/api/webhook`
8. Click **Save Changes**
9. Once your changes have saved, go back to the **Team Settings** tab, click the **Download manifest file** button and save the manifest package to your computer (you'll use it in the next section).

Step 4: Deploy your Microsoft Teams app

Now that you have your Bot deployed to Azure and configured to talk to your Moodle server, it's time to deploy your Microsoft Teams app. To do this you'll load the manifest file you downloaded from the Moodle Plugin Team Settings page in the previous step.

Before you can install the app you'll need to make sure external apps and sideloading of apps is enabled. To do so you can follow [these steps](#). Once you've ensured that external apps are enabled, you can follow the steps below to deploy your app.

1. Open Microsoft Teams.
2. Click the **Store** icon on the lower left of the navigation bar.
3. Click the **Upload a custom app** link from the list of options. *Note:* If you're logged in as a global administrator you'll have the option of uploading the app to your organization's app store, otherwise you'll only be able to load the app for Teams you're a part of ("sideloading").
4. Select the `manifest.zip` package you downloaded previously and click **Save**. If you haven't yet downloaded the manifest package, you can do so from the **Team Settings** tab of the plugin configuration page in Moodle.

Now that you have the app installed you can add the tab to any channel that you have access to. To do so navigate to the channel, click the + symbol and select your app from the list. Follow the prompts to finish adding your Moodle course tab to a channel.

That's it! You and your team, can now start working with your Moodle courses directly from Microsoft Teams.

To share any feature requests or feedback with us, please visit our [User Voice page](#).

NOTE

Microsoft will be moving from UserVoice to our own customer feedback solution on a product-by-product basis during 2021. [Learn more.](#)

Assign Microsoft Teams licenses for EDU

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft Teams is a digital hub that brings conversations, content, and apps together in one place. Because it's built on Office 365, schools benefit from integration with their familiar Office apps and services. Your institution can use Microsoft Teams to create collaborative classrooms, connect in professional learning communities, and communicate with school staff all from a single experience in Office 365 for Education.

To get started, IT administrators need to use the Microsoft 365 Admin Center to [enable Microsoft Teams for your school](#). Once complete, you must assign licenses to user accounts so your faculty, staff, and students can access Office 365 services, such as Microsoft Teams.

You can assign licenses to user accounts either individually or automatically through group membership. This article will walk you through how to assign Office 365 licenses to an individual or a small set of user accounts via the Microsoft 365 admin center. To assign licenses automatically through group membership, see one of our supporting articles:

- [Office 365 Powershell](#)
- [Group-based Licensing in Active Directory](#)

You can assign licenses to users on either the **Licenses** page, or on the **Active Users** page. Which method you use depends on whether you want to assign product licenses to specific users, or assign users licenses to specific products.

NOTE

If you're not using the new Microsoft 365 admin center, you can turn it on by selecting the **Try the new admin center** toggle located at the top of the Home page.

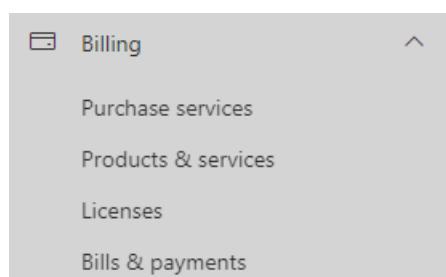

Assign licenses to users on the Licenses page

NOTE

You must be a Global admin, Billing admin, License admin, or User management admin. For more information, see [About Office 365 admin roles](#).

When you use the **Licenses** page to assign licenses, you assign licenses for a specific product for up to 20 users. On the **Licenses** page, you see a list of all the products you have subscriptions for, together with the total number of licenses for each product, how many licenses are assigned, and how many are available.

1. In the admin center, go to the **Billing** > [Licenses](#) page.

2. Select a product for which you want to assign licenses. Microsoft Teams is part of the free Office 365 A1 for Students SKU.

Licenses

Select a product to view and assign licenses.

[Go to Products & services](#) to manage billing or buy more licenses.

↓ Export ↻ Refresh			
Name ↑	Available quantity		Account type
 Microsoft 365 A3 for students	2 available 1 assigned of 3 total	<div><div></div></div>	Organization
 Microsoft 365 A5 for faculty	11 available 14 assigned of 25 total	<div><div></div></div>	Organization
 Microsoft 365 A5 for students	7 available 18 assigned of 25 total	<div><div></div></div>	Organization
 Microsoft Power Automate Free	9996 available 4 assigned of 10000 total	<div><div></div></div>	Organization
 Microsoft Teams Commercial Cloud (User Initiated)	Unlimited licenses 1 assigned		Organization
 Office 365 ProPlus for Education (device)	2 available 1 assigned of 3 total	<div><div></div></div>	Organization

3. Select Assign licenses.

Users

Manage and view licenses and apps for your users. Manage group-based licenses in the [Azure portal](#).

+ Assign licenses ↓ Export users ↻ Refresh

4. In the Assign licenses to users pane, begin typing a name, which should generate a list of names. Choose the name you're looking for from the results to add it to the list. You can add up to 20 users at a time.

Assign licenses to users

Search for users in your organization by name or email address to assign them licenses for Microsoft 365 A3 for students. You can assign to a maximum of 20 users at a time.

Teams devices for Education

12/7/2021 • 14 minutes to read • [Edit Online](#)

Overview

Hybrid and blended education is here to stay

Learning in the future will be hybrid and blended. Educators and students both require a fluid experience realized across a continuum of spaces, motivated by a need for flexibility when it comes to how and where learning takes place. Education won't be confined to a physical classroom or strictly virtual environments; remote participation will be just as dynamic as in-person learning. The flexibility that hybrid and blended learning offers, while not new to all, will be new to many and will have far-reaching impact.

The modern, hybrid classroom will be boundaryless. Students and educators will be empowered by synchronous and asynchronous learning as well as interactive, multi-modal engagement designed to meet the needs of every student in every circumstance. Teams devices have been designed to support a range of spaces so that no voice goes unheard.

Student and educators alike excel with Microsoft Teams Rooms

- Microsoft Teams Rooms enable safe, secure, student-focused learning, from classroom integration to breakout rooms for more focused collaboration, and even one-on-ones to address specific student needs and questions.
- Using personal and shared devices in a digital or hybrid learning environment helps students socialize and gain key skills they'll use throughout their lives.
- Teams functionality is not restricted to the classroom. Educators and administrators can easily connect with other faculty and staff within the same school or within the entire school district from their home, office, or wherever else they've optimized their environment. With Teams, professional development is accessible from anywhere.

Bring digital flexibility to physical spaces

To ensure students and educators working remotely can fully participate in group collaboration and meetings, education workspaces will need technology to help bridge the divide between the old, in-person models and the new, hybrid and remote spaces.

This image represents future technology.

Why choose a native Teams experience?

Microsoft Teams certified peripherals and rooms are purpose-built, native calling and meeting solutions delivering a complete Teams meeting experience, with high-definition audio and video, on Teams-certified first- and third-party hardware.

When we say “purpose-built and native,” we mean the experience is specifically and thoughtfully designed by Microsoft for the Teams user.

Teams Rooms go beyond what can be done with Teams on personal devices by providing unique in-room capabilities, like one-touch join, content cameras to share physical whiteboards into the meeting in an intelligent way, and proximity features like seamlessly transferring a Teams meeting from your personal device to the room.

Non-native and self-built systems that rely on external services, or a bring-your-own-device connection, will never truly match the ease of use or immersive quality of a native Teams Room.

Purpose-built for Teams

Advanced audio and video and sharing

Expansive device portfolio for any room

Select from fully modularized or integrated form factors across Android or Windows operating systems

Reimagined room experiences

Join Teams meetings friction-free to engage in inclusive, collaborative meetings for students and educators alike

Easily managed from one place

Fully manage and keep devices up to date and ready to go in Teams Admin Center and enable 24x7 proactive management from Microsoft with Microsoft Teams Rooms Premium

Space considerations

What is the role of the space?

Physical spaces are designed to accommodate the kinds of activities that will happen there. Different types of activities or connections may facilitate different meeting behaviors. A classroom is going to see much different behavior than that of a boardroom, for example.

Furniture helps define how a space is going to be used. Furniture and finishes will be important to think about for a classroom or meeting space to be effective.

For existing spaces, the technology should align to the room’s existing layout. As an example, if tables and chairs are set up for presentations and in-person instruction, the technology should follow. Microphones and cameras need to be positioned optimally in the room, not simply added anywhere they fit without consideration of how the room is used. Remote participants need to see the presentation material as clearly as in-person participants.

For new spaces, the intended use of the room should drive both furniture and technology considerations. For example, when designing a room intended to facilitate multiple purposes (such as individual work and group interaction), the space should be separated into two separate zones for maximum efficiency.

The following pair of images illustrates optimized Teams setups in an existing classroom space (top) and in a new, multi-purpose space (bottom):

What is the function of the space?

Will the activities in the space focus on collaborative co-creation?

Creativity requires a layout and a technology deployment that is designed around user collaboration. The right space facilitates work between users and the technology seamlessly and eliminate friction for even the most novice users. Teams devices are designed to be user-friendly enough for young students to navigate adeptly and for educators to control and customize from first use.

What about spaces where content sharing with both in-person and remote participants is the priority?

Content sharing and remote collaboration each demand a different physical layout and technology experience. The right space facilitates discussion and makes it easy for everyone to see and review shared content. No matter what space you are equipping, from a dorm flex space to a lecture hall, it needs to be Teams enabled.

Technology considerations

The right audio and video technology choices will help users get the most out of their Microsoft Teams meetings.

Audio

Audio considerations are critical to ensure both remote and in-room participants can be clearly heard and understood. Microphone and speaker coverage must include every seat in the room without leaving gaps.

What are the right audio devices for each space?

Pairing the right microphone and speakers for each space will give the best possible results for being heard clearly without distraction.

- In potentially noisy spaces, such as a common room in the home or desks in a classroom, headsets offer the best possible experience by restricting sound only to the meeting participants. Headset microphones are designed to pick up only the meeting speech, and the speakers are contained so that only the meeting attendees can hear what is going on.
- In more private settings (for example, a student's bedroom), devices choice can expand to include things like personal speakerphones. These personal devices allow for the same level of conversation quality as on headsets, but without the restriction of having to wear the device.
- In shared spaces, the options expand, but the same principles remain: meeting participants need to be heard and hear others clearly.
 - All-in-one audio devices are easy-to-deploy, high-quality options for smaller spaces with a limited number of participants seated relatively close to the audio device.
 - In larger spaces, the microphones and speakers separate to ensure maximum coverage across all participants in the space. Many solutions for medium- to large-sized rooms are available as part of a kit that requires no configuration, only physical installation of microphones and speakers.
 - In the very largest and most complex spaces, solutions are available that allow for a variety of microphone and speaker types to be used together, such as capturing a lecturer and audience voice from a large hall while simultaneously bringing the call to everyone. These solutions are best achieved when deployed by a [Microsoft partner](#) who has expertise in the design and deployment of more technically involved solutions.

Video

Video is as important as audio. Capturing physical, non-verbal communication like facial expressions or gestures is as important as the classroom or meeting content to ensure maximum engagement and understanding. Rooms need to be equipped with the appropriate size of display so that everyone can experience the meeting properly, whether in the room or remote. Rooms also need to have the right camera coverage and field of view (FOV) to effectively capture all the in-room meeting participants for those joining remotely.

What are the right cameras for each space?

High-quality video is a necessity for modern Teams collaboration. Technology for cameras has advanced significantly with high-quality cameras now available for all spaces.

- Included cameras in devices like laptops and tablets are a great starting point for use by individuals participating in video calls. For users looking to bring a richer video experience to a personal space, external cameras represent a step up from embedded devices and can be used in a greater number of scenarios and configurations, ensuring that call participants share the best quality view of themselves. These devices easily install with simple USB connections found on every PC.
- In shared spaces, the options and features expand. Smaller rooms may be covered by cameras included within all-in-one audio devices, such as soundbars. These cameras typically feature a wide field of view, ensuring that they capture every participant in the space in a single shot. Many of these cameras also feature things like intelligent framing of the image (so that the camera only shows the people in the meeting and not empty chairs) to track and understand space utilization.
- In larger rooms, cameras feature the technology needed to capture participants in a variety of locations at varying distances away. These cameras can capture groups or focus on specific individuals while maintaining great visual clarity. Devices that can track and feature only active speakers are regularly used in larger spaces so that many participants may be featured individually throughout a meeting as they

contribute their thoughts.

How do you interact virtually beyond video streams?

Teams meetings go beyond just audio and video calling for participants. There are a variety of ways to share and interact dynamically with content.

A common scenario is sharing content directly from a participant's device. Individual users can share the full audio and visual experience from individual applications or the entire contents of their screen directly to the meeting for everyone to view. This extends to all shared spaces with installed devices. Microsoft Teams Rooms also have the option to use a wired monitor connection to allow participants to share even if they lack the ability to join the meeting individually.

For content from the physical world, spaces with Microsoft Teams Room systems can handle a whiteboard or document camera that allows for the coordinated review and discussion of content from the space.

For a fully interactive experience, interactive displays (such as the Surface Hub family of products and the Microsoft digital Whiteboard) make it easy to interactively create content for in-person students as well as with remote students.

Example spaces

Public space

A public space, such as a common room in a family home or a table at a library, usually means users have to contend with noise, a lack of a permanent workspace, and other potential distractions.

The solution shown is:

A personal computer device used with a certified Teams headset.

Why this layout and device type?

A laptop running Teams ensures the user is not confined to one working area and can move their setup without having to sign in and out of any meetings. A headset with a built-in microphone restricts audio to meeting participants and filters background noise. The laptop's built-in camera ensures the user can be seen by all meeting participants.

Example devices:

- [HP Laptop – 14t-dq200](#)

- Alternate laptop options include:
 - [Microsoft Surface Laptop 4](#) – Greater for Higher Education
 - [Microsoft Surface Go Laptop](#) – Great for K-12
- [EPOS Sennheiser Headset – Adapt 560](#)

Installing or setting up this solution is:

Very easy. This is something that can be handled entirely by end users by simply combining their PC with a certified headset for audio and video calling.

Personal space

A personal space can be anything from a student's bedroom to an educator's office. Personal spaces generally mean the user has privacy within their working or learning environment, as well as a dedicated workspace.

Example A:

The solution shown is:

A personal PC with a high-quality USB camera and a separate USB speakerphone audio device.

Why this layout and device type?

A smaller, quieter, more focused personal space means the user doesn't have the distractions of public shared spaces or a traditional classroom. A PC running Teams allows for a dedicated workspace, and a USB camera ensures the user is seen within the meeting in high quality. A speakerphone device is best in private spaces where meeting audio doesn't have to compete with other noise and distractions.

Devices shown:

- Personal PC with Windows 10 and External Display
- [Yealink USB Webcam – UVC20](#)
- [Poly Speakerphone – Sync 20](#)

Example B:

The solution shown is:

A personal PC with an all-in-one camera, microphone, and speaker soundbar.

Why this layout and device type?

Serving the same purpose as Example A, this solution addresses a focused personal space. A PC running Teams allows for a dedicated workspace in combination with a combination USB camera, microphone, and speaker soundbar.

Devices shown:

- Personal PC with Windows 10 and External Display
- [Poly Soundbar – Studio P15](#)

Installing or setting up this solution is:

Very easy. This can be handled entirely by end users by combining their PC with the certified USB peripherals. Cameras and personal soundbars can easily be mounted above the display.

Classrooms

Classrooms, including traditional and reverse classrooms, require active engagement from everyone present. Effective instruction, discussion, and collaboration among many parties is key.

The solution shown is:

A classroom designed for both in-person and remote student participants with a layout that accommodates a single educator addressing both groups simultaneously.

Why this layout and device type?

A large display gives remote participants a physical presence within the room, along with front-of-the-room speakers that allow their voices to be heard by all, even by those at desks furthest from the source. Microphones are situated at the front of the room so teachers and students can be heard by all. A traditional whiteboard for analog content can be captured the room system and shared with both in-room and remote participants. The digital Microsoft Whiteboard is also a good solution for collaboration between remote and in-person students, as well as for post-class reference.

Devices shown:

- Room System - [Microsoft Surface Hub 2S](#)
 - Note that the Surface Hub solution represents a premium experience for collaboration and interactive usage. A [Microsoft Teams Room solution](#) paired with a large display can be used as an alternative in this same scenario.
- Analog Whiteboard capture – [Logitech Brio Content Camera Kit](#)
- Camera and Audio - [Logitech Rally Plus kit](#)
- Touch Console for Room Control – [Logitech TAP](#)

Installing or setting up this solution is:

Complex. This room features a physical installation, including wiring, that requires a knowledgeable AV deployment partner to properly plan for and deploy the camera and audio solutions so that they work seamlessly for the end users in the space.

Lecture halls

Much like classrooms, lecture halls contain numerous students who must focus on an educator and any information they're presenting. However, lecture halls generally don't require the same amount of interaction among students. The focus is on information, not collaboration.

The solution shown is:

A lecture hall designed for both in-person and remote student participants with a layout that accommodates a

single educator addressing both groups simultaneously, as well as creating and annotating content from a touch surface.

Why this layout and device type?

Remote participants can see the same field of view that in-person participants have via the mounted camera. The lecturer can see the remote students via their cameras on a display screen. A dedicated presentation screen and a touch-surface screen for whiteboarding display the lecturer's educational material for all. Ceiling-tile microphones and powerful speakers make sure the lecturer and any student questions are heard clearly.

Devices shown:

- Room System – [Crestron Flex C100 for Teams](#) with both an installed projector and a cart-based display
- Optional Digital Whiteboard - [Microsoft Surface Hub 2S](#)
- Camera – [AVer CAM520 Pro](#)
- Installed Audio – [QSC and Sennheiser for Large Rooms](#)

Installing or setting up this solution is:

Highly complex. This room features a physical installation that will require a knowledgeable AV deployment partner to properly plan for and deploy the camera and audio solutions so that they work seamlessly for the end users in the space. The installation requires expertise as it relates to wiring, audio configuration, and correct configuration of both the Microsoft Teams Room system and the associated Surface Hub 2 device.

Multi-purpose spaces

Teams can be implemented in almost any educational or multi-purpose space you can think of. Libraries, mixed-use presentation and collaboration spaces, café spaces, and open-air spaces can all be outfitted with a Teams system or Teams devices.

This solution shown is:

A room system with a large, projector-based front-of-room display, multiple touch consoles for operation, and multiple Surface Hub 2 devices for a wide range of uses.

Devices shown:

- Room System – [Crestron Flex C100 for Teams](#) with installed projector
- Optional Dual Digital Whiteboards - [Microsoft Surface Hub 2S](#)

- Camera – [Yealink UVC84](#)
- Installed Audio – [QSC and Sennheiser for Large Rooms](#)

Installing or setting up this solution is:

Highly complex. A multi-purpose space as described requires a knowledgeable AV deployment partner to properly plan for and deploy the projector-based display and camera and audio solutions, as well as to correctly configure both the Microsoft Teams Room system and the associated Surface Hub 2 devices so that they work seamlessly for the end users in the space.

Don't forget security

It's vital to ensure your solutions are secure against cyber threats. Microsoft uses cutting-edge AI and automation to keep data and private information safe when using a Teams Rooms system or device. Protecting your school or institution starts with identity and access management (via the Azure Active Directory) and device management (via Intune/AutoPilot).

Use the Frontline Worker onboarding wizard to get your frontline workforce up and running

12/7/2021 • 3 minutes to read • [Edit Online](#)

Overview

The Frontline Worker onboarding wizard in the Microsoft 365 admin center simplifies onboarding frontline workers to your organization. The wizard lets you quickly deploy an experience in Microsoft Teams that's tailored to your frontline workforce. Using the wizard, you can easily kick off your pilot deployment of Teams for the frontline workers in your organization.

The wizard sets up a team for your frontline workers and assigns licenses and [policy packages](#) to each team member. You can create your team from scratch or from a [team template](#), and then you add users and assign roles. The role determines the policy package that the wizard assigns to each user.

Currently, the wizard supports adding 100 users each time you run it. We're working on increasing the number of users per run soon. Check back here for the latest updates.

The wizard is available to all organizations that have at least one Microsoft 365 F license. You can run the wizard as many times as you need to roll out Teams to your frontline workforce in different locations or sites across your organization.

NOTE

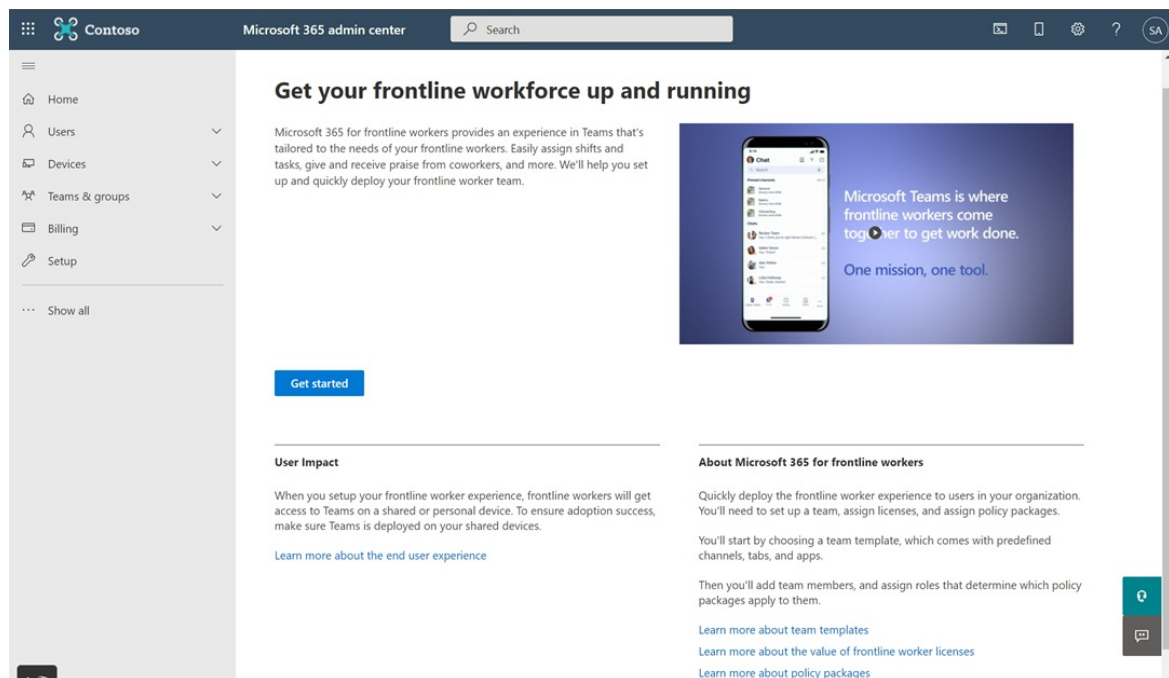

This wizard lets you quickly onboard your frontline workers to Teams through the Microsoft 365 admin center. For information about how deploy Teams to your frontline workers using scripts, see [How to provision Teams at scale for Frontline Workers](#).

NOTE

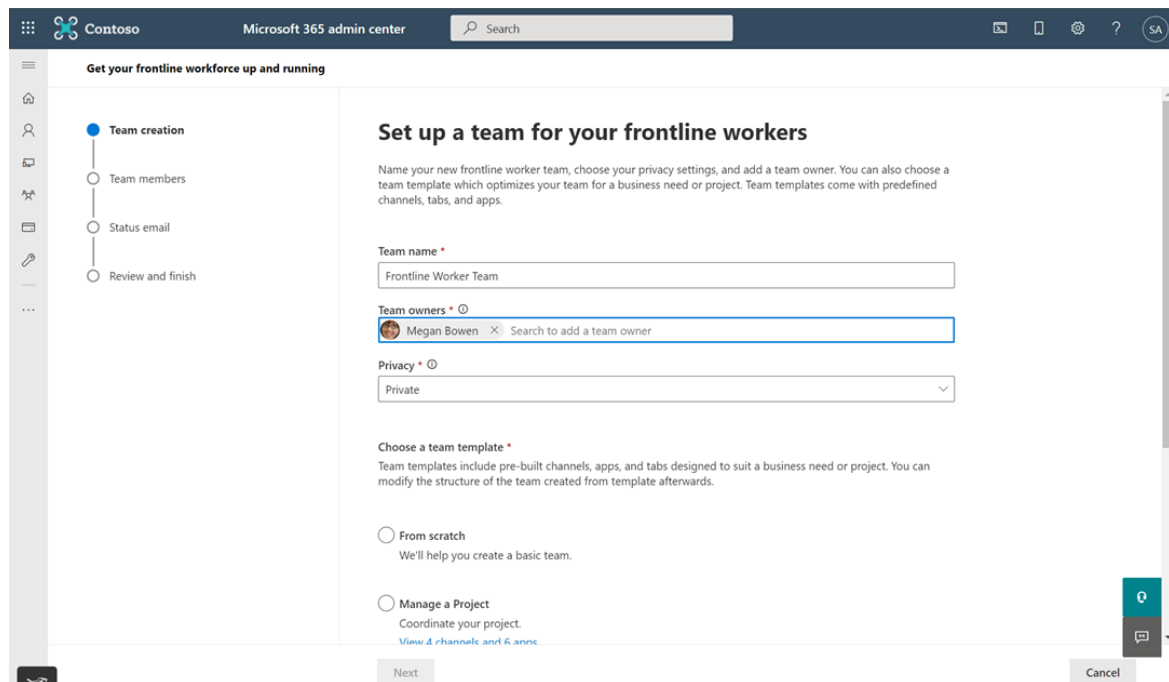

The wizard doesn't support [sensitivity labels](#) yet. If your organization requires sensitivity labels to create a team, you won't see the wizard in the Microsoft 365 admin center.

Run the wizard

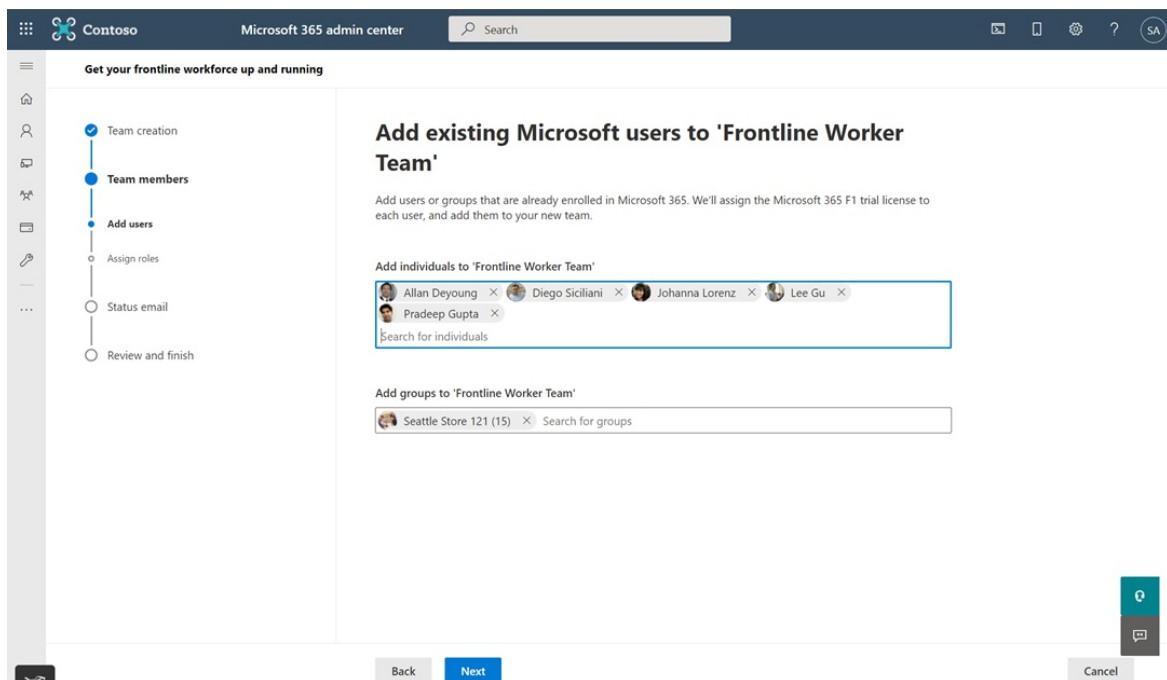

1. In the left navigation of the [Microsoft 365 admin center](#), choose **Setup**. Go to the **Apps and email** section, and then under **Get your frontline workforce up and running**, select **View**. Here, you can learn more about the capabilities that Microsoft 365 for frontline workers offers.

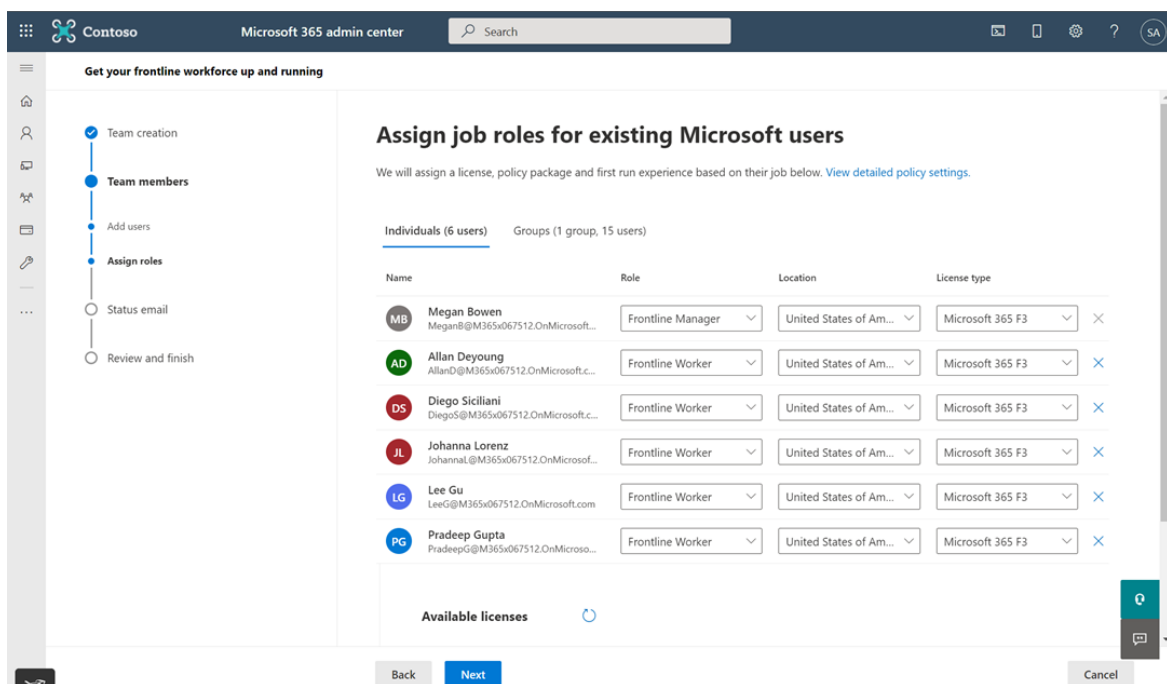

2. When you're ready, select **Get started** to run the wizard.
3. Enter a name for your team, add one or more team owners, and select a privacy setting. Then, choose whether to create your team from scratch or from a team template. Team templates come with predefined channels and tabs, which optimize the team for a particular business need or project.

4. Add users to the team. You can also add groups. If you add groups, keep in mind that licenses and policy packages are directly assigned to each user in the group, not the group itself.

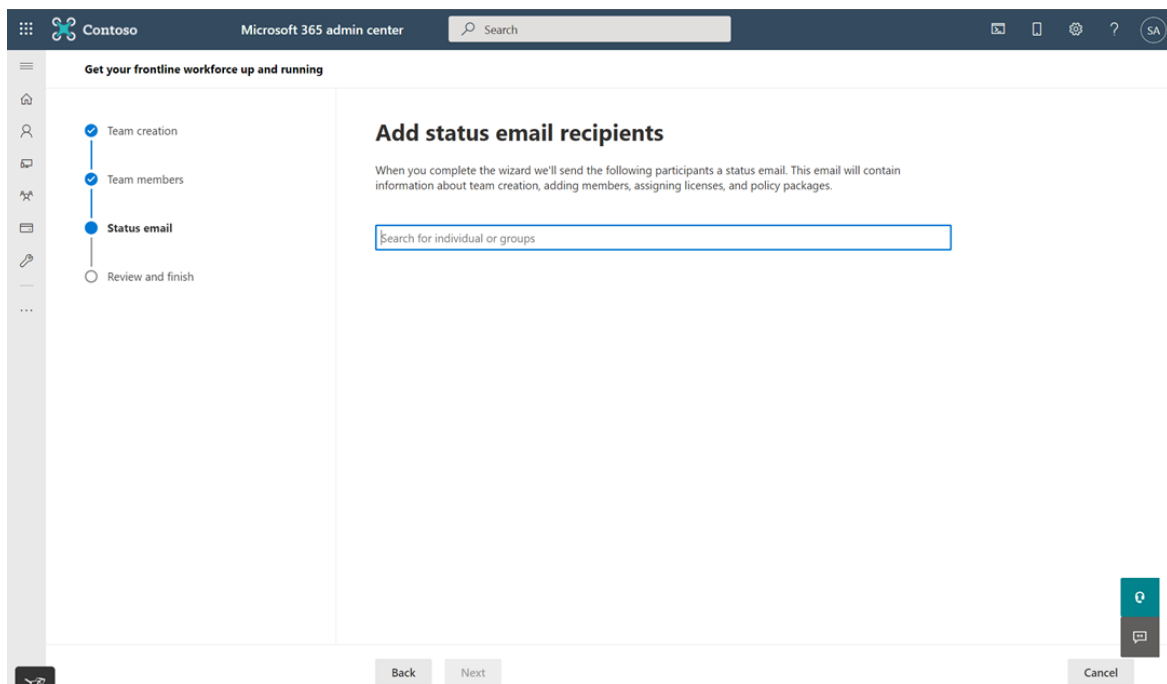

- Assign one of the following roles to each team member: Frontline Worker, Frontline Manager, None.

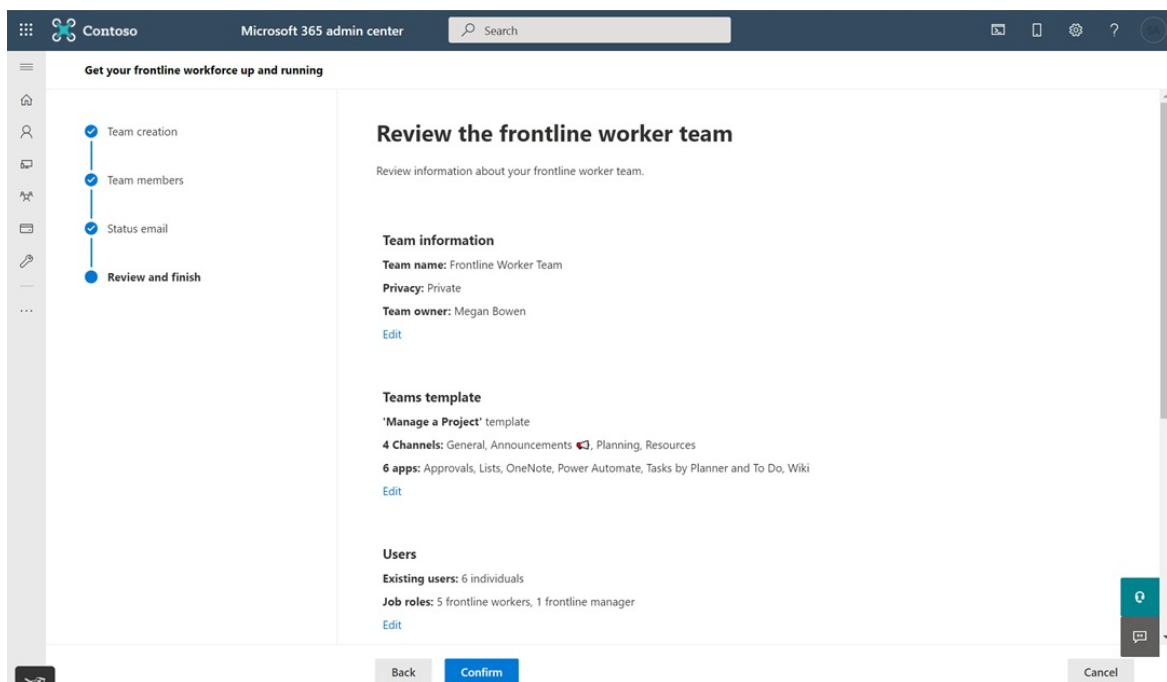

By assigning a Frontline Worker or Frontline Manager role, that user will receive a policy package. The policy package will create an experience in Teams that's tailored to their role. This experience includes pre-pinned apps and policies for healthy frontline worker and manager communication and collaboration.

Next, select a location and assign a Microsoft 365 F license to each team member. If you don't have enough licenses, you can select **Buy more licenses** to purchase more licenses.

- Choose who receives the status email after the wizard is completed. The email contains success and failure information about the actions performed by the wizard—creating the team, adding team members, and assigning a license and policy package to each team member. Use this information to troubleshoot any errors that may occur.

7. Review your selections, and then select **Confirm**.

The wizard creates your team and assigns licenses and policy packages to team members. This may take a few minutes to complete, after which the recipients you chose receive a status email.

8. You're on your way but you're not done yet! Next, check out the [What to do after running the wizard](#) section of this article.

What to do after running the wizard

After you run the wizard, it's important to:

- Let your frontline workers and managers know that they're assigned Teams licenses.
- If you're using shared devices, make sure Teams is installed on those devices. If your organization uses a "bring your own device" model, let your frontline workers and managers know that they have to download and install Teams to their devices.

When the frontline employee opens Teams for the first time, they'll receive a tailored first run experience, which

includes chats and channels, calling, and task management all within Teams.

How to provision Teams at scale for Frontline Workers

12/7/2021 • 17 minutes to read • [Edit Online](#)

Do you need to rapidly onboard a large number of users to Microsoft Teams and configure a streamlined experience for them? You can quickly provision identities, provision teams, and assign all relevant policies to control the end user experience by walking through the following instructions.

In this walkthrough, you'll learn how to:

- Create a large number of users.
- Create a large number of teams and set up the appropriate channels.
- Assign licensing at scale.
- Create appropriate Teams messaging policies, app setup policies, and app permission policies.
- Apply those policies to users at scale.
- Assign a large number of users to a designated team.

NOTE

If you've reviewed this information and feel like you need some help or have some questions, you can [click here](#) to reach out for White Glove Support.

Prerequisites

Download the assets from [this location](#).

IMPORTANT

The scripts in the link provided above are provided as-is by Microsoft, and must be modified for your individual needs.

Technical requirements

- Your tenant must have the appropriate number of licenses available that include Microsoft Teams. If you do not already have these licenses, check out [Teams Exploratory](#) for a free trial subscription.
- The user taking these steps must have these roles assigned: Global Admin, User Admin, and Teams Service Admin, in Azure AD.
- User must have the rights to install and configure software on their local machine.

Step-by-step process overview

1. Set up your environment

- a. Download from the GitHub repository containing the sample PowerShell scripts and documentation
- b. Configure the local environment
- c. Set up credentials
- d. Configure PowerShell Modules and environmental variables

2. Create and set up teams

- a. Create teams

- b. Steps to create teams
- c. Create channels for teams
- 3. **Create Teams policies**
 - a. Create Teams message policies
 - b. Create Teams app setup policies
 - c. Create Teams app permission policies
- 4. **Users and security groups**
 - a. Create users and security groups
 - b. Assign licensing to users via group-based licensing
- 5. **Assign users and policies**
 - a. Assign users to teams
 - b. Assign Teams policies to users
 - c. Optional: Convert group membership type
- 6. **Test and validate**
 - a. Sign in to Teams with a test user
 - b. Check for errors
 - c. Error handling
- 7. **Further reading**

Set up your environment

The following steps will allow you to set up your environment:

Download from the GitHub repository containing sample PowerShell scripts and documentation

Before you can proceed, you'll need to download the scripts at [this location](#).

Configure the local environment

Setting the local environment variables allows the scripts referenced here to be run using relative paths. The `rootPath` is the root of where you cloned this repository, and the `tenantName` is in the form `yourTenant.onmicrosoft.com` (https should not be included).

1. Open a PowerShell session and navigate to the scripts folder inside the cloned git repo.
2. Run the script `.\SetConfig.ps1 -tenantName [your tenant name] -rootPath "full path to the root of the git repo"`.

For example: `.\SetConfig.ps1 -tenantName contoso.onmicrosoft.com -rootPath "C:\data\source\FLWTeamsScale"`

Set up credentials

IMPORTANT

How credentials are managed in these scripts may not be appropriate for your use, and they're easily changed to meet your requirements. Always follow your company's standards and practices for securing service accounts and managed identities.

The scripts use credentials that are stored as XML files in `$ENV:LOCALAPPDATA\keys`, that is, the `AppData\Local` folder. The helper function `Set-Creds` in the module `BulkAddFunctions.psm1` needs to be called to set the credentials used to run these scripts. This technique removes the need for you to authenticate to all various service endpoints while maintaining the credentials in a local store. From within each script, the appropriate credentials are read with the helper function `Get-Creds` and those credentials are used to connect to the various services.

When you call **Set-Creds**, you're prompted to provide an XML file name that will be written to `$ENV:LOCALAPPDATA\keys`. You might have different credentials for different services. For example, you might have different credentials for MicrosoftTeams, AzureAD, and MSONline, in which case you can run **Set-Creds** more than once, saving each credential file with its own meaningful name.

Examples: `Set-Creds msol-cred.xml` `Set-Creds azuread-cred.xml` `Set-Creds teams-cred.xml`

Run the script **SetCreds.ps1** to save your credentials. You will be prompted with "Performing the operation "Export-Clixml"..." and enter 'Y' to approve.

NOTE

The account used for the credentials cannot require Multi-Factor Auth (MFA).

Here's an example of how the various scripts use the saved credentials to authenticate:

```
# Connect to MicrosoftTeams
$teams_cred = Get-Creds teams-cred.xml
Connect-MicrosoftTeams -Credential $teams_cred
```

Configure PowerShell modules and environmental variables

You'll need to install and connect to several PowerShell modules, including Azure AD, MSAL, MSCloudUtils, and MicrosoftTeams.

1. Find the **ConfigurePowerShellModules.ps1** in the scripts folder in the repository.
2. From PowerShell, run the **ConfigurePowerShellModules.ps1** script.

Create and set up teams

In order to communicate and collaborate with your frontline workers, you will first need to establish a series of teams and add standard channels to those teams, which we'll walk through next.

Create teams

Teams are a collection of people, content, and tools within your organization. For most frontline worker-centric organizations, it is best practice to anchor a team around a physical location. For example, a team for each of the following:

- Store
- Distribution center
- Manufacturing plant
- Hospital
- Grocery store

Best practice discussion: When designing your teams, it's important to keep in mind [Teams limits and specifications](#). For smaller organizations, an org-wide team can be used to streamline communication and complement a physical location structure. For others, a structured physical location Team naming convention helps assist Corporate Communications with Cross Posting to multiple teams simultaneously with ease. For example, you can search and cross-post to all Teams with US in the name to target all US locations. More information on cross-posting can be found [here](#).

Steps to create teams

1. Find the **TeamsInformation.csv** file in the data folder in the repository.
2. Update the information in the **TeamsInformation.csv** file with your organization's specific information.
Keep in mind our best practices above.

3. Find the **CreateTeams.ps1** script.
4. From PowerShell, run the **CreateTeams.ps1** script.

Create channels for teams

Channels are dedicated sections within a team to keep conversations organized by specific topic, project, discipline, and more. Every team automatically gets a General channel, but from there you can customize your structure according to the needs of your business. For example, your additional channel structure could include:

- **Manufacturing** - Safety, Line 1, Line 2, Corporate Communications, Training
- **Grocery** - Bakery, Produce, Meat, Corporate Communications, Training
- **Healthcare** - Nurses, Doctors, Critical Care Unit 1, Critical Care Unit 2
- **Hospitality** - Front Desk, Maintenance, Housekeeping, Valet and Baggage, Corporate Communications, Training
- **Retail** - Front of Store, Back of Store, Corporate Communications, Training

NOTE

Channels should not be thought of as a security boundary. They are a means of organizing your workers for the purposes of collaboration.

Best practice discussion: When designing your channel structure, it's important to keep things simple, especially when you're looking to onboard a lot of users. Resist the urge to create channels for every situation, role, or topic in order to minimize the need for training. Pick 3-5 channels at most to get started. Additional channels can easily be created as the need arises. In fact, it's okay to just use the General channel alone for now!

Steps to create channels for teams

1. Find the **TeamsChannels.csv** file in the scripts folder in the repository.
2. Update the **TeamsChannels.csv** file with your organization's specific information. Keep in mind our best practices above.
3. Find the **CreateTeamsChannels.ps1** script in the scripts folder in the repository.
4. From PowerShell, run the **CreateTeamsChannels.ps1** script.

Create Teams policies

As an admin, you can use teams policies in Microsoft Teams to control what users in your organization see and can. For example, you can control which applications are pinned to the left rail on your desktop or web browser, or the bottom bar on mobile devices, in order to simplify the end user experience when onboarding a large amount of users. Some of these policies can be created with PowerShell, and others have to be manually created in the Teams admin center.

Best practice discussion: For each of the following policies, we're choosing to actually create two policies: one for frontline workers and one for frontline managers. You can choose to create as many or as few as you like. For most customers, two is a good place to start, even if you give the same settings to each group initially. As your experience with Teams grows, you may choose to differentiate their experience further and having the two separate policies already created can make that simpler.

Create Teams messaging policies

Messaging policies are used to control which chat and channel messaging features are available to users in Microsoft Teams.

Best practice discussion: While you can use the default Global policy that is created automatically, we have opted to create a custom policy using the steps below to provide a more locked down, simple, and differentiated experience for frontline managers and frontline workers.

Steps to create Teams messaging policies

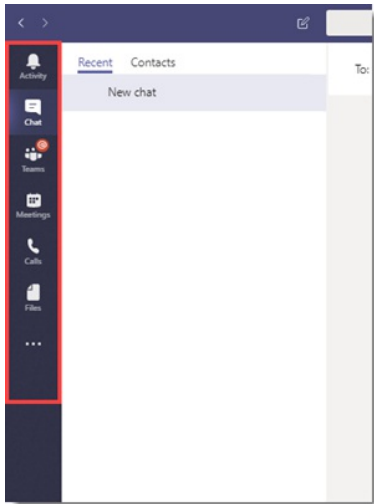

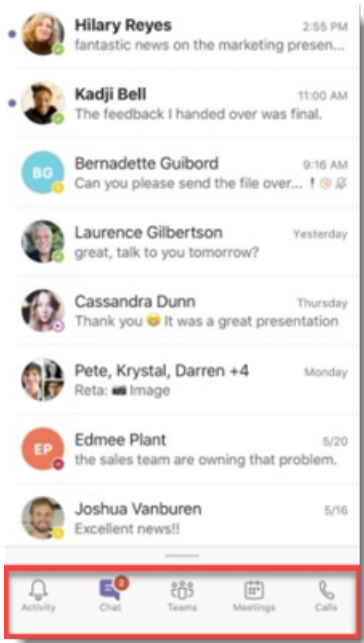

1. Find the **TeamsMessagingPolicies.csv** file in the scripts folder in the repository.
2. Update the **TeamsMessagingPolicies.csv** file with your organization's specific information. Additional information on some of the various options can be found [here](#).
3. Find the **CreateTeamsMessagePolicies.ps1** script in the scripts folder in the repository.
4. From PowerShell, run the **CreateTeamsMessagePolicies.ps1** script.

Create Teams app setup policies

As an admin, you can use app setup policies to do the following:

- Customize Teams to highlight the apps that are most important for your users. You choose the apps to pin and set the order in which they appear. Pinning apps lets you showcase apps that users in your organization need, including those built by third parties or by developers in your organization.
- Control whether users can pin apps to Teams.

Apps are pinned to the app bar. This is the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients (iOS and Android).

TEAMS DESKTOP CLIENT	TEAMS MOBILE CLIENT
	

Best practice discussion: You manage app setup policies in the Microsoft Teams admin center. They aren't able to be created with PowerShell. You can use the global (Org-wide default) policy or create custom policies and assign them to users. Users in your organization will automatically be assigned to the global policy unless you create and assign a custom policy. For our purposes, we are creating two new policies for frontline workers and frontline managers, in order to provide them a simpler and more streamlined experience to ease onboarding a large number of users simultaneously. You can choose to customize the experience as your business needs.

Create the frontline manager app setup policy

The following settings can be customized to meet your business needs. We have chosen some recommended options based on best practices and to improve the ease of onboarding new users at scale. For more information, click [here](#).

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Setup policies**.
2. Click **Add**.
3. Enter a name and description for the policy. For example, Frontline manager app setup policy.

Frontline manager app setup policy

Use this policy for frontline managers

- Turn off **Upload custom apps**.
- Turn off **Allow user pinning**.

Upload custom apps ⓘ	<input type="checkbox"/> Off
Allow user pinning	<input type="checkbox"/> Off

- If it's not already listed, add the **Shifts** app. For more information about Shifts, click [here](#).

	Teams	2a84919f-59d8-4441-a975-2a8c2643b741	Microsoft
	Shifts	42f6c1da-a241-483a-a3cc-4f5be9185951	Microsoft Corp.

Create Teams app permission policies

As an admin, you can use app permission policies to control what apps are available to Microsoft Teams users in

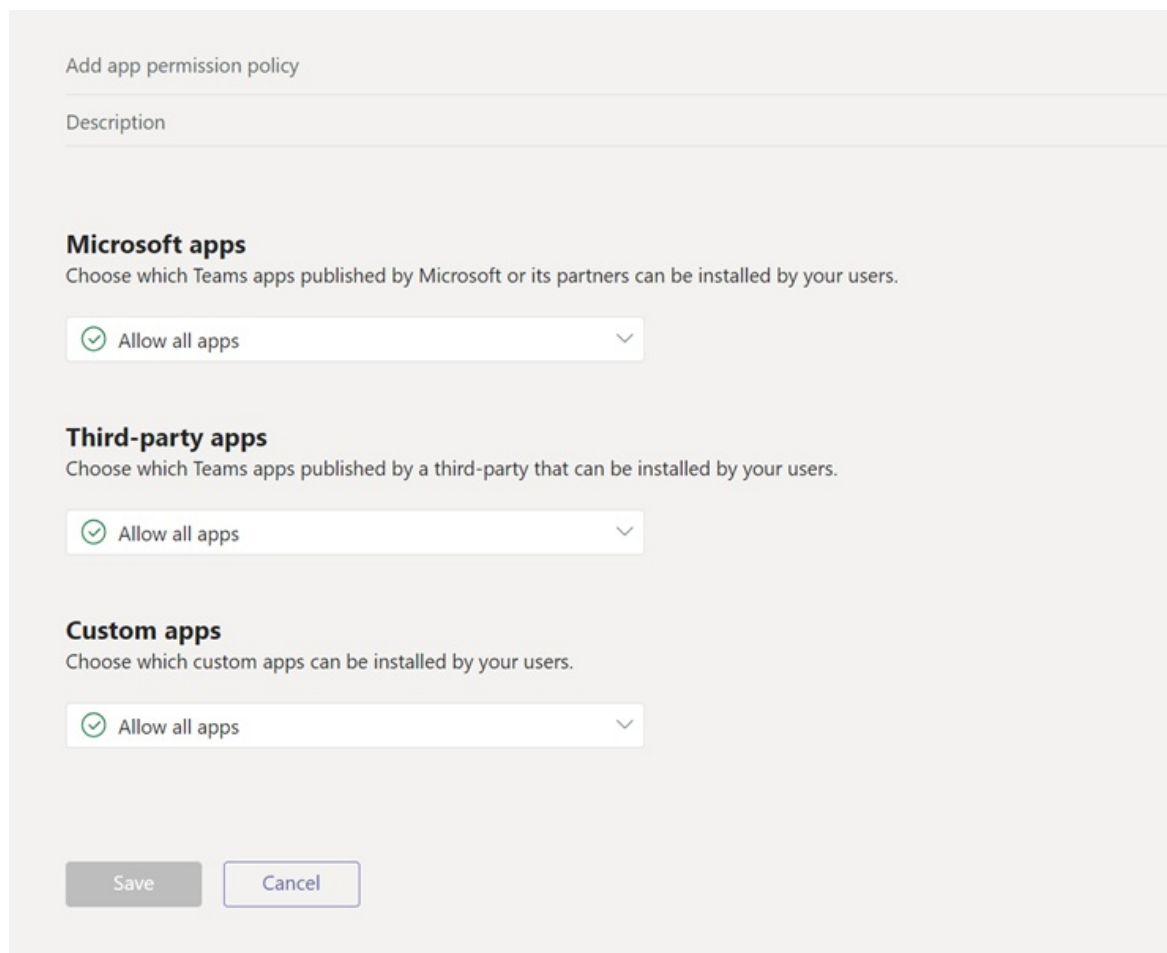

your organization. You can allow or block all apps, or specific apps published by Microsoft, third-parties, and your organization. When you block an app, users who have the policy are unable to install it from the Teams app store. You must be a global admin or Teams service admin to manage these policies.

Best practice discussion: You manage app setup policies in the Microsoft Teams admin center. They aren't able to be created with PowerShell. You can use the global (Org-wide default) policy or create custom policies and assign them to users. Users in your organization will automatically get the global policy unless you create and assign a custom policy. For our purposes, we are creating two new policies for frontline workers and frontline managers in order to provide a secure and more streamlined experience to ease onboarding a large number of users simultaneously. You can of course choose to customize the experience as your business needs.

Create the frontline manager app permission policy

The following settings can be customized to meet your business needs. These are some recommended options based on best practices that can improve the ease of onboarding new users at scale. For more information, click [here](#).

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Permission policies**.
2. Click **Add**.

Add app permission policy

Description

Microsoft apps
Choose which Teams apps published by Microsoft or its partners can be installed by your users.

✓ Allow all apps

Third-party apps
Choose which Teams apps published by a third-party that can be installed by your users.

✓ Allow all apps

Custom apps
Choose which custom apps can be installed by your users.

✓ Allow all apps

Save Cancel

3. Enter a name and description for the policy. For example, Frontline manager app permission policy.
4. Under **Microsoft apps**, select **Allow all apps**.
5. Under **Third-party apps**, select **Allow all apps**.
6. Under **Custom apps**, select **Allow all apps**.
7. Click **Save**.

Create the frontline worker app permission policy

The following settings can be customized to meet your business needs. These are some recommended options

based on best practices that can improve the ease of onboarding new users at scale. For more information, click [here](#).

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps** > **Permission policies**.
2. Click **Add**.

Add app permission policy

Description

Microsoft apps
Choose which Teams apps published by Microsoft or its partners can be installed by your users.

✓ Allow all apps

Third-party apps
Choose which Teams apps published by a third-party that can be installed by your users.

✓ Allow all apps

Custom apps
Choose which custom apps can be installed by your users.

✓ Allow all apps

Save Cancel

3. Enter a name and description for the policy. For example, Frontline worker app permission policy.
4. Under **Microsoft apps**, select **Allow all apps**.
5. Under **Third-party apps**, select **Block all apps**.
6. Under **Custom apps**, select **Allow all apps**.
7. Click **Save**.

Users and security groups

Create users and security groups

To work with a large amount of users in Teams you first need to have the users created in Azure AD. There are many ways to provision a large number of users, but we're going to highlight the following:

- If these users already exist in one of the following HR systems, use the following links to set up user provisioning:
 - SAP Success Factors - [Tutorial: Configure SAP SuccessFactors to Active Directory user provisioning](#).
 - Workday - [Tutorial: Configure Workday for automatic user provisioning](#).
- If you have your user information in other systems, proceed with the following steps.

In order to manage these users at scale more effectively, you need to create two security groups for frontline workers and frontline managers, and provision those users into the security groups directly, following these

steps:

1. Find the **Users.csv** file in the scripts folder in the repository.
2. Update the **Users.csv** file with your organization's specific information.
 - a. By default, the script we've provided will create a user with a temporary password that must be changed at first sign in. If you don't want to use the default password, edit the **CreateUsers.ps1** script to meet your requirements.
 - b. Make sure to update the **SecurityGroup** field to reflect the appropriate name created earlier.
3. Find the **SecurityGroups.csv** file in the scripts folder in the repository.
4. Update the **SecurityGroups.csv** file with your organization's specific security group information.
 - a. Make sure to update the **MessagePolicy**, **AppPermissionPolicy**, and **AppSetupPolicy** fields to map to the appropriate policies you created earlier.
 - b. Make sure to update the **LicensePlan** field to reflect the licensing that you intend to give each of these users. For more information on product names and service plan identifiers, review the documentation [here](#).
5. From PowerShell, run the script **CreateUsers.ps1** from assets.

Assign licensing to users via group-based licensing

Microsoft paid cloud services, such as Microsoft 365, Office 365, Enterprise Mobility + Security, Dynamics 365, and other similar products, require licenses. These licenses are assigned to each user who needs access to these services. To manage licenses, administrators use one of the management portals (Office or Azure) and PowerShell cmdlets. Azure Active Directory (Azure AD) is the underlying infrastructure that supports identity management for all Microsoft cloud services. Azure AD stores information about license assignment states for users.

In order to enable licensing at scale, Azure AD now includes group-based licensing, and for this reason we created the security groups earlier in this article. You can assign one or more product licenses to a group. Azure AD ensures that the licenses are assigned to all members of the group. Any new members who join the group are assigned the appropriate licenses. Licenses are removed from members who leave the group. This licensing management eliminates the need for automating license management via PowerShell to reflect changes in the organization and departmental structure on a per-user basis.

Assign users and policies

Assign users to teams

Now that you've created the users and created the teams, it's time to put all the users in the appropriate teams.

1. Find the **Users.csv** file in the data folder in the repository and make sure you have accurate mapping to Teams in this file.
2. From PowerShell, run the script **AssignUserstoTeams.ps1** from the scripts folder in the repository.

Assign Teams policies to users

Now that you've created the users and the policies to modify their experience in Teams, it's time to assign those policies to the correct users.

1. Find the **SecurityGroups.csv** file in the data folder in the repository and make sure you have accurate mapping of the policies to the groups.
2. From PowerShell, run the script **AssignPoliciesToUsers.ps1** from the scripts folder in the repository.

Optional: Convert group membership type

NOTE

This step is for people who have Azure AD P1 or above.

When licensed for Azure AD P1 or above, you have the option of using Dynamic Group Membership instead of using assigned membership. The scripts that created the Teams also created Office Groups of the membership type Assigned, which means its members must be explicitly added.

Using Dynamic membership, rules are written to determine if someone is a member of the team or not.

NOTE

When you run this script, the current membership of the group will be removed (except for its owners), and new members will be added when the membership synch job runs.

1. Find the **migrateGroups.csv** file in the data folder in the repository.
2. Update the CSV file **migrateGroups.csv** with the groups that will be migrated, along with the rule for dynamic membership.
3. Find the **ConvertGroupMembershipType.ps1** file in the scripts folder in the repository.
4. From PowerShell, run the script **ConvertGroupMembershipType.ps1**

Test and validate

Sign in to Teams with a test user

Now that you've completed all the steps, it's time to verify the work you've completed.

1. The created user will have an initial password that is in the **CreateUsers.ps1** and they are required to change it at their first sign in.
2. Verify the look and feel of Teams is what you expected. If not, review the **Create Teams policies** and the **Assign Teams policies to Users** sections.
3. Verify the user is in the correct team. If not, review the **Create and set up users** and **Assign users to teams** sections.

NOTE

If frontline employee provisioning is managed through your Identity and Access Management team, you will need to follow their process for providing the employee their credentials.

Check for errors

As you ran the earlier scripts, errors or exceptions were written to a .csv file located in the logs folder in your copy of the repository. This file can be used to investigate any issues that may have occurred.

An example of an exception could be if you tried to create a team that already existed in your tenant.

1. Find the **Logs** folder and review any .csv file it may contain. If there are no exceptions, you may not find an exception file here.

Error handling

Minimal error handling has been implemented in these sample scripts. There are try/catch blocks and, if triggered, we store the error into a variable in the catch block. Additional error handling must be implemented according to your preferences.

Manage the Shifts app for your organization in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

IMPORTANT

Effective June 30, 2020, Microsoft StaffHub has been retired. We're building StaffHub capabilities into Microsoft Teams. Today, Teams includes the Shifts app for schedule management and additional capabilities will roll out over time. StaffHub stopped working for all users on June 30, 2020. Anyone who tries to open StaffHub is shown a message directing them to download Teams. To learn more, see [Microsoft StaffHub has been retired](#).

Overview of Shifts

The Shifts app in Microsoft Teams keeps frontline workers connected and in sync. It's built mobile first for fast and effective time management and communication for teams. Shifts let frontline workers and their managers use their mobile devices to manage schedules and keep in touch.

- Managers create, update, and manage shift schedules for teams. They can send messages to one person ("there's a spill on the floor") or the entire team ("the regional GM is arriving in 20 minutes"). They can also send policy documents, news bulletins, and videos.
- Employees view their upcoming shifts, see who else is scheduled for the day, request to swap or offer a shift, and request time off.

It's important to know that Shifts currently don't support guests. This means that guests on a team can't be added to or use shift schedules when Guest access is turned on in Teams.

NOTE

For details about Shifts capabilities on different platforms, see [Teams features by platform](#).

Availability of Shifts

Shifts is available in all Enterprise SKUs where Teams is available.

Location of Shifts data

Shifts data is currently stored in Azure in data centers in North America, Western Europe, and Asia Pacific. For more information about where data is stored, see [Where is my data?](#)

Set up Shifts

Enable or disable Shifts in your organization

Shifts is enabled by default for all Teams users in your organization. You can turn off or turn on the app at the org level on the [Manage apps](#) page in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams apps > Manage apps**.
2. In the list of apps, do one of the following actions:

- To turn off Shifts for your organization, search for the Shifts app, select it, and then select **Block**.
- To turn on Shifts for your organization, search for the Shifts app, select it, and then select **Allow**.

Enable or disable Shifts for specific users in your organization

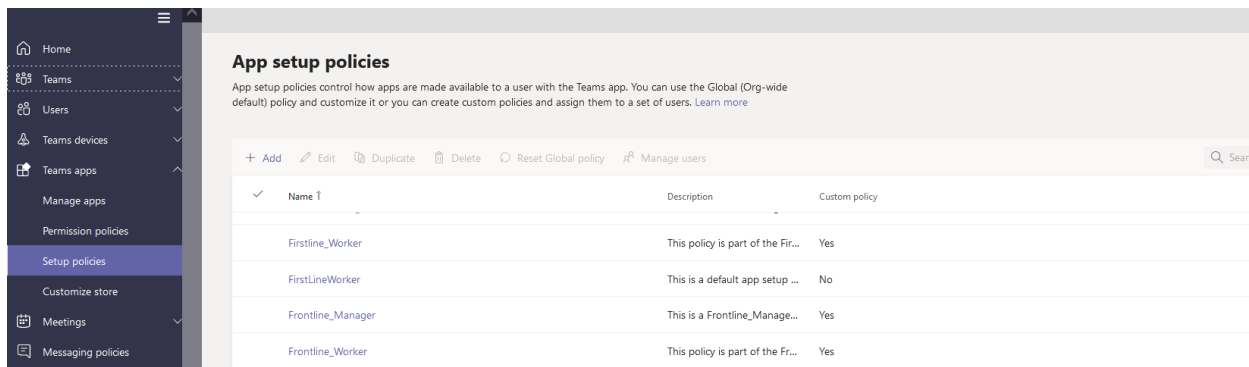

To allow or block specific users in your organization from using Shifts, make sure Shifts be turned on for your organization on the [Manage apps](#) page. Then create a custom app permission policy and assign it to those users. To learn more, see [Manage app permission policies in Teams](#).

Use the FirstLineWorker app setup policy to pin Shifts to Teams

App setup policies let you customize Teams to highlight the apps that are most important for users in your organization. The apps set in a policy are pinned to the app bar—the bar on the side of the Teams desktop client and at the bottom of the Teams mobile clients—where users can quickly and easily access them.

Teams includes a built-in FirstLineWorker app setup policy that you can assign to frontline workers in your organization. By default, the policy includes the Activity, Shifts, Chat, and Calling apps.

To view the FirstLineWorker policy, in the left navigation of the Microsoft Teams admin center, go to **Teams app** > **Setup policies**.

Assign the FirstLineWorker app setup policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Search the audit log for Shifts events

(in preview)

You can search the audit log to view Shifts activity in your organization. To learn more about how to search the audit log and to see a list of [Shifts activities](#) that are logged in the audit log, see [Search the audit log for events in Teams](#).

Before you can search the audit log, you have to first turn on auditing in the [Security & Compliance Center](#). To learn more, see [Turn audit log search on or off](#). Keep in mind that audit data is only available from the point at which you turned on auditing.

Manage shift-based access for frontline workers in Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

IMPORTANT

Effective June 30, 2020, Microsoft StaffHub has been retired. We're building StaffHub capabilities into Microsoft Teams. Today, Teams includes the Shifts app for schedule management and additional capabilities will roll out over time. StaffHub stopped working for all users on June 30, 2020. Anyone who tries to open StaffHub is shown a message directing them to download Teams. To learn more, see [Microsoft StaffHub has been retired](#).

Overview

This is a preview or early release feature.

Presence in Microsoft Teams indicates a user's current availability and status to other users. The presence of frontline workers is often less predictable than other staff as their working hours are typically not the same each day. As an admin, you can configure Teams to show a set of shift-based presence states for the frontline workers in your organization to indicate when they are on and off shift.

These shift-based presence states— **On shift**,  **Off shift**,  **Busy**—are separate from the [default set of presence states](#) in Teams. With these two sets of presence states, you can configure different experiences for people in your organization based on their role.

With shift-based access, you can manage access to Teams when frontline workers are off shift. For example, you can set Teams to display a message that frontline workers must acknowledge before they can use Teams when they're not on a scheduled shift.

Scenario

Here's an example of how your organization can manage shift-based access.

You have frontline workers in your organization that should only be paid for hours they work on a shift that their manager scheduled and approved. They shouldn't be paid for time spent working outside a scheduled shift, which includes using the Teams app. You set up a custom message that says "Your time on Teams when on off shift won't count toward payable hours", which is displayed when frontline workers try to access Teams when off shift. If they choose to use Teams, they click **I accept** with the understanding that they won't be paid for this time.

You also have information workers in your organization who are salaried and who don't work shifts. You configure your information workers to use the default presence states in Teams while giving your frontline workers shift-based presence.

Shift-based presence states

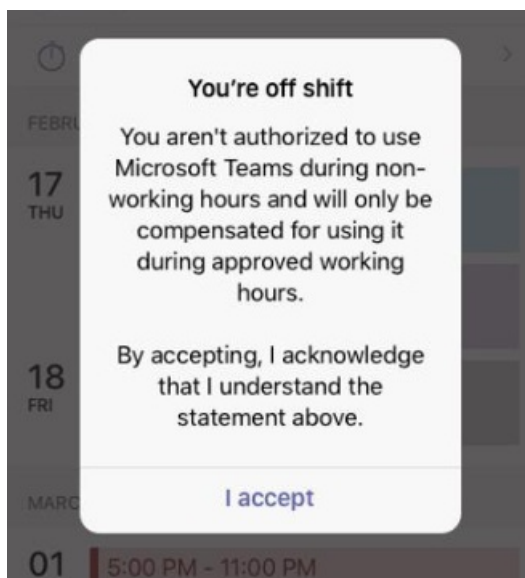

Here are the shift-based presence states.

APP CONFIGURED	USER CONFIGURED	MORE INFORMATION
✔ On shift		Automatically set at the start of a shift
✘ Off shift		Automatically set at the end of a shift
● Busy	● Busy	Automatically set. Can also be manually set when the frontline worker is on shift.

Off shift access to Teams

This feature lets you manage access to Teams when frontline workers are off shift. You can set Teams to display a message to frontline workers if they access Teams when off shift. Frontline workers must click **I accept** to acknowledge the message before they can use Teams.

You can use the default message, choose from a set of pre-defined messages, or customize the message to display any text that you want. Here's the default message:

You can also set the frequency when the message is displayed and set a grace period between when the first shift starts or last shift ends and when access to Teams is restricted.

Manage shift-based access

As an admin, you use policies to control shift-based presence for frontline workers in your organization. You manage these policies by using the following PowerShell cmdlets:

- [New-CsTeamsShiftsPolicy](#)
- [Get-CsTeamsShiftsPolicy](#)
- [Set-CsTeamsShiftsPolicy](#)
- [Grant-CsTeamsShiftsPolicy](#)
- [Remove-CsTeamsShiftsPolicy](#)

Use the `New-CsTeamsShiftsPolicy` cmdlet to create a new policy, set the policy settings that you want, and then use the `Grant-CsTeamsShiftsPolicy` cmdlet to assign the policy to users.

Here's some examples. For detailed information about each policy setting and parameter, including the list of predefined off shift messages that you can choose from, see [New-CsTeamsShiftsPolicy](#).

Example 1

In this example, we create a new policy named Off Shift Teams Access Default Message. In this policy, shift-based presence is turned on and the default message is displayed every time a user who is assigned this policy accesses Teams when off shift. The user can use Teams when off shift if they accept the message, and the grace period between when the first shift starts or last shift ends and when access is restricted is 10 minutes.

```
New-CsTeamsShiftsPolicy -Identity "Off Shift Teams Access Default Message" -EnableShiftPresence $true -
ShiftNoticeFrequency always -ShiftNoticeMessageType DefaultMessage -AccessType UnrestrictedAccess_TeamsApp -
AccessGracePeriodMinutes 10
```

NOTE

Use the **ShiftNoticeMessageType** parameter to set the message that you want to display. To see a list of the pre-defined messages that you can choose from for this parameter, see [New-CsTeamsShiftsPolicy](#).

Example 2

In this example, we create a new policy named Off Shift Teams Access Custom Message. In this policy, shift-based presence is turned on and a custom message is displayed every time a user who is assigned this policy accesses Teams when off shift. The user can use Teams when off shift if they accept the message, and the grace period between when the first shift starts or last shift ends and when access is restricted is 15 minutes.

```
New-CsTeamsShiftsPolicy -Identity "Off Shift Teams Access Custom Message" -EnableShiftPresence $true -
ShiftNoticeFrequency always -ShiftNoticeMessageType CustomMessage -ShiftNoticeMessageCustom "Your time on
Teams when on off shift won't count toward payable hours" -AccessType UnrestrictedAccess_TeamsApp -
AccessGracePeriodMinutes 15
```

NOTE

Use the **ShiftNoticeMessageType** parameter to set the message that you want to display. To learn more, see [New-CsTeamsShiftsPolicy](#).

Example 3

In this example, we create a new policy named Off Shift Teams Access Message1. In this policy, shift-based presence is turned on and the following predefined message is displayed every time a user who is assigned this policy accesses Teams when off shift.

"Your employer does not authorize or approve of the use of its network, applications, systems, or tools by non-exempt or hourly employees during their non-working hours. By accepting, you acknowledge that your use of Teams while off shift is not authorized and you will not be compensated."

The user can use Teams when off shift if they accept the message, and the grace period between when the first shift starts or last shift ends and when access is restricted is three minutes.

```
New-CsTeamsShiftsPolicy -Identity "Off Shift Teams Access Message1" -EnableShiftPresence $true -
ShiftNoticeFrequency always -ShiftNoticeMessageType Message1 -AccessType UnrestrictedAccess_TeamsApp -
AccessGracePeriodMinutes 3
```

NOTE

Use the **ShiftNoticeMessageType** parameter to set the message that you want to display. To see a list of the pre-defined messages that you can choose from for this parameter, see [New-CsTeamsShiftsPolicy](#).

Example 4

In this example, we assign a policy named Off Shift Teams Access Custom Message to a user named remy@contoso.com.

```
Grant-CsTeamsShiftsPolicy -Identity remy@contoso.com-PolicyName "Off Shift Teams Access Custom Message"
```

Schedule Owner for shift management

12/7/2021 • 2 minutes to read • [Edit Online](#)

Overview

Schedule Owner is a feature that lets you elevate the permissions of a team member to a schedule owner without making the employee a team owner. This means that the employee is authorized to manage their team's schedule without being able to modify any other team properties such as updating, editing, or deleting team channels.

What can a user with schedule owner permissions do?

- Create, edit, and publish schedules to manage their team's shift assignments.
- View and approve shift requests including requests to swap shifts and take open shifts.
- Manage settings in Shifts to enable certain features for the team.
- View and modify their team's timesheet to process employee payrolls.

Why Schedule Owner?

Without the Schedule Owner feature, day-to-day business functions could be disrupted. While the team owner helps to run the team, they might not necessarily be the person in charge of day-to-day scheduling. In this case, transferring only the schedule management responsibility to another team member streamlines daily operations within the team and eliminates the confusion of two team members having the same access privileges.

Scenario

Here's an example of how your organization can use the Schedule Owner feature.

You work in a large organization where department managers report directly to the store manager. The store manager has more authority within your company and is the team owner in Shifts. Department managers, on the other hand, are only ever added to Shifts as team members. While store managers have more seniority than department managers, it makes more sense for department managers to handle the day-to-day scheduling of their team's employees.

Without Schedule Owner, department managers must be given the exact same privileges as the team owner. Recently, department managers have been moving information around, and changing the name of channels, and it has caused complications with the store manager's work. The store manager wants the department managers to be able to organize their schedules, but doesn't want them to be able to change anything else on the team, outside of Shifts.

With Schedule Owner, the department managers can be given scheduling privileges, without any other team owner privileges.

Manage schedule ownership

As an admin, you use policies to control schedule management ownership in your organization. You manage these policies by using the following PowerShell cmdlets:

- [New-CsTeamsShiftsPolicy](#)
- [Get-CsTeamsShiftsPolicy](#)

- [Set-CsTeamsShiftsPolicy](#)
- [Grant-CsTeamsShiftsPolicy](#)
- [Remove-CsTeamsShiftsPolicy](#)

Example 1

Here, we create a new policy named ScheduleOwnerPolicy with the Schedule Owner feature turned on.

```
New-CsTeamsShiftsPolicy -Identity ScheduleOwnerPolicy -EnableScheduleOwnerPermissions $true -AccessType  
UnrestrictedAccess_TeamsApp
```

Example 2

In this example, we assign a policy named ScheduleOwnerPolicy to a user named remy@contoso.com.

```
Grant-CsTeamsShiftsPolicy -Identity remy@contoso.com -PolicyName ScheduleOwnerPolicy
```

Microsoft Teams for RealWear

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article covers the Microsoft Teams client for RealWear head-mounted wearables. Frontline workers using RealWear HMT-1 and HMT-1Z1 can now collaborate with a remote expert using video calling on Teams. Through a voice-controlled user interface, Teams for RealWear allows field workers to remain 100% hands-free while maintaining situational awareness in loud and hazardous environments. By showing what they see in real-time, field workers can accelerate the time to resolve issues and reduce the risk of an expensive downtime.

How to deploy Microsoft Teams for RealWear

- RealWear devices updated to release 11.2 or above. More information [here](#).
- Access to [RealWear Foresight](#) for distributing the Microsoft Teams client for Realwear.

Required Licenses

Microsoft Teams licenses are part of Microsoft 365 and Office 365 subscriptions. No additional licensing is required to use Teams for RealWear. For more information about getting Teams, check out [How do I get access to Microsoft Teams](#).

Managing RealWear devices

Microsoft Endpoint Manager

RealWear devices can be managed using Android Device Administrator mode. Support for management via Android Enterprise is limited, as the devices currently don't have Google Mobile Services (GMS) available.

- To learn more about managing RealWear devices on Microsoft Endpoint Manager, see [Android device administrator enrollment in Intune](#).
- For more details on policies, see [How to use Intune in environments without Google Mobile Services](#).

Third-party Enterprise Mobility Managers (EMMs)

For guidance on third-party EMMs, see [Supported Enterprise Mobility Management Providers](#).

End-user content

For further reading on this from an end-user perspective, check out [Using Microsoft Teams for RealWear](#).

Walkie Talkie app in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

The Walkie Talkie app in Teams provides instant push-to-talk (PTT) communication for your team and is now available on Android. Walkie Talkie allows users to connect with their team using the same underlying channels they're members of. Only users who connect to Walkie Talkie in a channel become participants and can communicate with each other using push-to-talk, one at a time.

With Walkie Talkie in Teams, frontline workers can now securely communicate with a familiar PTT experience without needing to carry bulky radios, and Walkie Talkie works anywhere with WiFi or cellular internet connectivity.

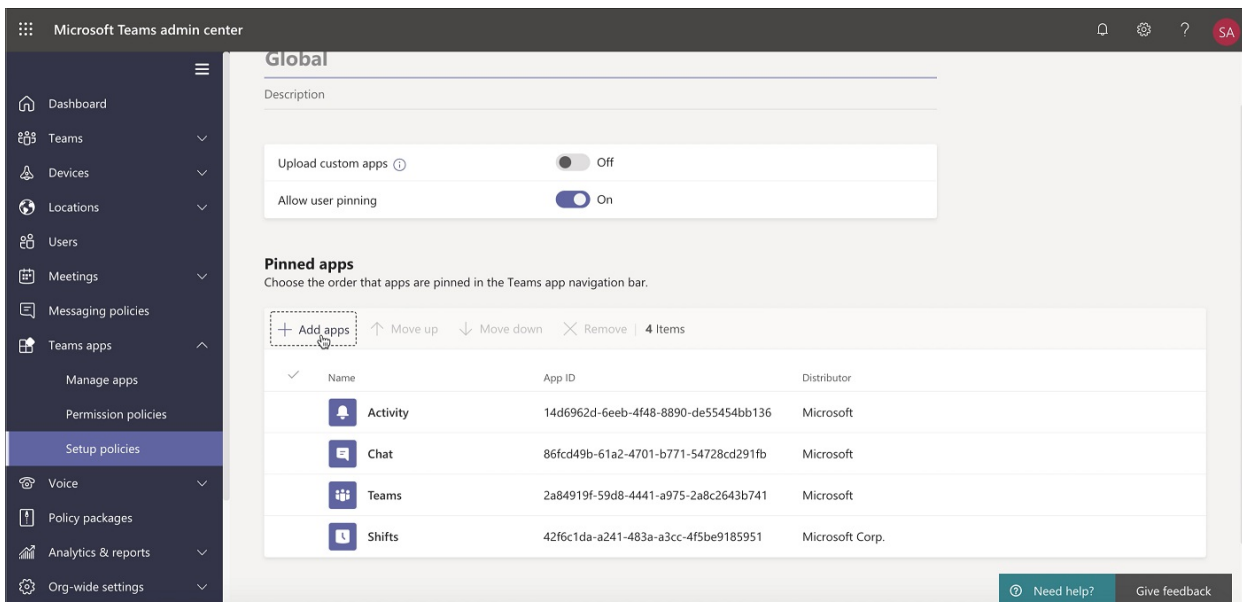

Getting started

Deploying Walkie Talkie

Currently, Walkie Talkie is available for Android devices with Google Mobile Services (GMS) and is not pre-installed. To enable this feature for users in your organization, you need to add Walkie Talkie to the [App Setup Policy](#) assigned to users from the [Teams Admin Center](#). Once enabled, Walkie Talkie will become available on the Android app within 48 hours.

Adding Walkie Talkie to your app list

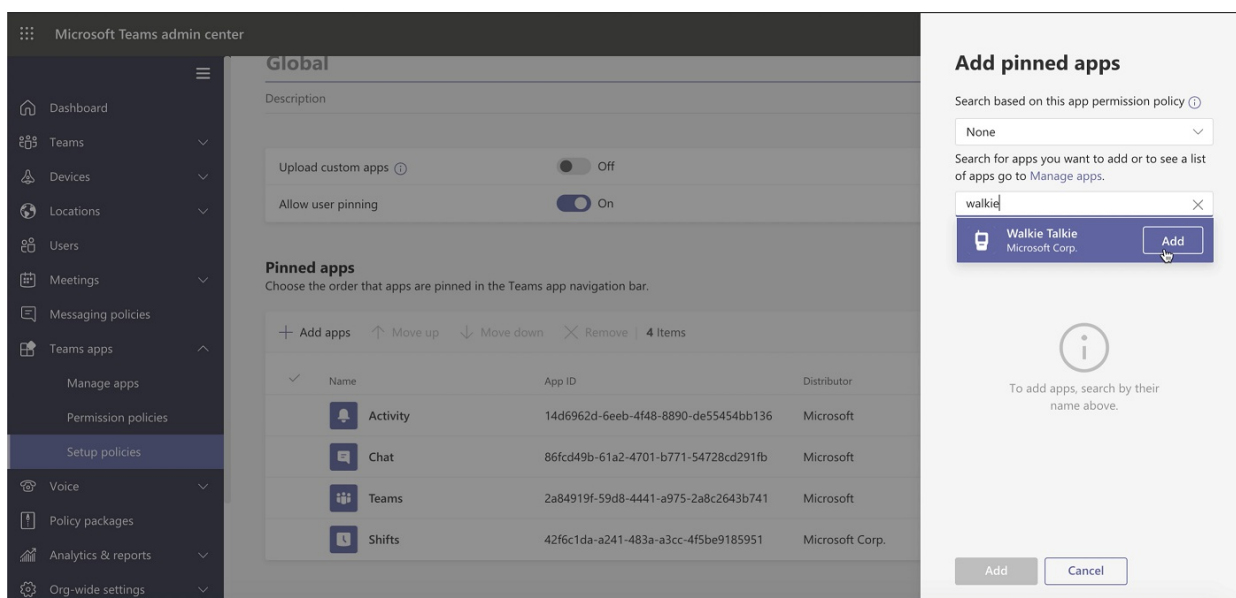

In the Microsoft Teams admin center, under **Teams app > Setup policies**, you should have **Allow user pinning** set to **On**. Then, under the Pinned Apps section, click **+ Add Apps**.

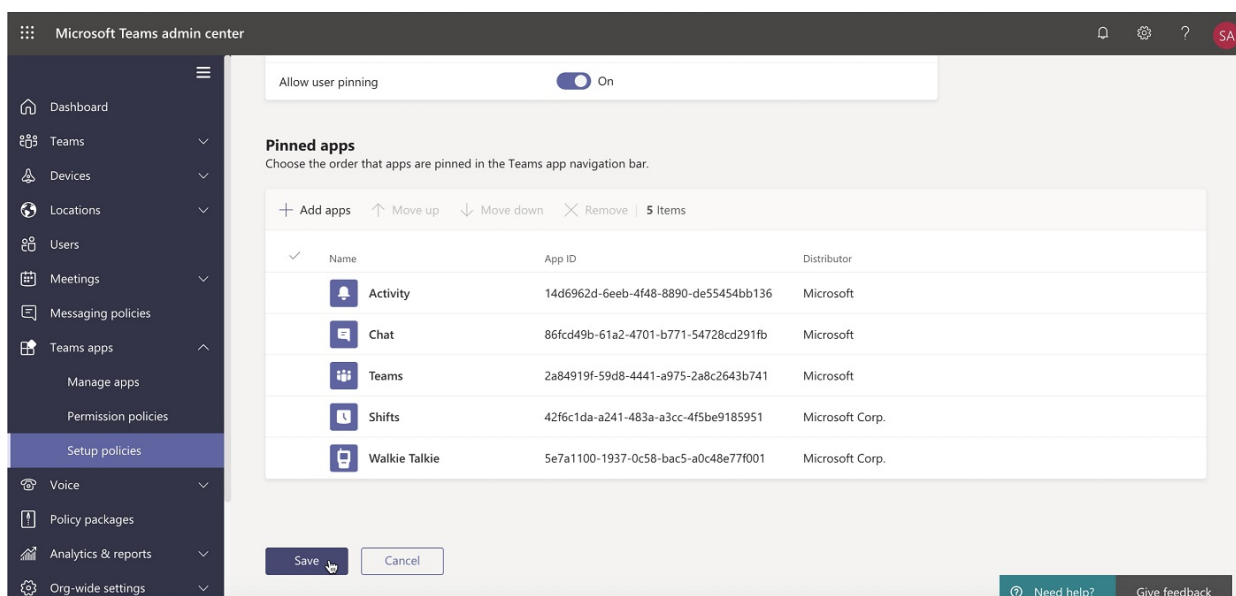

The screenshot shows the Microsoft Teams admin center interface. On the left is a navigation pane with options like Dashboard, Teams, Devices, Locations, Users, Meetings, Messaging policies, Teams apps, Manage apps, Permission policies, Setup policies (highlighted), Voice, Policy packages, Analytics & reports, and Org-wide settings. The main content area is titled 'Global' and shows the 'Setup policies' page. Under 'Description', there are two toggles: 'Upload custom apps' (Off) and 'Allow user pinning' (On). Below this is the 'Pinned apps' section, which includes a '+ Add apps' button and a table of pinned apps. The table has columns for Name, App ID, and Distributor. The pinned apps listed are Activity, Chat, Teams, and Shifts, all from Microsoft or Microsoft Corp.

✓	Name	App ID	Distributor
	Activity	14d6962d-6eeb-4f48-8890-de55454bb136	Microsoft
	Chat	86fcd49b-61a2-4701-b771-54728cd291fb	Microsoft
	Teams	2a84919f-59d8-4441-a975-2a8c2643b741	Microsoft
	Shifts	42f6c1da-a241-483a-a3cc-4f5be9185951	Microsoft Corp.

On the **Add pinned apps** panel that appears on the right, use the **Search** textbox to look for Walkie Talkie. When you have it as a search result, select the **Add** button to the right of the name to add it to your list.

The Walkie Talkie app should now appear on the Pinned Apps list, and be available for use once you click the **Save** button.

Network documentation

Walkie Talkie in Teams requires Internet connectivity and below the network conditions are required for optimal experience.

METRIC	REQUIRED
Latency (RTT)	< 300ms
Jitter	< 30ms
Packet Loss	< 1%

As noted above, the quality of real-time media over an IP network is greatly impacted by the quality of the network connectivity, but especially by the amount of:

- **Latency** - This is the time it takes to get an IP packet from point A to point B on the network. This network propagation delay is essentially tied to physical distance between the two points and the speed of light, including more overhead taken by the various routers in between. Latency is measured as Round-trip Time (RTT).

- **Inter-Arrival Jitter** - This is the average change in delay between successive packets.
- **Packet Loss** - This is often defined as a percentage of packets that are lost in a given window of time. Packet loss directly affects audio quality—from small, individual lost packets having almost no impact, to back-to-back burst losses that cause complete audio cut-out.

Expected data usage from Walkie Talkie is around 20 Kb/s when sending or receiving audio. When idle, expected data usage from Walkie Talkie is negligible.

Walkie Talkie devices

Frontline workers often need to speak and receive Walkie Talkie calls even when their phones are locked. This experience is possible through specialized devices with a dedicated PTT button.

- **Headsets**
 - Wireless headsets
 - [BlueParrott](#)
 - Wired headsets
 - [Klein Electronics](#)
- **Rugged phones**
 - Samsung [Galaxy XCover Pro](#), [Galaxy XCover 5](#), [Galaxy Tab Active 3](#)
 - Manual setup - With Teams installed, navigate to Settings > Advanced Features > XCover/Active key. Turn on 'Control XCover key with app' and select 'Teams'
 - [MDM setup](#)

NOTE

These devices are not Teams certified. They have been validated to work with Teams Walkie Talkie.

License requirements

Walkie Talkie app is included in all paid licenses of Teams in [Office 365 subscriptions](#). For more information about getting Teams, check out [How do I get access to Microsoft Teams?](#)

NOTE

Certain advanced features may require additional licensing. For example, integration with Samsung Galaxy XCover Pro requires a Knox license.

Further information

- ITAdmins can maintain control over who is using Walkie Talkie through App Policies.
- If your frontline worker is using mobile data to communicate via Teams, Walkie Talkie will use the same method.
- Walkie Talkie should work well in low bandwidth situations, or situations where your smartphone is connected and working. Walkie Talkie will not work when there is no connectivity at all.

For further reading on the end-user experience, see:

- [Get started with Teams Walkie Talkie](#)
- [Communicate with your team with Walkie Talkie](#)

Teams for Nonprofit organizations

12/7/2021 • 2 minutes to read • [Edit Online](#)

Nonprofit organizations have many unique business needs that Microsoft Teams and Microsoft 365 can help with. In particular, nonprofits often rely on a large volume of volunteers to help achieve their mission outcomes. So coordinating and communicating with internal staff and volunteers is key.

The following templates are designed specifically for nonprofit organizations. Use these templates to empower your staff and engage volunteers.

- Use the [Manage volunteers team template](#) to quickly and easily set up teams in Teams for your staff to communicate and collaborate on volunteer management tasks and activities. This template includes settings, channels, and apps designed to streamline volunteer management activities.

Your staff can use different channels to organize and share onboarding materials and frequently used documents, view reporting, post important team and event announcements, and more. The template also integrates with [Volunteer Management](#), an app that's part of [Microsoft Cloud for Nonprofit](#), enabling staff to manage volunteer engagement opportunities within Teams.

- Use the [Volunteer center SharePoint site template](#) to set up a central hub where your volunteers can access key information. Welcome new volunteers, post announcements, showcase upcoming events, and introduce your organization and staff. Provide easy access to training and onboarding materials, and key sites.

Teams features for nonprofit organizations are also part of Microsoft Cloud for Nonprofit. Learn more about [Microsoft Cloud for Nonprofit](#), which brings together capabilities from Microsoft Dynamics 365, Microsoft Power Platform, Microsoft 365, Microsoft Azure, and LinkedIn.

Use nonprofit team templates

12/7/2021 • 2 minutes to read • [Edit Online](#)

Team templates in Microsoft Teams allow you to quickly and easily create teams by providing a predefined team structure of settings, channels, and pre-installed apps.

For nonprofit organizations, team templates can be especially powerful, as they help you to quickly deploy consistent teams across your organization. Templates also help staff to get oriented with how to effectively use Teams.

Teams includes a Manage volunteers team template designed to streamline volunteer management activities. Use this pre-built template to quickly create teams for staff to communicate and collaborate on volunteer management tasks and activities.

In this article, you'll learn about the Manage volunteers team template and how to use it to create a team. This article also gives you an overview of how to manage team templates in the Teams admin center.

Manage volunteers team template

Bring your staff together to communicate and collaborate on volunteer management tasks and activities.

This template includes channels and apps designed to streamline volunteer management activities. Staff can organize and share onboarding materials and frequently used documents, view reporting, stay up to date on important team and event announcements, and more. The template also integrates with [Volunteer Management](#), an app that's part of [Microsoft Cloud for Nonprofit](#), enabling staff to manage volunteer engagement opportunities within Teams.

Here's the channels and apps that come with the Manage volunteers team template.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
---------------	------------	---

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
Manage volunteers	ManageVolunteers	<p>Channels:</p> <ul style="list-style-type: none"> • General <ul style="list-style-type: none"> ◦ Website¹ • Announcements • Reporting <ul style="list-style-type: none"> ◦ Power BI¹ • Volunteer Management <ul style="list-style-type: none"> ◦ Power Apps¹ • Engagement Opportunities <ul style="list-style-type: none"> ◦ Tasks¹ • Volunteer Onboarding <ul style="list-style-type: none"> ◦ SharePoint¹ ◦ OneNote¹ <p>Apps:</p> <ul style="list-style-type: none"> • Website • YouTube • Power BI • Power Apps • Tasks • SharePoint • OneNote

¹App added to the channel as a tab.

Create a team using the Manage volunteers team template

Create the team

It takes only a few quick steps to create a team from the Manage volunteers template.

1. In Teams, go to **Teams > Join or create a team > Create team**.
2. Choose the **Manage volunteers** team template.
3. Choose a privacy level:
 - **Private:** People need permission from the team owner to join the team.
 - **Public:** Anyone in your organization can join the team.
4. Give your team a name and add a description. You can also rename channels to customize the team.
5. Select **Create**.

To learn more, see [Create a team with a team template](#).

Add the Volunteer Management app to the Power Apps tab

To use the Volunteer Management app in Teams, add it to the Power Apps tab in the Volunteer Management channel.

1. In Teams, go to the team you created, choose the Volunteer Management channel, and then select the **Power Apps** tab.
2. In the drop-down list, select **Model-driven apps**, and then search for and select **Volunteer Management**.
3. Select **Save**.

To learn more, see [Embed a model-driven app as a tab app in Teams](#).

View and manage team templates in the Teams admin center

If you're an admin, you can view and manage team templates in the Microsoft Teams admin center. To view the Manage volunteers template, in the left navigation of the Teams admin center, go to **Teams** > **Team templates**.

You can also [create and assign templates policies](#) to your users to control which templates they see in Teams for creating teams.

To learn more about team templates in general, see [Get started with team templates in the Teams admin center](#).

Teams for Retail

12/7/2021 • 2 minutes to read • [Edit Online](#)

Use the admin resources here to manage and get the most out of Teams for your retail stores and workforce.

	Get started with Retail Teams templates

Use retail team templates

12/7/2021 • 4 minutes to read • [Edit Online](#)

Team templates in Microsoft Teams allow you to quickly and easily create teams by providing a predefined team structure of settings, channels, and pre-installed apps.

For retailers, team templates can be especially powerful, as they help you to quickly deploy consistent teams across your organization. Templates also help staff to get oriented with how to effectively use Teams.

Teams includes templates designed specifically for retailer needs. Use these pre-built templates to quickly create teams for staff to communicate and collaborate. In this article, we introduce you to each of these templates and recommend how to use them.

How you manage and work with team templates depends on whether you're an admin or developer.

IF YOU'RE:	THEN, YOU:
An admin or IT pro	Manage team templates in the Teams admin center . View team templates and apply templates policies to control which templates your staff can use in Teams for creating teams.
A developer	Use Microsoft Graph to create teams from team templates.

Manage team templates in the Teams admin center

As an admin, you can manage team templates in the Microsoft Teams admin center. Here, you can view details about each template. You can also [create and assign templates policies](#) to your staff to control which templates they see in Teams for [creating teams](#).

To learn more about team templates in general, see [Get started with team templates in the Teams admin center](#).

We currently offer the following pre-built retail team templates. To view them, in the left navigation of the Teams admin center, go to **Teams > Team templates**.

Organize a store

Bring your retail employees together in one central experience to manage tasks, share documents, and resolve customer issues. Integrate additional apps to streamline shift start and end processes.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
---------------	------------	---

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
Organize a store	retailStore	<p>Channels:</p> <ul style="list-style-type: none"> • General • Shift handoff • Store readiness <ul style="list-style-type: none"> ◦ Inspection¹ • Learning <p>Apps:</p> <ul style="list-style-type: none"> • Wiki • Tasks • Shifts • Inspection

¹App added to the channel as a tab

Manager Collaboration

The Manager Collaboration template is ideal for creating a team for a set of managers to collaborate across stores, regions, and so on. For example, if your organization has regions, you might create a Manager Collaboration team for the California region and include all the store managers in that region, along with the regional manager for that region.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
Retail for managers	retailManagerCollaboration	<p>Channels:</p> <ul style="list-style-type: none"> • General • Operations <ul style="list-style-type: none"> ◦ Tasks (Operations Tasks)¹ ◦ Inspection¹ • Learning <ul style="list-style-type: none"> ◦ Tasks (Learning Tasks)¹ <p>Apps:</p> <ul style="list-style-type: none"> • Wiki • Tasks • Inspection

¹App added to the channel as a tab

Use team templates with Microsoft Graph

Developers can use Microsoft Graph to create teams from pre-built team templates. To learn more about using team templates with Microsoft Graph, see [Get started with team templates using Microsoft Graph](#), [Microsoft Teams API overview](#), and [teamsTemplate resource type](#).

Here are the pre-built retail team templates.

Store

The Store template is ideal for creating a team to represent an individual retail store location. Using the Store template, you can create a team for each retail store location in your organization.

TEMPLATE TYPE	TEMPLATEID	TEMPLATE CHANNELS
Retail - Store	https://graph.microsoft.com/beta/teamsTemplates('retailStore')	<p>Channels</p> <ul style="list-style-type: none"> • General • Shift handoff² • Store readiness • Learning² <p>Team properties</p> <ul style="list-style-type: none"> • Team visibility set to Public <p>Member permissions</p> <ul style="list-style-type: none"> • Can't create, update, or delete channels • Can't add or remove apps • Can't create, update, or remove tabs • Can't create, update, or remove connectors

²Auto-favorited channels

Recommended ways to customize the Store template for your organization:

- If your organization has departments within each store, add a channel for each department. Adding a channel facilitates communication and collaboration within the department.
- If your organization has any internal websites (for example, a SharePoint site), consider pinning them as tabs in the relevant team channel.

Manager Collaboration

The Manager Collaboration template is ideal for creating a team for a set of managers to collaborate across stores, regions, and so on. For example, if your organization has regions, you might create a Manager Collaboration team for the California region and include all the store managers in that region, along with the regional manager for that region.

TEMPLATE TYPE	TEMPLATEID	TEMPLATE CHANNELS
Retail - Store	https://graph.microsoft.com/beta/teamsTemplates('retailManagerCollaboration')	<p>Channels</p> <ul style="list-style-type: none"> • General • Operations² • Learning² <p>Team properties</p> <ul style="list-style-type: none"> • Team visibility set to Private <p>Member permissions</p> <ul style="list-style-type: none"> • Can create, update, and delete channels • Can add and remove apps • Can create, update, and remove tabs • Can create, update, and remove connectors

²Auto-favorited channels

Recommended ways to customize the Manager Collaboration template for your organization:

- If your organization has any internal websites, such as a SharePoint site, that are relevant for managers, consider pinning them as tabs in a relevant team channel.

How to use team templates with Microsoft Graph

To use these templates, change the 'template@odata.bind' property in the request body from 'standard' to the TemplateIds above. For more information on how to deploy team templates, see the Microsoft Graph article on how to [create a team](#).

NOTE

The channels in the template will automatically be created under the **General** tab.

Example: Store template extension script

```
{
  "template@odata.bind": "https://graph.microsoft.com/beta/teamsTemplates('retailStore')",
  "DisplayName": "Contoso Store",
  "Description": "Team for all staff in Contoso Store",
  "Channels": [
    {
      "displayName": "Additional store channel",
      "IsFavoriteByDefault": false
    }
  ]
}
```

Teams for Government

12/7/2021 • 2 minutes to read • [Edit Online](#)

Use these resources to learn about specific considerations for deploying Teams in Microsoft 365 Government environments. When you're ready, follow the same recommended deployment path for Teams as outlined in [How to roll out Microsoft Teams](#).

	Plan for Microsoft 365 Government - GCC deployments
	Plan for Microsoft 365 Government - GCC High
	Plan for Microsoft 365 Government - DOD deployments
	Audio Conferencing with Direct Routing for GCC High and DoD

Support remote government workers using Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

If you're running Microsoft Teams as part of Office 365 for Government, use this guidance to support your remote workforce.

IT Guidance

Learn how to get Teams ready in your organization:

- Make sure everyone has access to Teams with a [paid subscription that includes Teams](#).
- If you already have a subscription, make sure that [Teams is turned on](#) for everyone.
- For rapid deployment, visit [Teams FastPath PowerPoint](#) to get Teams rolled out in your organization.
- Understand how to get your organization started with [Meetings in Teams](#).

End user communication

Ready to roll out Teams to your users? You can find these great email templates in the [Customer Success Kit for Government](#):

- Generate excitement with an [announcement letter](#) and [countdown template](#)
- Create weekly touch points with engaging emails:
 - Tease the launch of Teams with a [countdown email](#)
 - Let users know it's available with an [announcement email](#)
 - Show users new ways to work together with [Tips and tricks](#)

End user guidance

Share these assets and videos with your end users to help them get started quickly:

- Download the [Quick Start Guide for Government](#) to learn the Teams basics.
- Watch the [Short Quick Start Videos](#) for a walkthrough of Teams and [Meetings Videos](#) to learn how to use meetings in Teams.

Learn more

- Start your Teams journey with a series of live, [interactive trainings](#), designed to get your organization up and running with Teams.
- Join one of our [online classes](#) to see Teams in action and get your questions answered.
- Share [in-depth training videos](#) with users who want to learn more.
- Read the [Teams admin documentation](#) to learn how to roll out and manage Teams.

Use government team templates in the admin center

12/7/2021 • 2 minutes to read • [Edit Online](#)

Team templates allow you to quickly and easily create teams by providing a predefined template of settings, channels, and pre-installed apps.

Team templates have pre-built definitions of team structures designed around governmental needs. You can also extend the team templates to create teams that are tailored to your specific organizational needs.

In this article, we introduce each of the team templates and recommend how to use them.

This article is for you if you're responsible for planning, deploying, and managing multiple teams across your governmental organization. You've already deployed Teams service in your organization. If you haven't yet rolled out Teams, start by reading the [How to roll out Microsoft Teams](#).

To learn more about team templates in general, refer to [Get started with team templates](#).

Coordinate incident response

Centralize communication and critical resources for your crisis management or incident response team. Within this team, you can include many different types of files to help create a central place for all your documents. Use online meetings to improve information flow and situational awareness.

BASE TEMPLATE TYPE	BASETEMPLATEID	PROPERTIES THAT COME WITH THIS BASE TEMPLATE
Coordinate incident response	com.microsoft.teams.template.CoordinateIncidentResponse	Channels: <ul style="list-style-type: none">• General• Announcements• Logistics• Planning• Recovery• Urgent Apps: <ul style="list-style-type: none">• Wiki• Excel• OneNote• SharePoint• Planner

Manage the Office 365 G1 Trial for US government

12/7/2021 • 2 minutes to read • [Edit Online](#)

As of July 1, 2020, the Office 365 E1 Trial license is no longer available. If you need to license users for Microsoft Teams, read the [Microsoft Teams service description](#) for a list of paid subscriptions that include Teams.

Use the guidance in this article to manage your existing Office 365 G1 Trial licenses, including [upgrading to a paid subscription](#). To learn more, read [Microsoft 365 Government Plans](#) and the [Microsoft Teams capabilities available in the GCC Cloud](#).

Don't miss all of our guidance for [supporting remote workers with Teams](#).

Manage the G1 Trial

Once you've activated the Office 365 G1 Trial, turn on the license for any users who need it. To learn how, read [Manage user access to Teams](#).

Once you've turned on the G1 Trial for the users who need it, you'll manage these users just like you manage users who have a paid license. For more information, see [Manage Teams settings for your organization](#).

Upgrade users from the Office 365 G1 Trial license

To upgrade G1 Trial users to a paid subscription:

1. Purchase a subscription that includes Teams.
2. Remove the Office 365 G1 Trial subscription from the user.
3. Assign the newly purchased license.

For more information, see [Teams for Government](#).

NOTE

If the G1 Trial license ends and a user is not immediately upgraded to a subscription that includes Teams, the user data is not removed. The user still exists in Azure Active Directory and all data within Teams still remains. Once a new license is assigned to the user to enable Teams functionality again, all content will still exist.

Remove an Office 365 G1 Trial license

- If you would like to remove this license by using PowerShell, see: [Remove licenses from user accounts with Office 365 PowerShell](#)
- If you would like to remove this license through the admin portal, see: [Delete a user from your organization](#)

Plan for Microsoft 365 Government - GCC deployments

12/7/2021 • 4 minutes to read • [Edit Online](#)

This guidance is for IT pros who are driving deployments of Microsoft 365 in US federal, state, local, tribal, or territorial government entities or other entities that handle data that's subject to government regulations and requirements, where the use of Microsoft 365 Government - GCC is appropriate to meet these requirements. New March 26, 2020: Don't miss our downloadable [Quick Start guide for GCC](#).

IMPORTANT

Microsoft Teams is experiencing a tremendous spike in online calls and audio/video conferencing due to the coronavirus (COVID-19) pandemic.

In response to the unprecedented increase in calls, and to ensure continuity and availability, Microsoft is allowing Microsoft Teams GCC audio/video servers to leverage processing capacity in our commercial datacenters, as well as in our government datacenters.

These audio/video servers reside within the Microsoft Azure FedRAMP High accreditation boundary servers in the United States and do not store any customer content. However, these servers are processing audio and video for calls and conferences and are operating under our commercial staff during this interim period.

Qualified, screened personnel are monitoring these servers for potential access to customer data by reviewing any interactive log-ons to these servers. Qualified personnel meet GCC requirements for access to customer content. For details about screening requirements, see the [GCC service description](#).

Thank you for your support as we take steps to ensure that our services remain available and reliable in these extraordinary times.

NOTE

If your organization has already met the Microsoft 365 Government - GCC eligibility requirements and applied for and been accepted into the program, you can skip steps 1 and 2 and go directly to step 3.

Step 1. Determine whether your organization needs Microsoft 365 Government - GCC and meets eligibility requirements.

The Microsoft 365 Government - GCC environment provides compliance with US government requirements for cloud services, including FedRAMP Moderate, and requirements for criminal justice and federal tax information systems (CJI and FTI data types).

In addition to enjoying the features and capabilities of Microsoft 365, organizations benefit from the following features that are unique to Microsoft 365 Government - GCC:

- Your organization's customer content is logically segregated from customer content in the commercial Microsoft 365 services from Microsoft.
- Your organization's customer content is stored within the United States.
- Access to your organization's customer content is restricted to screened Microsoft personnel.
- Microsoft 365 Government - GCC complies with certifications and accreditations that are required for US Public Sector customers.

You can find more information about the Microsoft 365 Government - GCC offering for US Government customers at [Microsoft 365 Government plans](#), including [eligibility requirements](#).

The [Microsoft 365 US Government service description](#) describes the platform's benefits, which are centered around meeting compliance requirements within the United States.

TIP

You might want to transfer the tables of information in the service description into an Excel workbook and add two columns: **Relevant for my organization Y/N** and **Meets the needs of my organization Y/N**. Then you can review this list with your colleagues to confirm that this service meets your organization's needs.

Decision points

- Decide whether Microsoft 365 Government - GCC is appropriate for your organization.
- Confirm that your organization meets eligibility requirements.

NOTE

Microsoft 365 Government - GCC is only available in the United States. Non-US Government customers can choose from a number of [Microsoft 365 Government plans](#).

Step 2. Apply for Microsoft 365 Government - GCC

Having decided that this service is right for your organization, start the process of [applying for this service here](#).

Step 3. Understand Microsoft 365 Government - GCC default security settings.

We recommend that you take time to carefully review your [admin and security settings](#) before you modify them, and consider impacts on compliance before you make any changes to the default security settings.

Decision point

- Decide whether you'll modify any of the default Microsoft 365 Government - GCC security settings, resolving to first understand the impact of any changes you might make.

Step 4. Understand which capabilities are currently unavailable or disabled by default.

To accommodate the requirements of our government cloud customers, there are some differences between Microsoft 365 Government - GCC and Enterprise plans. Refer to the following table to see which features are available.

[Microsoft Teams service description](#)

NOTE

Once other workloads are fully available in the GCC cloud, then they will become available in Teams when all additional integration work is completed.

Decision point

- Decide whether the Teams feature set meets your organization's needs.

Step 5. Plan for governance

Determine your requirements for governance and how you can meet them. Go to [Plan for governance in Teams](#) for more information.

Decision point

- Determine and document your governance requirements, following the guidelines in [Plan for governance in Teams](#).

Step 6. Deploy Teams for collaboration

After you've been onboarded to Microsoft 365 Government – GCC, follow the recommended deployment path outlined in [How to roll out Microsoft Teams](#). Be sure to engage with your Adoption and Change Management team and Teams champions.

You can also work with [FastTrack](#) or your chosen partner to onboard the service.

Step 7. Deploy Teams for meetings and voice

This is also a great time to use Teams with your wider stakeholder group to start planning for rolling out meetings and [cloud voice features](#).

Plan for Office 365 Government - GCC High deployments

12/7/2021 • 3 minutes to read • [Edit Online](#)

This guidance is for IT pros who are driving deployments of Office 365 in US federal government entities or other entities that handle data that's subject to government regulations and requirements, where the use of Office 365 Government – GCC High is appropriate to meet these requirements.

NOTE

If your organization has already met the Office 365 Government – GCC High eligibility requirements and applied for and been accepted into the program, you can skip steps 1 and 2 and go directly to step 3.

Step 1. Determine whether your organization needs Office 365 Government - GCC High and meets eligibility requirements.

The Office 365 Government - GCC High environment provides compliance with US government requirements for cloud services. In addition to enjoying the features and capabilities of Office 365, organizations benefit from the following features that are unique to Office 365 Government – GCC High:

- Your organization's customer content is logically segregated from customer content in the commercial Office 365 services from Microsoft.
- Your organization's customer content is stored within the United States.
- Access to your organization's customer content is restricted to screened Microsoft personnel.
- Office 365 Government – GCC High complies with certifications and accreditations that are required for US Public Sector customers.

You can find more information about the Office 365 Government – GCC High offering for US Government customers at [Office 365 Government plans](#), including [eligibility requirements](#).

The [Office 365 US Government service description](#) describes the platform's benefits, which are centered on meeting compliance requirements within the United States.

TIP

You might want to transfer the tables of information in the service description into an Excel workbook and add two columns: **Relevant for my organization Y/N** and **Meets the needs of my organization Y/N**. Then you can review this list with your colleagues to confirm that this service meets your organization's needs.

Decision points

- Decide whether Office 365 Government - GCC High is appropriate for your organization.
- Confirm that your organization meets eligibility requirements.

NOTE

Office 365 Government - GCC High is only available in the United States. Non-US Government customers can choose from a number of [Office 365 Government plans](#).

Step 2. Apply for Office 365 Government - GCC High

Having decided that this service is right for your organization, start the process of [applying for this service](#).

Step 3. Understand Office 365 Government - GCC High default security settings.

We recommend that you take time to carefully review your [admin and security settings](#) before you modify them, and consider impacts on compliance before you make any changes to the default security settings.

 Decision point	<ul style="list-style-type: none">Decide whether you'll need to modify any of the default Office 365 Government - GCC High security settings, resolving to first understand the impact of any changes you might make.

Step 4. Understand which Teams capabilities are currently available in Office 365 Government - GCC High

To accommodate the requirements of our government cloud customers, there are some differences between Teams in Office 365 Government - GCC High and Teams in the Enterprise plans. Refer to the following table to see which features are available.

[Microsoft Teams service description](#)

Step 5. Plan for governance

Determine your requirements for governance and how you can meet them. Go to [Plan for governance in Teams](#) for more information.

	Decision point	<ul style="list-style-type: none">Determine and document your governance requirements, following the guidelines in Plan for governance in Teams.

Step 6. Deploy Teams for collaboration

After you've been onboarded to Office 365 Government – GCC High, follow the recommended deployment path outlined in [How to roll out Microsoft Teams](#). Be sure to engage with your Adoption and Change Management team and Teams champions.

You can also work with [FastTrack](#) or your chosen partner to onboard the service.

Plan for Office 365 Government - DoD deployments

12/7/2021 • 3 minutes to read • [Edit Online](#)

This guidance is for IT pros who are driving deployments of Office 365 in US federal government entities or other entities that handle data that's subject to government regulations and requirements, where the use of Office 365 Government – DoD is appropriate to meet these requirements.

NOTE

If your organization has already met the Office 365 Government – DoD eligibility requirements and applied for and been accepted into the program, you can skip steps 1 and 2 and go directly to step 3.

Step 1. Determine whether your organization needs Office 365 Government - DoD and meets eligibility requirements.

The Office 365 Government - DoD environment provides compliance with US government requirements for cloud services. In addition to enjoying the features and capabilities of Office 365, organizations benefit from the following features that are unique to Office 365 Government – DoD:

- Your organization's customer content is logically segregated from customer content in the commercial Office 365 services from Microsoft.
- Your organization's customer content is stored within the United States.
- Access to your organization's customer content is restricted to screened Microsoft personnel.
- Office 365 Government – DoD complies with certifications and accreditations that are required for US Public Sector customers.

You can also work with [FastTrack](#) or your chosen partner to onboard the service.

NOTE

The Mac Teams client for DOD environments is not yet supported.

Audio Conferencing with Direct Routing for GCC High and DoD

12/7/2021 • 8 minutes to read • [Edit Online](#)

Audio Conferencing with Direct Routing for GCC High and DoD enables participants to join Teams meetings in your GCC High or DoD organization by using a phone device. Meeting participants might prefer to use a phone device to join Teams meetings in scenarios such as when internet connectivity is limited or when users are on the road and don't have access to Teams. Participants can choose to join meetings by either dialing in to a dial-in phone number for your organization or by having the meeting dial out to their phone device.

With Audio Conferencing with Direct Routing for GCC High and DoD, your organization uses its own numbers as dial-in phone numbers and all meeting dial-outs to phone devices are routed via Direct Routing. To enable the service, organizations need to set up Direct Routing and configure phone numbers that can be used as dial-in phone numbers. The requirement to use Direct Routing is different from the Audio Conferencing service that's offered to non-GCC High and non-DoD organizations where the dial-in phone numbers are provided by Microsoft.

Deploy Audio Conferencing with Direct Routing for GCC High and DoD

Step 1: Get Audio Conferencing with Direct Routing for GCC High or DoD licenses

To use Audio Conferencing in GCC High or DoD, your organization and the users in your organization need to have an Audio Conferencing with Direct Routing license assigned. Here are the licenses you need to enable Audio Conferencing with Direct Routing for GCC High or DoD.

- GCC High: An Audio Conferencing - GCC High Tenant license for your organization and Audio Conferencing - GCC High licenses for your users.
- DoD: An Audio Conferencing - DoD Tenant license for your organization and Audio Conferencing - DoD licenses for your users.

A tenant license and at least one user license are required to enable the service. You can't enable the service with only the tenant license or with only user licenses. To get service licenses for your tenant and the users in your organization, contact your account team.

IMPORTANT

Users can't be enabled for Audio Conferencing with Direct Routing until dial-in phone numbers are set up. We recommend that you do not assign Audio Conferencing with Direct Routing for GCC High or DoD licenses to users until you set up dial-in phone numbers as outlined in this article. Failure to follow this guidance may cause the dial pad to be completely missing in the Teams client.

Step 2: Set up Direct Routing

To set up Direct Routing, see the following articles:

- [Plan Direct Routing](#)
- [Configure Direct Routing](#)

NOTE

When you set up Direct Routing, remember to use the GCC High or DoD-specific FQDNs and ports that are described in these two articles.

Step 3: Set up dial-in phone numbers

Dial-in phone numbers are the phone numbers that are associated to your Audio Conferencing bridge. These numbers are used by participants to join meetings scheduled by users in your organization. These numbers are also included in the meeting invites of the users who schedule meetings in your organization and on the "Find a local number" page.

Define service phone numbers in your tenant

You can use the `New-CsHybridTelephoneNumber` PowerShell cmdlet to define service phone numbers in your tenant that can be used to route calls to the Audio Conferencing service via Direct Routing.

```
New-CsHybridTelephoneNumber -TelephoneNumber <Phone number in E.164 format>
```

For example:

```
New-CsHybridTelephoneNumber -TelephoneNumber "+14250000000"
```

Assign the service phone numbers to the Audio Conferencing bridge of your organization

You can assign service phone numbers to the Audio Conferencing bridge of your organization by using the `Register-CsOnlineDialInConferencingServiceNumber` PowerShell cmdlet.

```
Register-CsOnlineDialInConferencingServiceNumber -identity <Telephone number in E.164 format> -BridgeId  
<Identity of the audio conferencing bridge>
```

You can see the ID of your Audio Conferencing Bridge using `Get-CsOnlineDialInConferencingBridge`. For example:

```
$b= Get-CsOnlineDialInConferencingBridge  
Register-CsOnlineDialInConferencingServiceNumber -identity 14257048060 -BridgeId $b.identity
```

Step 4: Define a global voice routing policy to enable the routing of outbound calls from meetings

The routing of outbound calls that are made to the PSTN from meetings organized by users in your organization is defined by the global voice routing policy of your organization. If your organization has a global voice routing policy defined, please verify that the global voice routing policy allows the outbound calls to the PSTN that are expected to be initiated from meetings organized by users in your organization. If your organization doesn't have a global voice routing policy defined, you will need to define one to enable the routing of outbound calls to the PSTN from meetings organized by users in your organization. Please note that the global voice routing policy of your organization also applies to one-to-one calls made to the PSTN by users in your organization. If one-to-one calls to the PSTN are enabled for users in your organization, make sure that the global voice routing policy meets the needs of your organization for both types of calls.

NOTE

Location-Based Routing isn't available in Microsoft 365 Government Community Cloud (GCC) High or DoD deployments. When enabling Audio Conferencing, please verify that no Audio Conferencing users in the GCC High or the DoD environments are enabled for Location-Based Routing.

Defining a global voice routing policy

A global voice routing policy can be defined by defining a PSTN usage, a voice route, a voice routing policy, and assigning the new voice routing policy as the global voice routing policy of your organization.

The following steps describe how to define a new global voice routing policy for an organization without one. If your organization already has voice routing policies defined, verify that the following configuration doesn't conflict with the existing voice routing policies of your organization.

To create a new PSTN usage in a remote PowerShell session in Skype for Business Online, use the following command:

```
Set-CsOnlinePstnUsage -Identity Global -Usage @{Add="International"}
```

For additional information, see [Set-CsOnlinePstnUsage](#).

To create a new voice route, use the following command:

```
New-CsOnlineVoiceRoute -Identity "International" -NumberPattern ".*" -OnlinePstnGatewayList sbc1.contoso.biz -OnlinePstnUsages "International"
```

When defining a new voice route for your organization, please specify one or multiple of the PSTN online PSTN gateways that have been defined for your organization during the configuration of Direct Routing.

The number pattern specifies which calls will be routed through the specified list of gateways based on the destination phone number of the call. In the example above, calls to any destinations in the world will match the voice route. If you would like to restrict the phone numbers that can be dialed from the meetings of users in your organization, you can change the number pattern to have the voice route match only the number patterns of the destinations allowed. Please note that if there are no voice routes that match the number pattern of the destination phone number of a given call, the call will not be routed.

For additional information, see [New-CsOnlineVoiceRoute](#).

To create a new voice routing policy, use the following command:

```
New-CsOnlineVoiceRoutingPolicy "InternationalVoiceRoutingPolicy" -OnlinePstnUsages "International"
```

If multiple PSTN usages are being defined in the voice routing policy, they will be evaluated in the order in which they are defined. It is recommended that the PSTN usages are defined in the order of the most specific to the more generic in terms of the number patterns of the voice routes associated with the PSTN usages. For example, if a PSTN usage was defined to route calls to the United States, and another PSTN usage was defined to route calls to any other location in the world, the PSTN usage for calls to the United States should be listed in the voice routing policy ahead of the PSTN usage to route calls to any other location in the world.

For additional information, see [New-CsOnlineVoiceRoutingPolicy](#).

To assign the new voice route to the global voice routing policy of your organization, use the following command:

```
Grant-CsOnlineVoiceRoutingPolicy -PolicyName "InternationalVoiceRoutingPolicy" -Global
```

For additional information, see [Grant-CsOnlineVoiceRoutingPolicy](#).

Once the global voice routing policy has been defined, any outbound calls made from meetings organized by users in your organization will be evaluated against the voice routes associated to the PSTN usages of the global voice routing policy. The outbound calls will be routed according to the first voice route that matches the

number pattern of the dialed phone number.

Step 5: Assign Audio Conferencing with Direct Routing for GCC High or DoD licenses to your users

To assign Audio Conferencing with Direct Routing for GCC High or DoD licenses to your user, see [Assign licenses to users](#).

Step 6: (Optional) See a list of Audio Conferencing numbers in Teams

To see the list of Audio Conferencing numbers of your organization, go to [See a list of Audio Conferencing numbers in Microsoft Teams](#).

Step 7: (Optional) Set auto attendant languages for the Audio Conferencing dial-in numbers of your organization

To change the languages of the Audio Conferencing dial-in numbers of your organization, see [Set auto attendant languages for Audio Conferencing in Microsoft Teams](#).

Step 8: (Optional) Change the settings of the Audio Conferencing bridge of your organization

To change the settings of the Audio Conferencing bridge of your organization, see [Change the settings for an Audio Conferencing bridge](#).

Step 9: (Optional) Set the phone numbers included in the meeting invites of the users in your organization

To change the set of phone numbers that are included in the meeting invites of the users in your organization, see [Set the phone numbers included on invites in Microsoft Teams](#).

Audio Conferencing capabilities not supported in Audio Conferencing with Direct Routing for GCC High and DoD

The following are Audio Conferencing capabilities that are not supported in Audio Conferencing with Direct Routing for GCC High and DoD:

- Entry and exit notifications using name recording. For Audio Conferencing with Direct Routing, entry and exit notifications are played in the meeting as tones.
- Disable the usage of toll-free numbers for the meetings specific organizer. User-level controls to restrict the usage of toll-free numbers to join the meetings of your organization aren't applicable to calls routed via Direct Routing.
- Sending notification emails to users when their settings change. Audio Conferencing notification emails aren't supported for Audio Conferencing with Direct Routing for GCC High and DoD.

Teams policy packages for government

12/7/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Policy packages are currently not available in Microsoft 365 Government GCC High or DoD deployments.

Overview

A **policy package** in Microsoft Teams is a collection of predefined policies and policy settings that you can assign to users who have similar roles in your organization. Policy packages simplify, streamline, and help provide consistency when managing policies. You can customize the settings of the policies in the package to suit the needs of your users. When you change the settings of policies in a policy package, all users who are assigned to that package get the updated settings. You can manage policy packages by using the Microsoft Teams admin center or PowerShell.

Policy packages pre-define policies for the following, depending on the package:

- Messaging
- Meetings
- Calling
- App setup
- Live events

Teams currently includes the following policy packages for government.

PACKAGE NAME IN THE MICROSOFT TEAMS ADMIN CENTER	BEST USED FOR	DESCRIPTION
Public safety officer	Public safety officers in your government organization	Creates a set of policies and policy settings that apply to public safety officers in your organization.
Frontline manager	Frontline Managers in your government organization	Creates a set of policies and applies those settings to Frontline Managers in your organization.
Frontline worker	Frontline Workers in your government organization	Creates a set of policies and applies those settings to Frontline Workers in your organization.

Policy packages

A policy package is a collection of predefined policies and settings that can be customized and applied to a group of users that have similar roles within your organization. The definitions in these policy packages aren't meant to assist with regulatory compliance, rather they are provided for your convenience and can be customized based on your own regulatory requirements. [Learn more](#)

Manage users

<input checked="" type="checkbox"/>	Name	Description
	Education (Higher education student)	This policy package is designed to create a set of policies and apply those settings to higher education students in your organization.
	Education (Primary school student using remote learn...	This policy package is designed to create a set of policies that apply to primary students to maximize student safety and collaboration wh
	Education (Primary school teacher using remote learn...	This policy package is designed to create a set of policies that apply to primary teachers to maximize student safety and collaboration wh
	Education (Primary school student)	This policy package is designed to create a set of policies and apply those settings to primary students in your organization.
	Education (Secondary school student)	This policy package is designed to create a set of policies and apply those settings to secondary students in your organization.
	Education (Teacher)	This policy package is designed to create a set of policies and apply those settings to teachers in your organization.
	Firstline manager	The policy package is designed to create a set of policies and apply those settings to managers of firstline workers in your organization.
	Firstline worker	This policy package is designed to create a set of policies and apply those settings to firstline workers in your organization.
	Healthcare clinical worker	This policy package is designed to create a set of policies and apply those settings to clinical workers in your healthcare organization.
	Healthcare information worker	This policy package is designed to create a set of policies and apply those settings to information workers in your healthcare organization
	Healthcare patient room	This policy package is designed to create a set of policies and apply those settings to patient rooms in your healthcare organization.
	Public safety officer	This policy package is designed to create a set of policies and apply those settings to public safety officers in your organization.
	Small and medium business user (Business Voice)	This policy package is designed to set an app setup policy that includes the app for a business voice experience for Teams users

Each individual policy is given the name of the policy package so you can easily identify the policies that are linked to a policy package. For example, when you assign the Public safety officer policy package to users in your organization, a policy named PublicSafety_Officer is created for each policy in the package.

Public safety officer

This policy package is designed to create a set of policies and apply those settings to public safety officers in your organization. [Learn more](#)

Assigned policies

Messaging policy	PublicSafety_Officer
Meeting policy	PublicSafety_Officer
App setup policy	PublicSafety_Officer
Calling policy	PublicSafety_Officer

Manage policy packages

View

View the settings of each policy in a policy package before you assign a package. In the left navigation of the Microsoft Teams admin center, select **Policy packages**, select the package name, and then select the policy name.

Decide whether the predefined values are appropriate for your organization or whether you need to customize them to be more restrictive or lenient based on your organization's needs.

Customize

Customize the settings of policies in the policy package, as needed, to fit the needs of your organization. Any changes you make to policy settings are automatically applied to users who are assigned the package. To edit the settings of a policy in a policy package, in the Microsoft Teams admin center, select the policy package, select the name of the policy you want to edit, and then select **Edit**.

Keep in mind that you can also change the settings of policies in a package after you assign the policy package. To learn more, see [Customize policies in a policy package](#).

Assign

Assign the policy package to users. If a user has a policy assigned, and then later you assign a different policy, the most recent assignment will take priority.

NOTE

Each user will require the Advanced Communications add-on in order to receive a custom policy package assignment. For more information, see [Advanced Communications add-on for Microsoft Teams](#).

Assign a policy package to one or several users

To assign a policy package to one or multiple users, in the left navigation of the Microsoft Teams admin center, go to **Policy packages**, and then select **Manage users**.

The screenshot shows the Microsoft Teams admin center interface. The left navigation pane includes options like Dashboard, Teams, Devices, Locations, Users, Meetings, Messaging policies, Teams apps, Voice, Policy packages (selected), Analytics & reports, Org-wide settings, Planning, Notifications & Alerts, Legacy portal, and Call quality dashboard. The main content area is titled 'Policy packages' and contains a 'Manage users' section. This section lists various policy packages with columns for Name and Description. The 'Healthcare clinical worker' package is highlighted. To the right, a 'Manage users' dialog box is open, showing a search bar with 'Amos Marble' and a list of users, including 'Amos Marble' with a green 'AM' icon. Below the list is a message: 'To add users, search by their display or username.' At the bottom of the dialog are 'Apply' and 'Cancel' buttons.

To learn more, see [Assign a policy package](#).

If a user has a policy assigned, and then later you assign a different policy, the most recent assignment will take priority.

Assign a policy package to a group

This feature is in private preview

Policy package assignment to groups let you assign multiple policies to a group of users, such as a security group or distribution list. The policy assignment is propagated to members of the group according to precedence rules. As members are added to or removed from a group, their inherited policy assignments are updated accordingly. This method is recommended for groups of up to 50,000 users but will also work with larger groups.

To learn more, see [Assign a policy package to a group](#).

Assign a policy package to a large set (batch) of users

Use batch policy package assignment to assign a policy package to large sets of users at a time. You use the [New-CsBatchPolicyPackageAssignmentOperation](#) cmdlet to submit a batch of users and the policy package that you want to assign. The assignments are processed as a background operation and an operation ID is generated for each batch.

A batch can contain up to 5,000 users. You can specify users by their object Id, UPN, SIP address, or email

address. To learn more, see [Assign a policy package to a batch of users](#).

Limits and specifications for Microsoft Teams

12/7/2021 • 13 minutes to read • [Edit Online](#)

This article describes some of the limits, specifications, and other requirements that apply to Teams.

Teams and channels

FEATURE	MAXIMUM LIMIT
Number of teams a user can create	Subject to a 250 object limit ¹
Number of teams a user can be a member of	1,000 ²
Number of members in a team	25,000 ⁶
Number of owners per team	100
Number of org-wide teams allowed in a tenant	5 ²
Number of members in an org-wide team	10,000
Number of teams a global admin can create	500,000
Number of teams a Microsoft 365 or Office 365 organization can have	500,000 ³
Number of channels per team	200 (includes deleted channels) ⁴
Number of Private channels per team	30 (includes deleted channels) ⁴
Number of members in a Private channel	250
Maximum size of distribution list, security group or Office 365 group that can be imported in to a team	3,500
Maximum number of members in an Office 365 group that can be converted to a team	10,000 ⁶
Channel conversation post size	Approximately 28 KB per post ⁵

¹ Any directory object in Azure Active Directory counts towards this limit. Global admins are exempt from this limit, as are apps calling Microsoft Graph using [application permissions](#).

² This limit includes archived teams.

³ To further increase the number of teams, you must contact Microsoft support and request further increase to the number of Azure Active Directory objects in your tenant. Increase is only made for real-life production scenarios.

⁴ Deleted channels can be restored within 30 days. During these 30 days, a deleted channel continues to be counted towards the 200 channel or 30 private channel per team limit. After 30 days, a deleted channel and its

content are permanently deleted and the channel no longer counts towards the per team limit.

⁵ 28 KB is an approximate limit because it includes the message itself (text, image links, etc.), @-mentions, number of connectors, and reactions.

⁶ Teams in GCC can accommodate 25,000 members but teams in GCCH/DoD can only accommodate 2,500 members. Further note that teams/channel mentions are blocked in teams with over 10,000 members.

Messaging

Chat

Users who participate in conversations that are part of the chat list in Teams must have an Exchange Online (cloud-based) mailbox for an admin to search chat conversations. That's because conversations that are part of the chat list are stored in the cloud-based mailboxes of the chat participants. If a chat participant doesn't have an Exchange Online mailbox, the admin won't be able to search or place a hold on chat conversations. For example, in an Exchange hybrid deployment, users with on-premises mailboxes might be able to participate in conversations that are part of the chat list in Teams. However, in this case, content from these conversations isn't searchable and can't be placed on hold because the users don't have cloud-based mailboxes. (For more, see [How Exchange and Microsoft Teams interact](#).)

FEATURE	MAXIMUM LIMIT
Number of people in a private chat ¹	250 ²
Number of people in a video or audio call from chat	20
Number of file attachments ³	10
Chat size	Approximately 28 KB per post ⁴

¹ If you have more than 20 people in a chat, the following chat features are turned off: Outlook automatic replies and Teams status messages; typing indicator; video and audio calling; sharing; read receipts. The "Set Delivery Options" button (!) is also removed when private group chats contain more than 20 members.

² Only 200 members at a time can be added to a group chat. [See this article for more information](#).

³ If the number of attachments exceeds this limit, you'll see an error message.

⁴ 28 KB is an approximate limit because it includes the message itself (text, image links, etc.), @-mentions, and reactions.

Emailing a channel

If users want to send an email to a channel in Teams, they use the channel email address. When an email is part of a channel, anyone can reply to it to start a conversation. Here are some of the applicable limits for sending email to a channel.

FEATURE	MAXIMUM LIMIT
Message size ¹	24 KB
Number of file attachments ²	20
Size of each file attachment	Less than 10 MB

FEATURE	MAXIMUM LIMIT
Number of inline images ²	50

¹ If the message exceeds this limit, a preview message is generated and the user is asked to download and view the original email from the link provided.

² If the number of attachments or images exceeds this limit, you'll see an error message.

For more information, see [Exchange Online limits](#).

NOTE

Message size, file attachments, and inline images limits are the same across all Microsoft 365 and Office 365 licenses. Emailing a channel is not available in Teams for Office GCC/GCCH/DOD organizations.

Channel names

Channel names can't contain the following characters or words:

TYPE	EXAMPLE
Characters	~ # % & * { } + / \ : < > ? ' " , ..
Characters in these ranges	0 to 1F 80 to 9F
Words	forms, CON, CONIN\$, CONOUT\$, PRN, AUX, NUL, COM1 to COM9, LPT1 to LPT9, desktop.ini, _vti_

Channel names also can't start with an underscore (_) or period (.) or end with a period (.).

Meetings and calls

FEATURE	MAXIMUM LIMIT
Number of people in a meeting (can chat and call in)	1000, includes GCC, GCCH, and DoD, but not A1 (300). View-only allows for up to 20,000 listen-only participants to join a meeting in which the organizer has a license for E3/E5/A3/A5 SKU, as well as, Government (GCC, GCC High, DoD). The view-only experience will soon be available for webinars as well. Learn more about the View-only experience . ^{1,2}
Number of people in a video or audio call from chat	20
Max PowerPoint File Size	2GB
Teams keeps meeting recordings that don't get uploaded to Microsoft Stream, available for local download	20 days

¹ For the best experience in large meetings, webinars, and live events, Microsoft recommends using the latest version of Teams desktop client or Teams mobile clients.

² Presenters in large meetings, webinars, and live events should use the Teams desktop client. For more tips on

hosting large meetings, please see [Best practices for a large Teams meeting](#).

NOTE

Breakout rooms can only be created in meetings that have fewer than 300 attendees. In addition, creating breakout rooms in a meeting automatically limits the number of meeting attendees to 300. Advise your end-users to not initiate breakout rooms in meetings where they expect more than 300 participants. For more information on large Team meetings, share the guidance [Best practices for a large Teams meeting](#) with your end-users.

Meeting expiration

NOTE

A meeting URL will never stop working. The expiry only relates to any PSTN dial-in numbers, CVI coordinates, and/or underlying meeting policies and settings.

MEETING TYPE	MEETING EXPIRES AFTER THIS MUCH TIME	EACH TIME YOU START OR UPDATE A MEETING, EXPIRATION EXTENDS BY THIS MUCH TIME
Meet now	Start time + 8 hours	N/A
Regular with no end time	Start time + 60 days	60 days
Regular with end time	End time + 60 days	60 days
Recurring with no end time	Start time + 60 days	60 days
Recurring with end time	End time of last occurrence + 60 days	60 days

NOTE

Microsoft Teams meetings have a time limit of 30 hours.

Teams Live Events

FEATURE	MAXIMUM LIMIT
Audience size	10,000 attendees
Duration of event	4 hours
Concurrent Live Events running in a Microsoft 365 or Office 365 organization ¹	15

¹ You can schedule as many Live Events as you want, but you can only run 15 at a time. As soon as the producer joins a live event, it's considered to be running. The producer who attempts to join the 16th live event gets an error.

For more information about live events and a comparison of Teams live events to Skype Meeting Broadcast, go to [Teams live events and Skype Meeting Broadcast](#). See also [Schedule a Teams live event](#).

Microsoft 365 live event limit increases

- Event support for up to 20,000 attendees
- 50 events can be hosted simultaneously across a tenant
- Event duration of 16 hours per broadcast

Additionally, Live Events with up to 100,000 attendees can be planned through the Microsoft 365 assistance program. The team will assess each request and work with you to determine options that may be available. [Learn more.](#)

Teams presence in Outlook is supported on the Outlook 2013 desktop app and later. To learn more about presence in Teams, see [User presence in Teams](#).

Each team in Microsoft Teams has a team site in SharePoint Online, and each channel in a team gets a folder within the default team site document library. Files shared within a conversation are automatically added to the document library, and permissions and file security options set in SharePoint are automatically reflected within Teams.

Each **private channel** has its own SharePoint site (previously called "site collection").

By storing the files in the SharePoint Online document library and OneDrive for Business, all compliance rules configured at the tenant level will be followed. (For more, see [How SharePoint Online and OneDrive for Business interact with Microsoft Teams.](#))

Because Teams runs on a SharePoint Online backend for file sharing, SharePoint limitations apply to the Files section within a Team. Here are the applicable storage limits for SharePoint Online.

[illegible]

FEATURE	MICROSOFT 365 BUSINESS BASIC	MICROSOFT 365 BUSINESS STANDARD	OFFICE 365 ENTERPRISE E1	OFFICE 365 ENTERPRISE E3	OFFICE 365 ENTERPRISE E5	OFFICE 365 ENTERPRISE F1
File upload limit (per file)	250 GB	250 GB	250 GB	250 GB	250 GB	250 GB

Channels are backed by folders within the SharePoint Online site (previously called "site collection") created for the team, so file tabs within Channels share the storage limits of the team they belong to.

For more information, see [SharePoint Online limits](#).

Class teams

Microsoft Teams for Education provides templates designed for unique education scenarios, such as classroom teaching. More information about team types, including class teams, is available in [Choose a team type to collaborate in Microsoft Teams](#).

A class team is a template type with additional apps included, and with limits separate to the number of team members.

NOTE

Using class teams requires an [Office 365 Education license](#).

Limits for class teams are listed in the following table:

FEATURE	MAXIMUM LIMIT
Number of members in a team	See the Teams and channels section of this article
Number of members to use Assignments in a class team	300
Number of members to use a OneNote Class Notebook in a class team	300

A class team can support more than 300 members. However, if you plan to use either the Assignments app or Class Notebook app within your team, you will need to keep the number of members below the maximum limits above.

Tags

FEATURE	MAXIMUM LIMIT
Number of tags per team	100
Number of suggested default tags per team	25
Number of team members assign to a tag	100
Number of tags assigned to a user per team	25

Contacts

Teams uses these contacts:

- Contacts in your organization's Active Directory
- Contacts added to the user's Outlook default folder

Teams users can communicate with anyone in your organization's Active Directory and can add anyone in your organization's Active Directory as a contact and to their contact lists by going to **Chat > Contacts** or **Calls > Contacts**.

Teams users can also add a person who isn't in your organization's Active Directory as a contact by going to **Calls > Contacts**.

Browsers

Teams fully supports the following Internet browsers, with noted exceptions for calling and meetings. This table applies to operating systems running on desktop computers.

BROWSER	CALLING - AUDIO, VIDEO, AND SHARING	MEETINGS - AUDIO, VIDEO, AND SHARING ^{1 2 3}
Internet Explorer 11	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on IE11 without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p> <p>Microsoft 365 apps and services will not support Internet Explorer 11 starting August 17, 2021 (Microsoft Teams will not support Internet Explorer 11 earlier, starting November 30, 2020). Learn more. Please note that Internet Explorer 11 will remain a supported browser. Internet Explorer 11 is a component of the Windows operating system and follows the Lifecycle Policy for the product on which it is installed.</p>
Microsoft Edge, RS2 or later	Fully supported, except no outgoing sharing ⁴	Fully supported, except no outgoing sharing
Microsoft Edge (Chromium-based), the latest version plus two previous versions	Fully supported	Fully supported
Google Chrome, the latest version plus two previous versions	Fully supported	<p>Fully supported</p> <p>Sharing is supported without any plug-ins or extensions on Chrome version 72 or later.</p>

BROWSER	CALLING - AUDIO, VIDEO, AND SHARING	MEETINGS - AUDIO, VIDEO, AND SHARING
Safari 14+	<p>1:1 calls not supported. Group calls fully supported.</p> <p>Video: Fully supported</p> <p>Sharing: Fully supported</p>	<p>Meetings: Fully supported</p> <p>Video: Fully supported</p> <p>Sharing: Fully supported</p>
Safari 13.1+	<p>1:1 calls not supported. Group calls supported with full audio support.</p> <p>Video: Incoming only</p> <p>Sharing: Fully supported</p>	<p>Meetings are supported with full audio support.</p> <p>Video: Incoming only</p> <p>Sharing: Fully supported</p>
Firefox, the latest version plus two previous versions	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on Firefox without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p>
Safari versions before 13	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on Safari without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p> <p>Safari is enabled on versions higher than 11.1 in preview. While in preview, there are known issues with Safari's Intelligent Tracking Prevention.</p>

¹ To [give and take control of shared content during sharing](#), both parties must be using the Teams desktop client. Control isn't supported when either party is running Teams in a browser. This is due to a technical limitation that we're planning to fix.

² Blur my background isn't available when you run Teams in a browser. This feature is only available in the Teams desktop client.

³ Teams meetings on browsers are limited to a single incoming video feed of active speaker.

⁴ Edge RS2 or later doesn't support sending real-time audio and video traffic through HTTP proxies.

NOTE

As long as an operating system can run the supported browser, Teams is supported on desktop computers. For example, running Firefox on the Linux operating system is an option for using Teams.

For mobile operating systems, we recommend that you run the Teams app, available from the Android and iOS stores. Running Teams in a mobile operating system is supported, but many features are unavailable.

Operating systems

For information about operating system requirements, see [Get clients for Microsoft Teams](#).

Manage user access to Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

You manage access to Teams at the user level by assigning or removing a Microsoft Teams product license. Except for joining Teams meetings anonymously, each user in your organization must have a Teams license before they can use Teams. You can assign a Teams license for new users when new user accounts are created or to users with existing accounts.

By default, when a licensing plan (for example, Microsoft 365 Enterprise E3 or Microsoft 365 Business Premium) is assigned to a user, a Teams license is automatically assigned, and the user is enabled for Teams. You can disable or enable Teams for a user by removing or assigning a license at any time.

Use messaging policies, managed from the [Teams Admin Center](#), to control what chat and channel messaging features are available to users in Teams. You can use the default policy or create one or more custom messaging policies for people in your organization. To learn more, read [Manage messaging policies in Teams](#). You manage Teams licenses in the Microsoft 365 admin center or by using PowerShell. You must be a Global admin or User management admin to manage licenses.

NOTE

We recommend that you enable Teams for all users so that teams can be formed organically for projects and other dynamic initiatives. Even if you're running a pilot, it may still be helpful to keep Teams enabled for all users, but only target communications to the pilot group of users.

Using the Microsoft 365 admin center

Teams user-level licenses are managed directly through the Microsoft 365 admin center user management interfaces. An administrator can assign licenses to new users when new user accounts are created, or to users with existing accounts.

IMPORTANT

The administrator must have Global Administrator or User Management Administrator privileges to manage Microsoft Teams licenses. Use the Microsoft 365 admin center to manage Teams licenses for individual users or small sets of users at a time. You can manage Teams licenses on the **Licenses** page (for up to 20 users at a time) or **Active users** page. The method you choose depends on whether you want to manage product licenses for specific users or manage user licenses for specific products.

If you need to manage Teams licenses for a large number of users, such as hundreds or thousands of users, [use PowerShell](#) or [group-based licensing in Azure Active Directory \(Azure AD\)](#).

Assign a Teams license

The steps are different depending on whether you use the **Licenses** page or **Active users** page. For step-by-step instructions, see [Assign licenses to users](#).

Remove a Teams license

IMPORTANT

It takes about 24 hours for disabling a Teams SKU to take effect.

When you remove a Teams license from a user, Teams is disabled for that user, and they will no longer see Teams in the app launcher or homepage. For detailed steps, see [Unassign licenses from users](#).

Using PowerShell

Use PowerShell to manage Teams licenses for users in bulk. You enable and disable Teams through PowerShell in the same way that you would for any other service plan license. You'll need the identifiers for the service plans for Teams, which are as follows:

- Microsoft Teams: TEAMS1
- Microsoft Teams for GCC: TEAMS_GOV
- Microsoft Teams for DoD: TEAMS_DOD

Assign Teams licenses in bulk

For detailed steps, see [Assign licenses to user accounts with PowerShell](#).

Remove Teams licenses in bulk

For detailed steps, see [Disable access to services with PowerShell](#) and [Disable access to services while assigning user licenses](#).

Example

The following is an example of how to use the [New-MsolLicenseOptions](#) and [Set-MsolUserLicense](#) cmdlets to disable Teams for users who have a specific licensing plan. For example, follow these steps to first disable Teams for all users who have a particular licensing plan. Then enable Teams for each individual user who should have access to Teams.

IMPORTANT

The [New-MsolLicenseOptions](#) cmdlet will enable all services that were previously disabled unless explicitly identified in your custom script. For example, if you want to leave both Exchange and Sway disabled while also disabling Teams, you'll need to include this in the script or both Exchange and Sway will be enabled for those users you identified.

Run the following command to display all available licensing plans in your organization. To learn more, see [View licenses and services with PowerShell](#).

```
Get-MsolAccountSku
```

Run the following commands, where <CompanyName:License> is your organization name and the identifier for the licensing plan that you retrieved in the earlier step. For example, ContosoSchool:ENTERPRISEPACK_STUDENT.

```
$acctSKU="<CompanyName:License>  
$x = New-MsolLicenseOptions -AccountSkuId $acctSKU -DisabledPlans "TEAMS1"
```

Run the following command to disable Teams for all users who have an active license for the licensing plan.

```
Get-MsolUser | Where-Object {$_.licenses[0].AccountSku.SkuPartNumber -eq  
($acctSKU).Substring($acctSKU.IndexOf(":")+1, $acctSKU.Length-$acctSKU.IndexOf(":")-1) -and $_.IsLicensed -  
eq $True} | Set-MsolUserLicense -LicenseOptions $x
```

Microsoft Teams add-on licenses

12/7/2021 • 12 minutes to read • [Edit Online](#)

What are add-on licenses?

Add-on licenses are licenses for specific Microsoft Teams features. They give you the flexibility to add features only for users in your organization who need them. To add a feature, buy one add-on license for each user who will use it.

What features can I get with add-on licenses?

Here's a list of features that you can add with Teams add-on licenses. The add-on licensing options available to you depend on the Microsoft 365 or Office 365 plan you have.

Feature	Description	Small business (<300 users)	Large business (>300 users)
Microsoft 365 Business Voice	Business Voice is a telephony solution designed for small and medium businesses of up to 300 users that bundles Phone System, Audio Conferencing, a Domestic Calling Plan, and more. Phone System capabilities that you'll get include voicemail, caller ID, call park, call forwarding, auto attendants, and call queues. To find out whether Business Voice is available in your country or region, see Country and region availability for Business Voice . For pricing info, see Pricing for Business Voice .	✓	

<p>Audio Conferencing</p>	<p>Sometimes people in your organization will need to use a phone to call in to a Teams meeting instead their computer. Set up Audio Conferencing for users who schedule or lead meetings. To find out whether Audio Conferencing is available in your country or region, see Country and region availability for Audio Conferencing and Calling Plans. For pricing info, see Pricing for Audio Conferencing.</p> <p>If you're a small or medium-sized business with up to 300 users and you currently don't have Audio Conferencing licenses, you can get Audio Conferencing free for one year. Starting October 1, 2020, the free Audio Conferencing offer is available to users who have Microsoft 365 Business Basic, Business Standard, Business Premium, Enterprise E1, or Enterprise E3 licenses. To learn more, see Set up Audio Conferencing for small and medium businesses.</p>	<p>✓</p>	<p>✓</p>
<p>Toll free numbers</p>	<p>If you want toll-free numbers for Audio Conferencing, auto attendants, or call queues, you must set up Communications Credits.</p>	<p>✓</p>	<p>✓</p>

Phone System	<p>Phone System is a hosted telephone service that gives you call control and Private Branch Exchange (PBX) capabilities, with options for connecting to the Public Switched Telephone Network (PSTN). Phone System features include cloud voicemail, caller ID, call park, call forwarding, auto attendants, call queues, call transfer, caller ID, and more.</p> <p>To learn more, see Here's what you get with Phone System. For pricing info, see Pricing for Phone System.</p>	√ ¹	✓
Calling Plans	<p>If you want users to be able to call phone numbers outside your organization, get a Calling Plan. There are Domestic Calling Plans and Domestic and International Calling Plans. For pricing info, see Pricing for Calling Plans.</p>	√ ¹	✓
Microsoft Teams Rooms	<p>Microsoft Teams Rooms isn't an add-on, but a feature that brings video, audio, and content sharing to conference rooms. See Teams Meeting Room Licensing.</p>	✓	✓
Advanced Communications	<p>Advanced Communications includes advanced meetings customization and tools to manage your organization's communication policies. Additional features include custom branded meeting lobby to tailor your meetings, and tools to monitor, track, and analyze data on users and devices.</p>	✓	✓

¹ If you're a small or medium-sized business who has a Microsoft 365 Enterprise plan, you can still buy add-on licenses for these voice features, however, we recommend that you consider a [Microsoft 365 Business](#) plan and [Business Voice](#).

What voice features are available with my plan?

See what add-on licenses you need to get voice features in Teams, depending on the plan you have.

Depending on the voice features that you want, we recommend comparing whether it's more cost effective for you to switch to a plan that includes those features. For example, for most large organizations, buying a bundle

of software in a Microsoft 365 Enterprise plan will result in lower overall cost. Typically, when you buy several add-on licenses individually instead of as part of a plan, you may end up with a higher combined cost.

- [Small business](#)
- [Enterprise](#)
- [Education](#)
- [Government](#)
- [Nonprofit](#)
- [Trial offers](#)

If you're a small or medium-sized business (less than 300 users), you have four ways to get voice features:

- Buy a Microsoft 365 Business plan and Microsoft 365 Business Voice.
- Buy an Enterprise E1 or E3 plan and Microsoft 365 Business Voice.
- Buy an Enterprise E1 or E3 plan and add voice features individually.
- Buy an Enterprise E5 plan, which includes voice features.

For Microsoft 365 Business Voice, you have two options to choose from:

- **Microsoft 365 Business Voice with a Calling Plan:** Get this if you want all phone number management and billing to be handled by Microsoft.
- **Microsoft 365 Business Voice without a Calling Plan (Direct Routing):** Get this if you want all phone number management and billing to be handled by your third-party telephone provider. You'll need to set up and deploy [Direct Routing](#) to connect your on-premises Session Border Controllers (SBCs) to Microsoft 365 or Office 365.

To learn more, see [What do I need to buy to use Microsoft 365 Business Voice?](#).

Here's a summary based on licensing plan.

SMALL BUSINESS (<300 PEOPLE)						
Base plan	Voice calling and conferencing options					
Microsoft 365 Business Basic Microsoft 365 Business Standard Microsoft 365 Business Premium	Microsoft 365 Business Voice International Calling Plan (optional) Communication Credits	Or	Microsoft 365 Business Voice with out calling plan Audio Conferencing Communication Credits	Or	Audio Conferencing Communication Credits	

SMALL BUSINESS (<300 PEOPLE)					
Microsoft 365 Enterprise E1/E3 Office 365 Enterprise E1/E3 Microsoft 365 F3 Office 365 F3 Microsoft 365 F1	Microsoft 365 Business Voice International Calling Plan (optional) Communication Credits	Or	Microsoft 365 Business Voice with out calling plan	Or	Audio Conferencing Phone System Domestic Calling Plan Domestic and International Calling Plan (optional) Communication Credits
Microsoft 365 Enterprise E5 Office 365 Enterprise E5	Domestic Calling Plan Domestic and International Calling Plan (optional) Communication Credits				

If Audio Conferencing isn't supported in your country or region, you have the option to get a Microsoft 365 Enterprise E5 without Audio Conferencing plan or an Office 365 Enterprise E5 without Audio Conferencing plan.

If you already have a Microsoft 365 Enterprise or Office 365 Enterprise plan, you can still buy add-on licenses for individual voice features. However, you have the option to switch to a [Microsoft 365 Business](#) plan and [Microsoft 365 Business Voice](#). In some cases, depending on the features that you want, it might be more cost effective to get a Microsoft 365 Business plan with Microsoft 365 Business Voice.

NOTE

If you need to use a third-party telephone service, [Direct Routing](#) is deployed in your organization, or if Calling Plans aren't available in your country or region, you need to use Direct Routing for voice features.

- [Teams service description](#)

Assign Teams add-on licenses to users

12/7/2021 • 5 minutes to read • [Edit Online](#)

Add-on licenses are licenses for specific Teams features such as Audio Conferencing, Phone System, and Calling Plans. This article describes how to assign add-on licenses to individual users and to large sets of users in bulk.

NOTE

See [Teams add-on licensing](#) for Teams features that are available with add-on licenses. You'll also find information about what licenses you need to buy and how to buy them (depending on your plan), so users can get features such as Audio Conferencing, toll-free numbers, and the ability to call phone numbers outside your organization. After you decide which features you want for your users, assign the licenses to them.

You can use the Microsoft 365 admin center or PowerShell to assign licenses to users in your organization. You must be a Global admin or User management admin to manage licenses.

What you need to know before you assign Phone System, Calling Plan, and Communication Credits licenses

Before you get started, review the following requirements:

- If you're using on-premises Public Switched Telephone Network (PSTN) connectivity for hybrid users, you only need to assign a Phone System license. Do NOT assign a Calling Plan license.
- Because of the latency between Microsoft 365 and Microsoft Teams, it can take up to 24 hours for a user to be assigned a Calling Plan after you assign a license. If the user isn't assigned a Calling Plan after 24 hours, [contact support for business products - admin help](#).
- You'll get an error message if you haven't purchased the correct number of licenses. If you need to buy more Calling Plan licenses, choose the option to buy more.
- Even if your users are assigned Enterprise E5 licenses, you still need to assign [Communications Credits](#) licenses to them if they want to make or receive calls from the PSTN.
- After you assign Calling Plan or Communication Credits licenses to your users, you'll need to get phone numbers for your organization, and then assign those numbers to users. For step-by-step instructions, see [Set up Calling Plans](#).

Using the Microsoft 365 admin center

Use the Microsoft 365 admin center to assign licenses to individual users or small sets of users at a time. You assign licenses on the **Licenses** page (for up to 20 users at a time) or the **Active users** page (for up to 40 users at a time). The method you choose depends on whether you want to manage product licenses for specific users or manage user licenses for specific products.

For step-by-step instructions, see [Assign licenses to users](#).

If you need to assign licenses for a large number of users, such as hundreds or thousands of users, use Powershell or [group-based licensing in Azure Active Directory \(Azure AD\)](#).

Using PowerShell

Use PowerShell to assign licenses to users in bulk. To learn more, see [Assign licenses to user accounts with PowerShell](#).

Example script

Here's an example of how to use a script to assign licenses to your users.

1. Install the 64-bit version of the [Microsoft Online Services Sign-in Assistant for IT Professionals RTW](#).
2. Install the Microsoft Azure Active Directory Module for Windows PowerShell:
 - a. Open an elevated Windows PowerShell command prompt (run Windows PowerShell as an admin).
 - b. Run the following command:

```
Install-Module MSOnline
```

- c. If you're prompted to install the NuGet provider, type **Y**, and then press Enter.
 - d. If you're prompted to install the module from PSGallery, type **Y**, and then press Enter.
3. At the Windows PowerShell command prompt, run the following script to assign licenses to your users, where <CompanyName:License> is your organization name and the identifier for the license that you want to assign. For example, litwareinc:MCOMEETADV.

The identifier is different than the friendly name of the license. For example, the identifier for Audio Conferencing is MCOMEETADV. To learn more, see [Product names and SKU identifiers for licensing](#).

```
#Create a text file with a single column that lists the user principal names (UPNs) of users to
assign licenses to. The MSOL service uses the UPN to license user accounts.
#Example of text file:''
#user1@domain.com
#user2@domain.com

#Import Module
ipmo MSOnline

#Authenticate to MSOLservice
Connect-MSOLService

#File prompt to select the userlist txt file
[System.Reflection.Assembly]::LoadWithPartialName("System.Windows.Forms") | Out-Null
$OFD = New-Object System.Windows.Forms.OpenFileDialog
$OFD.filter = "text files (*.*)| *.txt"
$OFD.ShowDialog() | Out-Null
$OFD.filename

If ($OFD.filename -eq '')
{
Write-Host "You did not choose a file. Try again" -ForegroundColor White -BackgroundColor Red
}

#Create a variable of all users
$users = Get-Content $OFD.filename

#License each user in the $users variable
foreach ($user in $users)
{
Write-host "Assigning License: $user"
Set-MsolUserLicense -UserPrincipalName $user -AddLicenses "litwareinc:<CompanyName:License>" -
ErrorAction SilentlyContinue
Set-MsolUserLicense -UserPrincipalName $user -AddLicenses "litwareinc:<CompanyName:License>" -
ErrorAction SilentlyContinue
}
```

For example, to assign Microsoft 365 Enterprise 1 and Audio Conferencing licenses, use the following

syntax in the script:

```
Set-MsolUserLicense -UserPrincipalName $user -AddLicenses "litwareinc:ENTERPRISEPACK" -ErrorAction SilentlyContinue
Set-MsolUserLicense -UserPrincipalName $user -AddLicenses "litwareinc:MCOMETADV" -ErrorAction SilentlyContinue
```

To assign a Microsoft Business Voice (without Calling Plan) license, use the following syntax in the script:

```
Set-MsolUserLicense -UserPrincipalName $user -AddLicenses "litwareinc:BUSINESS_VOICE_DIRECTROUTING" -ErrorAction SilentlyContinue
```

Product names and SKU identifiers for licensing

Here's a partial list of product names and their corresponding SKU part names that you can use as a reference when you use PowerShell to manage licenses in Teams.

To learn more, see [View licenses and services with PowerShell](#), [Product names and service plan identifiers for licensing](#), and [Education SKU reference](#).

PRODUCT NAME	SKU PART NAME
Microsoft Enterprise E5 (with Phone System)	ENTERPRISEPREMIUM
Microsoft Enterprise E5 (without Audio Conferencing)	ENTERPRISEPREMIUM_NOPSTNCONF
Microsoft Enterprise E5 (with Audio Conferencing)	ENTERPRISEPREMIUM
Microsoft Enterprise E3	ENTERPRISEPACK
Microsoft Enterprise E1	STANDARDPACK
Microsoft 365 Business Basic	O365_BUSINESS_ESSENTIALS
Microsoft 365 Business Standard	O365_BUSINESS_PREMIUM
Microsoft 365 Business	SPB
Microsoft Business Voice (Canada)	BUSINESS_VOICE_MED
Microsoft Business Voice (United Kingdom)	BUSINESS_VOICE
Microsoft Business Voice (United States)	BUSINESS_VOICE_MED2
Microsoft Business Voice (without Calling Plan)	BUSINESS_VOICE_DIRECTROUTING
Microsoft Business Voice (without Calling Plan) for the United States	BUSINESS_VOICE_DIRECTROUTING _MED
Audio Conferencing	MCOMETADV
Audio Conferencing Pay Per Minute (pay as you go) <i>Requires Communications Credits to be set up and enabled.</i>	MCOMETACPEA

PRODUCT NAME	SKU PART NAME
Phone System	MCOEV
Domestic and International Calling Plan	MCOPSTN2
Domestic Calling Plan (3000 minutes per user/month for US/PR/CA, 1200 minutes per user/month for EU countries)	MCOPSTN1
Domestic Calling Plan (120 minutes per user/month for each country) <i>This plan isn't available in the United States.</i>	MCOPSTN5
Domestic Calling Plan (240 minutes per user/month for each country) <i>This plan isn't available in the United States.</i>	MCOPSTN6
Communications Credits	MCOPSTNPP

Manage the Office 365 E1 trial

12/7/2021 • 2 minutes to read • [Edit Online](#)

As of July 1, 2020, the Office 365 E1 Trial license is no longer available. If you need to license users for Microsoft Teams, read the [Microsoft Teams service description](#) for a list of paid subscriptions that include Teams. Alternatively, eligible organizations can use the [Free version of Teams](#), or employees can activate the [Teams Exploratory](#) experience.

If you're a Teams for Education customer, check out the free [Office 365 A1 license](#).

Use the guidance in this article to manage your existing Office 365 E1 Trial licenses, including [upgrading to a paid subscription](#).

Don't miss all of our guidance for [supporting remote workers with Teams](#).

Manage the E1 Trial

Once you've activated the Office 365 E1 Trial, turn on the license for any users who need it. To learn how, read [Manage user access to Teams](#).

Once you've turned on the E1 Trial for the users who need it, you'll manage these users just like you manage users who have a paid license. For more information, see [Manage Teams settings for your organization](#).

Upgrade users from the Office 365 E1 Trial license

To upgrade E1 Trial users to a paid subscription:

1. Purchase a subscription that includes Teams.
2. Remove the Office 365 E1 Trial subscription from the user.
3. Assign the newly purchased license.

For more information, see [Microsoft Teams service description](#).

NOTE

If the E1 Trial license ends and a user is not immediately upgraded to a subscription that includes Teams, the user data is not removed. The user still exists in Azure Active Directory and all data within Teams still remains. Once a new license is assigned to the user to enable Teams functionality again, all content will still exist.

Remove an Office 365 E1 Trial license

- If you would like to remove this license by using PowerShell, see: [Remove licenses from user accounts with Office 365 PowerShell](#)
- If you would like to remove this license through the admin portal, see: [Delete a user from your organization](#)

Manage the Office 365 G1 Trial for US government

12/7/2021 • 2 minutes to read • [Edit Online](#)

As of July 1, 2020, the Office 365 E1 Trial license is no longer available. If you need to license users for Microsoft Teams, read the [Microsoft Teams service description](#) for a list of paid subscriptions that include Teams.

Use the guidance in this article to manage your existing Office 365 G1 Trial licenses, including [upgrading to a paid subscription](#). To learn more, read [Microsoft 365 Government Plans](#) and the [Microsoft Teams capabilities available in the GCC Cloud](#).

Don't miss all of our guidance for [supporting remote workers with Teams](#).

Manage the G1 Trial

Once you've activated the Office 365 G1 Trial, turn on the license for any users who need it. To learn how, read [Manage user access to Teams](#).

Once you've turned on the G1 Trial for the users who need it, you'll manage these users just like you manage users who have a paid license. For more information, see [Manage Teams settings for your organization](#).

Upgrade users from the Office 365 G1 Trial license

To upgrade G1 Trial users to a paid subscription:

1. Purchase a subscription that includes Teams.
2. Remove the Office 365 G1 Trial subscription from the user.
3. Assign the newly purchased license.

For more information, see [Teams for Government](#).

NOTE

If the G1 Trial license ends and a user is not immediately upgraded to a subscription that includes Teams, the user data is not removed. The user still exists in Azure Active Directory and all data within Teams still remains. Once a new license is assigned to the user to enable Teams functionality again, all content will still exist.

Remove an Office 365 G1 Trial license

- If you would like to remove this license by using PowerShell, see: [Remove licenses from user accounts with Office 365 PowerShell](#)

Manage the Microsoft Teams Exploratory license

12/7/2021 • 6 minutes to read • [Edit Online](#)

The Microsoft Teams Exploratory experience lets users in your organization who have Azure Active Directory (Azure AD) and aren't licensed for Teams initiate an exploratory experience of Teams. Admins can switch this feature on or off for users in their organization.

What's in the Teams Exploratory experience

The service plans that an admin will see as part of the Teams Exploratory experience are:

- Exchange Online (Plan 1)
- Flow for Microsoft 365 or Office 365
- Insights by MyAnalytics
- Microsoft Forms (Plan E1)
- Microsoft Planner
- Microsoft Search
- Microsoft StaffHub
- Microsoft Stream for Microsoft 365 and Office 365 E1 SKUs ¹</1>
- Microsoft Teams
- Mobile Device Management for Microsoft 365 or Office 365
- Office Mobile Apps for Office 365
- Office Online
- Power Apps for Microsoft 365 or Office 365
- SharePoint Online (Plan 1)
- Sway
- To-Do (Plan 1)
- Whiteboard (Plan 1)
- Yammer Enterprise

¹ The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch, you'll be able to opt in to this experience. In November, you'll have to opt out if you want to continue using Stream. Sometime in early 2021, we'll require all customers to use OneDrive for Business and SharePoint for new meeting recordings.

Who's eligible

Users fit the criteria for a Teams Exploratory experience if they:

- Have a managed Azure AD domain email address.

- Belong to a tenant with a paid subscription.
- Do not have an active Teams license.
- Are not in a tenant where a license assignment policy was created.

Users must be enabled to sign up for apps and trials (in the Microsoft 365 admin center). For more information, see [Manage the Teams Exploratory experience](#), later in this article.

Who isn't eligible

Users don't fit the criteria if they:

- Currently have Teams from a paid license or trial license, or previously had trial license
- Are in a tenant that used/received at least one special COVID offer.

Your organization isn't eligible for this offer if you're a Syndication Partner Customer or a GCC, GCC High, DoD, or EDU customer.

How users sign up for the Teams Exploratory experience

Eligible users can sign up for the Teams Exploratory experience by signing in to Teams from the desktop or web (teams.microsoft.com). At this time, enabling Exploratory through mobile is not supported. When they sign up, they'll be assigned this license automatically and the tenant admin will receive an email notification the first time someone in your org starts the Teams Exploratory experience.

Manage the Teams Exploratory experience

The Teams Exploratory experience is meant to be initiated by individual end users, and you can't initiate this offer on behalf of end-user employees.

The Teams Exploratory experience comes with an Exchange Online license, but it won't be assigned to the user until the admin assigns it. If the user doesn't have an Exchange license already, and the admin has yet to assign the Exchange Online license, the user won't be able to schedule meetings in Teams and might be missing other Teams functionality.

Admins can disable the ability for end users to run the Teams Exploratory experience within their organization by using the **Trial apps and services** switch.

Prevent users from installing trial apps and services

You can turn off a user's ability to install trial apps and services, which would prevent the user from running the Teams Exploratory experience.

1. From the Microsoft 365 admin center, go to **Settings > Org settings**, select **Services**, and then select **User owned apps and services**.

Services Security & privacy Organization profile		
	Name ↑	Description
	Microsoft Graph data connect	Manage and update your Microsoft Graph data connect settings.
	Microsoft Planner	Choose whether your users can publish plans and assigned tasks to an iCalendar feed.
	Modern authentication	Turn Modern authentication on or off for your entire organization.
	MyAnalytics	Manage and update MyAnalytics settings.
	Office 365 Groups	Manage external sharing.
	Office on the web	Let users open files stored in third-party storage services in Office.
	Office Scripts	Let users automate their tasks in Office on the web.
	Office software download settings	Choose whether your users can install Office apps on their own devices.
	Office What's New management Preview	Manage What's New content for Office.
	Reports	Show anonymous IDs instead of names in all reports, and send report data to Microsoft 365 usage analytics.
	SharePoint	Control external sharing.
	StaffHub	Choose whether to allow StaffHub in your organization.
	Sway	Manage sharing and content sources allowed for Sway.
	User owned apps and services	Allow users to access the Office Store and Office 365 trials.
	Whiteboard	Allow users to access Microsoft Whiteboard and collaborate on shared whiteboards.

2. Clear the check mark from **Let users install trial apps and services**.

User owned apps and services

☒ **Let users access the Office Store**
Allow people in your organization to access the Office Store using their work account. The Office Store provides access to apps that aren't curated or managed by Microsoft.

☐ **Let users install trial apps and services**
Allow people in your organization to sign up for Office 365 trials. These licenses will appear as user trials. They won't affect licenses owned by your organization or your billing.

NOTE

If your organization is ineligible for the Teams Exploratory experience, you won't see the **Let users install trial apps and services** option.

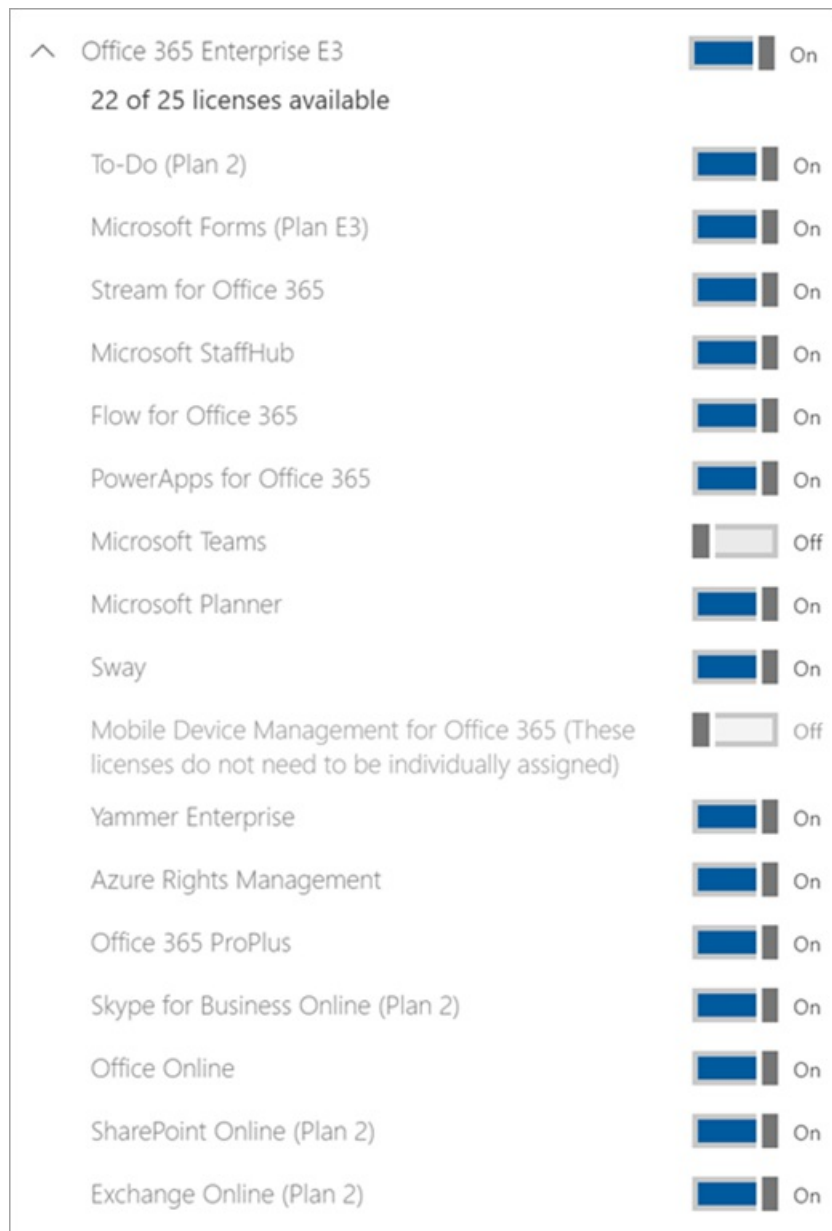

Manage availability for a user with a license that includes Teams

A user who is assigned a license that includes Teams isn't eligible for the Teams Exploratory experience. When the Teams service plan is turned on, the user can sign in and use Teams. If the service plan is disabled, the user can't sign in and the Teams Exploratory experience isn't available. You must have admin privileges.

To turn off access to Teams:

1. In the Microsoft 365 admin center, select **Users > Active users**.

2. Select the box next to the name of the user.
3. In the **Product licenses** row, choose **Edit**.
4. In the **Product licenses** pane, switch the toggle to **Off**.

Manage Teams availability for users who are already using the Teams Exploratory experience

If a user is running the Teams Exploratory experience, you can turn it off by removing the license or service plan. You must have admin privileges.

To turn off the Teams Exploratory experience license:

1. In the Microsoft 365 admin center, select **Users > Active users**.
2. Select the box next to the name of the user.
3. In the **Product licenses** row, choose **Edit**.
4. In the **Product licenses** pane, switch the toggle for this exploratory license to **Off**.

NOTE

The Teams Exploratory toggle switch will appear after the first user in the organization launches the Teams Exploratory experience.

Manage Teams for users who have the Teams Exploratory license

You can manage users who have the Teams Exploratory license just like you manage users who have a regular paid license. For more information, see [Manage Teams settings for your organization](#).

Upgrade users from Teams Exploratory

You must have admin privileges to upgrade users from Teams Exploratory. For more information see [Upgrade users from the Teams Exploratory trial](#).

NOTE

If the Teams Exploratory license ends and a user isn't immediately upgraded to a subscription that includes Teams, they lose access to Teams after a 30-days grace period. Another 30 days after which, the data is deleted. The user still exists in Azure Active Directory. Once a new license is assigned to the user to enable Teams functionality again, all content will still exist if the user is added within the grace period time frame.

Remove a Teams Exploratory license

- If you would like to remove this license by using PowerShell, see: [Remove licenses from user accounts with Office 365 PowerShell](#)
- If you would like to remove this license through the admin portal, see: [Delete a user from your organization](#)

What is the data retention policy

See [Microsoft 365 subscription information](#).

How long does the Teams Exploratory experience last

Teams Exploratory is available as a 12 month subscription (from initial user sign-up) for all new customers. The new Teams Exploratory subscription starts when the first user in an organization signs-up for Teams Exploratory and it will expire after 12 months. The expiry date will apply to all users in the same tenant as the 12-month term begins on the first user's sign-up date.

NOTE

The end date for the experience is configured at an organization level, meaning it will apply to all users in the same organization. For example, User 1 signs up for the subscription on January 1, 2021. This initiates a subscription end-date of December 31, 2021. Another user, User 2, signs up for the subscription on October 1, 2021. User 2 can use Teams Exploratory for two months, as their end-date will be December 31, 2021 because they're under the same organization's subscription as User 1.

What should administrators do at the end of the 12 month Teams Exploratory experience

At the end of the 12 month subscription, administrators should convert all Teams Exploratory users to a paid license that includes Teams. It is vital to ensure this is completed before the Teams Exploratory subscription expires to avoid any disruption to user's experience.

NOTE

Customers will be disabled and blocked from starting a new Exploratory trial licenses for 3 months past the expiration of their previous Exploratory trial license.

For more information, see [Upgrade users from Teams Exploratory](#), above in this article.

Upgrade users from the Teams Exploratory trial

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article provides an overview of how to upgrade your users from a Teams Exploratory trial to paid Teams licenses.

- [Step 1: When to upgrade](#)
- [Step 2: Choose an upgrade path](#)
- [Step 3: Assign paid licenses](#)

Step 1: When to upgrade

To check when your organization's Teams Exploratory trial is expiring and how many active users it has, go to **Billing > Your products** in the Microsoft 365 admin center. You'll also be notified before the Teams Exploratory trial expires.

IMPORTANT

You should make a plan to upgrade your users to paid licenses before the expiration date, so users don't lose access to Teams.

Users will lose access to Teams 30 days after the trial's expiration date. As long as users are assigned a paid license within 60 days of the expiration date, they can regain access to Teams and all content still exists. However, after 60 days, the users' data is deleted. After a new license is assigned to the users to enable Teams functionality, if they are added within the grace period time frame, all content remains. For more information, see [What happens to my data and access when my subscription ends?](#)

Step 2: Choose an upgrade path

Depending on the subscriptions your organization currently has, there are three ways to upgrade from a Microsoft Teams Exploratory trial to a paid license:

- **Upgrade an existing Microsoft 365 subscription.** Use this option if your organization has subscriptions to other Office products that don't include Teams. For more information, see [Upgrade to a different business plan](#). To see active users for an existing subscription, go to **Users > Active users** in the Microsoft 365 admin center.
- **Add users to an existing Microsoft 365 subscription.** Use this option if your organization doesn't have enough paid Teams licenses to cover the Teams Exploratory users. For more information, see [Buy or remove licenses](#). To add users to an existing subscription that already has enough available licenses, see [Move users to a different subscription](#). To see active users for an existing subscription, go to **Users > Active users** in the Microsoft 365 admin center.
- **Buy a new Microsoft 365 subscription.** Use this option if your organization doesn't have any existing subscriptions to Office products, or if your organization wants to buy a subscription that's different from their existing subscription to cover Teams Exploratory users. For more information, see [Buy a different Microsoft 365 for business subscription](#).

If you're not sure which Microsoft 365 subscription to upgrade to, see [Microsoft 365 for Business](#). If you need additional help choosing a subscription, or if your organization needs more than 300 licenses, contact your

[Microsoft partner](#) or Microsoft account representative.

Step 3: Assign paid licenses

IMPORTANT

Before you unassign any Teams Exploratory licenses, assign the new licenses to all the users you're upgrading. Otherwise, they lose access to Teams until you assign a paid license.

To assign your newly acquired licenses, see [Assign licenses to users](#).

After you assign the new licenses, unassign the Teams Exploratory licenses. See [Unassign licenses from users](#), for more information.

Auto-claim policies

Next time you upgrade, use auto-claim policies to create policies for your organization to automatically assign licenses from paid subscriptions to new users who haven't acquired a Teams license. For more information, see [Manage auto-claim policies](#).

Manage the free version of Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

In the classic free version of Microsoft Teams, the first person who signs up in your organization has a limited admin role. The person who has this limited role can add and remove team members and specify whether anyone can invite additional members, but this user has no advanced administrative capabilities and no access to the Microsoft Teams admin center. To learn more, read [Invite people to Teams Free \(classic\)](#).

To get the full set of Teams features, including enhanced administration, you'll need to [upgrade to the full version of Teams](#) by purchasing an appropriate Microsoft 365 or Office 365 subscription plan for your users.

To find out more about Teams versions and their capabilities, see [Compare Teams plans](#).

More information

- For a quick summary of the differences between Teams and Teams Free (classic), see [Differences between Microsoft Teams and Microsoft Teams Free \(classic\)](#).
- For more information about upgrading to the full version of Teams, see [Upgrade from Teams Free \(classic\) to Teams](#) and [Upgrade Microsoft Teams Free \(classic\) to subscription version](#).
- To get started with additional admin tasks associated with upgrading users, including adding user licenses, changing user names, and assigning temporary passwords, see [For admins upgrading from Teams Free \(classic\) to a paid subscription](#).

Get the right Teams trial

- As an alternative to Teams Free (classic), check out [Teams Exploratory](#).
- EDU customers should use the free [Office 365 A1 license](#).

Upgrade Microsoft Teams Free (classic) to subscription version

12/7/2021 • 3 minutes to read • [Edit Online](#)

If your organization is using the free version of Microsoft Teams, you can easily upgrade to the full version by purchasing a Microsoft 365 or Office 365 subscription plan for your users. The full version provides additional Teams features — like scheduling, audio conferencing, enhanced administration, and security capabilities — that the free version doesn't provide. Microsoft 365 and Office 365 combine the familiar Microsoft Office desktop suite with cloud-based versions of Microsoft's next-generation communications and collaboration services — including Exchange Online, SharePoint Online, and Office — to help users be productive from virtually anywhere through the internet. When you upgrade Teams, your existing Teams data will not be lost; all your teams, channels, chats, files, and permissions come with you.

NOTE

If you already have a Microsoft 365 or Office 365 subscription, you're eligible for the trial version of Teams (with your corporate identity), not the free version. The Teams trial provides the full version of Teams for a limited time. For more information, see [Manage the Microsoft Teams Commercial Cloud Trial offer](#).

How does Teams Free (classic) compare to the full version of Teams?

Teams Free (classic) is designed for small to medium businesses and has the following features:

- 500,000 maximum users
- Unlimited chat messages and search
- Guest access
- Integration with apps and services, including the Online versions of Word, Excel, PowerPoint, and OneNote
- 2 GB of storage per user and 10 GB of shared storage
- 1:1 and group online audio and video calling
- Channel meetings
- Screen sharing

The full version of Teams included with a Microsoft 365 or Office 365 subscription provides the following features in addition to the features that Teams free provides:

- No user limit (with an enterprise license)
- Exchange email hosting and custom email domain
- OneDrive, SharePoint, Planner, Yammer, and more Microsoft 365 and Office 365 services
- 1 TB of storage per user
- Scheduled meetings
- Audio conferencing
- Enhanced security and compliance features, including multi-factor authentication, single sign-on, and advanced auditing and reporting
- Administrative controls and support features, including 24 x 7 phone and web support, admin tools for managing users and apps, usage reporting for Microsoft 365 or Office 365 services, service-level agreement, and configurable user settings and policies

For a detailed comparison of Teams Free (classic) and Teams features, see [Compare Teams plans](#).

Upgrade requirements

You can upgrade to the full version of Teams if you meet the following requirements:

- You are the person who signed up for the existing Teams free subscription.
- If you are bringing your own domain, it isn't already associated with Azure Active Directory (via trial or purchased Microsoft 365 or Office 365 subscription).

NOTE

To upgrade and transfer your data, you have to buy your subscription through the upgrade process in the Teams application. If you purchased Microsoft 365 or Office 365 with Teams without going through the upgrade process, you can't transfer your data because you will already have a separate tenant.

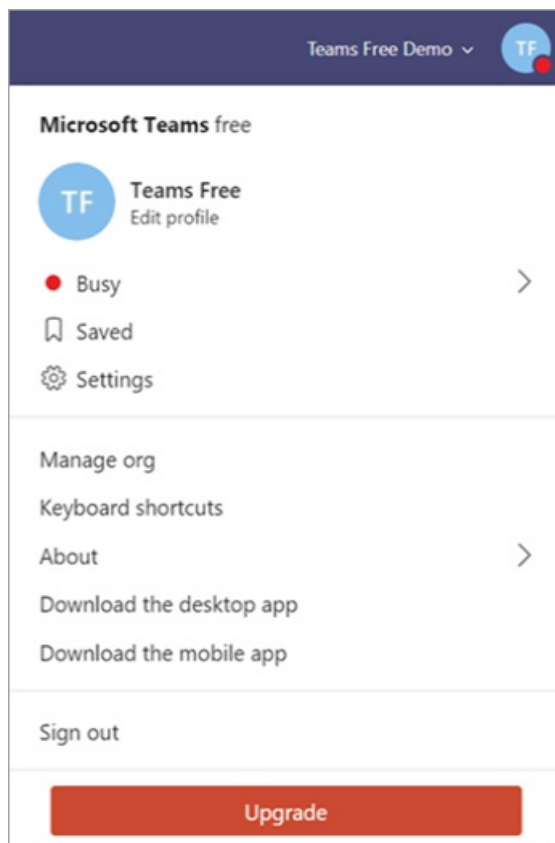

Limitations

Keep the following limitations in mind:

- You can't switch back to Teams Free (classic) after you upgrade.
- You can't merge multiple Teams Free (classic) tenants into a single paid tenant.
- All users must be in the same domain. (All users will get a sign-in in the format *username@domain.com*.)
- All users must be upgraded: a mix of Teams Free (classic) and paid subscription users in the same tenant is not supported.

How do I upgrade my organization?

To upgrade to the full version of Teams, select **Upgrade** in Teams.

Enter the email address that you use to sign in to Teams, and then purchase an Microsoft 365 Business Standard

plan. If you would like to purchase Microsoft 365 Business Basic or an Enterprise edition of Office 365, [contact support](#).

What's next?

After your upgrade is complete, see [Get started with Microsoft Teams](#) for first steps and [Adopt Microsoft Teams](#) for a phased approach to Teams adoption across your organization.

More information

- To find out more about Teams versions and their capabilities, see [Compare Teams plans](#).
- For more information about upgrading to the full version of Teams, see [Upgrade from Teams Free \(classic\) to Teams](#).
- For additional admin tasks associated with upgrading users, including adding user licenses, changing user names, and assigning temporary passwords, see [For admins upgrading from Teams Free \(classic\) to a paid subscription](#).
- For information about managing Teams free in your organization, see [Manage the free version of Microsoft Teams](#).

Advanced Communications add-on for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

If your organization is looking to further enhance your communication experience, get Advanced Communications for advanced meeting customization and tools to manage your organization's communication policies.

What is Advanced Communications?

Advanced Communications includes advanced meetings customization, tools to manage your organization's communication policies, premium manageability with custom policy packages, and custom branded meeting lobby to tailor your meetings.

- Customize your meeting pre-join experience with your company's logo in pre-join and the lobby.
- Create unifying meeting experiences with custom Together Mode scenes designed to the needs of your company and the meeting.
- Tailored experiences with custom policy packages by bundling your own set of policies for users with similar roles in your organization using the Teams Admin Center or PowerShell. Each user will require a license in order to receive a custom policy package assignment.

Advanced Communications is available in all Microsoft 365 markets as an add-on to any paid Microsoft 365 or Office 365 subscription. Features included in Advanced Communications won't be added to other Microsoft 365 or Office 365 plans and can't be purchased separately. To get the features, you must purchase the add-on.

NOTE

Features will be released as they become available. Visit the [Microsoft 365 Public Roadmap](#) for the latest feature timing.

NOTE

Advanced Communications isn't yet available for Microsoft 365 GCC High or Department of Defense (DoD) environments.

These features are available now in preview.

[Introduction to Teams policy-based recording for callings & meetings](#)

Messaging policies licensing

12/7/2021 • 2 minutes to read • [Edit Online](#)

We're hearing from customers around the globe how the COVID-19 (Coronavirus) pandemic has created new challenges as they work to handle drastic shifts in their day-to-day operations. Being able to directly and quickly connect with teammates during fast-changing conditions is essential to maintaining business continuity during the crisis response and as many of us return to the workplace.

Originally announced in June 2019, [priority notifications](#) for Microsoft Teams grants users the ability to continually send notifications that repeat every two minutes for up to 20 minutes on all messages marked as urgent. Priority notifications had been made available as a promotion to all Teams customers until the second half of 2020.

Effective immediately, we have ended this promotion and made priority notifications available to all Teams customers as a basic capability. Users will now be able to send and receive unlimited urgent messages with priority notification. [Learn more about managing priority notifications.](#)

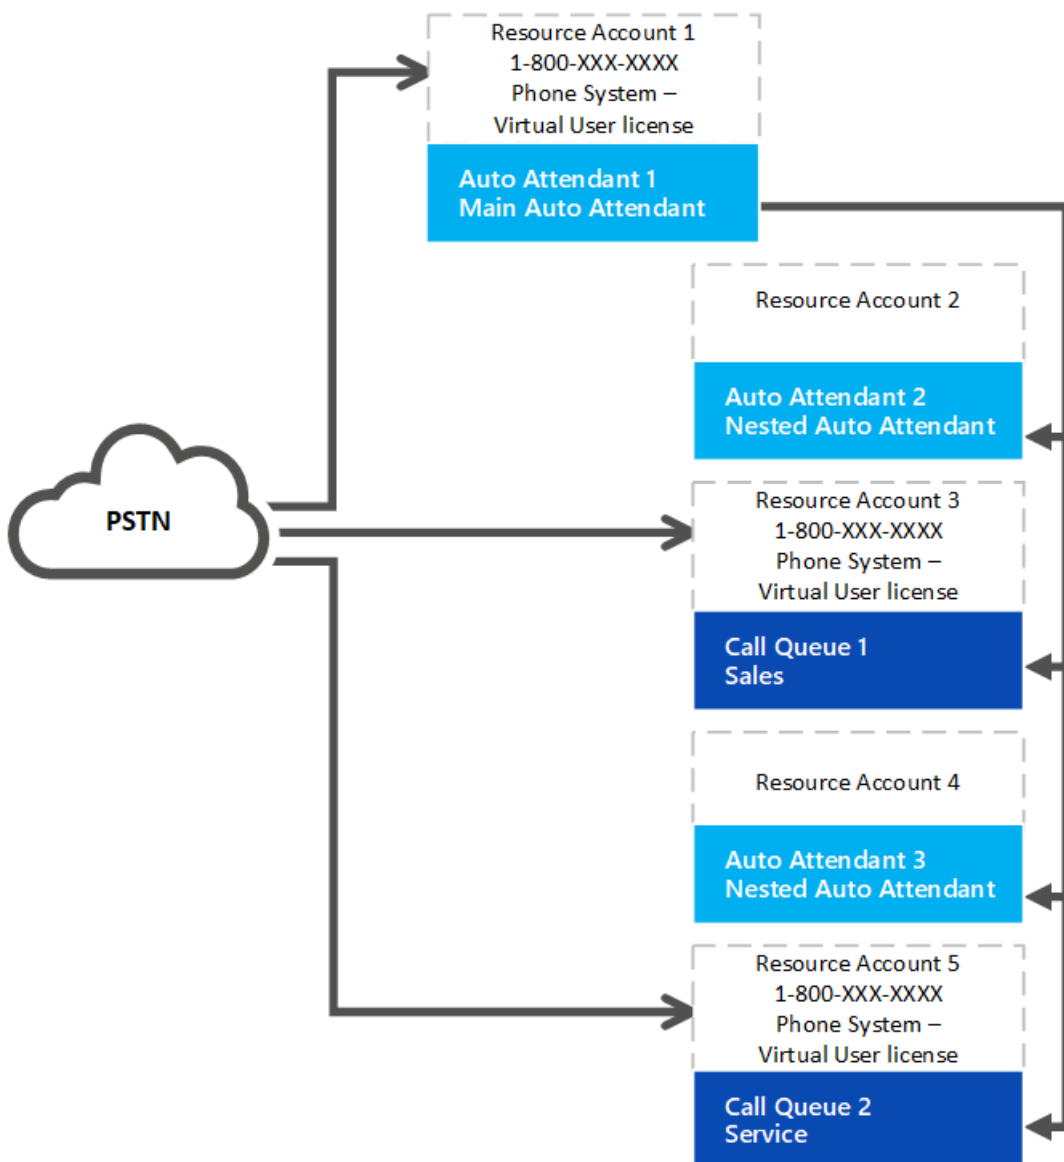

Microsoft 365 Phone System – Virtual User license

12/7/2021 • 3 minutes to read • [Edit Online](#)

Organizations with Phone System licensed users can assign either a free Microsoft 365 Phone System – Virtual User license or a paid Phone System user license to resource accounts. A Calling Plan isn't always required (see [Plan for Teams Auto attendant and call queues](#) for prerequisites when transferring calls to an external phone number). All auto attendants or call queues require an associated resource account. Resource accounts that require a phone number need a free Microsoft 365 Phone System – Virtual User license or a paid Phone System user license before a phone number can be applied to the resource account.

TIP

No license is needed for resource accounts that will be used with nested auto attendants or call queues that don't have a phone number assigned. See the following diagram for reference.

Virtual User license allocation

Your organization is allotted Microsoft 365 Phone System – Virtual User licenses depending on its overall size.

Any organization that has at least one license including Phone System or has Phone System added has 25 Virtual User licenses available at no cost. When you add 10 Phone System user licenses in your organization, one more Microsoft 365 Phone System – Virtual User license becomes available.

NOTE

Phone System is an add-on license available with Microsoft 365 and Office 365 E1 and E3. Phone System is also included as part of Microsoft 365 E5, Office 365 E5, and Microsoft 365 Business Voice licenses.

If your organization uses up the available free Microsoft 365 Phone System – Virtual User licenses in creating auto attendant or call queue nodes, you can still use the paid Phone system licenses with a resource account. Most organizations will have enough Virtual User licenses based on the scaling plan.

License allocation example

Contoso, Inc. purchased 600 licenses that included Phone System (one for each employee). Contoso is allotted an initial 25 plus 60 Microsoft 365 Phone System – Virtual User licenses, 85 in total. Their organization has 90 call queues and auto attendants that have phone numbers. They need to assign all the Microsoft 365 Phone System – Virtual User licenses and obtain five regular-priced Phone System licenses.

Contoso should consider redesigning the auto attendant and call queue system. If they use fewer phone numbers and more nested nodes that don't need a phone number, they simplify the implementation and reduce costs.

How to buy Microsoft 365 Phone System – Virtual User licenses

1. Sign in to the Microsoft 365 admin center.
2. Go to **Billing** > **Purchase services** > **Add-ons**
3. Scroll to the end to find the **Microsoft 365 Phone System – Virtual User** license. Select **Buy now**.

NOTE

Keep in mind you must still **Buy** the license even though it has a cost of zero.

Change an existing resource account to use a Microsoft 365 Phone System – Virtual User license

If you decide to switch the license on your resource account from a Phone System license to a Microsoft 365 Phone System – Virtual User license:

1. Get the new Microsoft 365 Phone System – Virtual User license.
2. Follow the linked steps in the Microsoft 365 Admin center to [Move users to a different subscription](#).

WARNING

Always remove a full Phone System License and assign the Microsoft 365 Phone System – Virtual User license in the same license activity. If you remove the old license, save the account changes, add the new license, and then save the account settings again, the resource account may no longer function as expected. If this happens, we recommend you create a new resource account for the Microsoft 365 Phone System – Virtual User license and remove the broken resource account.

Teams Essentials QuickStart guide for small businesses

12/7/2021 • 8 minutes to read • [Edit Online](#)

Microsoft Teams Essentials is a standalone Teams subscription that provides an all-in-one solution with meetings, chat, and collaboration for small businesses. As your business adapts to the increased need for remote working and virtual connections, you may be searching for a way to securely collaborate with employees, partners, suppliers, and customers. Whether you're a multi-city bakery, or a nine-person event agency, Microsoft Teams Essentials can bring your business together through one connected experience.

Before you continue

Microsoft Teams Essentials is available for purchase through Microsoft's direct website and select Microsoft Cloud Partners. Subscriptions through direct and partner differ in some ways because they use different identity systems. Visit the table later in this article for more details, go here: [Microsoft Teams Essentials plans](#)

A subscription purchased through Microsoft's direct website uses Microsoft account identity which allows you to use your existing email address like MeganB@outlook.com, MeganB@gmail.com, or MeganB@ContosoLandscaping.com to sign up.

Alternatively, Teams Essentials purchased through select Microsoft Certified Partners uses Azure Active Directory (AAD) which asks you to create a new login/identity. Partners can configure Teams Essentials to connect to your existing email address so you can sign in using your existing email address.

What Teams Essentials subscription do I have?

If you purchased Teams Essentials through Microsoft's website (direct), you own **Microsoft Teams Essentials**.

If you purchased Teams Essentials through a Microsoft Certified Partner, you own **Microsoft Teams Essentials (AAD identity)**.

How does Microsoft Teams Essentials compare to other Microsoft Teams plans?

The following table lists the major Microsoft Teams features available across plans. Certain caveats apply. See the footnotes for further information. This table may change without notice. For the most up-to-date, complete list of features, visit [Microsoft Teams service description](#).

MICROSOFT TEAMS PLAN	MICROSOFT TEAMS (FREE)	MICROSOFT TEAMS ESSENTIALS	MICROSOFT TEAMS ESSENTIALS (AAD IDENTITY)	MICROSOFT 365 BUSINESS BASIC

¹ Provides connection to Google Calendar and other 3rd party calendars with the following configuration:

[Microsoft Teams Essentials \(AAD Identity\) Configuration Guide](#)

² Teams Essentials (AAD Identity) through partner includes 2GB Exchange mailbox and no archiving, allowing users to sync with third party email providers.

IMPORTANT

To get enhanced administration and entire full set of Teams features, you'll need to upgrade to the full version of Teams by purchasing an appropriate [Microsoft 365](#) or [Office 365 subscription plan](#) for your users. We recommend this as you'll have more flexibility to manage the way your organization collaborates.

Administration limits and specifications for Microsoft Teams Essentials

Here are a few important Teams Essentials limits and specifications to consider as an admin:

- **Administration:** A Teams Essentials subscription **does not** come with access to the Teams Admin Center. Teams Essentials users can enjoy a simplified view of the Microsoft 365 admin center to conduct important tasks like managing subscriptions and configuring new users.
- **Microsoft Teams PowerShell:** You **cannot** manage Teams Essentials directly using PowerShell command line as there is no PowerShell support.
- **Storage:** Teams Essentials uses OneDrive's personal cloud storage for file storage.

Go here: [Microsoft Teams limits and specifications](#) to learn more about the limits, specifications, and other requirements that apply to Teams.

Get Microsoft Teams Essentials

Is your business new to Microsoft Teams? Thanks for choosing Microsoft!

To get started with Teams Essentials, follow these steps:

1. **Purchase the subscription.** Go to [Microsoft Teams Essentials for small business](#) and select **Buy now** under Microsoft Teams Essentials.
2. **Sign up with your existing email address.** Use an existing email address and follow the instructions to purchase user licenses.
3. **Review Teams service description.** Visit [Microsoft Teams service description](#) to learn more about

Microsoft Teams.

When you've completed these tasks, you're ready to plan, deploy, and use the Teams app.

To do that, complete these three steps:

1. **Install the Teams app.** Install the Teams client on your PC or mobile device by going to [Download Microsoft Teams](#) and selecting an option under **Teams for home**. Ensure that you've downloaded a Teams for home option as Teams for work and school are not compatible with Teams Essentials.

Download Microsoft Teams for Windows desktop

2. **Get Familiar with Teams.** The best way to become familiar with Teams is to start using it right away. Take some time to explore the application so you have a better understanding of its capabilities.
3. **Plan for adoption.** For small businesses, planning for user adoption can be as simple as individually showing your users how to use Teams. Often, small business customers don't consider this step for new applications, which negatively affects the application's success and adoption.
4. **Manage Teams Essentials.** Similar to the free version of Microsoft Teams, you have a limited admin role as the first person to sign up for Teams Essentials in your organization. You can add and remove team members and specify whether anyone can invite another members with this role, but you won't have advanced administrative capabilities or access to the Microsoft Teams admin center.

Upgrade from a free version of Microsoft Teams to Microsoft Teams Essentials

If your organization is using a free version of Microsoft Teams, you can easily upgrade to the Teams Essentials version by purchasing a plan for your users directly in Teams.

Upgrade Requirements

You can upgrade to Microsoft Teams Essentials if you're the person who signed up for the existing Teams free subscription. In the free version of Microsoft Teams, the first person who signed up for Teams in your organization has a limited admin role.

NOTE

To upgrade and transfer your data, you have to buy your subscription through the Teams application [upgrade process](#) outlined in this section. Upgrading to Teams Essentials is not currently supported for Teams free (classic) users. You can upgrade to the full version of Teams by following the steps in this article: [Upgrade from Teams free to Teams](#).

Limitations

Keep the following limitations in mind:

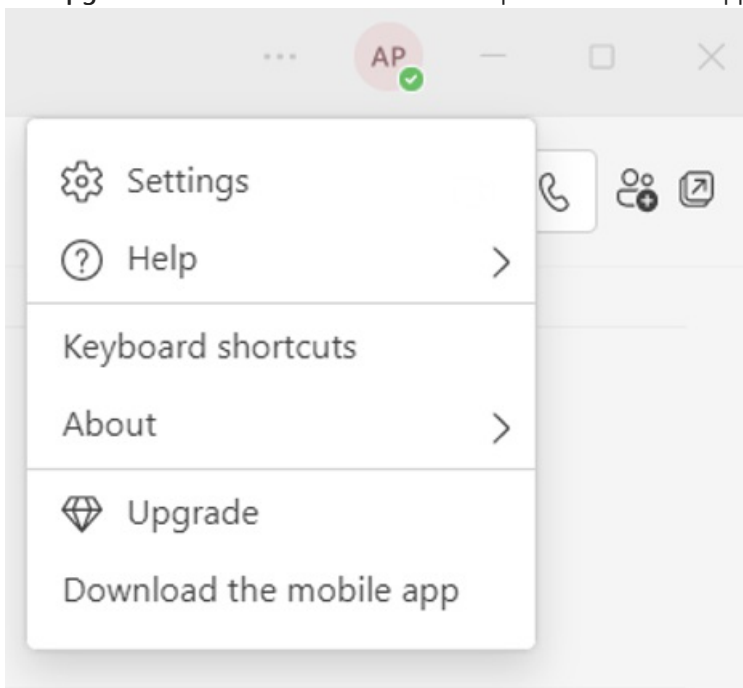

- You can't switch back to Teams (free) after you upgrade.
- You can't merge multiple Teams (free) tenants into a single paid tenant.
- All users must be in the same domain. (All users will get a login in the format *username@domain.com*.)
- All users must be upgraded: a mix of Teams (free) and paid subscription users in the same tenant isn't supported.

IMPORTANT

If you're currently using Microsoft Teams free (classic), you go here to upgrade to Microsoft 365 [Upgrade from Teams free to Teams](#).

How do I upgrade my organization?

To upgrade to the Microsoft Teams Essentials version of Teams, select ... in the top navigation menu. Next, select the **Upgrade** button at the bottom of the drop down menu that appears.

After selecting the **Upgrade** button in Teams, you'll be directed here: [Microsoft Teams for Small Business](#)

Enter the current email address you use to sign into Teams, and then purchase the Microsoft Teams Essentials plan.

Can I purchase Teams Essentials using AAD identity through Microsoft's website?

No. Teams Essentials with AAD identity is only available through select Microsoft Cloud Partners. If you're interested in working with a Partner, visit [Find a Microsoft Partner Cloud Solution Provider](#).

Can I use an existing email system with Teams Essentials?

Yes. You can keep your existing email system and leverage Teams Essentials to meet, chat and collaborate.

Can I connect my existing calendar solution with Teams Essentials?

Yes. You can sync existing calendars from Outlook.com and Google with Teams Essentials.

To connect an existing calendar solution with Teams Essentials (AAD Identity), follow the instructions later in this article.

How do I connect my current email and calendar with Teams Essentials (AAD Identity)?

To get started, visit [Connect Microsoft Teams Essentials \(AAD Identity\) to an existing email system with calendar](#) for more information. You can connect an existing email system like Google Workspace to Microsoft Teams Essentials (AAD Identity) to stay connected across platforms with integrated calendars and sign in.

Can I upgrade Teams Essentials bought directly through Microsoft's website to Microsoft 365?

Upgrades from Teams Essentials to Microsoft 365 will be available soon.

More information

- Visit [Configuration Guide](#) for configuration steps on connecting Microsoft Teams Essentials (AAD Identity) to an existing email system with calendar
- To find out more about Teams versions and their capabilities, visit [Compare Teams plans](#)

Connect Microsoft Teams Essentials (AAD Identity) to an existing email system with calendar

12/7/2021 • 12 minutes to read • [Edit Online](#)

This guide provides configuration steps for connecting Microsoft Teams Essentials (AAD Identity) to an existing email system with calendar.

Microsoft Teams Essentials (AAD Identity) brings together the best of Teams with meetings, chat, calling, and collaboration. Teams Essentials (AAD Identity) can connect to your existing email system to provide an integrated experience like having all Teams notifications in an existing email inbox, all calendar events in Teams, and the ability to sign into Teams with your existing email address.

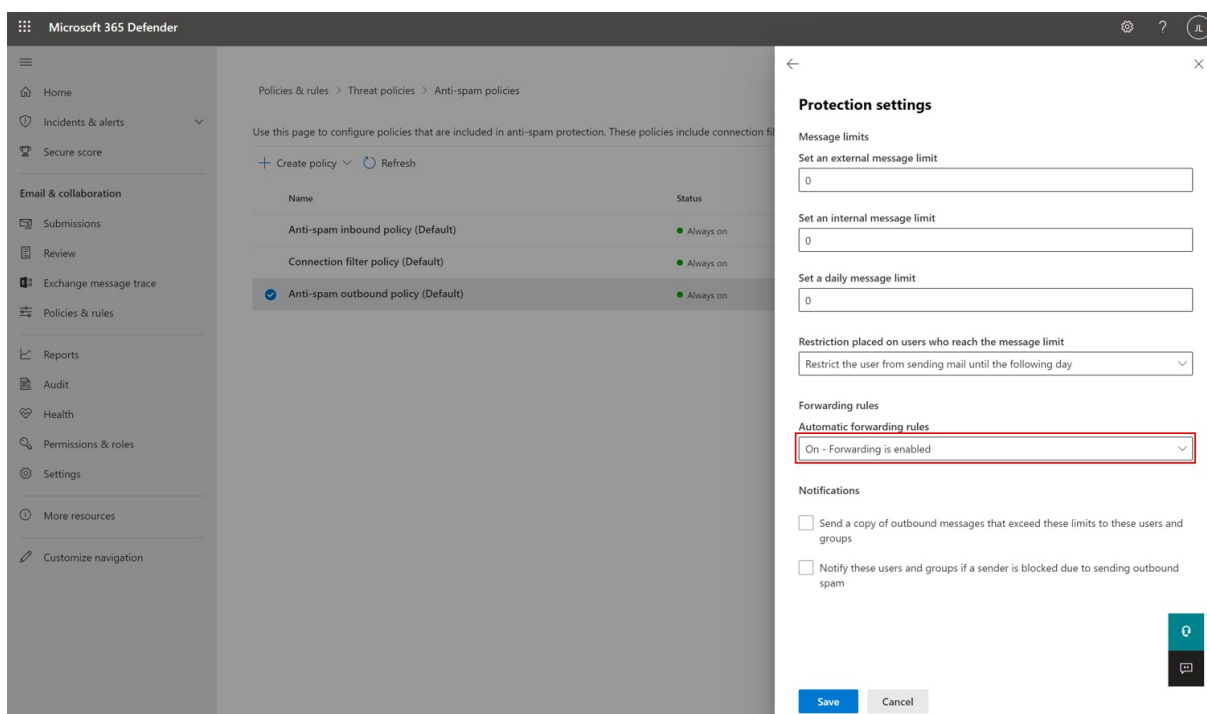

Once connected, you can see responses to scheduled meetings and invitations to collaborate in your mailbox and Microsoft Teams. You can also view and interact with incoming meetings from your calendar using Teams and third-party meeting software like Google Workspace.

Prerequisites

The configuration steps in this article involve the process of automatically forwarding items from Exchange Online. By default, automatic forwarding is disabled by the anti-spam outbound policy. This policy must be enabled to connect Teams Essentials to an existing mailbox and calendar system.

To enable automatic forwarding:

1. Go to the Microsoft 365 Defender portal at <https://security.microsoft.com/>
2. Under the left navigation menu, go to **Email & collaboration** > **Policies & rules** > **Threat policies** > **Anti-spam** in the Policies section
3. On the **Anti-spam policies** page, select **Anti-spam outbound policy (Default)** from the list
4. In the policy details flyout that appears, select **Edit protection settings** to modify the autoforwarding rule.
5. Under **Forwarding rules**, change the automatic forwarding condition to **On – forwarding is enabled** and save your changes.

To learn more about configuring outbound spam policies, visit [Configure outbound spam filtering - Office 365 | Microsoft Docs](#).

Connect Teams Essentials to Exchange Online with Exchange on-premises

You can enjoy all that Teams Essentials (AAD) has to offer by using a hybrid approach to configure the connection between Microsoft Teams and Exchange Online with Exchange on-premises.

To make calendar access work for your on-prem mailboxes, follow the guidance provided at [Configuring Teams calendar access for Exchange on-premises mailboxes - Microsoft Tech Community](#)

To deploy Microsoft Teams Rooms in a hybrid environment with Exchange on premises, visit [Deploy Microsoft Teams Rooms with Exchange on-premises - Microsoft Teams | Microsoft Docs](#)

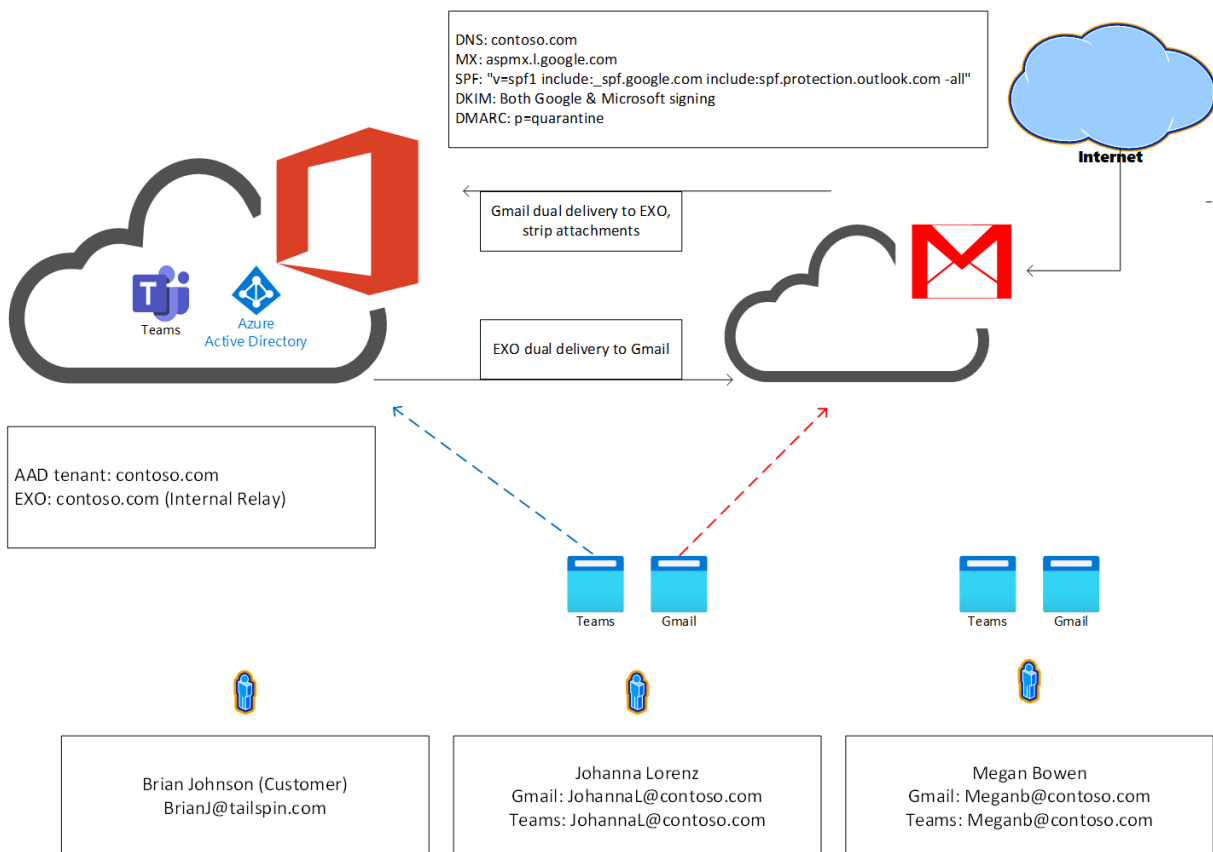

Connect Teams Essentials to third-party email systems with calendar

If you don't plan to switch your organization's mailbox to Microsoft 365, you can connect Teams Essentials to an existing third-party email and calendar system. This connection allows you to receive Teams notifications in your existing email system while viewing existing meeting invites and calendar events in Microsoft Teams.

Connect Teams Essentials to third-party email using vanity domain (Google Workspace example)

The following section shows you how to connect Microsoft Teams to an existing email system with calendar, like Google Workspace. You will accomplish this connection by leaving the current email system intact, forwarding all email to Exchange Online, filtering everything except emails of the calendaring type. In doing so, calendaring emails automatically appear in the Teams calendar accepted as tentative and non-calendaring type emails are deleted.

All email generated in Microsoft 365 is forwarded to Google Workspace so that users get Teams reminders and notifications. User identities, like the user's primary email, can be duplicated. Single sign-on is also possible, but not required. Users should be able to join Teams meetings from either the third-party calendar or Teams calendar. Another Teams features will work as expected.

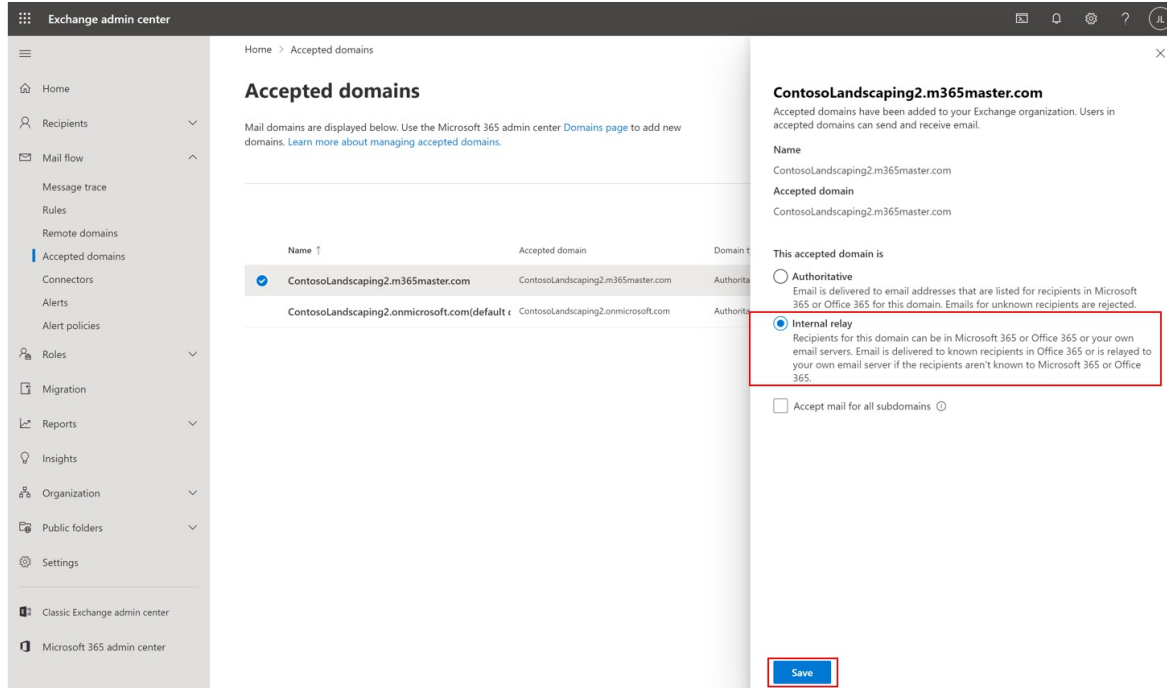

These examples rely on the [Connect-ExchangeOnline](#) PowerShell commandlet that is part of the [Exchange Online PowerShell V2 module](#). If you get an error when running Connect-ExchangeOnline, ensure that you've followed the recommended instructions for installing the module using [Install the EXO V2 module](#). When Connect-ExchangeOnline prompts for credentials, be sure to use a tenant administrator account.

Step One: Set up a new Microsoft 365 tenant domain

1. Go to the admin center at <https://admin.microsoft.com>.
2. Go to **Set Up > Domains** and select **Add domain** to add your existing domain. If you don't add a domain, people in your organization will use the onmicrosoft.com domain for their email addresses until you do. Be sure to add your domain before adding users, so you don't have to set them up twice.
3. Verify the domain with a TXT record by following the steps at [Verify with a TXT Record](#).
4. When prompted, select **Do not allow Microsoft 365 to configure DNS**.
5. When prompted, leave the existing MX records in place without altering them.
6. Update the existing SPF TXT record to include Microsoft 365.
7. Configure DomainKeys Identified Mail (DKIM) for Microsoft 365 by following these steps to manually [set up DKIM](#).
8. Sign back into the Microsoft 365 admin center at <https://admin.microsoft.com/AdminPortal/> to enable DKIM
9. In the navigation panel on the left, select **Setup > Domains**
10. Using the checkbox, select your existing non-Microsoft domain (ex: JohannaL@contosolandscaping2.m365master.com) from the current lists of domains.
11. Select the button with **three vertical dots** to open a menu.
12. From the menu, select **Set as default**

13. Confirm set as default in the window that appears to set your existing domain as default.

For more guidance on adding a domain to Microsoft 365, follow the steps described in [Add a domain to Microsoft 365](#).

Step Two: Add users and assign Teams Essentials licenses

1. Go to the admin center at <https://admin.microsoft.com> to add an individual user
2. Go to **Users > Active users**, and select **Add a user**
3. In the **Set up the basics** pane, fill in the basic user information, then select **Next**.
 - **Name:** Fill in the first and last name, display name, and username.
 - **Domain:** Choose the domain for the user's account. For example, if the user's username is Jakob, and the domain is contoso.com, they'll sign in by using jakob@contoso.com.
 - **Password settings:** Choose to use the autogenerated password or to create your own strong password for the user. Determine whether you want to send the password in an email when the user is added.
4. In the **Assign product licenses** pane, select the location and the appropriate license for the user. If you don't have any licenses available, you can still add a user and buy more licenses. Select **Next**.
5. In the **Optional settings** pane, expand **Roles** if you would like to make this user an admin. Expand **Profile info** to add additional information about the user.
6. Select **Next**, review your new user's settings, make any other changes if necessary, then select **Finish adding**, then close.

To add multiple users at the same time, follow the recommend steps at [Add users and assign licenses - Microsoft 365 admin | Microsoft Docs](#)

Step Three: Configure Google Workspace

Configure email dual delivery to Microsoft 365 and strip attachments:

1. Follow Google's steps for setting up dual delivery: <https://support.google.com/a/answer/9228551?hl=en>
2. Add route for Office 365
 - Go the Google Admin console at <https://admin.google.com>)

- Go to Apps > Google Workspace > Gmail > Hosts.
- Enter a route name. (For example, Microsoft 365)
- Choose 'Single host' and enter the MX record specified for domain in Microsoft 365 (For example: ContosoLandscaping2-m365master-com.mail.protection.outlook.com)

Smart host method to resolve ATTR35 response code when mail is sent to Exchange on premises/Exchange Online :

- Choose 'Single host' and enter the MX record for the initial domain of the tenant as the smart host. The initial domain is in the format GUID.onmicrosoft.com. A GUID is a unique value that's provided to every organization as part of their enrollment in the service. A GUID is a 128-bit integer (16 bytes) that can be used across all computers and networks wherever a unique identifier is required.
- You can use command line: nslookup -type MX GUID.onmicrosoft.com to resolve the MX record (For example: contosolandscaping2.mail.protection.outlook.com)
- Choose **Port:25**
- Proceed with recommended options

3. Configure route to Office 365

- Open the **Google Admin console** at <https://admin.google.com>
- Go to **Apps > Google Workspace > Gmail > Routing**
- On the **Routing** tab, select **Configure**
- Enter **Name** for rule. (For example, Gmail to Office 365)
- For **email messages to affect**, select both **Inbound** and **Internal receiving**
- Under **For the above types of messages**, select **Modify message**
- Under **Also deliver to**, select **Add more recipients** then select **Add to add the secondary mail route**.
- Under **Recipients**, select the down arrow "" and select **Advanced**.
- Select **Change route**.
- From the list, select the secondary mail route you created earlier
- Under **Attachments**, select **Remove attachments from message**
- Scroll down and select **Save**.

Add your subdomain in Google workspace to receive email from Microsoft 365.

Next, you'll create forwarding rules on Microsoft 365 mailboxes to your subdomain. Choose a subdomain to use in Google Workspace to receive email from Microsoft 365 (For example, g.contosolandscaping2.m365master.com)

1. Start at **Google Admin console** (at admin.google.com)
2. Go to **Account > Domains > Manage Domains**
3. Select **Add a domain**
4. Enter the domain name you selected
5. Select **user alias domain**
6. Select **Add domain & start verification**
7. Wait for verification to complete and refresh the page

8. Select **Activate Gmail**
9. Choose **Skip MX record setup** and then select **NEXT**
10. On the **Route mail to another server** dialog, take note of the server to route mail to (For example, aspmx.l.google.com) and select **I use another mail server**

Allow email from Microsoft 365 to bypass SPAM filter

1. Find an appropriate header from the Microsoft 365 tenant by sending an email to a user on Google workspace.
2. Open the message and select **Show Original**
3. Choose an email header that uniquely identifies mail coming from your Microsoft 365 tenant. (For example, X-MS-Exchange-CrossTenant-id: 92f60fc7-eab3-403b-9d7d-9d683bf0a4b5)
4. Go to **Google Admin console** at <https://admin.google.com>
5. Go to **Apps > Google Workspace > Gmail > Compliance**
6. Navigate to **Content Compliance** and select **Configure**
7. Give the setting a name. For example, Allowlist Microsoft 365 email.
8. Under **email messages to affect** check **Inbound**
9. Under **Add expressions that describe the content you want to search for in each message** select if **ANY** of the following match the message
10. Under **Expressions**, select **Add** xi. Under **Add setting**, choose **Advanced content match**
11. Under **Location** choose **Full Headers**
12. Under **Match Type** choose **Full Text**
13. Under **content**, enter the email header that uniquely identifies email coming from your Microsoft 365 tenant (For example, X-MS-Exchange-CrossTenant-id: 92f60fc7-eab3-403b-9d7d-9d683bf0a4b5)
14. Select **Save**
15. In the **If the above expressions match, do the following** field > **Modify Message** and check **Bypass spam filter for this message** under **Spam**.
16. Select **Save**

Step Four: Configure Microsoft 365 settings for the integration

Configure connector to route mail from Microsoft 365 to Gmail:

1. Go to the **Microsoft Admin Center** at <https://admin.microsoft.com/AdminPortal>
2. Select **Show all** in the left-hand navigation menu.
3. Under **Admin centers**, select **Exchange** to open the Exchange admin center in a new tab
4. In the **Exchange admin center's** left-hand navigation menu, select **Mail flow > Connectors**, open the overflow menu (...) and select **Add a connector**
5. Under **Connection from** in the new connector window, select **Office 365**
6. Under **Connection to** select your organization's email server then select **Next**
7. Enter a **Name** for the new connector (Ex: To Gmail) and continue **Next**

8. In the **Use of Connector** section, select **Only when I have a transport rule set up that redirects messages to this connector** and select **Next**.
9. In the **Routing** section, enter the appropriate smart mail host (For example, aspmx.l.google.com), select **+**, and then continue **Next**.
10. In the **Security restrictions** section, accept the default settings by selecting **Next**.
11. In the **Validation email** section, enter a valid email address for the Gmail system (For example, johanna@contosolandscaping2.m365master.com), select the **plus sign (+)**, and then select **Validate**.
12. Wait for validation to complete and if successful press **Next**.
13. Under **Review connector**, verify configuration is correct and press **Create Connector**.
14. When you see the Connector created notification, press **Done**.

Forward mail from Microsoft 365 mailboxes to Gmail

1. Use the **Microsoft 365 Admin Center** to update each mailbox or you can use a **PowerShell** script, such as the following:

```
$forwardingDomain = "g.contosolandscaping2.m365master.com"
Connect-ExchangeOnline
$Mailboxes = Get-Mailbox -ResultSize Unlimited -Filter {RecipientTypeDetails -eq "UserMailbox"}
Foreach ($mbx in $mailboxes) {

    Set-Mailbox $mbx.Identity -DeliverToMailboxAndForward $true -ForwardingSMTPAddress
    $($mbx.Alias,$forwardingDomain -join "@")
}
```

Configure Exchange Online direct to calendar transport rule

1. Configuring this setting will automatically accept calendar invites so that they show up in Teams calendar without requiring users to interact with the invite in Outlook Web App.
2. The following script can be used to create the transport rules:

```
Connect-ExchangeOnline
New-TransportRule -Name "Direct to Calendar" -MessageTypeMatches Calendaring -SetHeaderName "X-MS-Exchange-Organization-CalendarBooking-Response" -SetHeaderValue Tentative
New-TransportRule -Name "Direct to Calendar triage action" -MessageTypeMatches Calendaring -SetHeaderName "X-MS-Exchange-Organization-CalendarBooking-TriageAction" -SetHeaderValue MoveToDeletedItems
```

Disable Outlook on the web for mailboxes

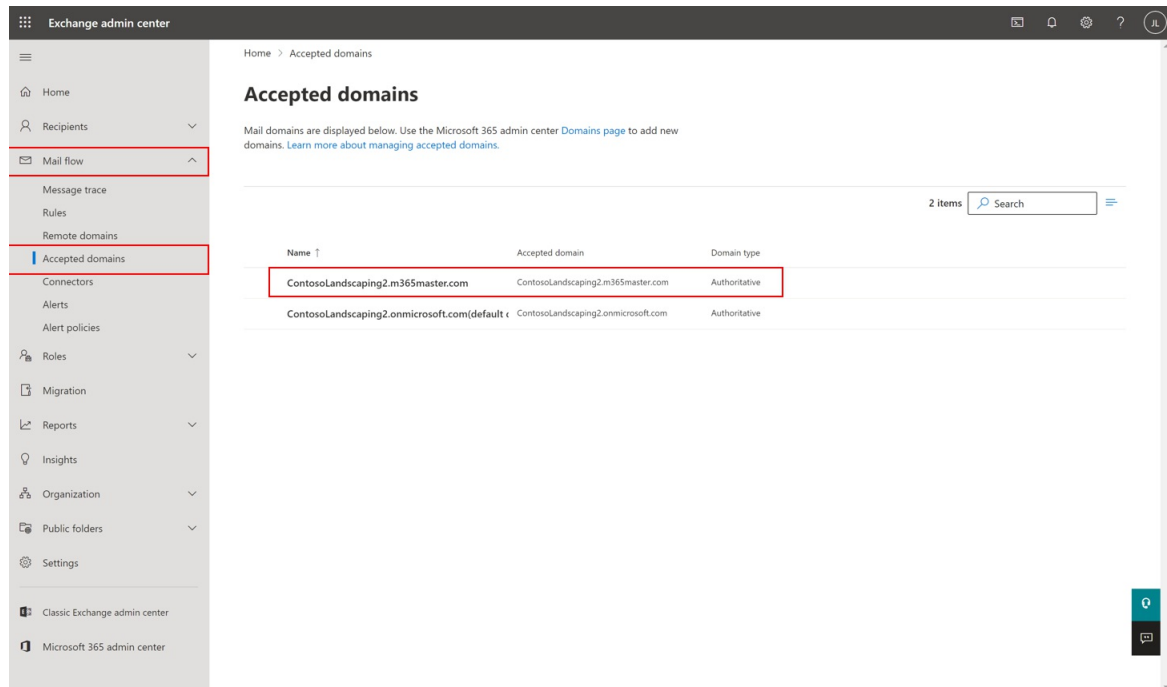

1. Follow the instructions at [Enable or disable Outlook on the web for a mailbox in Exchange Online](#) to disable Outlook on the web for mailboxes.
2. You can disable Outlook on the web using the **Exchange Admin Center** or **PowerShell**. You may use the following PowerShell example to disable Outlook on the web for all mailboxes:

```
Connect-ExchangeOnline
$Mailboxes = Get-Mailbox -ResultSize Unlimited -Filter {RecipientTypeDetails -eq "UserMailbox"}
Foreach ($mbx in $mailboxes) {
    Set-CASMailbox $mbx.Identity -OWAEnabled $false
}
```

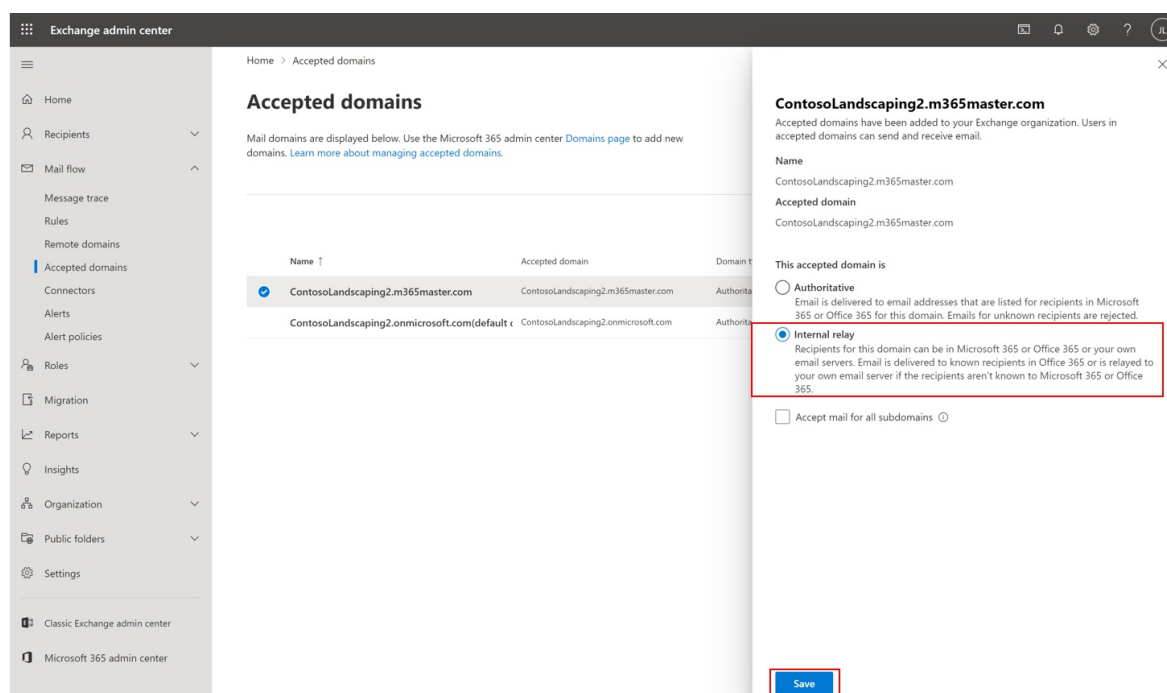

Step Five: Configure Exchange Online domain for internal relay

This step ensures that email is sent to third-party system for final resolution.

1. Go to the **Microsoft Admin Center** at <https://admin.microsoft.com/AdminPortal>
2. In left-hand navigation, select **Show all**
3. Under **Admin Centers**, select **Exchange** to open Exchange admin center in a new tab
4. In **Exchange admin center**, select **Mail flow** from the left-hand navigation menu, then select **Accepted domains**
5. Tap on the domain name configured in the third-party system (For example, contosoLandscaping2.m365master.com)

6. Select **Internal Relay**, then click **Save**

Step Six: Create a rule to delete all inbound mail to Exchange Online except for Calendaring

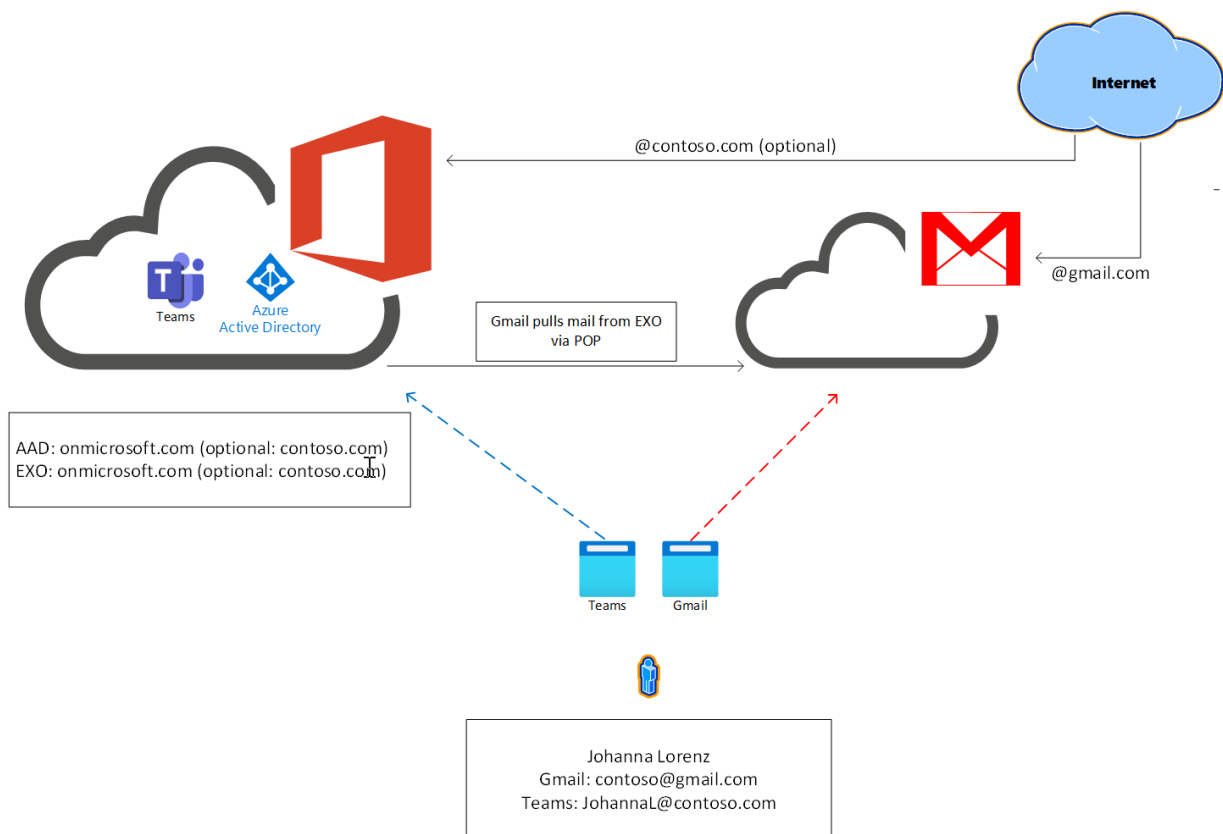

1. You can configure this rule in the **Exchange Admin Center** or **PowerShell**. You may use the following **PowerShell** example to create the rule:

```
Connect-ExchangeOnline
New-TransportRule -Name "Delete all except Calendaring" -ExceptIfMessageTypeMatches Calendaring -
FromScope NotInOrganization -DeleteMessage:$true
```

Connect Teams Essentials to third-party email not using vanity domain (Gmail example)

You can schedule and join a Teams meeting directly from Google Workspace by connecting a consumer Gmail account to Teams Essentials with primary reliance on the [Teams G Suite Add On](#). This gives you the opportunity to schedule video and audio conferencing with screen sharing, meeting chat, digital whiteboards, and more.

You will configure Gmail to pull email from Exchange Online to ensure mail generated in Microsoft 365 and Teams arrive successfully in Gmail. Security defaults may need to be disabled to accomplish this connection, which makes using a strong unique password essential. A custom domain isn't required for this scenario, but it can be configured in Microsoft 365 for use in Gmail if you'd like to use one.

Ensure that you have a Gmail account set up.

If you already have an existing account, you can proceed to the next step. If not, visit [Create new Google account](#) to set up a new Gmail account.

2. Set up your Microsoft 365 tenant

Configure Teams AAD users

1. Follow the guidance at [Add users and assign licenses](#) to add multiple users

Configure identity protection

1. Disable Security defaults if active.
2. Configure multifactor authentication for users

3. If using conditional access, be sure to make exception for POP access to mailbox

Add domain to Microsoft 365 Admin Center (optional)

1. Under navigation, select Settings > Domain, then select Add domain
2. Enter your domain name in the appropriate field
3. Follow the instructions on screen to verify your domain with TXT record
4. When prompted, allow Microsoft to configure DNS
5. Complete the instructions to verify MX record route to Microsoft 365
6. Configure SPF TXT record to include Microsoft 365
7. Complete the instructions for configuring DKIM TXT records for Microsoft 365
8. Verify DKIM is enabled by logging out and signing back into the Admin center

3. Configure Gmail

1. Configure Gmail to pull Exchange Online mail into its system
2. Configure the Teams Calendar add-in
3. Enable Gmail to use business domain (optional)

Microsoft 365 Groups and Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft 365 Groups is the cross-application membership service in Microsoft 365. At a basic level, a Microsoft 365 Group is an object in Azure Active Directory with a list of members and a coupling to related workloads including a SharePoint team site, shared Exchange mailbox, Planner and Power BI workspace. You can add or remove people to the group just as you would any other group-based security object in Active Directory.

By default, users in Microsoft 365 can create and manage groups. For more information about Microsoft 365 Groups, see [Learn about Microsoft 365 Groups](#) and the [Groups in Microsoft 365 for IT Architects](#) poster.

How Microsoft 365 Groups work with Teams

When you create a team, a Microsoft 365 group is created to manage team membership. The group's related services, such as a SharePoint site, Power BI workspace, etc. are created at the same time.

People who create teams can choose to use an existing Microsoft 365 group if they are an owner of that group. Each channel in the team has a separate folder in the document library. Creating folders directly in the document library does not create channels in the team.

When creating a Microsoft 365 group in Outlook or SharePoint, the group mailbox is visible in Outlook. When creating a team in Teams, the group mailbox is hidden by default. You can use the [Set-UnifiedGroup](#) cmdlet with the **HiddenFromExchangeClientsEnabled** parameter to make a mailbox visible.

Group membership

If you remove a member of a team, they are removed from the Microsoft 365 group as well. Removal from the group immediately removes the team and channels from the Teams client. If you remove a person from a group using the Microsoft 365 admin center, they will no longer have access to the other collaborative aspects such as SharePoint Online document library, Yammer group, or shared OneNote. However, they will still have access to the team's chat functionality for approximately two hours.

As a best practice for managing team members, add and remove them from the Teams client to ensure that permissions updates for other group-connected workloads occur quickly. If you add or remove team members outside of the Teams client (by using the Microsoft 365 admin center, Azure AD, or Exchange Online PowerShell), it can take up to 24 hours for changes to be reflected in Teams.

Deleting groups and teams

Deleting a Microsoft 365 group will remove the mailbox alias for persistent Outlook/OWA conversations and Teams meeting invites, and mark the SharePoint site for deletion. It takes approximately 20 minutes between the removal of a team and its effect on Outlook. Deleting a team from the Teams client will remove it immediately from view to all who are members of the team. If you remove members of a Microsoft 365 Group that has had Teams functionality enabled on it, there could be a delay of approximately two hours before the team is removed from view in the Teams client for the affected people who were removed.

For details about groups and teams end of lifecycle options, see [End of lifecycle options for groups, teams, and Yammer](#) and [Archive or delete a team in Microsoft Teams](#).

[Foundations of Microsoft Teams \(video\)](#)

[Restore a deleted Group](#)

Create a Microsoft 365 resource account using the Microsoft 365 admin center

12/7/2021 • 3 minutes to read • [Edit Online](#)

Microsoft 365 resource accounts are mailbox and Teams accounts that are dedicated to specific resources, such as a room, projector, and so on. These resource accounts can automatically respond to meeting invites using rules you define when they're created. For example, if you have a common resource such as a conference room, you can set up a resource account for that conference room that will automatically accept or decline meeting invites depending on its calendar availability.

IMPORTANT

Microsoft 365 resource accounts aren't the same as Teams resource accounts. Teams resource accounts can be used with call queues and auto attendants to accept phone calls from external phone numbers. Microsoft 365 resource accounts are tied to an Exchange Online mailbox and enable booking of shared resources, such as rooms, projectors, and so on.

If you want to know more about Teams resource accounts, see [Manage resources accounts in Microsoft Teams](#).

Licensing

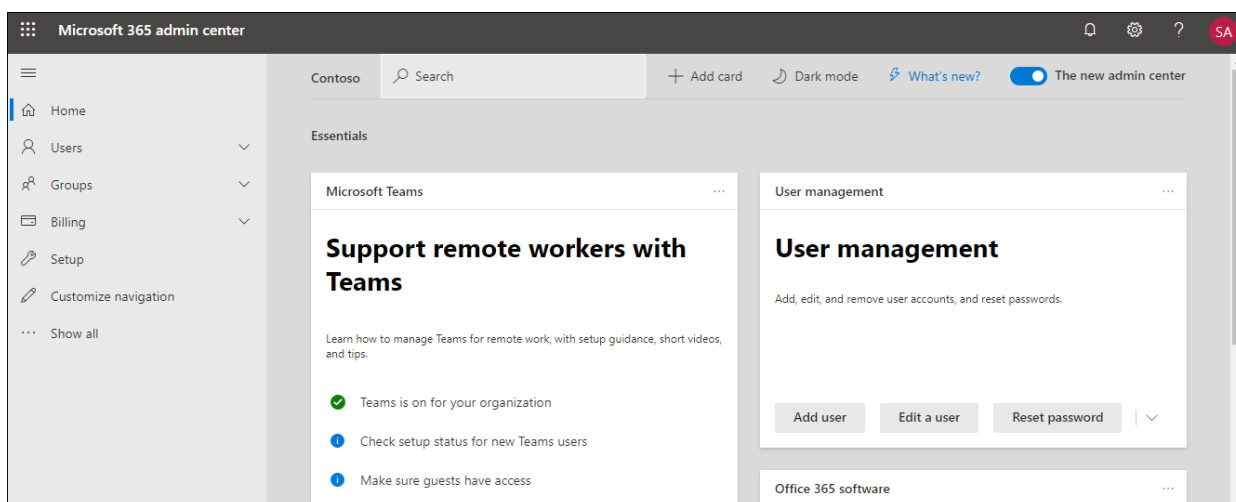

Before you create a Microsoft 365 resource account, check to see what kind of license it needs. If you'll only use a resource account to book a resource (that is, invite the resource to your meeting and have it automatically accept or decline the invitation), you don't need to assign a license to a resource account. You'll need to assign a license to the resource account in the following situations:

- **Teams meeting** If you want the resource (such as a Microsoft Teams Rooms console, collaboration bar, and so on) to join a Teams meeting so attendees can use it to present video and audio through it, you need a Meeting Room license.
- **PSTN calls** If you want the resource to make or receive calls to or from an external phone numbers (called a Public Switched Telephone Network or PSTN call), you need a Microsoft 365 Phone System or Microsoft 365 Business Voice license.

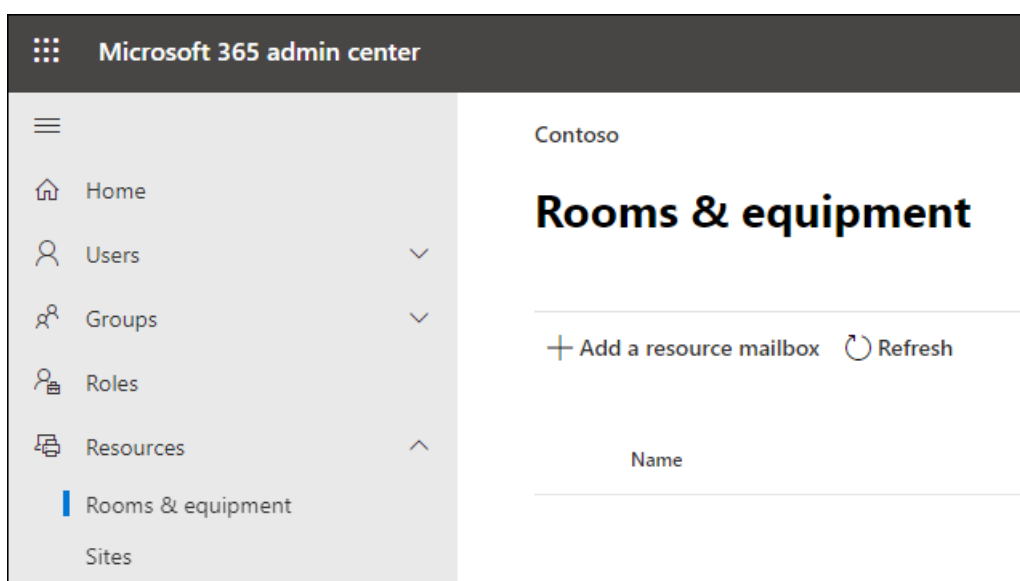

For more information about Meeting Room, Phone System, and Business Voice licenses, see [Microsoft Teams add-on licenses](#)

Create a resource account in the Microsoft 365 admin center

1. Sign in to Microsoft 365 by visiting <https://admin.microsoft.com>
2. Provide the admin credentials for your Microsoft 365 tenant. This will take you to your Microsoft 365 admin center.

3. In the admin center, navigate to **Resources** in the left panel (you might need to select **Show all** first), and then select **Rooms & equipment**.

4. Select **Add a resource mailbox** to create a new room account. Enter a display name and email address for the account, select **Add**, and then select **Close**. We recommend you standardize on a naming convention for all of your resource accounts.

NOTE

By default, resource accounts are set up with the following settings. If you want to change them, select **Set scheduling options** before you select **Close**. If you want to change them later, navigate to **Resources > Rooms & equipment**, select the resource account and then select **Edit** under **Booking options**.

- Allow repeat meetings
- Automatically decline meetings outside of the following limits
 - Booking window (days): 180
 - Maximum duration (hours): 24
- Auto accept meeting requests

5. Navigate to the **Users** section in admin center and, in the **Active users** list, you will see the room you just created.

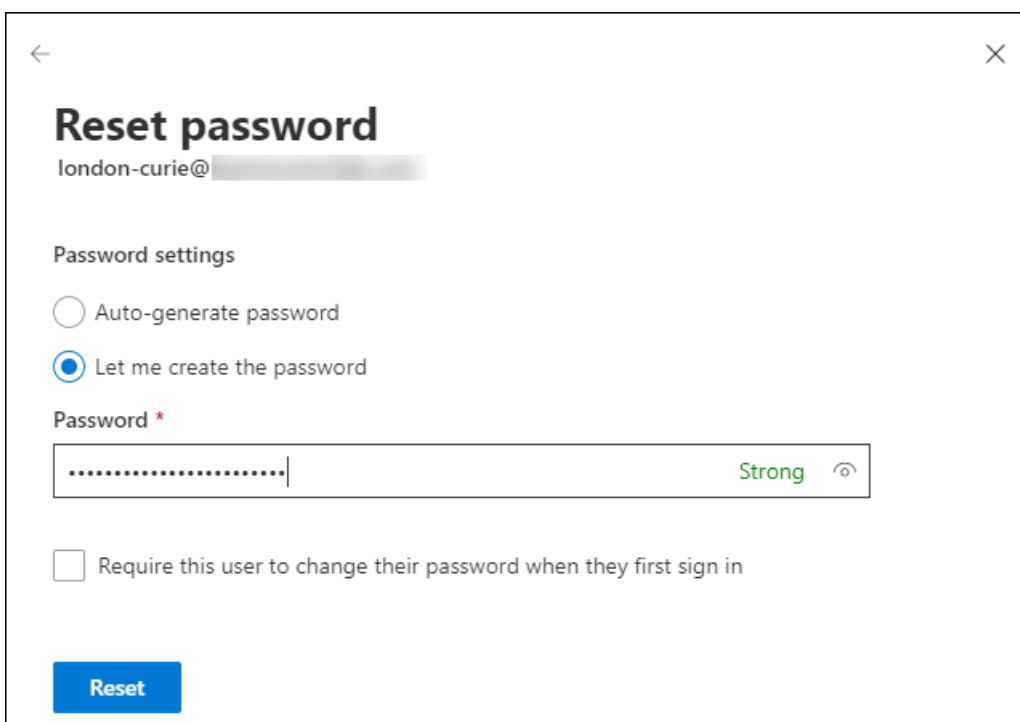

Microsoft 365 admin center				
<div> <div>Home</div> <div>Users</div> <div>Active users</div> <div>Contacts</div> <div>Guest users</div> <div>Deleted users</div> <div>Devices</div> <div>Groups</div> </div>	Add a user Refresh		1 selected Search Filter	
	Display name ↑		Username	
	Focus Room 3 (STP-Avanti)(4)		MTR-STP-Avanti4@	
	Focus Room 4 (IND-464)		mtr-ind-focusroom-4@	
	Huddle Room (STP-Avanti)(6)		MTR-STP-Avanti-2@	
	Huddle Room 1 (STP-Avanti)(6)		MTR-STP-Avanti-3@	
	London-Curie(4)		london-curie@	
	Megan Bowen		MeganB@	

6. Select on the name of the room and an account properties panel will appear on the right.

The screenshot shows the user profile page for 'London-Curie(4)'. At the top left is a purple circular profile picture with the letters 'LO'. To its right is the name 'London-Curie(4)' and a status 'Sign in allowed' with three small icons (key, lock, trash). Below this is a navigation bar with tabs: 'Account' (selected), 'Devices', 'Licenses and Apps', 'Mail', and 'OneDrive'. The main content area is divided into sections: 'Username' (london-curie@... with a 'Manage username' link), 'Groups' (with a 'Manage groups' link), 'Roles' (No administrator access with a 'Manage roles' link), 'Contact information' (Display Name: London-Curie(4), First Name, Last Name, Phone number, with a 'Manage contact information' link), and 'Office activations' (with a 'View Office activations' link).

7. Now you need to assign a password to the resource account. In the panel, you can see the account properties and several optional actions. Select the **Reset password** key icon under the username to change the password. Unselect **Require this user to change their password when they first sign in**. It is not possible to change the password via the device sign-in process. Select **Reset**.

The screenshot shows the 'Reset password' dialog box. At the top is a back arrow and a close 'X' button. The title is 'Reset password' followed by the email 'london-curie@...'. Under 'Password settings', there are two radio buttons: 'Auto-generate password' (unselected) and 'Let me create the password' (selected). Below this is a 'Password *' field with a masked password '.....' and a strength indicator 'Strong' with an eye icon. At the bottom, there is an unchecked checkbox labeled 'Require this user to change their password when they first sign in' and a blue 'Reset' button.

8. In the Licenses

and **Apps** section, set **Select location** to the country or region where the device will be installed. Scroll down and check the box next to the license to be assigned - such as Meeting Room - and then select **Save changes**. The license may vary depending on your organization.

Enhance existing Microsoft 365 groups with Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams users can enhance an existing Microsoft 365 Group with Teams functionality. When looking at enhancing a public Microsoft 365 Group, users can do that if the number of members is equal to or less than 5,000.

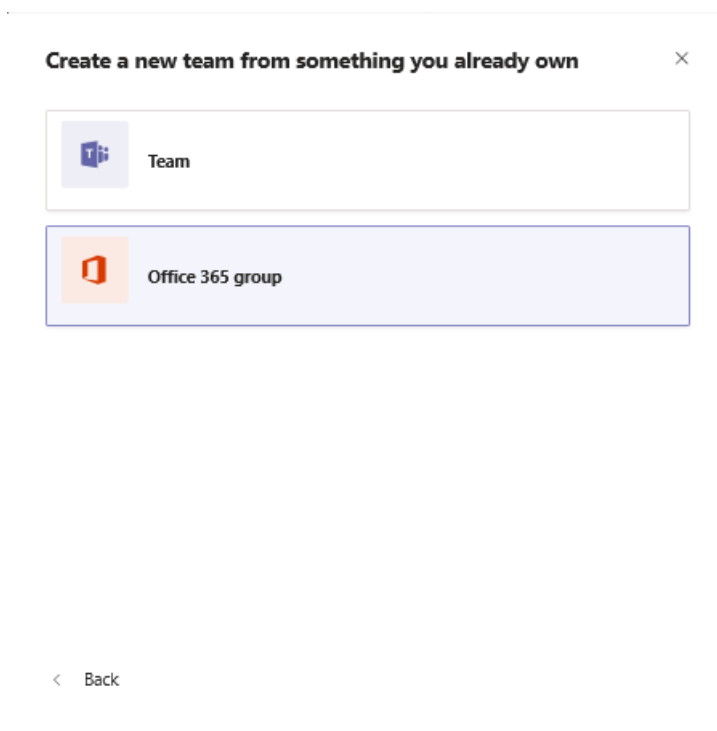

To do this, users should go through the flow of creating a new team from the Microsoft Teams client. Select **Create from > Microsoft 365 group**, and then choose the existing group that you want to enhance with Teams. Existing group members will be added as members to the team automatically.

IMPORTANT

Only Microsoft 365 Group owners have permission to enhance an existing group with Teams, and that group must contain less than 5,000 users. Teams that have already been enhanced will not show up in the list.

The option to create a team from a Microsoft 365 Group will not be available unless these conditions have been met.

Users can also invite a distribution list to a team, and the members of that distribution list will be added to the team. This is a one-time add, and later changes in group membership in the distribution list will not be replicated or synced to Teams.

You can also add mail-enabled security groups as members of a team. But, if you later add more members to the security group, those members are not automatically added to the team. You must add the new members separately or re-add the security group to the team. (If you re-add the security group, deduplication makes sure members are added only once.)

There are two types of privacy settings with Microsoft 365 groups, **public** and **private**. Whereas both group types can be enabled for Teams, there is a slight difference when it comes to self-service.

- Users can search for public groups and can join by themselves without a need for team owner's approval.
- Private groups are not searchable, and users cannot join unless a team owner add them as a member.

When creating a new team in Teams, an owner of an existing private Microsoft 365 group has an option to use the membership in the Microsoft 365 group to create the team. Users can add their existing SharePoint and OneNote files by adding a tab for SharePoint and merging OneNote files.

How Exchange and Microsoft Teams interact

12/7/2021 • 7 minutes to read • [Edit Online](#)

TIP

Watch the following session to learn how Teams interacts with Azure Active Directory (AAD), Microsoft 365 Groups, Exchange, SharePoint and OneDrive for Business: [Foundations of Microsoft Teams](#)

For the full Teams experience, every user should be enabled for Exchange Online, SharePoint Online, and Microsoft 365 Group creation.

Users' Exchange mailboxes can be hosted online or on-premises.

Users hosted on Exchange Online or Exchange Dedicated vNext can use all the features of Teams. They can create and join teams and channels, create and view meetings, call and chat, modify user profile pictures (if the Outlook on the web mailbox policy allows them to do so), and add and configure connectors, tabs, and bots. For a more comprehensive list of available features, see the table below.

Users hosted on Exchange Online Dedicated (Legacy) must be synchronized to Azure Active Directory on Microsoft 365 or Office 365. They can create and join teams and channels, add and configure tabs and bots, and make use of the chat and calling features. However, they cannot modify profile pictures, manage meetings, access outlook contacts, or manage connectors.

IMPORTANT

For integration with on-premises, it's highly recommended that you have an Exchange full Classic Hybrid deployment with Exchange Server 2016 or later. Modern Hybrid support is limited to Free/Busy and will not provide calendar integration from Teams to mailboxes on-premises, for example. For more information about setting up a hybrid deployment, see [Exchange Server hybrid deployments](#).

Users with mailboxes hosted on-premises must be synchronized to Azure Active Directory. They can make use of all the features in the above scenario, but additionally, they can manage meetings if the requirements listed on [Requirements for mailboxes hosted on-premises](#) section are met.

The following table provides a helpful quick reference to feature availability based on the Exchange environment.

Actions supported:

USE R'S MAI LBO X IS HOS TED IN:	EDIS COV ERY	LEG AL HOL D	RET ENTI ON	TEA M AND CHA NNE L MG MT	CRE ATE AND VIE W MEE TIN GS IN TEA MS	MO DIFY USE R PRO FILE PICT URE	CAL L HIST ORY	MA NAGE CON TACT S	ACC ESS OUT LOOK CON TACT S	VOI CEM AIL	ADD AND CON FIGU RE CON NECT ORS	ADD AND CON FIGU RE TAB S	ADD AND CON FIGU RE BOT S
Exc han ge Onli ne	Yes ¹	Yes ¹	Yes	Yes	Yes	Yes ⁷	Yes	Yes	Yes ⁶	Yes	Yes	Yes	Yes
Exc han ge Onli ne Ded icat ed vNe xt	Yes ¹	Yes ¹	Yes	Yes	Yes	Yes ⁷	Yes	Yes	Yes ⁶	Yes	Yes	Yes	Yes
Exc han ge Onli ne Ded icat ed – Leg acy (Syn c to Azur e AD requ ired)	Yes ¹	Yes 1,2	Yes ³	Yes	No	No	Yes	Yes	No	Yes ⁴	Yes ⁵	Yes	Yes
Exc han ge On- pre mis es (Syn c to Azur e AD)	Yes 1,9	Yes ¹	Yes ³	Yes	Yes ⁸	Yes ¹⁰	Yes	Yes	No	Yes ⁴	Yes ⁵	Yes	Yes

¹ eDiscovery and Legal Hold for compliance on channel messages is supported for all hosting options.

² Teams private chat messages are not yet supported for Legal Hold for this hosting option.

³ Retention will use a shadow mailbox for the online user to store messages.

⁴ Teams users with on-premises Exchange mailbox may use voicemail with Teams and receive voicemail messages in Outlook, but voicemail messages will not be available to view or play within the Teams client.

⁵ If one of the owners of a team can add connectors, everyone else in that team will be able to do so, even if their mailboxes are homed on-premises.

⁶ Only contacts in default contacts folder. Access to other contacts folders or sub-folders is not supported.

⁷ Teams honors the [Outlook on the web mailbox policy](#) setting that's configured by tenant admins to control whether users can change their profile picture. If the `-SetPhotoEnabled` setting is turned off in the policy, users cannot add, change, or remove their profile picture, so the profile picture won't be synced to teams if the admin changes the photo.

⁸ You need to meet the requirements listed in the [Requirements to create and view meetings for mailboxes hosted on-premises](#) section.

⁹ A minimum of an Exchange Online Plan 1 license is also required. For more information, see [Search for Teams chat data for on-premises users](#).

¹⁰ On-premises users can use Teams to update their profile picture even if the `SetPhotoEnabled` Outlook on the Web mailbox policy is set to `false`.

Requirements to get the most out of Microsoft Teams

Microsoft Teams works with several Microsoft 365 and Office 365 services to provide users with rich experience. To support this experience, you need to enable certain features or services and assign licenses.

- Users must be assigned an Exchange Online license.
- SharePoint Online is required to share and store files in team conversations. Microsoft Teams doesn't support SharePoint on-premises.
- Users must be assigned a SharePoint Online license if they want to share files in Chats. If users aren't assigned and enabled with SharePoint Online licenses, they don't have OneDrive for Business storage in Microsoft 365 or Office 365. File sharing will continue to work in Channels, but users are unable to share files in Chats without OneDrive for Business storage in Microsoft 365 or Office 365.
- Users must be enabled for Microsoft 365 group creation to create teams in Microsoft Teams.

IMPORTANT

If you uninstall the Skype for Business client after you move a user to **Teams Only** mode, presence may stop working in Outlook and other Office apps. Presence works fine in Teams. To resolve this issue, select your profile picture in the top right-hand corner of Microsoft Teams and then select **Settings**. On the **General** tab under **Application**, select **Register Teams as the chat app for Office (requires restarting Office applications)**. After you select this option, close and re-open all Office apps, including Outlook. After you open Outlook, presence information will be available.

Requirements to create and view meetings for mailboxes hosted on-premises

If mailboxes are hosted on-premises, to create and view meetings, the following requirements must be met:

- The required Teams license needs to be assigned for the Azure Active Directory synced user.
- Users must be synchronized to Azure Active Directory. For information about how to use Azure AD

Connect to synchronize with Azure Active Directory, see [Hybrid identity documentation](#).

- Mailboxes are hosted in Exchange Server 2016 Cumulative Update 3 or later.
- Autodiscover and Exchange Web Services is published externally.
- OAuth authentication is configured preferably via the Exchange Hybrid Configuration Wizard running a full hybrid configuration (Classic or Modern). If you are not able to use the Hybrid Configuration Wizard, configure OAuth as described in [Configure OAuth authentication between Exchange and Exchange Online organizations](#).

NOTE

Exchange trusts OAuth Token from Teams service which is known as EvoSTS. Step 1 should be enough, but just the EvoSTS; ACS is used for Free/Busy lookup in the calendar.

- The checkbox for the Exchange Hybrid Deployment feature in Azure AD Connect is set. For more information, see [Exchange hybrid writeback](#).
- For calendar app support and Teams Outlook Add-In for Mac, Exchange Web Service URLs must be configured as SPNs in Tenant Azure AD for the Exchange Service Principal. This step is done with Hybrid Configuration Wizard or following [manual steps for Hybrid Modern Authentication](#).

To enable calendar delegation for these users:

- You must also complete steps as described in [Configure Integration and OAuth between Skype for Business Online and Exchange Server](#); these steps will provide the Teams scheduling application the required permissions to confirm delegate permissions.

NOTE

Step 2 includes role assignment for ArchiveApplication, which is not required for delegation.

- The Teams Scheduling add-in for Outlook requires Exchange 2013 CU19 or later when scheduling a meeting on behalf of someone else. This is to support the unauthenticated discovery of the mailbox by our service to check delegate permissions against the delegator mailbox. The delegate and delegator location could be Exchange 2013 or later, or Exchange online, but Autodiscover must resolve to Exchange 2013 CU19 or later.

Additional considerations

Here are some extra things to think about as you implement Microsoft Teams in your organization.

- In Microsoft Teams, security and compliance features like eDiscovery, Content Search, archiving, and legal hold work best in Exchange Online and SharePoint Online environments. For channel conversations, messages are journaled to the group mailbox in Exchange Online, where they're available for eDiscovery. If SharePoint Online and OneDrive for Business (using work or school account) are enabled across the organization and for users, these compliance features are available for all files within Teams as well.
- Control and protect the configuration of compliance policies in Teams and Exchange using Conditional Access. For more information see [How do Conditional Access policies work for Teams?](#)
- If your organization has compliance requirements to ensure all meeting discussions are discoverable, you should disable private meetings if the organizer has an Exchange on-premises mailbox. For more information, see [Private meeting scheduling](#).

- In an Exchange hybrid deployment, content from chat messages is searchable regardless of whether chat participants have a cloud-based mailbox or an on-premises mailbox. To learn more, read [Searching cloud-based mailboxes for on-premises users](#). To learn about searching for content in Teams, read [Content Search in the Microsoft 365 Compliance Center](#).
- For presence status, Microsoft Teams must check whether the mailbox is hosted on Exchange Online or on-premises. The service then decides where to access the mailbox. To enable the Teams service to check the mailbox location through the REST API call to the Exchange Online service, you have to deploy an Exchange hybrid environment by running the Exchange Hybrid Configuration wizard, as described in [Create a hybrid deployment with the Hybrid Configuration wizard](#).

Troubleshooting

For a full troubleshooting guide on the topic, make sure to check out [Troubleshoot Microsoft Teams and Exchange Server interaction issues](#).

Configure an Exchange hybrid organization for use with Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Generally, you should not have to configure any Exchange Online functionality for use with Microsoft Teams. However, for Exchange Hybrid scenarios, there are steps necessary to ensure Group memberships are synchronized between Exchange Server (on-premises) and Exchange Online. This involves enablement of Group Writeback functionality in Azure AD Connect along with various initialization scripts: [Configure Microsoft 365 Groups with on-premises Exchange hybrid](#).

How SharePoint and OneDrive interact with Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

TIP

Watch the following session to learn how Teams interacts with Azure Active Directory (AAD), Microsoft 365 Groups, Exchange, SharePoint and OneDrive: [Foundations of Microsoft Teams](#)

Each team in Microsoft Teams has a team site in SharePoint, and each standard channel in a team gets a folder within the default team site document library. Each [private channel](#) gets its own, separate SharePoint site. To learn more about these team sites and channel sites, see [Manage Teams connected sites and channel sites](#).

Files shared within a conversation are automatically added to the document library, and permissions and file security options set in SharePoint are automatically reflected within Teams. To see the impact of changing a site address in SharePoint, read [Change a site address](#).

Private chat files are stored in the sender's OneDrive folder, and permissions are automatically granted to all participants as part of the file sharing process.

If users aren't assigned SharePoint licenses, they don't have OneDrive storage in Microsoft 365. File sharing works in standard channels, but users won't be able to share files in chats without OneDrive storage in Microsoft 365.

By storing the files in the SharePoint document library and OneDrive, all compliance rules configured at the organization level will be followed.

NOTE

Integration with SharePoint Server is not supported for Teams.

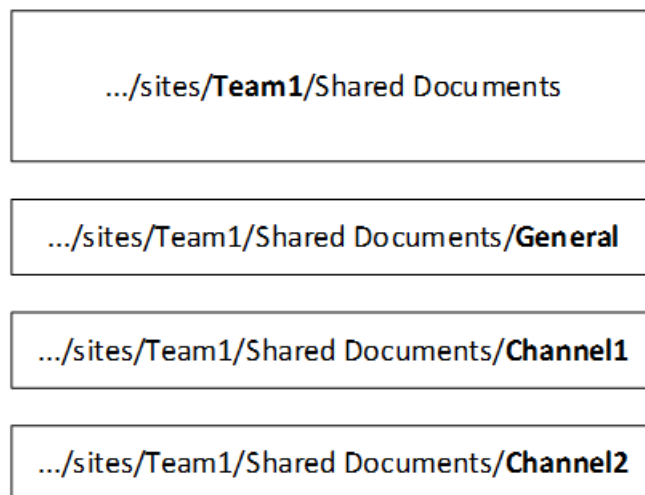

The following is the example of relationships between team, standard channel, and document library.

For every team, a SharePoint site is created, and the **Shared Documents** folder is the default folder created for the team. Each standard channel, including the **General** channel (the default channel for each team) has a folder in **Shared Documents**.

Microsoft Teams

SharePoint Online

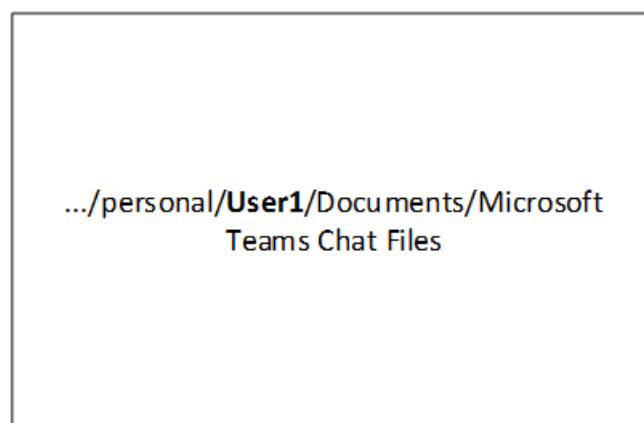

The default SharePoint site and document library can't be replaced with a different one.

For every user, the OneDrive folder **Microsoft Teams Chat Files** is used to store all files shared within private chats with other users (1:1 or 1:many), with permissions configured automatically to restrict access to the intended user only.

Microsoft Teams

OneDrive for Business

Note that for public teams, the SharePoint team site is provisioned with "Everyone except external users" access. The public team isn't displayed in Teams for people who aren't members of that team. However, they can access content on the SharePoint team site using the URL of the SharePoint team site.

Channel Files tab

The **Files** tab in Teams closely resembles the SharePoint documents view. On the **Files** tab, users can:

- See additional options in the **New** file menu.
- Sync files to their local drive.
- On the **All Documents** menu, switch from **List** view to **Compact list** to **Tiles** view.

- Identify files that need attention or have malware.
- Immediately see whether a file is read-only or checked out.
- Check out and check in files.
- Pin, unpin, and change the sort order of files.
- Identify which files need metadata
- Choose from many more filter options.
- Group files based on column headings.
- Modify column settings (move left or right, hide) and column width.

Default link type setting

The type of sharing link shown by default when a user shared a file is set in the SharePoint admin center. See [Change the default link type when users get links for sharing](#) for information.

Microsoft Teams PowerShell Overview

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams PowerShell module is a set of cmdlets for managing Teams directly from the PowerShell command line. PowerShell provides powerful features for automation that can be leveraged for managing your Teams workload.

You can use the Microsoft Teams PowerShell module using one of the following methods:

- Install the Microsoft Teams PowerShell module via [PowerShell Gallery](#) (recommended option).
- Install the Microsoft Teams PowerShell module via [Manual Download](#).

Features

The Microsoft Teams PowerShell module includes the following features:

- Uses a single module to manage all aspects of Teams administration, including users, teams, policies, and configuration.
- Supports authentication mechanisms such as access tokens and credentials.

Data collection

Microsoft Teams PowerShell module default settings collect telemetry data. Microsoft aggregates collected data to identify patterns of usage and common issues, such as cmdlets with low success, to help us prioritize our work to improve the Teams PowerShell experience. Microsoft Teams PowerShell module does not collect any private or personal data. For more details, refer to the [Microsoft Privacy Statement](#).

[Skype for Business cmdlet reference](#)

[Use Microsoft Teams admin roles to manage Teams](#)

Install Microsoft Teams PowerShell Module

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article explains how to install the Microsoft Teams PowerShell module using PowerShell Gallery. The Microsoft Teams PowerShell module is supported on all Windows platforms.

Requirements

Microsoft Teams PowerShell module requires PowerShell 5.1 or higher on all platforms. Install the [latest version of PowerShell](#) available for your operating system.

To check your PowerShell version, run the following command from within a PowerShell session:

```
$PSVersionTable.PSVersion
```

We recommend that you use the Install-Module cmdlet to install the Microsoft Teams PowerShell module.

If PowerShell Gallery (PSGallery) isn't configured as a trusted repository for **PowerShellGet**, the first time you use the PSGallery you'll see the following message:

Untrusted repository

You are installing the modules from an untrusted repository. If you trust this repository, change its InstallationPolicy value by running the `Set-PSRepository` cmdlet.

Are you sure you want to install the modules from 'PSGallery'?

[Y] Yes [A] Yes to All [N] No [L] No to All [S] Suspend [?] Help (default is "N"):

Answer **Yes** or **Yes to All** to continue with the installation.

Installing using the PowerShellGallery

Microsoft Teams PowerShell module is currently supported for use with PowerShell 5.1 on Windows. Follow these steps to install the module:

- Update to [Windows PowerShell 5.1](#). If you're on Windows 10 version 1607 or higher, you already have PowerShell 5.1 installed.
- Install [.NET Framework 4.7.2](#) or later.
- Run the following command to install the latest PowerShellGet:

```
Install-Module -Name PowerShellGet -Force -AllowClobber
```

- Install the Teams PowerShell Module.

```
Install-Module -Name MicrosoftTeams -Force -AllowClobber
```

Offline Installation

In some environments, it's not possible to connect to the PowerShell Gallery. In those situations, please follow

these [manual installation steps](#).

Sign in

To start working with Microsoft Teams PowerShell module, sign in with your Azure credentials.

```
Connect-MicrosoftTeams
```

Update Teams PowerShell Module

To update any PowerShell module, you should use the same method used to install the module. For example, if you originally used Install-Module, then you should use [Update-Module](#) to get the latest version.

```
Update-Module MicrosoftTeams
```

WARNING

If Teams PowerShell has already been imported into your PowerShell session, updating the module will fail. Close PowerShell and re-open a new elevated PowerShell session.

Uninstall Teams PowerShell

To uninstall Microsoft Teams PowerShell, open a new PowerShell command prompt and run the following:

```
Uninstall-Module MicrosoftTeams

# Uninstall all versions of the module
Uninstall-Module MicrosoftTeams -Allversions
```

Next Steps

Now you're ready to manage Microsoft Teams using Microsoft Teams PowerShell. See [Managing Teams with Teams PowerShell](#) to get started.

[Skype for Business cmdlet reference](#)

Manage Teams with Microsoft Teams PowerShell

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article shows you how to use Microsoft Teams PowerShell to manage Teams and Skype for Business.

Use this guidance in conjunction with the [Microsoft Teams cmdlet reference](#) and [Skype for Business cmdlet reference](#).

To manage Teams in the Teams admin center, see [Manage Teams with Azure Cloud Shell](#).

Create and manage teams using PowerShell

The cmdlets for creating and managing teams are in the [Microsoft Teams PowerShell module](#).

Teams are backed by Office 365 Groups, so when you create a team, you create a group. There are a set of cmdlets provided for operating on the core team and its settings (`new-team` , `get-team` , `set-team`), managing team users (`add-teamuser` , `remove-teamuser`), as well as cmdlets for managing the channels of the team (`new-teamchannel` , `remove-teamchannel`). All of these cmdlets can be run as end users, but they'll work only on the teams that you own or are a member of. If you are a Global Admin or Teams Administrator, you'll be able to act on all teams in your organization.

```
New-Team -DisplayName "Contoso Marketing" -Description "Collaboration space for Contoso's Marketing department"
```

NOTE

The **GroupId** used in the Microsoft Teams PowerShell module cmdlets is the same as the **Identity** property returned by `Get-UnifiedGroup` in the Exchange PowerShell module.

Manage Teams with Azure Cloud Shell

Cloud Shell is an interactive, authenticated, browser-accessible shell that lets you manage your resources. For more information on Cloud Shell, see [Azure Cloud Shell](#).

To access the Azure Cloud Shell and use PowerShell to manage Teams, sign in to the Teams admin center.

1. Select the Cloud Shell icon in the top right corner.

2. When prompted, choose **PowerShell**.

Welcome to Azure Cloud Shell

Select Bash or PowerShell. You can change shells any time via the environment selector in the Cloud Shell toolbar. The most recently used environment will be the default for your next session.

Bash PowerShell

3. Run the following command to start a Teams PowerShell session:

```
Connect-MicrosoftTeams
```

After you've completed these steps, you're ready to run Teams PowerShell commands.

IMPORTANT

If you want to use Cs* cmdlets, you first need to connect to Teams by using the `Connect-MicrosoftTeams -UseDeviceAuthentication` command.

Manage policies via PowerShell

NOTE

- Skype for Business Online Connector is being consolidated into Teams PowerShell. It is currently available in public preview. In time, Skype for Business Online cmdlets that apply to Teams will be natively available in the Teams PowerShell module. Installation steps are available in the [Install Teams PowerShell](#) article.
- The cmdlets will be available in your PowerShell session once you connect to Skype for Business Online. For more information, please see [Manage Skype for Business Online with Office 365 PowerShell](#).

Find the cmdlets for managing policies in the [Skype for Business cmdlet module](#).

A policy is a group of settings that can be applied granularly to individual users. Each policy type has its own set of cmdlets for creating, viewing, deleting, and updating the policies themselves, and then assigning those policies to users. The general structure is:

- **GET** commands (for example, `Get-CsTeamsMeetingPolicy`): Returns the policy documents that are available for you to assign in your organization, including the policies created by Microsoft for you to use as well as the custom policies you've created.
 - To find only the custom policies you've created in your organization, use `-Filter "tag:*`.
- **NEW** commands (for example, `New-CsTeamsMeetingPolicy`): Creates new policies for your organization to assign to users in your organization. Not all policies support the creation of custom policies. Often this is to ensure that the policies you use in your organization have a supported combination of settings.
- **SET** commands (for example, `Set-CsTeamsMeetingPolicy`): Sets particular values on a given policy. Some policies don't have SET commands available, or they contain parameters that can't be customized in the policy. The PowerShell descriptions tell you which parameters can't be customized.
 - To edit the policy that will by default be assigned to users in your organization who do not have a

custom policy assigned, run `Set-Cs<PolicyName> -Identity Global`.

- **REMOVE** commands (for example, `Remove-CsTeamsMeetingPolicy`): Deletes a custom policy that has been created in your tenant. If you delete a custom policy that has been assigned to at least one user in your organization, that user will fall back to the global policy.
 - You can't actually remove the global policy in your organization, but if you want to reset the global policy in your organization to the Microsoft-provided default settings, run `Remove-Cs<PolicyName> -Identity Global`.
- **GRANT** command (for example, `Grant-CsTeamsMeetingPolicy`): Assigns a policy to a particular user.
 - To remove a custom policy assignment and make the user fall back to the default policy in your organization, run `Grant-Cs<PolicyName> -Identity <User Identity> -PolicyName $null`.

TIP

Not all policies allow custom policies to be created, and some policies have settings that you can't customize (so you can view the setting but can't set a custom value during `set-` and `new-`). The documentation for each cmdlet calls out whether parameters are available for use by customers.

Common parameters:

- **Identity**: For `Get-`, `Set-`, `New-`, and `Remove-`, the **Identity** parameter will always refer to a specific policy instance. For `Grant`, the **Identity** parameter refers to a specific user object to whom the policy is being applied.

Manage configurations via PowerShell

Find the cmdlets for managing your configuration in the [Skype for Business cmdlet module](#).

Configurations are buckets of settings maintained in the service that can't be specified at a user level. Settings always apply across the whole organization. Your global configuration is the only effective configuration in your organization. Each configuration type comes with two primary cmdlets:

- `Get-Cs<ConfigurationName>` (for example, `Get-CsTeamsClientConfiguration`):
- SET commands (for example, `Set-CsTeamsClientConfiguration`): set properties in the configuration of that type. Specify the parameters that you want to modify.

NOTE

You can reference the configuration that you're modifying in one of two ways: by specifying **-Identity Global**, or by running `Get-Cs<ConfigurationName>` | `Set-Cs<ConfigurationName>`.

What can each admin role do?

Read [Use Microsoft Teams admin roles to manage Teams](#) to understand which admin roles can run each PowerShell cmdlet.

Microsoft Teams PowerShell Release Notes

12/7/2021 • 7 minutes to read • [Edit Online](#)

This page provides the latest Teams PowerShell change log for both General Availability and Public Preview releases.

Release Notes

NOTE

-**preview** in the version column below represents updates to Teams PowerShell public preview.

DATE	VERSION	UPDATES
November 2021	3.0.0	<ul style="list-style-type: none">• Soon Microsoft Teams PowerShell Module versions in the 3.x.x series will be the only versions supported. All earlier versions will be on the deprecation path.• [BREAKING CHANGE] Get-CsOnlineUser and Get-CsOnlineVoiceUser: The following changes apply for TeamsOnly tenants:<ul style="list-style-type: none">• These cmdlets have now been migrated from the earlier implementation to the newer APIs.• (Using -Identity parameter): Attributes that are no longer relevant for Teams have been deprecated for TeamsOnly Tenants. Some attributes have also been renamed/replaced—see Get-CsOnlineUser and Get-CsOnlineVoiceUser.• Get-CsOnlineUser (with -Filter parameter): Formatting for filtering based on AssignedPlans and EnterpriseVoice has been modified. Filterable attributes have also been temporarily limited (based on usage) for TeamsOnly Users—see Get-CsOnlineVoiceUser.• These cmdlets will be gradually rolled out and some tenants will not experience these changes until the rollout is complete by the end of CY21.• [BREAKING CHANGE] Get-CsTenant: Attributes that are no longer relevant in the Teams world have been deprecated for TeamsOnly tenants—see Get-CsTenant.

DATE	VERSION	<ul style="list-style-type: none"> • Releases modernized versions of all UPDATES 75+ Grant-Cs<Name>Policy cmdlets (all parameter sets). These are expected to work similar to their remoting counterparts. The modern versions will be gradually rolled out, so some tenants will see the earlier remoting version (until the rollout completes). • Releases modernized versions of all 75+ Remove-Cs<Name>Policy cmdlets. These are expected to work similar to their remoting counterparts. The modern versions will be gradually rolled out, so some tenants will see the earlier remoting version (until the rollout completes). • Releases [Set Remove]-CsPhoneNumberAssignment cmdlets. These cmdlets will be gradually rolled out, so some tenants will get an error message referencing the existing cmdlets that they can use (until the rollout completes). • Releases new parameter EnhancedEmergencyServiceDisclaimer for [Set New]-CsTeamsEmergencyCallingPolicy cmdlet. • Releases [Get Add Remove]-TeamChannelUser cmdlets. • Releases Export-CsOnlineAudioFile cmdlet. • Fixes error handlings for [Get Import Remove]-CsOnlineAudioFile cmdlets. • Fixes for Get-Team error handling. Outputs the error message if fetching teams data fails. • Fixes for Connect-MicrosoftTeams - AccessToken the difference in expiration time is increased.

DATE	VERSION	UPDATES
November 2021	2.6.2-preview	<ul style="list-style-type: none"> • Releases modernized versions of all 75+ Grant-Cs<Name>Policy cmdlets (all parameter sets). These are expected to work similarly to their remoting counterparts. The modern versions will be gradually rolled out, tenants that aren't flighted will see the older remoting version. • Releases modernized versions of all 75+ Remove-Cs<Name>Policy cmdlets. These are expected to work similarly to their remoting counterparts. The modern versions will be gradually rolled out, tenants that aren't flighted will see the older remoting version. • Releases Set-CsUserCallingSettings cmdlet. This cmdlet will be eventually released in GA module. Releasing the trial version in preview module. • Releases Export-CsOnlineAudioFile cmdlet. • Fixes error handlings for [Get Import Remove]-CsOnlineAudioFile cmdlets.
October 2021	2.6.1-preview	<ul style="list-style-type: none"> • Releases [Set Remove]-CsPhoneNumberAssignment cmdlets. These cmdlets will be gradually rolled out. So some tenants will get an error message referencing the existing cmdlets they can use (until the rollout completes). • Releases Get-CsOnlineTelephoneNumberCountry and Get-CsOnlineTelephoneNumberType cmdlets. • Releases new parameter EnhancedEmergencyServiceDisclaimer for [Set New]-CsTeamsEmergencyCallingPolicy cmdlet. • Releases Get-CsUserCallingSettings cmdlet. This cmdlet will be eventually released in GA module. Releasing the trial version in preview module.

DATE	VERSION	UPDATES
September 2021	2.6.0	<ul style="list-style-type: none"> • Fixes the bug where MicrosoftTeams module lookup failed if made a nested module of another custom PowerShell module. Now, MicrosoftTeams cmdlets are available even if it's a nested module of another module. • Releases [Get New Complete Clear]-CsOnlineTelephoneNumberOrder cmdlets. • Releases Get-CsOnlineTelephoneNumberCountry and Get-CsOnlineTelephoneNumberType cmdlets. • Releases new parameters for these cmdlets : Get-CsOnlineApplicationInstance, New-CsExternalAccessPolicy, New-CsTeamsAppSetupPolicy, New-CsTeamsCallingPolicy, New-CsTeamsCallParkPolicy, New-CsTeamsMeetingPolicy, New-CsTeamsMessagingPolicy, Set-CsTeamsAppSetupPolicy, Set-CsTeamsCallParkPolicy, Set-CsTeamsGuestMessagingConfiguration, Set-CsTeamsMeetingPolicy, Set-CsTenantFederationConfiguration, Set-CsExternalAccessPolicy, Set-CsTeamsCallingPolicy. • Fixes the failure that occurred when retrying login with Connect-MicrosoftTeams after an incorrect sign-in attempt. • Updates to make the module's release notes available in PowerShell Gallery for each new version.

DATE	VERSION	UPDATES
September 2021	2.5.2-preview	<ul style="list-style-type: none"> • Note: Starting from this version, the release notes will also be published on PowerShell Gallery along with the module itself to reduce the delay in availability of release notes. • Releases [Get Set Grant New Remove]-CsTeamsEnhancedEncryptionPolicy cmdlets. • Removes [Get Set New Remove]-CsTenantBlockedNumberExceptionPattern cmdlets. • Fixes the bug where the Microsoft Teams module lookup failed if it was made a nested module of another custom PowerShell module. Now, Microsoft Teams cmdlets are available even if its a nested module of another module. • Releases [Get New Complete Clear]-CsOnlineTelephoneNumberOrder cmdlets. • Releases Get-CsOnlineTelephoneNumberCountry and Get-CsOnlineTelephoneNumberType cmdlets. • Fixes the failure that occurred when retrying sign-in with Connect-MicrosoftTeams after an incorrect sign-in attempt. • Fixes Add-TeamChannelUser and Remove-TeamChannelUser failing for a private channel.

DATE	VERSION	UPDATES
August 2021	2.5.1	<ul style="list-style-type: none"> • The Access Token login for Connect-MicrosoftTeams now uses a unified token array instead of separate parameters for each resource-specific token. More details can be found here: Connect-MicrosoftTeams. • The interactive login failure of Connect-MicrosoftTeams in Cloudshell has been fixed. It now defaults to using the logged-in identity of the user instead of prompting for re-authentication. • TeamsUnassignedNumberTreatment cmdlets are now available. • Get-CsOnlineDialInConferencingBridge and Set-CsOnlineDialInConferencingBridge cmdlets have now been migrated from the older implementation to the newer APIs. • Modernized versions of Get-CsTenant and Get-CsOnlineUser (with -identity parameter only) have been released. They no longer emit deprecated properties and have some formatting changes compared to their remoting counterparts. • Note: The New-Team related updates have been reverted from 2.5.0 and the previous version has been provided so as to avoid any breaking changes.
July 2021	2.4.1-preview	<ul style="list-style-type: none"> • Grant cmdlets changes now available. • New Voice related cmdlets are released. • Removal of certificate thumbprint authentication for -Cs* cmdlets. • Logging fix for logging files of all cmdlets. • Fixes issues with *TeamChannelUser cmdlets.

DATE	VERSION	UPDATES
June 2021	2.4.0-preview	<ul style="list-style-type: none"> • Preview only release of modernized versions of Get-CsTenant, Get-CsOnlineUser (with -identity parameter only), Get-CsOnlineDialInConferencingLanguages Supported, and Import-CsOnlineAudioFile. • Modernized versions of Get-CsOnlineDialInConferencingLanguages Supported and Import-CsOnlineAudioFile are expected to work similar/same to their remoting counterparts. • Modernized versions of Get-CsTenant and Get-CsOnlineUser (when run with -identity parameter) don't emit deprecated properties. • Modernized versions of Get-CsTenant and Get-CsOnlineUser (when run with -identity parameter) have some formatting changes when compared to their remoting counterparts. • Releases [Get Set Grant New Remove]-CsTeamsAudioConferencingPolicy cmdlets. • Releases Get-CsOnlineAudioFile and Remove-CsOnlineAudioFile cmdlets. • Set-TeamTargetingHierarchy, Remove-TeamTargetingHierarchy, Get-TeamTargetingHierarchyStatus are now available for GCC customers. • Fixes the endpoint called by the Get-TeamTargetingHierarchyStatus command.
May 2021	2.3.2-preview	<ul style="list-style-type: none"> • Support for AccessToken login with Connect-MicrosoftTeams. Added -AccessTokens parameter that accepts the array of token. MSGraph and Teams resource token are required when using the AccessTokens parameter. • Removed AadAccessToken and MsAccessToken parameters.
May 2021	2.3.1	<ul style="list-style-type: none"> • Update from .NETCore 2.1 to 3.1 • Added cmdlet to get multi-geo region for users and groups • Fixes for integrated windows authentication to use -AccountId with Connect-MicrosoftTeams • TeamsCallHoldPolicy cmdlets are now available • Updates to input parameters and output formats of many commands • Fixes large latency issue while remoting commands • GA custom package features

DATE	VERSION	UPDATES
April 2021	2.2.0-preview	<ul style="list-style-type: none"> • Fixes for integrated Windows authentication to use -AccountId with Connect-MicrosoftTeams. • Added cmdlet to get details of total change notification events that can be sent to users. • Added cmdlet to get multi-geo region for users and groups. • Handling of values passed to TeamsEnvironment name was case sensitive. This has been fixed. • Major refactor of remote session management within the module to facilitate unit tests. There should be no functional change for tenant admins.
April 2021	2.1.0-preview	<ul style="list-style-type: none"> • Fixed output formatting of some remoting cmdlets (for example, Get-CsTeamsNetworkRoamingPolicy, Get-CsTeamsMeetingPolicy, Get-CsTeamsMessagingPolicy, and more). • Updated parameter list of policy management cmdlets.
March 2021	2.0.0	<ul style="list-style-type: none"> • Uses MSAL for authentication & authorization • Connect-MicrosoftTeams is the entry point for all cmdlets. • New-csOnlineSession is no longer available. It has been replaced with Connect-MicrosoftTeams. • Enable-csonlinesessionforreconnection is no longer required. The feature has been natively implemented in Teams PowerShell Module. • Refactored Policy Package cmdlets and adds group package assignment • Significant performance enhancements for Get-Team cmdlet • Improved logging and debugging option for existing cmdlets • Added template management cmdlets • Deprecation of New-CsOnlineSession
February 2021	1.1.11-preview	<ul style="list-style-type: none"> • Added template management cmdlets • Mezzo and batching enhancements for Get-Team cmdlet • Improved logging and debugging option for existing cmdlets • Refactored Policy Package cmdlets
December 2020	1.1.10-preview	<ul style="list-style-type: none"> • Updates to New-team cmdlet with increased retries and sleep duration

DATE	VERSION	UPDATES
December 2020	1.1.9-preview	<ul style="list-style-type: none"> • Updates for Skype for Business Online Integration • Fix for the duplicate prompt with Connect-Microsoft Teams
November 2020	1.1.8-preview	<ul style="list-style-type: none"> • Adds custom policy package cmdlets • Fixes for the targeting hierarchy upload commands
November 2020	1.1.7-preview	<ul style="list-style-type: none"> • Uses MSAL for authentication & authorization • Refactored Policy Package cmdlets and adds group package assignment • Refactored targeting hierarchy upload commands to use an asynchronous model • User will be prompted twice during initial authentication when they do not use the -credential parameter. Users can pass credentials using the -credential parameter to avoid a duplicate prompt. This behavior will be fixed in the next release.
September 2020	1.1.6	<ul style="list-style-type: none"> • Skype for Business Online Connector integration
September 2020	1.1.5-preview	<ul style="list-style-type: none"> • Skype for Business Online Connector integration
July 2020	1.1.4	<ul style="list-style-type: none"> • Added group policy assignment cmdlets
June 2020	1.1.3-preview	<ul style="list-style-type: none"> • Skype for Business Online Connector integration • Get-Team optimizations • Enhanced reliability
June 2020	1.0.7	<ul style="list-style-type: none"> • Added Cmdlet preloading • .NET Framework optimizations
April 2020	1.0.6	<ul style="list-style-type: none"> • Authenticode and assembly signing • Added Get-CsPolicyPackage • Added Get-CsUserPolicyPackage • Added Get-CsUserPolicyPackageRecommendation • Added Grant-CsUserPolicyPackage • Added New-CsBatchPolicyPackageAssignmentOperation • Added Set-TeamArchivedState • Added Set-TeamPicture • Removed Get-TeamHelp
March 2020	1.0.5	<ul style="list-style-type: none"> • Added New-CsBatchPolicyAssignmentOperation

DATE	VERSION	UPDATES
Feb 2020	1.0.4	<ul style="list-style-type: none">• Get-Team optimizations

Migrating from Skype for Business Online Connector to the Teams PowerShell module

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams PowerShell Module provides a complete set of cmdlets for managing Teams directly from the PowerShell command line. Administrators do not require Skype For Business Online Connector for their Teams administration.

NOTE

Teams administrator were notified through Message center post (MC244740, dated March 16, 2021; MC250940, dated April 16 2021) about this change.

Teams PowerShell Module uses modern authentication, but the underlying Windows Remote Management (WinRM) client must be configured to allow Basic authentication. See [Download and install Windows PowerShell](#) for instructions on how to enable WinRM for Basic authentication.

How to Migrate

Migrating from using Skype for Business Online Connector to Teams PowerShell module is easy and simple. The below steps explains how to do this.

1. Install the latest Teams PowerShell module. For steps, see [Install Microsoft Teams PowerShell](#).
2. Uninstall Skype For Business Online Connector. To do this, in Control Panel, go to **Programs and Features**, select **Skype for Business Online, Windows PowerShell Module**, and then select **Uninstall**.

3. In your PowerShell scripts, change the module name that's referenced in `Import-Module` from

`SkypeOnlineConnector` or `LyncOnlineConnector` to `MicrosoftTeams`.

For example, change `Import-Module -Name SkypeOnlineConnector` to `Import-Module -Name MicrosoftTeams`.

4. When using Teams PowerShell Module 2.0 or later, update your scripts that refers `New-CsOnlineSession` to `Connect-MicrosoftTeams`. `Import-PsSession` is no longer required to establish a Skype for Business Online Remote PowerShell Session as that is done implicit when using `Connect-MicrosoftTeams`.

```
# When using the Skype for Business online connector

# Establishing a session
Import-Module SkypeOnlineConnector [LyncOnlineConnector]
$credential = Get-Credential
$SkypeSession = New-CsOnlineSession -Credential $credential
Import-Session $SkypeSession

# Example getting tenant details
Get-CsTenant

# Disconnecting and closing the Session
Get-PsSession $SkypeSession | Remove-PsSession

# When using Teams PowerShell Module 2.0 or later

# Establishing a session
Import-Module MicrosoftTeams
$credential = Get-Credential
Connect-MicrosoftTeams -Credential $credential

# Example getting tenant details
Get-CsTenant

# Disconnecting and closing the Session
Disconnect-MicrosoftTeams
```

Minutes available for Calling Plans.	There are four plan options available per calendar month: <ul style="list-style-type: none">• 120 minute Domestic Calling Plan• 240 minute Domestic Calling Plan• 3000 minute Domestic Calling Plan• Domestic and International Calling Plan: 3000 minutes of domestic -OR- 600 minutes of international calling (whichever is reached first in the calendar month)

FEATURE	DETAILS
Can make outbound calls to premium numbers?	Not supported at this time.
Can make outbound calls to?	To 196 countries, including these .

NOTE

When a Calling Plan (domestic or domestic and international) user in the U.S. dials a phone number in Canada, it will be treated as a domestic call. This is also the case when a user in Canada dials a phone number in the U.S. However, if you also use calling plan policies to limit user dial-out to “domestic” only, a U.S. user won’t be able to call Canada and likewise, a Canada user won’t be able to call a U.S. user.

NOTE

Calls to the U.S. are treated as domestic calls.

Can make outbound calls to premium numbers?	Not supported at this time.
Can make outbound calls to?	To 196 countries, including these .

NOTE

When a Calling Plan (domestic or domestic and international) user in the U.S. dials a phone number in Canada, it will be treated as a domestic call. This is also the case when a user in Canada dials a phone number in the U.S. However, if you also use calling plan policies to limit user dial-out to “domestic” only, a U.S. user won’t be able to call Canada and likewise, a Canada user won’t be able to call a U.S. user.

NOTE

United States domestic calling includes calls to all 50 U.S. states and Puerto Rico. Users assigned with the license usage location of U.S. and/or Puerto Rico share the same pool of minutes.

Microsoft Teams: EN 301 549 Déclaration de conformité en matière d'accessibilité

12/7/2021 • 31 minutes to read • [Edit Online](#)

Date : 23 juin 2021

Nom du produit : Microsoft Teams

Description du produit : Microsoft Teams, Teams for Work et Teams for Education sont des plateformes qui permettent à toutes les personnes de chatter, de créer des canaux, de suivre les activités, de partager des calendriers et de passer des appels/ faire des réunions, ainsi que d'utiliser une console d'administrateur.

Cette déclaration de conformité ne couvre pas les extensions de fonctionnalités qui peuvent être installées et déployées au sein de la plateforme Teams (par exemple, les applications Office 365 telles que Word, PowerPoint, Excel, OneNote, les listes de fichiers de SharePoint, et autres), dont beaucoup font l'objet de déclarations de conformité distinctes dans les rapports de conformité des produits Microsoft.

Remarque : Teams ne prend pas en charge tous les paramètres de Windows, mais prend en charge un zoom intégré jusqu'à 200 %.

Plate-forme : Win32

Version du produit : 1.2.00.6412

Site web en matière d'accessibilité : [Microsoft Accessibility](#)

Pour obtenir de l'aide sur ce rapport, veuillez [nous envoyer un email](#).

Section 1 Champ d'application

La présente attestation de conformité à la norme [EN 301 549 v2.1.2 \(PDF\)](#) [précise les exigences fonctionnelles en matière d'accessibilité](#) applicables aux produits et services TIC de Microsoft.

Section 2 Références

Section 3 Définitions et abréviations

Section 4 Déclarations de conformité aux exigences fonctionnelles

Exigences fonctionnelles d'accessibilité

Section 5 Exigences génériques

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES
5.1.2.2 – 5.1.6.2	Non applicable	Fonctionnalité fermée

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES
5.2 Activation des fonctionnalités d'accessibilité Dans le cas où la TIC présente des fonctionnalités d'accessibilité documentées, il est possible d'activer les fonctionnalités qui sont requises pour répondre à un besoin spécifique sans faire appel à une méthode qui ne prend pas en charge ce besoin.	Pris en charge	
5.3 Biométrie Dans le cas où la TIC fait appel à des caractéristiques biologiques, elle ne fait pas de l'utilisation d'une caractéristique biologique le seul moyen d'identification de l'utilisateur ou de contrôle de la TIC.	Non applicable	
5.4 Préservation des informations d'accessibilité pendant la conversion Dans le cas où la TIC convertit des informations ou une communication, elle préserve toutes les informations non exclusives documentées qui sont fournies pour l'accessibilité dans la mesure où ces informations peuvent être contenues dans le format de destination ou prises en charge par ce dernier.	Non applicable	
5.5.1 Mode de fonctionnement Dans le cas où la TIC présente des éléments actionnables qui doivent être actionnés en les prenant, en les pinçant ou en exerçant une torsion du poignet, un autre mode de fonctionnement accessible qui ne nécessite pas ces gestes est proposé.	Non applicable	
5.5.2 Discernabilité des éléments actionnables Dans le cas où la TIC a des éléments actionnables, elle propose un moyen de discerner chaque élément actionnable sans que la vision ne soit nécessaire et sans accomplir le geste associé à cet élément actionnable.	Non applicable	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES
5.6.1 Statut tactile ou auditif Dans le cas où la TIC est dotée d'une commande de verrouillage et où cette commande est présentée visuellement à l'utilisateur, la TIC propose au moins un mode de fonctionnement avec lequel il est possible de déterminer le statut de la commande par le son ou par le toucher sans actionner la commande.	Non applicable	
5.6.2 Statut visuel Dans le cas où la TIC est dotée d'une commande de verrouillage et où cette commande n'est pas présentée visuellement à l'utilisateur, la TIC propose au moins un mode de fonctionnement avec lequel il est possible de déterminer visuellement le statut de la commande lorsque la commande est présentée.	Non applicable	
5.7 Répétition automatique des touches Dans le cas où la TIC est dotée de la fonction répétition automatique des touches et où cette fonction ne peut être désactivée : a) le délai avant la répétition automatique est réglable jusqu'à au moins 2 secondes ; et b) la vitesse de répétition peut être réduite jusqu'à un caractère par intervalle de 2 secondes.	Non applicable	
5.8 Acceptation des doubles frappes sur le clavier Dans le cas où un clavier est fourni, le délai, après une frappe sur le clavier, pendant lequel une autre frappe ne sera pas acceptée si elle est identique à la frappe précédente est réglable jusqu'à au moins 0,5 seconde.	Non applicable	
5.9 Actions simultanées de l'utilisateur Dans le cas où la TIC nécessite, pour fonctionner, plusieurs actions simultanées de l'utilisateur, cette TIC propose au moins un mode de fonctionnement qui ne nécessite pas plusieurs actions simultanées de la part de l'utilisateur pour fonctionner.	Pris en charge	

Section 6 TIC avec communication voix bidirectionnelle

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>6.1 Bande passante audio pour la parole (recommandation pour information)</p> <p>Dans le cas où la TIC permet la communication voix bidirectionnelle, elle doit être capable, pour donner une bonne qualité audio, de chiffrer et de déchiffrer la communication voix bidirectionnelle dans une bande de fréquence plafonnée à au moins 7 000 Hz.</p>	Pris en charge	
<p>6.2.1.1 Communication en temps réel par texte (RTT)</p> <p>Dans le cas où la TIC est compatible avec la communication voix bidirectionnelle dans un contexte d'utilisation spécifié, elle permet à un utilisateur de communiquer avec un autre utilisateur en RTT.</p>	Non applicable	
<p>6.2.1.2 Voix et texte simultanés</p> <p>Dans le cas où la TIC ou les TIC fournies à un utilisateur sont compatibles avec la communication voix bidirectionnelle et permettent à un utilisateur de communiquer avec un autre utilisateur en RTT, elles proposent un mécanisme permettant de sélectionner un mode de fonctionnement qui permet la voix et le texte simultanés.</p>	Non applicable	
<p>6.2.2.1 Affichage visuellement distinguable</p> <p>Dans le cas où la TIC est dotée de capacités d'envoi et de réception en RTT, l'affichage du texte envoyé est visuellement différencié de celui du texte reçu.</p>	Non applicable	
<p>6.2.2.2 Direction envoi/réception déterminable par un programme informatique</p> <p>Dans le cas où la TIC est dotée de capacités d'envoi et de réception en RTT, la direction (envoi/réception) du texte transmis est déterminable par un programme informatique, à moins que le RTT n'ait une fonctionnalité fermée.</p>	Non applicable	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>6.2.3 Interopérabilité Dans le cas où une TIC dotée de la fonctionnalité RTT affiche une interopérabilité avec d'autres TIC dotées de la fonctionnalité RTT (comme l'exige le 6.2.1.1), elles sont compatibles avec au moins un des quatre mécanismes d'interopérabilité RTT décrits ci-dessous :</p> <p>a) TIC inter-opérant sur le Réseau Téléphonique Public (RTC) avec une autre TIC qui se connecte directement au RTC comme décrit dans la Recommandation ITU-T V.18 [i.23] ou l'une de ses annexes pour les signaux de téléphonie en mode texte sur l'interface RTC ;</p> <p>b) TIC inter-opérant avec une autre TIC utilisant la VoIP SIP et utilisant une technologie RTT conforme au document RFC 4103 ;</p> <p>c) TIC inter-opérant avec une autre TIC utilisant une technologie RTT conforme à l'ensemble des protocoles IP Multimedia Sub-System (IMS) spécifiés dans les documents TS 126 114, TS 122 173 et TS 134 229 ;</p> <p>d) TIC inter-opérant avec une autre TIC utilisant une spécification commune adaptée et applicable pour l'échange RTT qui est publiée et peut être consultée. Cette spécification commune comprend une méthode pour indiquer la perte ou de la corruption de caractères.</p>	Non applicable	
<p>6.2.4 Réactivité de la RTT Dans le cas où la TIC utilise la saisie RTT, cette saisie RTT est transmise au réseau TIC compatible RTT dans la seconde qui suit sa saisie.</p>	Non applicable	
<p>6.3 Identification de l'appelant Dans le cas où la TIC propose l'identification de l'appelant et où des fonctions de télécommunications similaires sont proposées, l'identification de l'appelant et les fonctions de télécommunication similaires sont disponibles sous forme de texte et via au moins une autre modalité.</p>	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>6.4 Alternatives aux services basés sur la voix Dans le cas où la TIC propose la communication voix en temps réel et propose également des fonctions de messagerie vocale, de réception automatique ou de serveur vocal interactif, la TIC doit offrir aux utilisateurs un moyen d'accéder aux informations et d'exécuter les fonctions fournies par la TIC sans utiliser l'audition ou la parole.</p>	Pris en charge	
<p>6.5.2 Résolution Lorsqu'une TIC qui permet la communication voix bidirectionnelle est également dotée d'une fonctionnalité vidéo en temps réel, cette TIC :</p> <ul style="list-style-type: none"> a) est compatible au moins avec la résolution « QCIF » ; b) doit de préférence être compatible avec au moins la résolution « CIF ». 	Pris en charge	
<p>6.5.3 Taux de trame (vitesse d'images) Lorsqu'une TIC qui propose la communication voix bidirectionnelle est dotée d'une fonctionnalité de vidéo en temps réel, cette TIC :</p> <ul style="list-style-type: none"> a) prend en charge un taux de trame d'au moins 12 images par seconde (IPS) ; b) doit de préférence prendre en charge un taux de trame d'au moins 20 images par seconde (IPS) avec ou sans langue des signes dans le flux de données vidéo. 	Pris en charge	
<p>6.5.4 Synchronisation entre le signal audio et le signal vidéo Lorsqu'une TIC qui permet la communication voix bidirectionnelle est dotée d'une fonctionnalité de vidéo en temps réel, cette TIC doit garantir un écart de temps de 100 ms maximum entre la voix et les images présentées à l'utilisateur.</p>	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>6.6 Alternatives aux services vidéo</p> <p>Dans le cas où la TIC propose la communication vidéo en temps réel et propose également des fonctions de répondeur, de réception automatique ou de réponse interactive, la TIC doit proposer aux utilisateurs un moyen d'accéder aux informations et d'accomplir les tâches associées à ces fonctions :</p> <p>a) pour les informations audibles, sans utilisation de l'audition ;</p> <p>b) pour les commandes vocales, sans utilisation de la voix ;</p> <p>c) pour les informations visuelles, sans utilisation de la vision.</p>	Pris en charge	

Section 7 TIC avec fonctions vidéo

Cette section ne s'applique pas à Microsoft Teams.

Section 8 Matériel informatique

Cette section ne s'applique pas à Microsoft Teams.

Section 9 Web

Cette section ne s'applique pas à Microsoft Teams.

Section 10 Documents non basés dans le Web

Cette section ne s'applique pas à Microsoft Teams.

Section 11 Logiciel

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.1.1.1.1 Contenu non textuel (lecture d'écran prise en charge)</p> <p>Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.1.1 Contenu non textuel</p>	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.1.2.1.1 Audio seulement et vidéo seulement (préenregistré) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran et où aucune information sonore préenregistrée n'est nécessaire pour permettre l'utilisation des fonctions fermées de la TIC, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.2.1 Audio seulement et vidéo seulement (préenregistré).	Non-applicable	
11.1.2.2 Sous-titres (préenregistrés) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.2.2 : Sous-titres (préenregistrés).	Non-applicable	
11.1.2.3.1 Audiodescription ou média alternatif (préenregistré) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.2.3 : Audiodescription ou média de remplacement (préenregistré).	Non-applicable	
11.1.2.4 Sous-titres (en direct) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès indiqués WCAG 2.1 dans le Tableau 1.2.4. Sous-titre (en direct).	Non-applicable	
11.1.2.5 Audiodescription (préenregistrée) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.2.5 Audiodescription (préenregistrée).	Non-applicable	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.1.3.1.1 Informations et relations Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.3.1 Informations et relations.	Pris en charge	Les cartes de contact qui ne sont pas lues dans l'onglet Groupes utilisent plutôt l'onglet A-Z qui se trouve à côté.
11.1.3.2.1 Ordre séquentiel logique Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.3.2 Ordre séquentiel logique.	Pris en charge	
11.1.3.3 Caractéristiques sensorielles Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.3.3 Caractéristiques sensorielles.	Pris en charge	
11.1.3.4 Orientation Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.3.4 Orientation	Non évalué	
11.1.3.5 Indentification du motif de la saisie Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.3.5	Non évalué	
11.1.4.1 Utilisation de la couleur Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.4.1 Utilisation de la couleur.	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.1.4.2 Contrôle du son Si du contenu audio d'un logiciel est audible automatiquement pendant plus de 3 secondes, il existe un mécanisme pour l'arrêter ou le mettre en pause, ou alors il existe un mécanisme pour contrôler le volume audio indépendamment du volume du système général.	Pris en charge	
11.2.1.12 Contraste (minimum) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.4.3 Contraste (minimum)> .	Pris en charge avec des exceptions	Différents textes accessoires dans l'interface utilisateur ont un rapport de contraste inférieur à 4,5: 1 par rapport à l'arrière-plan.
11.1.4.4.1 Redimensionner le texte Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui permet l'accès aux fonctions d'agrandissement de la plate-forme ou de la technologie d'assistance, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 1.4.4 Redimensionner le texte.	Pris en charge	
11.1.4.5.1 Images de texte Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le tableau 11.14 Images de texte.	Pris en charge	
11.1.4.10.1 Redistribution Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, le contenu peut être présenté sans perte d'information ou de fonctionnalité, et sans qu'il soit nécessaire de le faire défiler en deux dimensions : <ul style="list-style-type: none"> • Contenu défilant verticalement sur une largeur équivalente à 320 pixels CSS ; • Contenu défilant horizontalement à une hauteur équivalente à 256 pixels CSS ; Sauf pour les parties du contenu qui nécessitent une mise en page bidimensionnelle pour l'utilisation ou la signification.	Non évalué	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.1.4.11 Contraste non textuel Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le tableau 1.4.11 Contraste non textuel.	Non évalué	
11.1.4.12 Espacement du texte Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui n'a pas de zone de mise en page de taille fixe essentielle pour que l'information soit transmise, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le tableau 1.4.12 Espacement du texte.	Non évalué	
11.1.4.13 Passer le curseur ou focaliser Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le tableau 1.4.13 Passer le curseur ou focaliser	Non évalué	
11.2.1.1.1 Clavier Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui permet l'accès aux claviers ou à une interface clavier, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 2.1.1 Clavier.	Pris en charge avec des exceptions	<ul style="list-style-type: none"> • Le retour à l'appel à partir de la notification n'est pas pris en charge. Pour revenir à l'appel, il convient d'utiliser le moniteur d'appel situé dans la fenêtre principale de l'application. • Les infobulles d'écran n'apparaissent pas lorsque le clavier est centré sur les icônes.
11.2.1.16 Pas de piège au clavier Si le focus du clavier peut être positionné sur un composant du logiciel à l'aide d'une interface clavier, réciproquement, il peut être déplacé hors de ce même composant simplement à l'aide d'une interface clavier et, si ce déplacement exige plus que l'utilisation d'une simple touche flèche ou tabulation ou toute autre méthode standard de sortie, l'utilisateur est informé de la méthode permettant de déplacer le focus hors de ce composant.	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.2.1.4.1 Raccourcis touches de caractère</p> <p>Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 2.1.4 Raccourcis touches de caractère.</p>	Non évalué	
<p>11.2.2.1 Réglage du délai</p> <p>Pour chaque délai qui est fixé par le logiciel, au moins l'un des points suivants est vrai :</p> <ul style="list-style-type: none"> • Suppression : l'utilisateur est autorisé à supprimer la limite de temps avant de la dépasser; ou • Ajustement : l'utilisateur est autorisé à ajuster la limite de temps avant de la dépasser dans un intervalle d'au moins dix fois la durée paramétrée par défaut ; ou • Prolongation : l'utilisateur est averti avant que la limite de temps n'expire et il lui est accordé au moins 20 secondes pour prolonger cette limite par une action simple (par exemple, « appuyer sur la barre d'espace ») et l'utilisateur est autorisé à prolonger la limite de temps au moins dix fois ; ou • L'exception du temps réel : la limite de temps est une partie constitutive d'un événement en temps réel (par exemple, une enchère) et aucune alternative n'est possible ; ou • L'exception de la limite essentielle : la limite de temps est essentielle et la prolonger invaliderait alors l'activité ; ou • L'exception des 20 heures : la limite de temps est supérieure à 20 heures. 	Non applicable	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.2.2.2 Mettre sur pause, arrêter, masquer Pour toute information en mouvement, clignotante, défilante ou mise à jour automatiquement, tous les points suivants sont vrais :</p> <p>Déplacement, clignotement, défilement : pour toute information en mouvement, clignotante ou défilante qui (1) démarre automatiquement, (2) dure plus de cinq secondes et (3) est présentée conjointement avec un autre contenu, l'utilisateur dispose d'un mécanisme pour la mettre en pause, l'arrêter ou la masquer, à moins que le mouvement, le clignotement ou le défilement s'avère un élément essentiel au bon déroulement de l'activité ; et</p> <p>Mise à jour automatique : pour toute information mise à jour automatiquement qui (1) démarre automatiquement et (2) est présentée conjointement avec un autre contenu, l'utilisateur dispose d'un mécanisme pour la mettre en pause, l'arrêter ou pour contrôler la fréquence des mises à jour à moins que la mise à jour automatique s'avère essentielle au bon déroulement de l'activité.</p>	Pas pris en charge	L'arrêt des GIF animés n'est pas pris en charge
<p>11.2.3.1 Pas plus de trois flashes ou sous le seuil critique Le logiciel est exempt de tout élément qui flashe plus de trois fois dans n'importe quel intervalle d'une seconde ou ce flash doit se situer sous le seuil de flash générique et le seuil de flash rouge.</p>	Pris en charge	
<p>11.2.4.3 Parcours du focus Si un logiciel peut être parcouru de façon séquentielle et que les séquences de navigation affectent la signification ou l'action, les éléments reçoivent le focus dans un ordre qui préserve la signification et l'opérabilité.</p>	Pris en charge	
<p>11.2.4.4 Fonction du lien (selon le contexte) Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 2.4.4 Fonction du lien (selon le contexte).</p>	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.2.4.6 En-têtes et étiquettes Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 2.4.6 En-têtes et étiquettes.	Pris en charge	Les messages et les chaînes de réponse sont marqués comme titres pour une navigation efficace. Prise en charge de l'accessibilité pour les équipes Microsoft.
11.2.4.7 Visibilité du focus Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le 2.4.7 Visibilité du focus.	Pris en charge	
11.2.5.1 Mouvements du curseur Toutes les fonctionnalités qui utilisent des mouvements multipoints ou basés sur des trajectoires pour l'opération peuvent être utilisées avec un seul curseur sans geste basé sur une trajectoire, à moins qu'un mouvement multipoints ou basé sur une trajectoire soit essentiel.	Non évalué	
11.2.5.2 Annulation du curseur Pour les fonctionnalités qui peuvent être commandées à l'aide d'un seul curseur, au moins l'un des points suivants est vrai : <ul style="list-style-type: none"> • Pas d'événement bas : L'événement bas du curseur n'est pas utilisé pour exécuter une partie de la fonction ; • Abandonner ou Annuler : L'exécution de la fonction est en cours d'exécution et un mécanisme permet d'interrompre la fonction avant la fin ou d'annuler la fonction après la fin ; • événement haut : L'événement haut annule tout résultat de l'événement bas précédent ; • Essentiel : Il est essentiel de compléter la fonction sur l'événement bas 	Non évalué	
11.2.5.3 Nom de l'étiquette Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le 2.5.3 Nom de l'étiquette.	Non évalué	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.2.5.4 commande de mouvement Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le 2.5.4 Commande de mouvement	Non évalué	
11.3.1.1.1 Langue du logiciel Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, le langage humain par défaut du logiciel peut être déterminé par un programme informatique.	Pris en charge	
11.3.2.1 Au focus Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 3.2.1 Au focus.	Pris en charge avec exceptions	En passant la souris sur la carte d'un contact, vous placez le curseur du clavier à l'intérieur de la carte.
11.3.2.2 À la saisie Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 3.2.2 À la saisie.	Pris en charge	
11.3.3.1.1 Identification des erreurs Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur et qui prend en charge l'accès aux technologies d'assistance pour la lecture d'écran, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 3.3.1 Identification des erreurs.	Pris en charge	
11.3.3.3 Étiquettes ou instructions Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 3.2.2 Étiquettes ou instructions.	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.3.3.3 Suggestion après une erreur Dans le cas où la TIC est un logiciel non-web qui est doté d'une interface utilisateur, elle remplit les Critères de Succès WCAG 2.1 indiqués dans le Tableau 3.3.3 Suggestion après une erreur.</p>	<p>Pris en charge</p>	
<p>11.3.3.4 Prévention des erreurs (juridiques, financières, de données) Pour les logiciels qui entraînent des obligations légales ou des transactions financières de la part de l'utilisateur, qui modifient ou effacent des données contrôlables par l'utilisateur dans des systèmes de stockages de données ou qui enregistrent les réponses de l'utilisateur à des tests, au moins l'une des conditions suivantes est vraie :</p> <ol style="list-style-type: none"> 1. Réversibilité : les soumissions sont réversibles. 2. Vérification : les données saisies par l'utilisateur sont vérifiées au niveau des erreurs de saisie et la possibilité est donnée à l'utilisateur de les corriger. 3. Confirmation : un mécanisme est disponible pour examiner, confirmer et corriger les informations avant de finaliser leur soumission. 	<p>Non applicable</p>	
<p>11.4.1.1.1 Analyse syntaxique Pour un logiciel qui utilise des suivis de modification de langue de telle manière que le suivi est indiqué séparément et à la disposition des technologies d'assistance et caractéristiques d'accessibilité du logiciel ou d'un agent utilisateur sélectionnable par un utilisateur, les éléments ont des suivis de modification de début et de fin complètes, ils sont imbriqués conformément à leurs spécifications, ils ne contiennent pas d'attributs dupliqués et chaque ID est unique, sauf dans le cas où les spécifications autorisent ces caractéristiques.</p>	<p>Pris en charge</p>	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.4.1.2.1 Nom, rôle et valeur Pour tout composant d'une interface utilisateur (et notamment des éléments de formulaire, liens et composants générés par des scripts), le nom et le rôle peuvent être déterminés par un programme informatique ; les états, les propriétés et les valeurs qui peuvent être paramétrés par l'utilisateur peuvent être définis par un programme informatique ; et la notification des changements de ces éléments est mise à la disposition des agents utilisateurs, et notamment des technologies d'assistance.</p>	<p>Pris en charge avec des exceptions</p>	<p>La sélection « état de la réunion » depuis la liste de réunion n'est pas apparente du point de vue de la programmation. Il convient d'utiliser le bon contenu de l'application ou le bon titre de la fenêtre pour vérifier.</p> <ul style="list-style-type: none"> • Certaines des informations complémentaires résultant de l'action de l'utilisateur lors d'une réunion ne sont pas automatiquement lues par les lecteurs. • La possibilité d'ajouter du texte alt. à une image n'est pas supportée • Le contenu d'iFrame/webview n'est pas accessible avec les lecteurs d'écran. Utilisez plutôt Teams web.
<p>11.5.2.2.1 Prise en charge du service d'accessibilité de la plate-forme pour les logiciels qui fournissent une interface utilisateur Les logiciels de plate-forme fournissent un ensemble de services de plate-forme documentés qui permettent aux logiciels qui fournissent une interface utilisateur fonctionnant sur le logiciel de plate-forme d'interagir avec la technologie d'assistance.</p> <p>Le logiciel de la plate-forme devrait prendre en charge les exigences 11.5.2.5 à 11.5.2.2.17, sauf que, lorsqu'un concept d'interface utilisateur correspondant à l'une des clauses 11.5.2.5 à 11.5.2.17 n'est pas pris en charge par l'environnement logiciel, ces exigences ne sont pas applicables. Par exemple, les attributs de sélection de 11.5.2.14 (Modification des attributs de focalisation et de sélection) peuvent ne pas exister dans les environnements qui ne permettent pas la sélection, qui est le plus souvent associée au copier-coller.</p>	<p>Non applicable</p>	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.5.2.2 Prise en charge des services d'accessibilité de la plate-forme les technologies d'assistance</p> <p>Le logiciel de la plate-forme fournit un ensemble de services d'accessibilité de plate-forme documentés qui permettent aux technologies d'assistance d'interagir avec un logiciel doté d'une interface utilisateur fonctionnant sur le logiciel de la plate-forme.</p> <p>Le logiciel de la plate-forme doit être compatible avec les exigences des clauses 11.5.2.5 à 11.5.2.17 étant toutefois entendu que, dans le cas où le concept d'une interface utilisateur qui correspond à l'une des clauses 11.5.2.5 à 11.5.2.17 n'est pas compatible avec l'environnement logiciel, ces exigences ne s'appliquent pas. Par exemple, les attributs de sélection du 11.5.2.14 (Modification du focus et attributs de sélection) peuvent ne pas exister dans les environnements qui ne permettent pas la sélection, ce qui est le souvent le cas de la fonction copier-coller.</p>	Non applicable	
<p>11.5.2.3 Utilisation des services d'accessibilité</p> <p>Dans le cas où le logiciel présente une interface utilisateur, il utilisera les services documentés d'accessibilité applicables de la plate-forme. Si ces services documentés d'accessibilité de la plate-forme ne permettent pas au logiciel de remplir les exigences applicables des clauses 11.5.2.5 à 11.5.2.17, alors un logiciel qui est doté d'une interface utilisateur utilise d'autres services documentés pour interagir avec la technologie d'assistance.</p>	Voir sections 11.5.2.5 à 11.5.2.17	
<p>11.5.2.4 Technologie d'assistance</p> <p>Dans le cas où la TIC est une technologie d'assistance, elle utilise les services documentés d'accessibilité de la plate-forme.</p>	Non applicable	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.5.2.5 Informations relatives à l'objet</p> <p>Dans le cas où le logiciel présente une interface utilisateur il rendra, en utilisant les services décrits dans la clause 11.3.2.3, le rôle, l'état ou les états, la frontière, le nom et la description des éléments de l'interface utilisateur déterminables par un programme informatique par les technologies d'assistance.</p>	Pris en charge	
<p>11.5.2.6 Ligne, Colonne et titres</p> <p>Dans le cas où le logiciel présente une interface utilisateur, il rendra, à l'aide des services décrits dans la clause 11.5.2.3, la ligne et la colonne de chaque cellule d'un tableau de données, y compris les titres de la colonne et de la ligne s'il y en a, déterminables par un programme informatique par les technologies d'assistance.</p>	Pris en charge	
<p>11.5.2.7 Valeurs</p> <p>Dans le cas où le logiciel présente une interface utilisateur, il rendra, à l'aide des services décrits dans la clause 11.5.2.3, la valeur actuelle d'un élément de l'interface utilisateur et toutes valeurs minimales ou maximales de la fourchette, si l'élément de l'interface utilisateur transmet des informations sur une fourchette de valeurs, déterminables par un programme informatique par les technologies d'assistance.</p>	Pris en charge	
<p>11.5.2.8 Relations des étiquettes</p> <p>Dans le cas où le logiciel présente une interface utilisateur, il exposera la relation qu'un élément de l'interface utilisateur a en tant qu'étiquette d'un autre élément, ou en tant qu'élément étiqueté par un autre élément, à l'aide des services décrits dans la clause 11.5.2.3, de sorte que ces informations soient déterminables par un programme informatique par les technologies d'assistance.</p>	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.5.2.9 Relations parent-enfant Dans le cas où le logiciel présente une interface utilisateur, il rendra, à l'aide des services décrits dans la clause 11.5.2.3, la relation entre un élément de l'interface utilisateur et des éléments parent ou enfant déterminables par un programme informatique par les technologies d'assistance.	Pris en charge	
11.5.2.10 Texte Dans le cas où le logiciel présente une interface utilisateur, il rendra, à l'aide des services décrits dans la clause 11.5.2.3, les contenus textuels, les attributs textuels et la frontière du texte qui apparaît à l'écran, déterminables par un programme informatique par les technologies d'assistance.	Pris en charge	
11.5.2.11 Liste des actions disponibles Dans le cas où le logiciel présente une interface utilisateur, il rendra, à l'aide des services décrits dans la clause 11.5.2.3, une liste des actions disponibles qui peuvent être exécutées sur un élément de l'interface utilisateur déterminable par un programme informatique par les technologies d'assistance.	Pris en charge	
11.5.2.12 Exécution des actions disponibles Quand les exigences de sécurité l'autorisent, un logiciel qui est doté d'une interface utilisateur autorise, en utilisant les services décrits dans la clause 11.5.2.3, l'exécution programmatique des actions exposées conformément à la clause 11.5.2.11 par les technologies d'assistance.	Pris en charge	
11.5.2.13 Suivi du focus et des attributs de sélection Dans le cas où le logiciel est doté d'une interface utilisateur, il rendra, à l'aide des services décrits dans la clause 11.5.2.3, les informations et mécanismes nécessaires pour suivre le focus, le point d'insertion du texte et les attributs de sélection des éléments de l'interface utilisateur, déterminables par un programme informatique par les technologies d'assistance.	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
<p>11.5.2.14 Modification du focus et des attributs de sélection Quand les exigences de sécurité l'autorisent, un logiciel qui est doté d'une interface utilisateur autorise, en utilisant les services décrits dans la clause 11.5.2.3, les technologies d'assistance à modifier par un programme informatique le focus, le point d'insertion du texte et les attributs de sélection des éléments de l'interface utilisateur dans la mesure où l'utilisateur peut les modifier.</p>	Pris en charge	
<p>11.5.2.15 Notification des changements Dans le cas où le logiciel est doté d'une interface utilisateur, il avisera, à l'aide des services décrits dans la 11.5.2.3, les technologies d'assistance de toute modification des attributs des éléments de l'interface utilisateur déterminables par un programme informatique qui sont référencés dans les exigences 11.5.2.5 à 11.5.2.11 et 11.5.2.13.</p>	Pris en charge	
<p>11.5.2.16 Modifications de l'état et des propriétés Quand les exigences de sécurité l'autorisent, un logiciel qui est doté d'une interface utilisateur autorise les technologies d'assistance, en utilisant les services décrits dans la clause 11.5.2.3, à modifier par un programme informatique l'état et les propriétés des éléments de l'interface utilisateur, dans la mesure où l'utilisateur peut les modifier.</p>	Pris en charge	
<p>11.5.2.17 Modifications des valeurs et du texte Quand les exigences de sécurité l'autorisent, un logiciel qui est doté d'une interface utilisateur autorise les technologies d'assistance, en utilisant les services décrits dans la 11.5.2.3, à modifier les valeurs et le texte des éléments de l'interface utilisateur à l'aide des méthodes de saisie de la plate-forme, dans le cas où un utilisateur peut les modifier sans utiliser de technologie d'assistance.</p>	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.6.1 Contrôle par l'utilisateur des caractéristiques d'accessibilité Dans le cas où un logiciel est une plate-forme, il propose des modes d'utilisation suffisants pour permettre un contrôle de l'utilisateur sur les caractéristiques d'accessibilité de la plate-forme qui sont documentées comme étant destinées aux utilisateurs.	Non applicable	
11.6.2 Pas de perturbation des caractéristiques d'accessibilité Dans le cas où le logiciel est doté d'une interface utilisateur, il ne perturbe pas les caractéristiques d'accessibilité documentées qui sont définies dans la documentation relative à la plate-forme sauf si l'utilisateur le demande en cours de fonctionnement du logiciel.	Pris en charge avec exceptions	<ul style="list-style-type: none"> • Pour un thème à contraste élevé, utilisez le thème fourni dans l'application à partir de la boîte de dialogue Paramètres. • Le paramètre de désactivation de l'animation fourni dans la plate-forme n'est pas pris en charge
11.7 Préférences de l'utilisateur Dans le cas où le logiciel est doté d'une interface utilisateur, il propose des modes d'utilisation suffisants qui utilisent les préférences de l'utilisateur pour les paramètres de la plate-forme (couleur, contraste, police, taille de la police et curseur de focus), à l'exception des logiciels qui sont destinés à être isolés de la plate-forme à laquelle ils appartiennent.	Pris en charge avec exceptions	<ul style="list-style-type: none"> • Pour un thème à contraste élevé, utilisez le thème fourni dans l'application à partir de la boîte de dialogue Paramètres. • Le paramètre de désactivation de l'animation fourni dans la plate-forme n'est pas pris en charge
11.8.2 Création de contenu accessible Les systèmes auteurs permettent et guident la production de contenu conforme aux clauses 9 (Contenu Web) ou 10 (Contenu non-web) telles qu'applicables.	Pris en charge avec exceptions	La possibilité d'ajouter du texte alt. pour les images n'est pas prise en charge
11.8.3 Préservation des informations sur l'accessibilité dans le cadre des transformations Si le système auteur assure des transformations de restructuration ou des transformations de recodage, alors les informations sur l'accessibilité sont préservées dans le résultat s'il existe des mécanismes équivalents dans la technologie du contenu du résultat.	Non applicable	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
11.8.4 Assistance à la réparation Si la fonctionnalité de contrôle de l'accessibilité d'un système auteur peut détecter que le contenu ne remplit pas une exigence des clauses 9 (Web) ou 10 (Documents non-web) selon le cas, alors le système auteur présente une ou plusieurs suggestions de réparation.	Non applicable	
1186.5 Modèles Quand un système auteur propose des modèles, au moins un modèle prenant en charge la création de contenu conforme aux exigences des clauses 9 (Web) ou 10 (Documents non-web), selon le cas, est disponible et identifié comme tel.	Non applicable	

Section 11 Logiciels - Fonctionnalité fermée Cette section ne s'applique pas à Microsoft Teams.

Section 12 Documentation et services d'assistance

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
12.1.1 Caractéristiques d'accessibilité et de compatibilité La documentation produit fournie avec la TIC, qu'elle soit fournie séparément ou intégrée dans la TIC, dresse la liste des caractéristiques d'accessibilité et de compatibilité de la TIC et explique comment les utiliser.	Pris en charge	
12.1.2 Documentation accessible La documentation produit fournie avec la TIC est mise à disposition dans au moins un des formats électroniques suivants : a) un format web qui est conforme à la clause 9, ou b) un format non-web qui est conforme à la clause 10.	Pris en charge	
12.2.2 Informations sur les caractéristiques d'accessibilité et de compatibilité Les services d'assistance de la TIC communiquent des informations sur les caractéristiques d'accessibilité et de compatibilité qui sont mentionnées dans la documentation produit.	Pris en charge	

CRITÈRES	FONCTIONNALITÉS PRISES EN CHARGE	REMARQUES ET EXPLICATIONS
12.2.3 Efficacité de la communication Les services d'assistance de la TIC répondent aux besoins en communication des personnes porteuses de handicap directement ou depuis un point de référence.	Pris en charge	Disability Answer Desk
12.2.4 Documentation accessible La documentation fournie par les services d'assistance est mise à disposition dans au moins un des formats électroniques suivants : a) un format Web qui est conforme à la clause 9, ou b) un format non-web qui est conforme à la clause 10.	Pris en charge	

Section 13 TIC assurant le relais ou l'accès à des services d'urgence

Cette section ne s'applique pas à Microsoft Teams.

Accessibility solutions for Skype for Business Online and Microsoft Teams in France

12/7/2021 • 5 minutes to read • [Edit Online](#)

Rapport sur les actions engagées par Microsoft pour favoriser l'accès des personnes en situation de handicap aux communications électroniques

Fournir des expériences accessibles à tous est au cœur de la mission de Microsoft, qui consiste à permettre à chaque personne et à chaque organisation de la planète d'accomplir davantage. Microsoft offre un certain nombre de fonctionnalités d'accessibilité pour Skype Entreprise et Microsoft Teams qui s'inscrivent dans son engagement fort en faveur de l'accessibilité et de l'inclusion.

Accessibilité pour Microsoft Teams et Skype Entreprise

Vue d'ensemble

Microsoft Teams et Skype for Business dans Office 365 sont des outils de collaboration sur le lieu de travail avec des fonctions de conversation, de vidéoconférence et d'appel. Chacune de ces plateformes comprend des fonctionnalités d'accessibilité pour faciliter la communication des utilisateurs ayant une déficience visuelle, une dextérité limitée ou d'autres handicaps. Un résumé de ces fonctionnalités est disponible sur le site web Accessibilité de Microsoft Teams <https://support.office.com/fr-fr/article/prise-en-charge-de-l-accessibilit%C3%A9-dans-microsoft-teams-d12ee53f-d15f-445e-be8d-f0ba2c5ee68f?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR> et sur le site web Accessibilité de Skype Entreprise <https://support.office.com/fr-fr/article/prise-en-charge-de-l-accessibilit%C3%A9-dans-skype-entreprise-fbe39411-6f25-405d-acb4-861735865d18?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>. Pour une description plus détaillée des fonctionnalités d'accessibilité de Microsoft Teams et de Skype Entreprise, nous vous invitons à lire ce qui suit.

Fonctionnalités d'accessibilité

Microsoft Teams fournit des pages d'aide avec des raccourcis clavier et des instructions de navigation pour les utilisateurs de lecteurs d'écran :

- Raccourcis clavier pour appeler, envoyer des messages et naviguer dans Microsoft Teams
<https://support.office.com/fr-fr/article/raccourcis-clavier-de-microsoft-teams-2e8e2a70-e8d8-4a19-949b-4c36dd5292d2?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Utilisation d'un lecteur d'écran pour créer et modifier des équipes pour les conversations dans Microsoft Teams <https://support.office.com/fr-fr/article/utiliser-un-lecteur-d-%C3%A9cran-pour-cr%C3%A9er-des-%C3%A9quipes-dans-microsoft-teams-fcd5a839-0458-47d2-9688-7cffb66779c5?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Comment envoyer des messages privés ou chatter dans Microsoft Teams à l'aide d'un lecteur d'écran
<https://support.office.com/fr-fr/article/utiliser-un-lecteur-d-%C3%A9cran-pour-envoyer-un-message-ou-discuter-en-priv%C3%A9-dans-microsoft-teams-c99901c9-00dc-44d4-8921-4aa120bf298b?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Utilisation d'un lecteur d'écran pour trouver et répondre aux alertes dans Microsoft Teams
<https://support.office.com/fr-fr/article/utiliser-un-lecteur-d-%C3%A9cran-pour-rechercher-des-alertes-et-y-r%C3%A9pondre-dans-microsoft-teams-8290757e-789d-4e5a-a2ac-9ae4a07d55c2?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>

Microsoft Teams permet désormais aux utilisateurs de brouiller leur arrière-plan ou d'utiliser une image de fond

pendant les réunions, ce qui peut être utile aux personnes malentendantes qui ont du mal à lire sur les lèvres et à celles qui peuvent être facilement distraites par un environnement actif: <https://support.office.com/fr-fr/article/rendre-votre-arrière-plan-flou-dans-une-réunion-en-équipe-f77a2381-443a-499d-825e-509a140f4780?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>. Les utilisateurs de Microsoft Teams peuvent gérer les notifications par le biais des paramètres, désactiver entièrement les notifications en activant le mode "Ne pas déranger", et masquer, mettre en sourdine et épingler les discussions, tout cela contribuant à minimiser les distractions et à aider l'utilisateur à se concentrer dans un environnement très actif. La possibilité d'activer la suppression du bruit en temps réel pour réduire le bruit de fond pendant les réunions sera ajoutée.

Microsoft Teams a introduit une fonction "lever la main" qui permettra à toute personne participant à une réunion Microsoft Teams d'envoyer un signal visuel indiquant qu'elle a quelque chose à dire, utile à tous les utilisateurs qui souhaitent participer pleinement aux discussions de la réunion, y compris les personnes souffrant de troubles de la parole.

Microsoft Teams permet aux utilisateurs d'épingler et de recadrer les vidéos et de passer de la visualisation du contenu partagé pendant une réunion à celle des personnes qui y participent, ce qui peut être utile aux personnes malentendantes qui lisent sur les lèvres ou utilisent un interprète en langue des signes. Les utilisateurs peuvent également envoyer des messages audio et utiliser la technologie de dictée assistée par Microsoft Windows pour convertir la parole en texte, ce qui peut aider les personnes malvoyantes et malentendantes à communiquer avec les autres participants à la réunion.

En outre, la fonction de chat des équipes de Microsoft Teams est compatible avec un large éventail de technologies d'assistance, notamment les lecteurs d'écran, les logiciels de dictée, le contrôle visuel (sous Windows 10), le contrôle vocal (sous iOS et Android), les agrandisseurs d'écran et les commutateurs d'accès (sous iOS et Android).

Skype Entreprise dans Office 365 prend également en charge diverses fonctionnalités d'accessibilité. Pour les personnes qui utilisent des lecteurs d'écran, l'interface utilisateur de Skype Entreprise peut être parcourue à l'aide du clavier, et des pages d'aide sont fournies pour expliquer :

- les raccourcis clavier dans Skype Entreprise <https://support.office.com/fr-fr/article/Raccourcis-clavier-dans-Skype-entreprise-42ff538f-67f2-4752-afe8-7169c207f659?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Comment ajouter des personnes à la liste de contacts en utilisant Skype Entreprise avec un lecteur d'écran <https://support.office.com/fr-fr/article/Ajouter-des-personnes-%c3%a0-vos-contacts-avec-Skype-Entreprise-et-un-lecteur-d-%c3%a9cran-669b53a4-9dd1-4506-8fe2-ae42d8baf8?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Comment passer ou recevoir un appel dans Skype Entreprise à l'aide d'un lecteur d'écran <https://support.office.com/fr-fr/article/Passer-ou-recevoir-un-appel-%c3%a0-l-aide-de-Skype-Entreprise-avec-un-lecteur-d-%c3%a9cran-d73b5b49-080f-436f-802c-208b958204e4?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Comment utiliser un lecteur d'écran avec Skype Entreprise pour consulter la messagerie vocale <https://support.office.com/fr-fr/article/Utiliser-un-lecteur-d-%c3%a9cran-avec-Skype-Entreprise-pour-consulter-la-messagerie-vocale-6e2f9f74-980b-42c7-92d8-e2afbe69b7d9?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Comment envoyer un message instantané dans Skype Entreprise à l'aide d'un lecteur d'écran <https://support.office.com/fr-fr/article/Envoi-d-un-message-instantan%c3%a9-dans-Skype-Entreprise-%c3%a0-l-aide-d-un-lecteur-d-%c3%a9cran-e7059839-94fb-4f73-92b4-76de51133f2e?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>
- Comment participer à une réunion en ligne en utilisant Skype Entreprise avec un lecteur d'écran <https://support.office.com/fr-fr/article/Participer-%c3%a0-une-r%c3%a9union-en-ligne-avec-Skype->

[Entreprise-et-un-lecteur-d-%c3%a9cran-68e8a11a-8796-4ce9-89d6-38a15b6da456?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR](https://support.office.com/fr-fr/article/Partager-votre-%c3%a9cran-avec-Skype-Entreprise-et-un-lecteur-d-%c3%a9cran-678ce631-1499-4a24-8d32-a68498ce9ff4?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR)

- Comment partager son écran en utilisant Skype Entreprise avec un lecteur d'écran
<https://support.office.com/fr-fr/article/Partager-votre-%c3%a9cran-avec-Skype-Entreprise-et-un-lecteur-d-%c3%a9cran-678ce631-1499-4a24-8d32-a68498ce9ff4?omkt=fr-FR&ui=fr-FR&rs=fr-FR&ad=FR>

Lorsque vous utilisez Skype Entreprise, les menus interactifs de réponse vocale peuvent être ralentis, accélérés et redémarrés, et les utilisateurs peuvent choisir de sauter des messages, et Microsoft Teams prend en charge le réglage de la vitesse de la boîte vocale. Microsoft Teams et Skype Entreprise prennent en charge les appels textes (TTY). Les utilisateurs de Skype Entreprise utilisant Outlook 2010 ou des versions plus récentes peuvent choisir de recevoir leurs messages vocaux au format texte, ce qui peut être bénéfique pour les personnes malentendantes ou sourdes : <https://support.microsoft.com/fr-fr/office/consultation-de-la-messagerie-vocale-et-des-options-de-skype-entreprise-2deea7f8-831f-4e85-a0d4-b34da55945a8?ui=fr-fr&rs=fr-fr&ad=fr>. Les administrateurs informatiques de Microsoft Teams peuvent gérer la transcription pour leurs clients. Pour une lecture plus facile, Microsoft Teams prend en charge le zoom et Skype Entreprise permet d'ajuster la taille du texte des messages instantanés.

Les pages consacrées à chacune de ces plates-formes décrivent comment se présentent généralement Skype Entreprise et Microsoft Teams sur les appareils qui prennent en charge ces plates-formes, telles que Windows, Mac, iOS et Android. Les descriptions de des agencements de Skype Entreprise peuvent être particulièrement utiles aux utilisateurs aveugles, malvoyants ou à mobilité réduite pour les aider à construire une représentation mentale des points de repère des interfaces utilisateur (IU) afin de faciliter la navigation dans l'IU.

La reconnaissance vocale de Windows peut également aider les personnes à mobilité réduite et bénéficier de l'utilisation de commandes vocales plutôt que du clavier ou de la souris. Les instructions pour activer la reconnaissance vocale sur un ordinateur fonctionnant sous Windows 10 sont disponibles ici : <https://support.microsoft.com/fr-fr/help/17208/windows-10-use-speech-recognition>.

Assistance client

Afin d'offrir la meilleure expérience possible à tous nos clients, Microsoft propose une assistance technique pour les questions liées à l'accessibilité par l'intermédiaire de son bureau de réponse aux questions des personnes handicapées. L'équipe d'assistance du Answer Desk Accessibilité est formée à l'utilisation de nombreuses technologies d'assistance populaires et peut offrir une assistance en français par téléphone ou par chat : <https://support.microsoft.com/fr-fr/accessibility/disability-answer-desk>.

Déclarations de conformité à la norme EN 301 549

Pour aider ses clients à évaluer l'accessibilité, Microsoft propose une documentation qui décrit comment Skype Entreprise et Microsoft Teams se conforment à la norme européenne EN 301 549 relative aux exigences d'accessibilité applicables aux marchés publics des produits et services liés aux TIC (Technologies de l'Information et de la Communication) en Europe. Des copies des rapports EN 301 549 sont jointes en annexes.

Calling plans in Microsoft 365 - Code of practice for the United Kingdom (U.K.)

12/7/2021 • 7 minutes to read • [Edit Online](#)

This Code applies to small business customers (organizations with 10 employees or less) in the United Kingdom (UK) with respect to the Microsoft 365 or Office 365 Calling Plan service (the "Service") in accordance with UK communications regulations. Other Skype for Business services are governed by your service agreement with Microsoft and any other terms applicable to your use of the particular service.

1. About Skype for Business

Skype for Business is provided in the UK by Microsoft Ireland Operations Limited, which has its registered office at 70 Sir John Rogerson's Quay, Dublin 2, Ireland.

2. Customer service

If you have any sales, billing, or technical support questions, you may contact us either by phone during normal business hours or online:

Toll-Free Phone Number: 0800 032 6417

Online: Sign in to the Microsoft 365 admin center and submit a service request by selecting **New service request** under **Support**.

Normal business hours are Monday through Friday, from 9:00 am to 5:00 pm.

You may be able to answer some of your questions by visiting the [Skype for Business website](#).

3. Complaints and dispute resolution

Our top priorities are customer satisfaction and excellent service. However, in the event that you have a complaint, we will work quickly to help you resolve your issue. Our [Calling Plans in Microsoft 365 or Office 365 - complaint handling code for the United Kingdom \(U.K.\)](#) page details the procedures for small businesses to file a complaint with us and our independent dispute resolution scheme.

4. Number porting

Skype for Business in some cases may be unable to transfer a customer's telephone number for use with the Service. Where number portability is available, Skype for Business will take all reasonable steps to ensure that the transfer of the number and subsequent activation is completed promptly once an agreement to transfer the number has been reached with the customer's current service provider.

5. Service reliability

Microsoft 365 or Office 365 Calling Plan relies on your broadband connection. If your broadband connection experiences a power cut or failure, you will not be able to make telephone calls. The causes for these failures may be outside of our control.

6. Emergency calls

Skype for Business provides access to 999/112 public emergency call services to customers within England,

Wales, Scotland and Northern Ireland. However, emergency calls to 999 or 112 operate differently with Microsoft 365 or Office 365 Calling Plan services than on traditional telephone services. Customers are required to notify each user of the Microsoft 365 or Office 365 Calling Plan services of these differences.

The differences include the following: (i) Skype for Business may not know the actual location of a caller, which could result in the emergency services being despatched to the wrong location; (ii) when a Skype for Business user dials an emergency call, the user may be asked by an operator to provide his or her current location to assist in properly routing the emergency call and despatching emergency services; (iii) if the user's device has no power, is experiencing a power outage or, for any reason, cannot otherwise access the Internet, the user cannot make an emergency call through Microsoft 365 or Office 365 Calling Plan services; and (iv) although Microsoft 365 and Office 365 Calling Plan services can be used anywhere in the world where an Internet connection is available, users should not call 999 or 112 outside England, Wales, Scotland or Northern Ireland because the call likely will not be routed to the appropriate emergency service.

It is important that each customer registers the location of your users and keeps this information updated so that it can be provided to the emergency services. You can make changes to location information online through the Skype for Business administrator portal.

7. Refund policy

Our refund policy is stated in your service agreement.

8. Contract terms and conditions

Standard contract conditions for the Service are provided in your service agreement.

9. Subscription fees and charges

Information about subscription plans and usage charges (including Premium Rate Services and National Translation Services number charges) can be found on [Skype for Business website](#).

10. Directory listing

If you would like a Directory Enquiry listing (including an entry in the Phone Book) for your telephone number, it can be provided for an additional fee. For further details, please contact us using our contact information provided in Section 2.

11. Users with disabilities

This Code and the Complaints Handling Code are available in large print or audio format.

12. Premium rate services

What are premium rate services?

Premium Rate Services are telephone numbers that render information and entertainment that are charged to your telephone bill. Premium Rate Services include, but are not limited to, charity donations, voting lines (i.e. Britain's Got Talent), directory enquiries, gambling lines, and adult services lines (i.e. dating). Calls to Premium Rate Services are more expensive than calls to other landline numbers and begin with 0871, 0872, 0873, 118, and 09.

Premium Rate Services are delivered by service providers ("Service Providers"). Service Providers either (a) provide the goods or services or (b) act as resellers or aggregators on behalf of a number of such providers.

How do premium rate services work?

Skype for Business sends your Premium Rate Services call to another telephone company ("Terminating Communications Provider") which receives the call on behalf of the Services Provider. While Premium Rate Services revenue is divided amongst the Services Provider, Skype for Business, and the Terminating Communications Provider, most of the revenue is received by the Services Provider.

Charges

All usage charges for Premium Rate Services can be found on our [website](#). The duration of a call for calling premium rate numbers shall be based on one-minute increments. Fractions of minutes will be rounded up to the next minute. The connection fee, where applicable, will be charged at the beginning of the call.

Telephone preference service and fax preference services

Telephone Preference Service ("TPS"), which is operated by the Direct Marketing Association on behalf of Ofcom, is a register that enables customers to opt-out of receiving unsolicited sales calls. If you would like to register with the TPS, you may do so at <https://www.tpsservices.co.uk/tps-services-for-consumers/register-on-the-tps.aspx> or by calling 0843 005 9576.

Like TPS, Fax Preference Service ("FPS") is a register where businesses and individuals may opt-out of receiving unsolicited sales and market faxes. You may register with FPS by calling 0843 005 9576 or online at https://secure.dma.org.uk/cgi-bin/session.pl?reg_option=fps.

Internet dialler protection

An Internet dialler, which is similar to a computer virus, is software that can be downloaded onto your computer and can connect your computer to Premium Rate Services without your knowledge or consent. To protect your computer, we recommend that you exercise caution when clicking on links or popups and downloading material for unknown sources. For further protection, upon request by phone or e-mail, we can bar access to all or specific Premium Rate Services for content and cost reasons. In addition, we recommend that you download all necessary security software to protect your computer and that you frequently install updates for such software as it becomes available. If you believe you have been victimized by an Internet dialler, please contact us by phone or e-mail.

PhonepayPlus

All Service Providers must register with PhonepayPlus, which is an independent organization approved by Ofcom. PhonepayPlus regulates Premium Rate Services and investigates complaints filed by consumers. All Service Providers must adhere to the PhonepayPlus Code of Practice, which can be found at <http://www.phonepayplus.org.uk/for-business/code-of-practice>. If a Service Provider violates the Code of Practice, PhonepayPlus may:

- Require a party to remedy a breach
- Issue fines
- Bar access to services

Service provider contact information

To find contact information for a Service Provider, you can use PhonepayPlus' #NumberChecker tool at <http://www.phonepayplus.org.uk/for-consumers/making-an-enquiry/submit-an-online-enquiry>. If you believe that you were wrongfully charged for a Premium Rate Service, you should contact the Service Provider directly.

Complaints

If you wish to file a complaint about a Service Provider with PhonepayPlus, you may, free of charge, submit an enquiry either online or by phone:

- Phone: 0300 30 300 20 (9:30 am - 5 pm Monday to Friday)
- Online Enquiry: <http://www.phonepayplus.org.uk/for-consumers/making-an-enquiry/submit-an-online-enquiry>

Dispute resolution

If you believe that the charge on your Premium Rate Service charge on your bill was an error on Skype for Business' part and you would like a refund, you can file a complaint according to the Skype for Business Complaint Handling Code. If you file a complaint with Skype for Business and either (a) the complaint is not resolved after eight (8) weeks of submission or (b) you receive a letter from us stating that we have reached a final decision, you may refer the complaint to Ombudsman Services, which is a third party approved by Ofcom to deal with complaints regarding communications services.

13. National translation services, personal numbers and 0870 numbers

National Translation Services are telephone numbers that begin with 08 or 0500 (Freephone numbers) and are classified as "special service numbers" by the National Telephone Numbering Plan. Personal Numbers are prefixed with the numbers 070.

Rates for National Translation Services, Personal Numbers, and 0870 numbers are provided on our [website](#) and may fluctuate depending on the time of day and the day of the week that your call is made. Calls to 0800 numbers are free.

Calling plans in Microsoft 365 - Complaint handling code for the United Kingdom (U.K.)

12/7/2021 • 2 minutes to read • [Edit Online](#)

This Code applies to small business customers (organizations with 10 employees or less) in the United Kingdom (UK) with respect to the Microsoft 365 Calling Plan service (the "Service") in accordance with UK communications regulations. Other Skype for Business services are governed by your service agreement with Microsoft and any other terms applicable to your use of the particular service.

How to make a complaint

Customer satisfaction is a priority for Skype for Business. However, in the event that you are dissatisfied with the Service for any reason, you may file a complaint by phone or online:

- Toll-Free Phone Number: 0800 032 6417
- Online: Sign in to the Microsoft 365 admin center and submit a service request by selecting **New service request** under **Support**.

Timelines

If you file a complaint by phone during normal business hours, you will speak to a live Skype for Business representative, who will attempt to resolve the issue during the phone call.

If you file a complaint online, a Skype for Business representative will respond to your complaint within two (2) business days of receiving the complaint and will attempt to resolve the issue immediately.

If a Skype for Business representative is unable to resolve the issue immediately, he or she will clearly explain further steps that need to be taken to investigate the matter. The representative will provide you his or her contact information so that you may contact him or her with any questions throughout the course of the investigation.

Skype for Business aims to resolve all complaints related to the Service within seven (7) business days of receipt.

If you are unhappy with the manner in which your complaint regarding the Service is managed, you may ask the Skype for Business representative handling your complaint, by phone or email, to escalate the complaint to in accordance with your service agreement. Microsoft will evaluate the complaint within seven (7) days of receipt.

Alternative dispute resolution

If your complaint regarding the Service is not resolved after eight (8) weeks of submission or if you receive a letter from us stating that we have reached a final decision, you may refer the complaint to Ombudsman Services, which is a third party approved by Ofcom to deal with complaints regarding communications services. We will also notify you, in writing, about the availability of such alternative dispute resolutions services.

Ombudsman Services is independent of Microsoft and will render an impartial decision on the merits of the complaint. There is no cost for referring a complaint to Ombudsman Services.

All complaints must be sent to Ombudsman Services within twelve (12) months of filing the complaint with Skype for Business.

The steps for referring a complaint to Ombudsman Services can be found on the Ombudsman Services' [website](#).

You may reach Ombudsman Services by filling out a contact form on the Ombudsman Services' website or by phone, letter, or email:

- Contact Form: <https://www.ombudsman-services.org/about-us/contact-us>

- Phone: 0330 440 1614

Fax: 0330 440 1615

Textphone: 0330 440 1600

- E-mail: osenquiries@os-communications.org

Emergency calling terms and conditions

12/7/2021 • 2 minutes to read • [Edit Online](#)

IMPORTANT INFORMATION

Emergency Services calling operates differently with Calling Plans in Microsoft 365 or Office 365 than on traditional telephone services. It is important that you understand these differences and communicate them to all users with Calling Plans in Microsoft 365 or Office 365. You acknowledge and agree that you have read and understand the differences in our Emergency Services calling and will provide this notice to each user with Calling Plans in Microsoft 365 or Office 365.

The differences in our Emergency Services calling capabilities include the following: (i) Skype for Business and Teams may not know the actual location of a caller making an Emergency Services call, which could result in the call being routed to the wrong Emergency Services call center and/or emergency services being dispatched to the wrong location; (ii) if the user's Teams client is offline, or if the user's device is unable to access the internet for any reason, such as a network outage or power outage, Emergency Services calls through Phone System in Microsoft 365 or Office 365 are not supported and are not expected to work; and (iii) although Calling Plans in Microsoft 365 or Office 365 can be used anywhere in the world where an internet connection is available, users should not make an Emergency Services call from a location outside their home country/region because the call likely will not be routed to the appropriate call center in that country/region.
