Welcome to Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

If you're the admin for Microsoft Teams in your organization, you're in the right place. When you're ready to get going with Teams, start with [How to roll out Teams](#) and [Set up secure collaboration with Microsoft 365 and Microsoft Teams](#).

If you're new to Teams and want to learn more, check out our short [Welcome to Teams](#) video (55 seconds).

Don't miss our Welcome to Teams for the Teams admin video (just over 3 minutes):

If you're looking for end user Teams Help, click **Help** on the left side of the app, or go to the [Microsoft Teams help center](#). For training, go to [Microsoft Teams Training](#).

Teams architecture

Teams is built on Microsoft 365 groups, Microsoft Graph, and the same enterprise-level security, compliance, and manageability as the rest of Microsoft 365 and Office 365. Teams leverages identities stored in Azure Active Directory (Azure AD). Teams keeps working even when you're offline or experiencing spotty network conditions.

To see where Teams fits in the context of Microsoft 365, check out this architecture poster: [Teams as part of Microsoft 365](#)

When you create a team, here's what gets created:

- A new [Microsoft 365 group](#)
- A [SharePoint Online](#) site and document library to store team files
- An [Exchange Online](#) shared mailbox and calendar
- A OneNote notebook
- Ties into other Microsoft 365 and Office 365 apps such as Planner and Power BI

When you create a team from an existing group, that group's membership, site, mailbox, and notebook are surfaced in Teams. To learn more, check out this poster: [Groups in Microsoft 365 for IT Architects](#)

To customize and extend Teams, add third-party apps through [apps, bots, and connectors](#). With Teams, you can include people from outside your organization by [adding them as a guest](#) to a team or channel. As part of Microsoft 365 and Office 365, Teams offers a robust [development platform](#) so you can build the teamwork hub you need for your organization.

TIP

For a deep dive into Teams architecture, watch the videos on the [Teams Platform Academy](#).

Managing Teams

As the admin, you'll manage Teams through the Microsoft Teams admin center. For a quick orientation, watch the Manage Teams using the Teams admin center video (3:03 min):

To learn more:

- [Use Teams admin roles to manage Teams](#)
- [Manage Teams in the Teams admin center](#)
- [Manage Teams during the transition to the new Teams admin center](#)
- [Manage Teams features in your Microsoft 365 or Office 365](#)

To stay on top of what's coming for Teams and all other Microsoft 365 or Office 365 products and services in your organization, be sure to check [Message center](#) and the [Teams roadmap](#). You'll get announcements about new and updated features, planned changes, and issues to help keep you informed and prepared.

Upgrade from Skype for Business to Teams

Teams is the primary client for intelligent communications in Microsoft 365 and Office 365, and it'll eventually replace Skype for Business Online. To stay on top of new features coming to Teams, see the [Microsoft 365 Roadmap](#). To complement persistent chat and messaging capabilities, Teams offers a comprehensive meeting and calling experience, with built in, fully integrated voice and video. Check out [Teams is now a complete meeting and calling solution](#) in the Microsoft Teams Blog.

If you're running Skype for Business and are ready to upgrade to Teams, or if you're running Skype for Business and Teams side-by-side and are ready to fully move to Teams, we have the tools, tips, and guidance to help make your transition successful. To learn more, see [Upgrade to Teams](#).

Teamwork

Every team is different; there's no one-size-fits-all approach to collaboration. Microsoft 365 and Office 365 are designed to meet the unique needs of every team, empowering people to communicate, collaborate, and achieve more with purpose-built, integrated applications.

When deciding which Microsoft 365 or Office 365 apps and services to use, think about the work your organization does and the types of conversations your teams need to have.

- **Teams**, as the hub for teamwork, is where people - including people outside your organization - can actively connect and collaborate in real time to get things done. Have a conversation right where the work is happening, whether coauthoring a document, having a meeting, or working together in other apps and services. Teams is the place to have informal chats, iterate quickly on a project, work with team files, and collaborate on shared deliverables.
- **Outlook** for collaborating in the familiar environment of email and in a more formal, structured manner or when targeted and direct communication is required.
- **SharePoint** for sites, portals, intelligent content services, business process automation, and enterprise search. SharePoint keeps content at the center of teamwork, making all types of content easily shareable and accessible across teams. Tight integration with Outlook, Yammer, and Teams enables seamless content collaboration across conversation experiences.
- **OneDrive for Business** for storing files and sharing them with people that a user invites. Content that a user saves to OneDrive for Business is private until the user shares it with others, making it the best option for storing personal and draft documents that are not intended to be shared or not ready to be shared.
- **Yammer** to connect people across the organization. Drive company-wide initiatives, share best practices, and build communities around common topics of interest or areas of practice. Crowdsource ideas to foster open discussions with people across the company.
- **Office apps** are all the familiar tools that people know and use regularly, including Word, Excel, PowerPoint, and OneNote.

Microsoft Teams deployment overview

12/7/2021 • 2 minutes to read • [Edit Online](#)

TIP

Are you looking for information on how to install the Teams client on your PC or mobile device? Go here: [Download Microsoft Teams](#).

Hi! Thanks for choosing Microsoft Teams. Whether you're a five-person law firm, or a large multi-national distributor, Teams can help bring your organization together via chats, voice calling, video conferences, file sharing, and more. And no matter whether you're just getting into collaboration tools for the first time, or if you're upgrading to Teams from Microsoft Skype for Business, we can help you get up and running.

Because Teams supports such a wide array of organization types and starting points, there are several options for setting it up. To help you find the information you need, we've split up some articles into two audiences:

Small business (fewer than 50 users) and **Medium/large business** (more than 50 users). When reading an article, choose the audience tab that best matches your organization. Here are what the tabs look like:

The following is a list of sections you can choose from in the **Get started** section and a short description of each.

NOTE

If you have an existing Skype for Business Online or on-premises Skype for Business deployment, check out the following topics in addition to those in the **Get started** section.

- [Upgrade from Skype for Business](#)
- Plan hybrid connectivity

SECTION	DESCRIPTION
Quick start	<p>The Quick start section introduces you to Teams in your own organization. You can start using features like teams, chats, file sharing, and more.</p> <p>If you're a small business, this might be all you need to roll out Teams to your employees.</p> <p>For larger businesses, use this section to start a pilot amongst your information technology group so you can get familiar with Teams.</p>
Small business setup	<p>The Small business setup section guides smaller businesses through setting up Teams. Small business may want all the core features of Teams (such as chat, teams, channels, meetings, and phone support), but don't need to plan for multiple office locations, rolling out Teams to large numbers of users, and so on.</p>

SECTION	DESCRIPTION
Enterprise setup	The Enterprise setup section guides larger business through setting up Teams in situations where network planning, lifecycle management, and wide-scale adoption, are critical factors to successful deployment. This section also helps you understand the requirements for audio and video conferencing, and configuring Phone System and PSTN connectivity.
Deploy Team clients	The Deploy Teams clients section provides instructions for setting up the Teams client on PC, mobile, and other devices. It also includes information on how larger business can deploy Teams across your organization and what URLs and IP addresses should be opened on your firewalls.
Teams training	The Teams training section provides training materials for end-users who use the Teams clients, and also for organization admins who need to manage Teams across your organization.

Get started with Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

TIP

Are you looking for information on how to install the Teams client on your PC or mobile device? Go here: [Download Microsoft Teams](#).

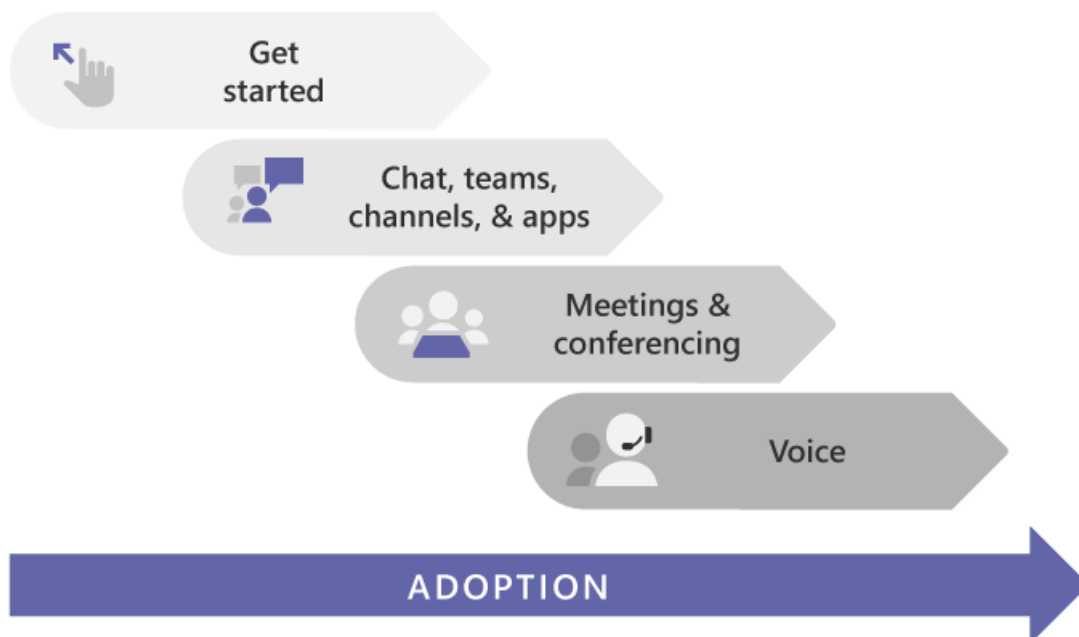

Start here

Whether you're a small business or a multi-national, this is the place to start rolling out Teams. These articles will guide you through a small-scale Teams rollout, which may be all you need if you're a small business or if you're rolling out Teams quickly as your first Microsoft 365 workload to support **remote workers**.

If you're a larger organization, use these articles to pilot Teams with a small group of early adopters so you can learn about Teams and start planning your org-wide deployment. Later, use the guidance on the [Microsoft Teams Adoption](#) site to help you roll out Teams across your organization.

We recommend rolling out Teams in stages, workload by workload, as your organization is ready. **You don't have to wait until you've completed one step before you move to the next.** Some organizations may want to roll out all Teams features at once, while others may prefer a phased approach. Here are the Teams workloads, in the order we recommend rolling them out:

- [Chat, teams, channels, & apps](#)
- [Meetings & conferencing](#)
- [Cloud voice](#)

If you have a medium or large organization, [use Advisor for Teams to help you roll out Microsoft Teams](#) to help you plan the rollout of these workloads across your organization. The Advisor uses Teams itself to create a plan tasks and assign them to owners, share documents, and enable discussions amongst your deployment team.

Make sure you're ready

To get ready for your Teams rollout, here's what you need to do, whether Teams is your first workload ("Teams First") or the next workload in an existing Microsoft 365 or Office 365 deployment:

- [Prepare your organization's network for Teams](#)
 - This includes configuring your Microsoft 365 or Office 365 domain, SharePoint Online, Exchange Online, and OneDrive for Business.
- Get Teams licenses for everybody. Check out [Teams plans](#) and [Microsoft Teams service description](#).
- [Learn about the benefits of installing the desktop, web, and mobile clients](#)

Get familiar with Teams

If you're new to Teams, the best way to get familiar with it is to start using it right away. The great thing about Teams is that what you set up now won't get in the way of any upgrades or migrations you might need to do later.

TIP

Check out the learning paths and modules available in [Microsoft Learn for Teams](#). You can get a tour of the [Teams admin center](#), learn how to [configure your network for Teams](#), get ideas on how to best [onboard your users to Teams](#), and more!

Use the steps below to set up a couple teams and onboard a few early adopters to help you get familiar with Teams.

- Step 1: [Create your first teams and channels](#)
- Step 2: [Onboard early adopters](#)
- Step 3: [Monitor usage and feedback](#)
- Step 4: [Start your organization-wide rollout](#)

Upgrade or migrate from Skype for Business

If you're coming to Teams from Skype for Business (online or on premises), or if you need a hybrid configuration, you still want to follow the recommended path above for a Teams deployment, but first you need to do some extra planning. Start by reviewing the guidance in the table below that applies to your organization's profile.

	YOUR ORGANIZATION'S PROFILE	GUIDANCE
<input type="checkbox"/>	I'm currently using Skype for Business Online, and I'm ready to move to Teams.	Go to Upgrade to Teams .
<input type="checkbox"/>	My organization is running Skype for Business Server, and I want to roll out Teams.	<p>For a full-scale Teams rollout, first you need to configure hybrid connectivity between your on-premises environment and Microsoft 365. Start by reading Plan hybrid connectivity between Skype for Business Server and Microsoft 365 or Office 365.</p> <p>You should also review Upgrade to Teams.</p>

	YOUR ORGANIZATION'S PROFILE	GUIDANCE
	I don't have Skype for Business Server, but I do have an on-premises Public Switched Telephone Network (PSTN) solution. I want to roll out Teams, but I want to keep my on-premises PSTN solution.	<p>Roll out Teams following the suggestions in this article.</p> <p>Then read Plan Direct Routing to learn about using Phone System Direct Routing to hook up your on-premises PSTN solution with Teams.</p>

Create your first teams and channels in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Setting up and using your first set of teams and channels builds your experience with Teams and identifies champions who can help drive Teams adoption across your organization. If you haven't installed Teams yet, check out [Get Teams clients](#) and [Sign in to Teams using modern authentication](#).

Suggestions for your first teams and channels

A team is a collection of people who gather together around a common goal. Channels are the collaboration spaces within a team where the actual work gets done.

To learn more, see [Overview of teams and channels in Teams](#) and [Best practices for organizing teams in Teams](#).

We suggest you start with a "Get to know Teams" team where your early adopters can play around, ask questions, and discover the capabilities of Teams. This team can be essential to your success as you begin to experiment with Teams.

"Get to know Teams" team

Your project team can use the "Getting to know Teams" team to ensure they're set up with Teams clients, have some initial conversations, and explore what Teams can do. You may already have a group of people in your organization who enjoy getting early access to new capabilities. This can be one of their initial teams when you bring them on board and will help you get early feedback.

Here's a suggested structure for the team.

CHANNEL	DESCRIPTION AND USAGE	PINNED TABS, BOTS, AND APPS
General	All teams start with a General channel. Use this channel to make announcements as you start getting to know Teams.	
Say hi	Introduce yourself to the team and share what you want to get from Teams.	
How do I	A channel to ask how-to questions. Step 1 – install the desktop and mobile clients. Step 2 – jump into Teams.	Pinned tab that links to the Teams help center Pinned tab that links to Teams training videos Pinned tab that links to Teams desktop and mobile client download links
Feedback	Share your thoughts on your Teams experiences.	Pinned tab with Polly Poll
Ideas for future teams	Share your thoughts on where Teams can drive additional value in your organization. What could these teams be called? Who would be members?	

CHANNEL	DESCRIPTION AND USAGE	PINNED TABS, BOTS, AND APPS
Support	If something isn't working as expected, use this channel to get help.	

Get your first teams up and running

As an admin, you can create and manage teams and channels in the Teams client or the Microsoft Teams admin center. You can create teams as public or private. You can also create an [org-wide team](#). Anyone using Teams in your organization can join a public team. For private teams, team owners manage team membership. And for an org-wide team, everyone in your organization is automatically added.

To get started, we recommend you create private teams and add another owner to manage team settings and membership.

NOTE

In the steps that follow, we use the Teams desktop client to create teams and channels. Keep in mind that as an admin, you can also do these tasks in the Microsoft Teams admin center.

Create a team

On the left side of Teams, click **Teams**, at the bottom of the teams list, click **Join or create a team**, and then click **Create a new team**.

Once you've created the team, invite people to join it. You can add individual users, groups, and even entire contact groups (formerly known as "distribution lists").

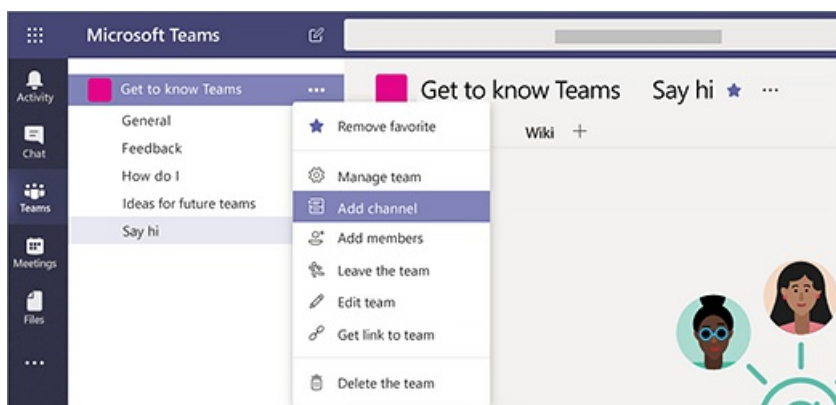

Add a team owner

Find the team that you created, click **More options** (three dots) > **Manage team**. Then go to the **Members** tab. Find the people you want to designate as team owners. Under **Role**, click **Owner**.

Create a channel in a team

Find the team that you created, click **More options** ... > **Add channel**. You can also click **Manage team** and add a channel in the **Channels** tab.

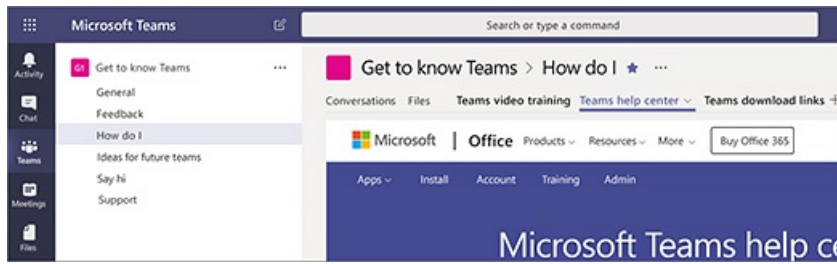

Give the channel a descriptive name to make it easier for users to understand the purpose of the channel.

As a team owner, you can automatically favorite channels for the whole team, making the channels more visible

for everyone on the team. You can also pin tabs to the channel to add tools, such as OneNote, links to webpages, and other content to make it easy for users to find what they need and share their thoughts.

Here's an example of the "How do I" channel in the "Get to know Teams" team, showing pinned tabs that link to Teams webpages – Teams video training, Teams help center, and Teams download links.

Next steps

Go to [Onboard your early adopters](#).

Onboard early adopters to Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

Invite users to Teams

Send a welcome email to users with the names and descriptions of the teams you created and invite them to join the conversations in Teams. Be sure to include the following links in the email so they know where to get Teams clients, training, and support:

- [Teams web client](#)
- [Desktop and mobile client download links](#)
- [Teams training videos](#)
- [Teams Help documentation](#)

For example, for the "Get to know Teams" team, you might want to start your email like this:

Welcome to Microsoft Teams for <insert_company_name>. Teams is a chat-based workspace that brings together chat, files, people, and tools in one place.

We created a team called "Get to know Teams" to get you started. Use it to experiment, ask questions, and discover the possibilities of Teams.

To join, click <link to the team>.

Engage with users when they first join. Post a welcome message in Teams and start a chat in a channel. Doing this sets the tone and encourages users to make the switch to Teams. In the welcome message, include the same links you sent in email so users know where to get Teams as well as any other helpful information to get users up and running quickly. Touch base with users to ensure they know how to download, install, and sign in to Teams so they can start chatting, sharing files, and collaborating with each other.

Get Teams clients

Teams has clients for desktop (Windows and Mac), web, and mobile (iOS and Android). We recommend users install the desktop and mobile clients to have the best experience with Teams.

Jump to: [Teams for Windows](#) | [Teams for Mac](#) | [Teams for web browsers](#) | [Teams for iOS](#) | [Teams for Android](#)

Desktop client

The Teams desktop client gives Windows and Mac users the best overall experience. To learn more, see [Get clients for Teams \(Desktop client\)](#) and [Hardware requirements for the Microsoft Teams app](#).

NOTE

As an admin, you can choose the method to distribute the installation files to computers in your organization, such as Microsoft Endpoint Configuration Manager (Windows) or Jamf Pro (macOS).

Teams for Windows

The easiest way to install the Windows desktop client is to:

1. Download the Windows desktop client from <https://teams.microsoft.com/downloads>.
2. Run the installer (doesn't require admin permissions).

3. Start Teams after installation completes.

NOTE

Later, when you're considering a more formal, mass rollout of Teams across your organization, check out the [Teams Windows desktop client](#) video to learn how to plan for and deploy it.

Teams for Mac

The easiest way to install the Mac desktop client is to:

1. Download the Mac desktop client from <https://teams.microsoft.com/downloads>.
2. Run the installer (requires admin permissions).
3. Start Teams after installation completes.

Web client

Teams provides a feature-rich web client, <https://teams.microsoft.com>, that supports a variety of browsers.

Teams fully supports the following Internet browsers, with noted exceptions for calling and meetings. This table applies to operating systems running on desktop computers.

BROWSER	CALLING - AUDIO, VIDEO, AND SHARING	MEETINGS - AUDIO, VIDEO, AND SHARING ^{1 2 3}
Internet Explorer 11	Not supported	Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on IE11 without PSTN coordinates, users must download the Teams desktop client. Video: Not supported Sharing: Incoming sharing only (no outgoing) Microsoft 365 apps and services will not support Internet Explorer 11 starting August 17, 2021 (Microsoft Teams will not support Internet Explorer 11 earlier, starting November 30, 2020). Learn more . Please note that Internet Explorer 11 will remain a supported browser. Internet Explorer 11 is a component of the Windows operating system and follows the Lifecycle Policy for the product on which it is installed.
Microsoft Edge, RS2 or later	Fully supported, except no outgoing sharing ⁴	Fully supported, except no outgoing sharing
Microsoft Edge (Chromium-based), the latest version plus two previous versions	Fully supported	Fully supported
Google Chrome, the latest version plus two previous versions	Fully supported	Fully supported Sharing is supported without any plug-ins or extensions on Chrome version 72 or later.

BROWSER	CALLING - AUDIO, VIDEO, AND SHARING	MEETINGS - AUDIO, VIDEO, AND SHARING
Safari 14+	<p>1:1 calls not supported. Group calls fully supported.</p> <p>Video: Fully supported</p> <p>Sharing: Fully supported</p>	<p>Meetings: Fully supported</p> <p>Video: Fully supported</p> <p>Sharing: Fully supported</p>
Safari 13.1+	<p>1:1 calls not supported. Group calls supported with full audio support.</p> <p>Video: Incoming only</p> <p>Sharing: Fully supported</p>	<p>Meetings are supported with full audio support.</p> <p>Video: Incoming only</p> <p>Sharing: Fully supported</p>
Firefox, the latest version plus two previous versions	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on Firefox without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p>
Safari versions before 13	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on Safari without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p> <p>Safari is enabled on versions higher than 11.1 in preview. While in preview, there are known issues with Safari's Intelligent Tracking Prevention.</p>

¹ To [give and take control of shared content during sharing](#), both parties must be using the Teams desktop client. Control isn't supported when either party is running Teams in a browser. This is due to a technical limitation that we're planning to fix.

² Blur my background isn't available when you run Teams in a browser. This feature is only available in the Teams desktop client.

³ Teams meetings on browsers are limited to a single incoming video feed of active speaker.

⁴ Edge RS2 or later doesn't support sending real-time audio and video traffic through HTTP proxies.

NOTE

As long as an operating system can run the supported browser, Teams is supported on desktop computers. For example, running Firefox on the Linux operating system is an option for using Teams.

For mobile operating systems, we recommend that you run the Teams app, available from the Android and iOS stores. Running Teams in a mobile operating system is supported, but many features are unavailable.

Mobile client

The Teams mobile clients for iOS and Android keep users connected and productive when on-the-go. To learn more, see [Get clients for Teams \(Mobile clients\)](#).

Teams for iOS

Users running iOS 10.0 or later can download the Teams mobile app from the Apple App Store and get started right away.

Teams for Android

Users running Android 4.4 or later can download the Teams mobile app from the Google Play Store and get started right away.

Drive initial adoption

It's important to encourage your early adopters to actively use Teams to promote new collaboration experiences and develop Teams champions. We recommend using the "How do I" channel in the "Get to know Teams" team you created to share guidance with your users to help drive adoption.

For detailed guidance on driving Teams adoption for your organization, see [Adopt Teams](#).

Next steps

Go to [Monitor usage and feedback](#).

Monitor usage and feedback in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

It's important to know how users are using Teams and what their experience is with Teams. Usage reports can help you better understand usage patterns, and along with user feedback, give you insights to inform your wider rollout and where to prioritize training and communication efforts.

Monitor usage

For your first set of teams, we recommend you review reports twice a week to understand emerging trends.

For example, usage reports show that not many users are using the Teams mobile clients. This may indicate that users aren't sure how to install the clients. Posting step-by-step installation instructions in a channel may help drive usage of a wider range of clients. Or, usage reports show that users are primarily using Teams for private chats. In this example, you may want to review your team scenarios because users are chatting outside the initial teams and channels that were set up.

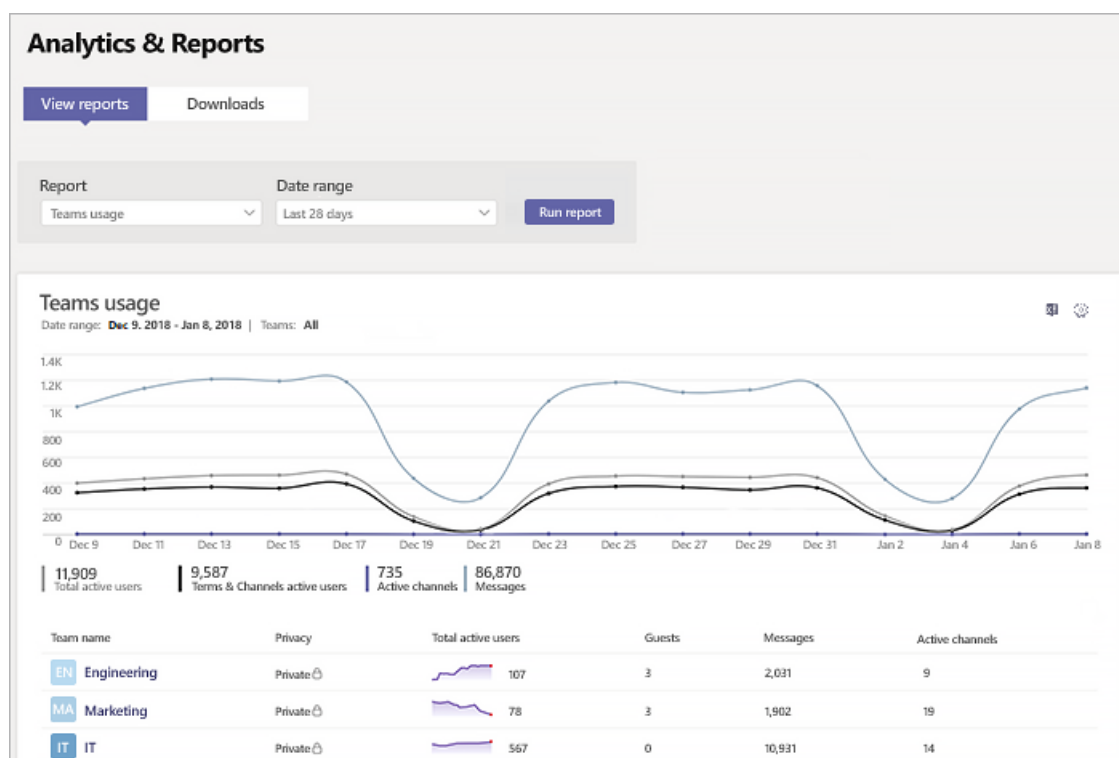

Here's how to get reports to view Teams usage.

Teams analytics & reports (Microsoft Teams admin center)

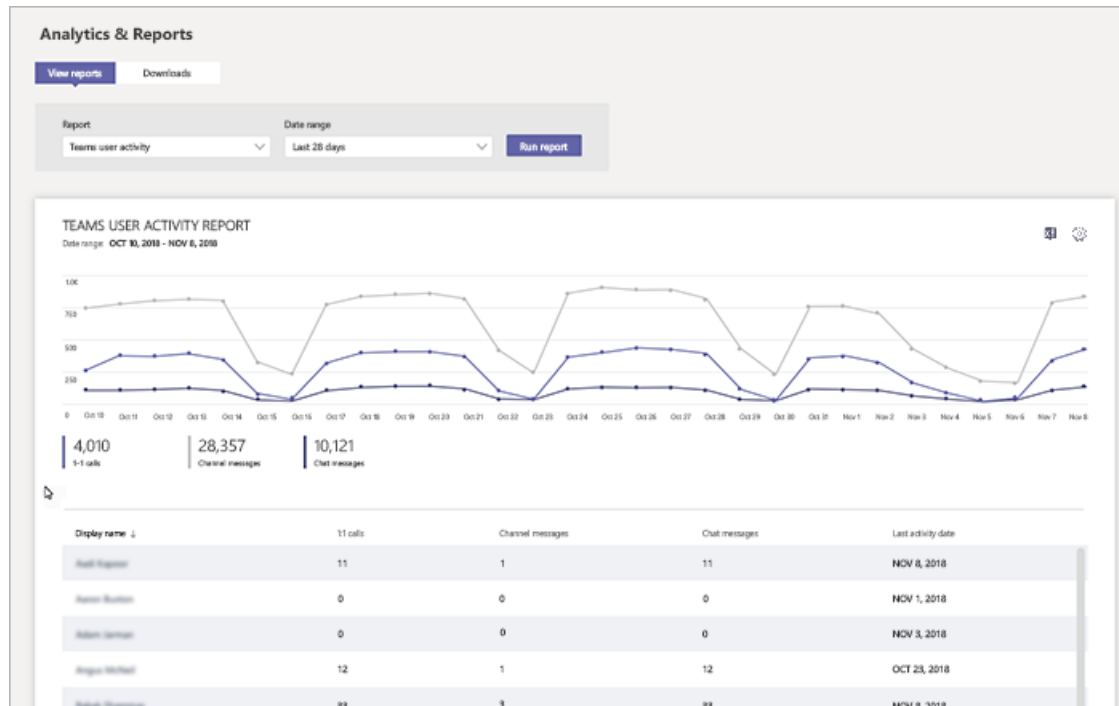

Teams reports in the Microsoft Teams admin center give you insights into how Teams is used in your organization. Use the reports to get a view into Teams usage, user activity, and device usage across your organization.

To view these reports, you must be a global admin in Microsoft 365 or Office 365, Teams service admin, or Skype for Business admin. Go to the Microsoft Teams admin center, in the left navigation, select **Analytics & reports**, and then under **Report**, choose the report you want to run.

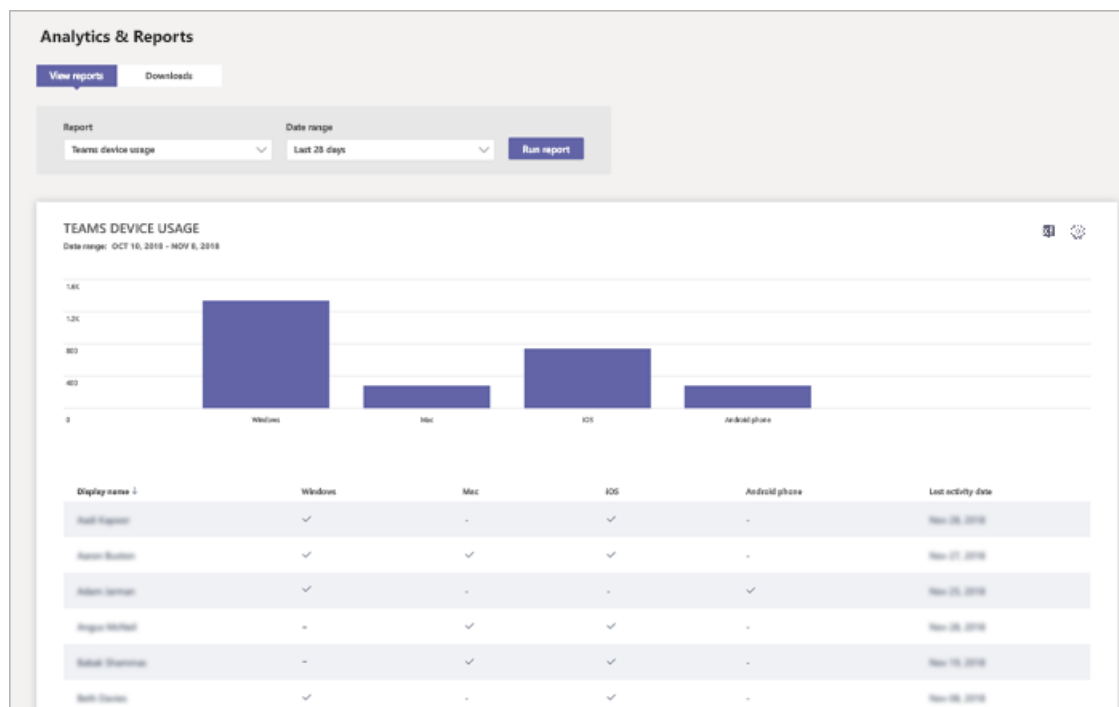

- **Teams usage report:** This report gives you an overview of usage activity in Teams, including the total active users and channels, and the number of active users and channels, guests, and messages in each team.

- **Teams user activity report:** This report gives you insight into the types of activities users engage in, such as how many people communicate through 1:1 calls, channel messages, and private chat messages.

- **Teams device usage report:** This report shows you how users connect to Teams, including how many people use Teams on their mobile devices when on-the-go.

To learn more, check out [Teams analytics and reporting](#).

Teams activity reports (Microsoft 365 admin center)

You can also view Teams activity through reports that are available from the Microsoft 365 admin center. These reports are part of the Microsoft 365 reports in the Microsoft 365 admin center and provide information about user activity and device usage.

To view these reports, go to the Microsoft 365 admin center, click **Reports > Usage**. Under **Select a report**, click **Microsoft Teams**. From here, choose the report you want to view.

To learn more, go to [Use activity reports for Teams](#).

Microsoft 365 usage analytics

You can use Microsoft 365 usage analytics in Power BI to view and analyze usage data for Teams and other Microsoft 365 or Office 365 products and services. Microsoft 365 usage analytics is a content pack that includes a pre-built dashboard and a number of pre-built reports. Each report gives you specific usage data and insights. To connect to the content pack, you need Power BI and must be a global admin in Microsoft 365, Office 365, or reports reader. If you don't already have Power BI, [sign up for the free Power BI service](#).

To learn more, see [Microsoft 365 usage analytics](#).

Gather feedback

The adoption of a new collaboration experience is about changing the behavior of users. Enabling change requires training, encouragement, and positive examples. It's important for users to have a voice during the transition to Teams and to be able to openly share their experiences. We recommend using the Feedback channel in the "Get to know Teams" team you created to collect and address feedback from users on their experiences with Teams.

Next steps

Go to [Get resources to plan your organization-wide rollout of Teams](#).

Start your organization-wide rollout of Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Now that you've successfully set up your first teams and onboarded a few early adopters, it's time to begin your rollout of Teams to the rest of your organization.

TIP

Before you begin your Teams rollout, we strongly recommend that you complete the [Prepare for a Teams deployment with Microsoft 365](#) Microsoft Learn module. This 30 minute module will jump-start your understanding of Teams and talk through key decisions you need to make as you roll out Teams.

If you want to check out more learning paths and modules available for Teams, see [Microsoft Learn for Teams](#).

Select **Small business** if you only have a few employees or don't have multiple locations or a complex network.

Select **Medium/large business** if you want to create a formal adoption process for key stakeholders; have multiple locations or a large network with proxy servers or multiple firewalls; have complex compliance requirements; or have other non-standard requirements that require extra planning.

- [Small business](#)
- [Medium/large business](#)

Teams small business setup is great for organizations that want all the functionality of Teams but don't have the characteristics of larger organizations that require extra planning. For example, small organizations may not need a large-scale deployment process, or not need to conform to regulatory requirements in multiple countries.

If this sounds like your organization, you can complete Teams small business setup. Small business setup gets you up and running with Teams quickly, letting you skip some of the considerations specific to larger organizations.

[Go to small business](#)

Support remote workers using Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

Does your organization want to use Microsoft Teams to support your users who work remotely or from home? Use the guidance in this article to get up and running quickly.

If you're a small or medium-sized business, don't miss [Empower your small business with remote work](#).

IT admin guidance

- Make sure everyone has access to Teams with a [paid subscription that includes Teams](#). As an option, eligible organizations can use the [Free version of Teams](#), or employees can activate the [Teams Exploratory](#) experience.
- If you already have a subscription that includes Teams, [turn it on for everyone](#).
- Understand how to get your organization started with [Meetings and live events in Teams](#).

For more, read [Additional resources for supporting remote workers](#) below.

End-user communications

Ready to roll out Teams to your users? Get the [Customer Success Kit](#), which contains these great email templates:

- Use the **Announcement Email** to tell users that Teams is available for them.
- Send **Countdown - Your First Day in Teams Email** to help users feel productive quickly.
- A few days later, send the **Tips and Tricks Email** to help your users get the most out of Teams.

End-user guidance

Share these assets and videos with your end users to help them get started quickly:

- Watch the [Welcome video](#) to get an overview of Teams.
- Download the [Quick Start Guide](#) to learn the Teams basics.
- Watch a series of short [Quick Start videos](#) for a walkthrough of Teams.
- Watch the [Meetings videos](#) to learn how to use meetings in Teams.

Additional resources for supporting remote workers

1. Read the [FAQ: Support your remote workforce](#), which we're updating regularly.
2. [Use Advisor for Teams to help you roll out Teams](#). Advisor for Teams (in the Teams admin center) walks you through your Teams deployment.
3. Read our recent blog posts:
 - [How Microsoft is enabling its employees to work remotely with Microsoft Teams](#)
 - [Helping small and medium-sized businesses work remotely with Teams](#)

- [The top nine ways Microsoft IT is enabling remote work for its employees](#)

4. Teams for Education

- If you work in education and want to set up teachers, students, and administrators on Teams, use Office 365 A1. This free version of Office 365 is available to all educational institutions. Sign up at [Get Office 365 free for your entire school](#).
- Don't miss [Get started with Teams for remote learning](#).

5. Make sure your employees have adequate internet access and bandwidth for Teams. Use the guidance in [Prepare your organization's network for Teams](#) to learn how to ensure adequate bandwidth.

- Limited bandwidth can affect audio quality in Teams meetings. To ensure the best meeting experience under low-bandwidth conditions, encourage users to limit video and use PSTN for calls and meeting audio.
- Read this timely blog (March 6, 2020), [How to quickly optimize Microsoft 365 or Office 365 traffic for remote staff & reduce the load on your infrastructure](#).
- March 26, 2020 blog: [Running on VPN: How Microsoft is keeping its remote workforce connected](#)
- If you're in China, check out [Microsoft 365 or Office 365 global tenant performance optimization for China users](#).
- If you need help with troubleshooting or with fixing problems with call or meeting quality, then follow the guidance in [Known issue - China: Dialing into Skype for Business/Teams conference IDs](#) at the bottom of this article.

6. Security when everyone's working from home

- Microsoft Security blog (March 26, 2020): [Alternative ways for security professionals and IT to achieve modern security controls in today's unique remote work scenarios](#)
- [Work remotely, stay secure—guidance for CISOs](#)
- [Top 12 tasks for security teams to support working from home](#)
- [Optimize Microsoft 365 or Office 365 connectivity for remote users using VPN split tunneling](#)
- [Security and Teams](#) goes into all the technical details of Teams security, as part of Microsoft 365 enterprise-grade security best practices and procedures.

7. Share a link to [Teams video training](#) to help your employees get the most out of Teams.

8. Go deeper: Learn more about rolling out Teams.

- As a mid-sized organization (500-5000 users), start your Teams journey with live, [interactive workshops](#).
- Join one of our [online classes](#) to see Teams in action and get your questions answered.
- Share [in-depth training videos](#) with users who want to learn more.
- Read [How to roll out Teams](#) to learn how to get ready for and manage Teams.

9. Read our new content about working remotely and share it with your users:

- Microsoft blog (March 10, 2020): [Staying productive while working remotely with Teams](#)
- [Work remotely with Teams](#)

- Teams blog (February 28, 2020): [Four tips for working from home with Microsoft Teams](#)
- [Collaborate with Microsoft 365 or Office 365](#)
- [Work remotely with Microsoft 365 or Office 365](#)
- [Nine tips for working remotely](#)
- Satya Nadella and Teams Product Marketing Manager Aya Tange video about [using Teams to work remotely](#) (March 20, 2020)

10. Encourage everyone to [install](#) and use the mobile app: [iOS](#) or [Android](#).

NOTE

If you're in China, go here to [Get Teams for Android in China](#).

11. Use Teams to stay in touch with your employees:

- [Org-wide teams](#) and [Company Communicator](#) app template.
- Send out information about your org's work-from-home and health and safety policies.
- Use [Live events](#) for company-wide meetings and outreach. If your meeting reaches the [Limits and specifications](#) of a Teams regular meeting, then make it a live event. Turn on live captions for [meetings](#) and [live events](#). Turn on subtitles in live events. These features increase inclusivity, productivity, and comprehension.

12. Staff up your [helpdesk](#) to deal with user inquiries.

13. If you're new to the Teams admin role, check out [Admin training for Teams](#).

14. Make sure your users have the devices they need to be seen and heard clearly. Check out [Teams-certified devices](#) for personal and shared spaces.

Known issue - China: Dialing into Skype for Business or Teams conference IDs

The following is a summary of a Feb 7, 2020 Message center post (MC203397):

Microsoft understands that some users in the China region are experiencing issues dialing into Skype for Business or Teams conference IDs. In most cases, these problems are external to systems under our control. Often, the issue is with local mobile and telephony carriers.

We recommend the following if you're having audio conferencing problems:

- Ask the caller or meeting organizer to call your PSTN or mobile number.
- Join the call or meeting from the desktop or mobile clients, using VoIP.

If you need to log a support ticket, include the following items:

- Exact time of call
- Conference bridge number dialed
- Caller phone network
- Caller phone number

Set up Microsoft Teams in your small business

12/7/2021 • 6 minutes to read • [Edit Online](#)

There are lots of ways you can customize Teams. The following sections show you how to set up each Teams workload: **chats, teams and channels**; **meetings and conferencing**; and **cloud voice**. The order in which you set up each workload is up to you. While we recommend setting up the chats, teams, and channels workload first, you can start with meetings and conferencing or even cloud voice. The choice is yours.

NOTE

If you haven't done so already, we strongly suggest that you begin your Teams deployment with a pilot. A pilot will allow you and a few early adopters to get familiar with Teams and its features before your planning and eventual roll out. For more information about how to start your pilot, check out [Get started with Microsoft Teams](#).

Before you roll out Teams broadly, make sure your organization is ready by reviewing the items in [Make sure you're ready](#).

Jump to the section you're interested in:

- [Workloads](#)
 - [Chat, teams, and channels](#)
 - [Meetings and conferencing](#)
 - [Business Voice](#)
- [Deploy clients](#)
- [Training](#)

Workloads

Chat, teams, and channels

Chat, teams, and channels, are the cornerstone of Teams. **Chat** lets one or more users talk to each other, share files, and meet privately. **Teams**, which can be visible to everyone in your organization or only to those in the team, let the right people collaborate whatever the task or occasion, whether it's a long-running project or planning for a birthday party. **Channels** within teams can segment topics, projects, departments, or anything else make sense for your team. For details about chat, teams, and channels, check out [Overview of teams and channels](#).

TIP

See how you can manage team roles, access, and messaging policies by completing the [Manage Microsoft Teams](#) module on Microsoft Learn.

As you think about rolling out teams and channels, you need to decide who should be able to create them, whether guests from outside your organization can access them, and so on. The article [Chat, teams, channels, & apps in Microsoft Teams](#) has lots of information about planning for chat, teams, and channels, however, here are some key things from that article you should think about. Select on a decision if you want more information about it.

DECISION	DESCRIPTION
Who should be Teams administrators?	<p>Admin roles can be used to grant specific permissions to people who you want to administer Teams. Small businesses may not need these extra roles because the same person may be responsible for all aspects of Teams. You can always add or remove administrators later on.</p> <p>Use Microsoft Teams administrator roles to manage Teams</p>
Who should be Team owners and members?	<p>Team owners control who can access a team and its channels. They can decide whether a team or channel is public (to the organization) or private and can set up policies like whether a channel should be moderated. Members can access the team and its channels (unless a channel is set to private and they're not a member of that channel) and can be designated as moderators.</p> <p>Assign team owners and members in Microsoft Teams</p>
Should guest access be enabled?	<p>Guest access lets people in your organization invite people outside your organization access your teams and channels. Guest access is often used to collaborate with people outside your organization who don't have a formal relationship with yours. For example, you might invite a project planner to work on a project temporarily.</p> <p>Guest access is different than external access. Guest access invites specific individuals access to interact with people in your organization.</p> <p>Guest access is turned Off by default.</p> <p>Turn on or turn off guest access to Microsoft Teams</p>

You don't need to do anything else for your users to start using chat, teams, and channels. However, there are lots of options for controlling how Teams is used. You can changes now, or wait until you can see how people are using Teams. For more information, check out the following articles:

- [Manage messaging policies in Teams](#)
- [Teams settings](#)

Meetings and conferencing

Meetings and conferencing lets people in your organization meet with each other and those outside your organization. Anyone with a Teams or Skype for Business client can join **meetings** to which they've been invited. Using the microphone, camera, and screen of their device lets participants join in the conversation without the need for a phone. Participants can chat, make voice calls, and share video and apps with other participants using a PC or mobile device.

Audio conferencing lets participants join to meetings via a regular phone by calling a conference phone number and entering a meeting ID. Audio conferencing is useful when a participant doesn't have a good Internet connection, the meeting is voice-only, or some other circumstance doesn't allow them to join via the Teams client.

TIP

Get more familiar with meetings and events by completing the [Manage meetings, conferences, and events with Microsoft Teams](#) module on Microsoft Learn.

Meetings are enabled by default in Teams, however, you can control the meeting experience for organizers and

participants. You can also set policies for what people are, and aren't, allowed to do before and during meetings. For more information, check out the following articles:

- [Admin quick start - Meetings and live events in Microsoft Teams](#)
- [Set up Audio Conferencing for small and medium businesses](#)

Business Voice

[Microsoft 365 Business Voice](#) is a great solution for businesses with fewer than 300 users that gives you all the features of an office phone system. Business Voice includes voicemail, caller ID, phone system menus, toll-free numbers, and more, without the need to manage a complex and costly on-premises phone system.

Based on Microsoft 365 Phone System, Business Voice simplifies adding voice to your organization by bundling Phone System features and add-ons, and providing an easy-to-follow wizard to help you set up your phone system. If your organization is located in a [country or region that supports Business Voice](#), you can transfer your phone numbers to Microsoft 365 and let us manage your phone system for you.

With Microsoft 365 as your phone system, you can turn any device into a phone by installing the Teams client on it. Or, if you'd rather have a traditional desk phone or conference phone, there are many Teams-certified devices to choose from. Either way, calls are always routed to where you are, and calls you make always have your office phone number.

If you're interested in trying out Business Voice, check out [What do I need to buy to use Microsoft 365 Business Voice?](#).

Deploy clients

When you're ready for your users to start using Teams, they can install the Teams client on their Windows, Mac, or Linux PC, or on their Android or iOS device. Users can download the Teams client directly from <https://teams.microsoft.com/downloads>.

Make sure everyone who'll be using Teams has a Teams license. For more information about assigning a Teams license, see [Manage user access to Teams](#).

TIP

Get recommendations on how to plan your Teams client deployment by completing the [Deploy Microsoft Teams clients](#) module on Microsoft Learn.

If your organization uses Microsoft Endpoint Configuration Manager, Group Policy, or a third-party distribution mechanism, to deploy software to your user's computers, see [Install Microsoft Teams using Microsoft Endpoint Configuration Manager](#).

If you want detailed information about deploying Teams clients, see [Get clients for Microsoft Teams](#).

Training

For information on how to train your users to use Teams, see [Microsoft Teams training](#).

Teams enterprise deployment overview

12/7/2021 • 4 minutes to read • [Edit Online](#)

If you're a medium or large business, you need to think about how you're going to roll out the service to your users, how you're going to deploy the Microsoft Teams client to them, how your network design could impact the quality of real-time communication, and so on. Check out the following sections for pointers to articles that'll help you plan for Teams in your organization.

NOTE

If you haven't done so already, we strongly suggest that you begin your Teams deployment with a pilot. A pilot will allow you and a few early adopters to get familiar with Teams and its features before your planning and eventual roll out. For more information about how to start your pilot, check out [Get started with Microsoft Teams](#).

After you've read the sections below and are ready to start deploying Teams in your organization, see [Set up Microsoft Teams in your enterprise](#).

Architecture

Teams is tightly integrated into Microsoft 365 and uses many features to power chat, file sharing, meetings, telephony, video streaming, and more. Before you roll out Teams, check out [Microsoft Teams IT architecture and telephony solutions posters](#) to get familiar with how Teams works with the rest of Microsoft 365 to create a complete collaboration experience for your users.

Workloads

Teams has three workloads that can be deployed independently of each other: **chat, teams, and channels**; **meetings and conferencing**; and **Phone System and PSTN (public switched telephone network) connectivity**. Each workload has its own section in our documentation to make it easier to find information about that workload. This includes deployment planning information.

To see deployment planning information for the workload you want to deploy, see the following articles:

- [Chat, teams, and channels](#)
- [Meetings and conferencing](#)
- [Phone System and PSTN connectivity](#)

Network planner

Network planning for Teams is extremely important when you have large numbers of users, complex networks, or both. Teams supports voice calling and video conferencing, both of which rely on real-time communications to provide the best experience possible for users. Networks must:

- Have sufficient bandwidth capacity to accommodate the number of concurrent voice calls, video conferences, meetings, screen sharing, and so on.
- Have network hardware that supports real-time communication protocols.
- Allow the required network ports between devices on your networks, Microsoft 365 services, and external users.

See the following articles to help you understand Teams network requirements:

- [Prepare your organization's network for Microsoft Teams](#)
- [Proxy servers for Teams or Skype for Business Online](#)

To help you with your planning, Teams includes the Network planner. The Network planner asks you questions about the number and types of users you have, how many sites your organization has, the bandwidth capacity of your network links, and more. Using this information, the Network planner creates a report that shows the bandwidth requirements for each activity, along with the recommendations.

[Go to Network planner](#)

(You must be a [Microsoft 365 global admin](#) to open the Network planner.)

For details about how the Network planner works, see [Use the Network planner for Microsoft Teams](#).

To see an example of how Network planner can plan your network, see [Using Network Planner - example scenario](#).

Teams advisor

The Teams advisor is a solution within Teams that brings together teams, channels, file sharing, and Planner, to create a deployment project for your organization. Teams advisor creates project plan, specific to the workload you select (such as chat, teams, and channels), that includes the recommended tasks you should perform during your deployment. Each task contains instructions, suggestions, and links to relevant articles, to guide you through the process. You can easily assign tasks to one or more individuals, and specify start and end dates for each task.

TIP

See how you can use Teams advisor to help you plan your Teams deployment by completing the [Roll out using the Teams advisor](#) module on Microsoft Learn.

[Go to Teams advisor](#)

(You must be a [Microsoft 365 global admin](#) to open the Teams advisor.)

For details about how the Teams advisor works, see [Use Advisor for Teams to help you roll out Microsoft Teams](#).

Lifecycle and governance planning

As you plan your Teams deployment, you need to consider the lifecycle of teams, channels, files, and so on, in your organization. You should also think about what types of information will be stored in them. Teams may be created for a specific project, for a department, or they might be used as a central resource for the entire organization. Each of these uses have different requirements, which drive questions like the following:

- How long will the teams remain active?
- Who should own and manage the teams and their channels?
- Should certain compliance requirements apply to some teams, but not others?
- Should there be a naming policy to help users identify the right team?

Creating policies and guidelines as part of your initial deployment will help ensure that your users can find the information they need. Just as importantly, however, appropriate policies will help protect your organization from information leakage, help you conform to regulatory requirements, and help you retain information as needed for archival purposes.

To learn more about lifecycle management and governance in Teams, see the following:

- [Plan for lifecycle management in Teams](#)
- [Plan for governance in Teams](#)

Adoption

To ensure that your organization and your users get the most out of Teams, you need an adoption program. An effective adoption program can mobilize early adopters who can:

- Articulate the benefits of Teams to their colleagues and to business or group leaders.
- Spark excitement in others who see how Teams improves collaboration and makes it easier to connect with each other.
- Help evaluate existing business processes and make recommendations for how Teams can be integrated into them.
- Report back to the deployment team both successes and difficulties to help improve the adoption process.

For details about setting up an adoption program, see [Adopt Microsoft Teams](#).

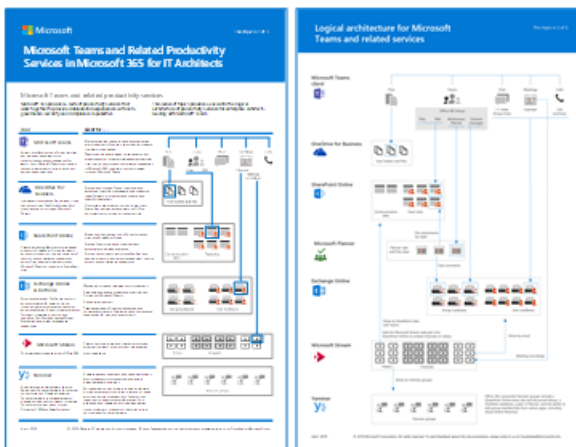

Microsoft Teams IT architecture and voice solutions posters

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams as part of Microsoft 365

Teams is central to the logical architecture of productivity services in Microsoft 365 - including data governance, security, and compliance capabilities.

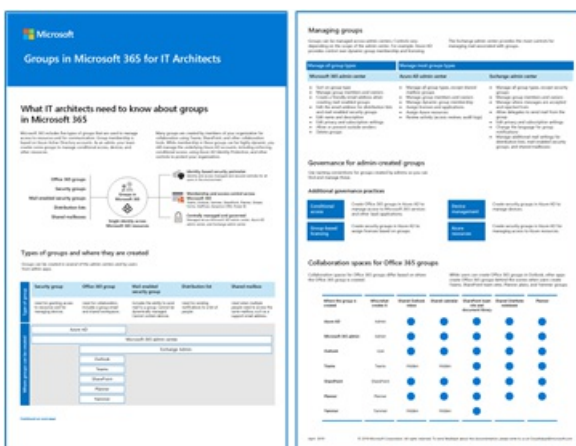

This series of illustrations provides a view into the logical architecture of productivity services for enterprise architects, leading with Teams.

[PDF](#) | [Visio](#)

Groups in Microsoft 365

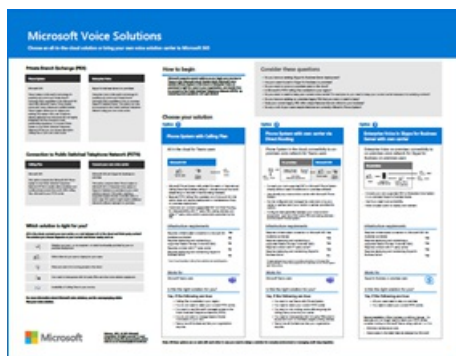

This is what IT architects need to know about groups in Microsoft 365. These illustrations detail the different types of groups, how they're created and managed, and a few governance recommendations.

[PDF](#) | [Visio](#)

Microsoft voice solutions

Microsoft supports several options as you begin your journey to Teams in the Microsoft cloud. This poster helps you decide which Microsoft voice solution (Phone System in the cloud or Enterprise Voice on-premises) is right for users in your organization, and how your organization can connect to the Public Switched Telephone Network (PSTN).

[PDF](#) | [Visio](#)

For more information, see the article for this poster: [Microsoft voice solutions](#)

Prepare your organization's network for Microsoft Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

Network requirements

If you've already [optimized your network for Microsoft 365 or Office 365](#), you're probably ready for Microsoft Teams. In any case - and especially if you're rolling out Teams quickly as your first Microsoft 365 or Office 365 workload to support **remote workers** - check the following before you begin your Teams rollout:

1. Do all your locations have internet access (so they can connect to Microsoft 365 or Office 365)? In addition to normal web traffic, make sure you've opened the TCP ports and IP addresses listed for Teams in [Office 365 URLs and IP address ranges](#).

IMPORTANT

If you need to federate with Skype for Business, either on-premises or online, you will need to configure an additional DNS record.

DNS RECORD	SERVICE	PROTOCOL	PRIORITY	WEIGHT	PORT	TARGET
SRV	sipfederation tls	TCP	100	1	5061	sipfed.online.l ync.com

2. Do you have a verified domain for Microsoft 365 or Office 365 (for example, contoso.com)?
 - If your organization hasn't rolled out Microsoft 365 or Office 365, see [Get started](#).
 - If your organization hasn't added or configured a verified domain for Microsoft 365 or Office 365, see the [Domains FAQ](#).
3. Has your organization deployed Exchange Online and SharePoint Online?
 - If your organization doesn't have Exchange Online, see [Understand how Exchange and Microsoft Teams interact](#).
 - If your organization doesn't have SharePoint Online, see [Understand how SharePoint Online and OneDrive for Business interact with Microsoft Teams](#).

Once you've verified that you meet these network requirements, you may be ready to [Roll out Teams](#). If you're a large multinational enterprise, or if you know you've got some network limitations, read on to learn how to assess and optimize your network for Teams.

IMPORTANT

For educational institutions: If your organization is an educational institution and you use a Student Information System (SIS), [deploy School Data Sync](#) before you roll out Teams.

Running on-premises Skype for Business Server: If your organization is running on-premises Skype for Business Server (or Lync Server), you must [configure Azure AD Connect](#) to synchronize your on-premises directory with Microsoft 365 or Office 365.

Best practice: Monitor your network using CQD and call analytics

Use the [Call Quality Dashboard \(CQD\)](#) to gain insight into the quality of calls and meetings in Teams. CQD can help you optimize your network by keeping a close eye on quality, reliability, and the user experience. CQD looks at aggregate telemetry for an entire organization where overall patterns can become apparent, which lets you identify problems and plan remediation. Additionally, CQD provides rich metrics reports that provide insight into overall quality, reliability, and user experience.

You'll use [call analytics](#) to investigate call and meeting problems for an individual user.

Network optimization

The following tasks are optional and aren't required for rolling out Teams, especially if you're a small business and you've already rolled out Microsoft 365 or Office 365. Use this guidance to optimize your network and Teams performance or if you know you've got some network limitations.

You might want to do additional network optimization if:

- Teams runs slowly (maybe you have insufficient bandwidth)
- Calls keep dropping (might be due to firewall or proxy blockers)
- Calls have static and cut out, or voices sound like robots (could be jitter or packet loss)

For an in-depth discussion of network optimization, including guidance for identifying and fixing network impairments, read [Microsoft 365 and Office 365 Network Connectivity Principles](#).

NETWORK OPTIMIZATION TASK	DETAILS
Network planner	<p>For help assessing your network, including bandwidth calculations and network requirements across your org's physical locations, check out the Network Planner tool, in the Teams admin center. When you provide your network details and Teams usage, the Network Planner calculates your network requirements for deploying Teams and cloud voice across your organization's physical locations.</p> <p>For an example scenario, see Using Network Planner - example scenario.</p>
Advisor for Teams	<p>Advisor for Teams is part of the Teams admin center. It assesses your Microsoft 365 or Office 365 environment and identifies the most common configurations that you may need to update or modify before you can successfully roll out Teams.</p>
External Name Resolution	<p>Be sure that all computers running the Teams client can resolve external DNS queries to discover the services provided by Microsoft 365 or Office 365 and that your firewalls are not preventing access. For information about configuring firewall ports, go to Microsoft 365 and Office 365 URLs and IP ranges.</p>
Maintain session persistence	<p>Make sure your firewall doesn't change the mapped Network Address Translation (NAT) addresses or ports for UDP.</p>

NETWORK OPTIMIZATION TASK	DETAILS
Validate NAT pool size	Validate the network address translation (NAT) pool size required for user connectivity. When multiple users and devices access Microsoft 365 or Office 365 using Network Address Translation (NAT) or Port Address Translation (PAT) , you need to ensure that the devices hidden behind each publicly routable IP address do not exceed the supported number. Ensure that adequate public IP addresses are assigned to the NAT pools to prevent port exhaustion. Port exhaustion will contribute to internal users and devices being unable to connect to the Microsoft 365 or Office 365 service.
Routing to Microsoft data centers	Implement the most efficient routing to Microsoft data centers . Identify locations that can use local or regional egress points to connect to the Microsoft network as efficiently as possible.
Intrusion Detection and Prevention Guidance	If your environment has an Intrusion Detection or Prevention System (IDS/IPS) deployed for an extra layer of security for outbound connections, be sure to allow all Microsoft 365 or Office 365 URLs.
Configure split-tunnel VPN	<p>We recommend that you provide an alternate path for Teams traffic that bypasses the virtual private network (VPN), commonly known as split-tunnel VPN. Split tunneling means that traffic for Microsoft 365 or Office 365 doesn't go through the VPN but instead goes directly to Microsoft 365 or Office 365. Bypassing your VPN will have a positive impact on Teams quality, and it reduces load from the VPN devices and the organization's network. To implement a split-tunnel VPN, work with your VPN vendor.</p> <p>Other reasons why we recommend bypassing the VPN:</p> <ul style="list-style-type: none"> • VPNs are typically not designed or configured to support real-time media. • Some VPNs might also not support UDP (which is required for Teams). • VPNs also introduce an extra layer of encryption on top of media traffic that's already encrypted. • Connectivity to Teams might not be efficient due to hair-pinning traffic through a VPN device.
Implement QoS	Use Quality of Service (QoS) to configure packet prioritization. This will improve call quality in Teams and help you monitor and troubleshoot call quality. QoS should be implemented on all segments of a managed network. Even when a network has been adequately provisioned for bandwidth, QoS provides risk mitigation in the event of unanticipated network events. With QoS, voice traffic is prioritized so that these unanticipated events don't negatively affect quality.

NETWORK OPTIMIZATION TASK	DETAILS
Optimize WiFi	<p>Similar to VPN, WiFi networks aren't necessarily designed or configured to support real-time media. Planning for, or optimizing, a WiFi network to support Teams is an important consideration for a high-quality deployment. Consider these factors:</p> <ul style="list-style-type: none"> • Implement QoS or WiFi Multimedia (WMM) to ensure that media traffic is getting prioritized appropriately over your WiFi networks. • Plan and optimize the WiFi bands and access point placement. The 2.4 GHz range might provide an adequate experience depending on access point placement, but access points are often affected by other consumer devices that operate in that range. The 5 GHz range is better suited to real-time media due to its dense range, but it requires more access points to get sufficient coverage. Endpoints also need to support that range and be configured to leverage those bands accordingly. • If you're using dual-band WiFi networks, consider implementing band steering. <i>Band steering</i> is a technique implemented by WiFi vendors to influence dual-band clients to use the 5 GHz range. • When access points of the same channel are too close together, they can cause signal overlap and unintentionally compete, resulting in a bad experience for the user. Ensure that access points that are next to each other are on channels that don't overlap. <p>Each wireless vendor has its own recommendations for deploying its wireless solution. Consult your WiFi vendor for specific guidance.</p>

Bandwidth requirements

Teams is designed to give the best audio, video, and content sharing experience regardless of your network conditions. That said, when bandwidth is insufficient, Teams prioritizes audio quality over video quality.

Where bandwidth isn't limited, Teams optimizes media quality, including high-fidelity audio, up to 1080p video resolution, and up to 30fps (frames per second) for video and content.

This table describes how Teams uses bandwidth. Teams is always conservative on bandwidth utilization and can deliver HD video quality in under 1.5Mbps. The actual bandwidth consumption in each audio/video call or meeting will vary based on several factors, such as video layout, video resolution, and video frames per second. When more bandwidth is available, quality and usage will increase to deliver the best experience.

Meetings

1,000/1,500

1,500/2,500

2,500/4,000

Minimum, Recommended, and Best performance bandwidth requirements are based on per-endpoint usage. Typically, there's one endpoint per user, such as a computer or mobile device. However, if a user joins a Teams meeting on *both* a computer *and* a mobile device, two endpoints are associated with that user.

- **Minimum** Bandwidth requirements for video calls are up to 240p resolution, screen sharing content frame rates adaptive 1.875 to 7.5fps, and Together Mode/Large Gallery video up to 540p resolution.
- **Recommended** Bandwidth requirements for video calls are up to 1080p resolution*, screen sharing content frame rates adaptive 7.5 to 30fps, and Together Mode/Large Gallery video up to 1080p resolution*.
- **Best Performance** Guidance allows higher fidelity video for larger attendee meetings, high loss environments, and higher motion content with screen sharing content frame rates adaptive 15 to 30fps.

*Expect up to 1080p quality but depending on your network conditions, video resolution and quality will be optimized accordingly.

[Teams Troubleshooting](#)

Use Advisor for Teams to help you roll out Microsoft Teams

12/7/2021 • 15 minutes to read • [Edit Online](#)

Advisor for Teams walks you through your Microsoft Teams rollout. It assesses your Microsoft 365 organization environment and identifies the most common configurations that you may need to update or modify before you can successfully roll out Teams. Then, Advisor for Teams creates a Deployment team (in Teams), with channels for each workload you want to roll out. Each workload in the Deployment team comes with a comprehensive Planner plan that includes all the rollout tasks for each workload. Using this Planner plan, you'll assign tasks to the people responsible for each phase of the rollout - including the project manager, Teams admins, support people, and your adoption and user readiness team. Each rollout task contains all the guidance and resources you need to successfully complete the task.

Advisor for Teams is part of the [Teams admin center](#). At a minimum, you'll need a Microsoft 365 Business Basic license so you can take advantage of the Advisor for Teams integration with Forms and Planner. To begin using Advisor for Teams, click the **Start** button in the **Deploying Teams workload** widget on the Dashboard. Or go to **Planning > Teams Advisor**.

IMPORTANT

Advisor for Teams isn't available for Microsoft 365 Government (GCC High or DoD) deployments.

For a guided overview of the Advisor for Teams experience, check out the [Deploy & Configure Microsoft Teams](#) Microsoft Mechanics video.

Using Advisor for Teams

Teams, Forms, and Planner licenses are required to use Advisor for Teams. However, you don't have to be a Teams admin to use Advisor for Teams - anybody in your organization can use it. We've set up special permissions so non-admin users can get to Advisor for Teams, even though it's in the Teams admin center. You DO have to be a Teams admin, Teams Administrator, or Global Administrator to open the tenant readiness assessments (this is because the special non-admin roles don't have access to the Microsoft Graph APIs underlying the assessments).

IMPORTANT

If **Teams Advisor** is missing under **Planning** in the Teams admin center, it means the user isn't licensed for Teams.

The first time you use Advisor for Teams, it will create a Deployment team for you in Teams. It adds a channel for each workload you select.

IMPORTANT

If a Deployment team has already been created and a different user tries to create it, they'll get an error telling them to contact their support team. This prevents Teams from unintentionally disclosing information about the existing team and its members. Ask the owner of the Deployment team to add you, or contact your support person for help.

Available Advisor for Teams plans

Advisor for Teams currently provides the following plans:

1. Chat, teams, channels, and apps
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
2. Meetings and conferencing
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
3. Skype for Business upgrade
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
 - Designed for customers who are currently using Skype for Business Online or Skype for Business on-premises environments, the Skype for Business upgrade plan will help you take the guesswork out of your upgrade journey. Leveraging a proven success framework for implementing change, the plan will guide you through the step-by-step process whether you're just getting started with Teams, already using Teams alongside Skype for Business, or ready to upgrade. The plan will also connect you to [online guidance and best practices](#), [downloadable assets](#), [live 1:many planning workshops](#), and additional resources to support your success.
4. Education (visible only to Educational organizations)
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
 - Designed for Educational organizations, the Education plan will help you deploy, adopt, and manage Teams in your educational institution.

For commercial organizations, we recommend that you start with the Chat, teams, channels, and apps plan. For educational organizations, we recommend that you start with Education plan. When you're done deploying that workload, go back to Advisor for Teams and select **Add channel** to start the next workload.

Tenant assessment

Each plan includes a tenant readiness assessment that you can use to quickly identify aspects of your environment that may need remediation before you roll out Teams. The assessments include prerequisites and best practices. Each assessment test will have a green check mark or an orange warning triangle.

-  A green check mark means your tenant passed the specific test.
-  An orange warning triangle means that we suggest you follow up to determine if any action is needed (for example, a Microsoft 365 Group expiration policy is recommended but not required).

IMPORTANT

Once a user with an Administrative role starts Advisor for Teams, all assessments run in the background. If you update or remediate something, it may not be reflected in your assessments for up to 24 hours.

The sections below describe each assessment, including whether something is a prerequisite or best practices, what each assessment checks is doing and why, and guidance for remediation as needed.

Assessment tests for all workloads

ASSESSMENT TEST	WHAT IT TELLS YOU
Vanity domain configured	Whether there's a non-@onmicrosoft.com domain configured for your tenant (for example, @contoso.onmicrosoft.com). You can use the @onmicrosoft.com domain, of course, or you can configure a vanity domain - your choice. For more information, read Add a domain to Microsoft 365 .
Teams licenses	This is a prerequisite - you must have Teams licenses in order to roll out Teams. Queries the Microsoft Graph to see whether you have Teams licenses (with at least one license available to assign). For more information, read Microsoft Teams service description .
Exchange Online licenses	Whether you have an active subscription with available Exchange Online licenses. While Exchange isn't required for basic Teams functionality, integration with Exchange provides an optimal Teams experience. Queries the Microsoft Graph to analyze the subscriptions associated with your tenant and validate whether you have subscriptions with an eligible Exchange Online license (with at least one license available to assign). For more information, read How Exchange and Teams interact .
SharePoint Online licenses	Whether you have an active subscription with available SharePoint Online licenses. We recommend per-user SharePoint Online licenses to provide OneDrive for Business for file storage in chats. Queries the Microsoft Graph to see whether you have SharePoint Online licenses (with at least one license available to assign). For more information, read How SharePoint Online and OneDrive for Business interact with Teams .
Guest access enabled	Whether guest access is turned on. Guest access lets you invite external users to your join your teams. See Collaborate with guests in a team to walk through turning on guest access in Teams; the checklist includes the required Azure AD configurations.
External access configured	Whether external access is turned on. By default, it's turned on, with open federation.

Assessments for chat, teams, channels, and apps

In addition to the [Assessment tests for all workloads](#), the following additional assessments are run for the chat, teams, channels, and apps workload:

ASSESSMENT TEST	WHAT IT TELLS YOU
Microsoft 365 Group naming policy configured	Whether naming standards have been configured for Microsoft 365 Groups. Microsoft 365 Groups naming policy enables your organization to apply a consistent naming strategy to user-created teams and also applies to other Groups workloads (including Outlook, SharePoint, Planner, and Yammer). This test queries Azure AD via the Microsoft Graph to check for the existence of naming policies that apply to Microsoft 365 Groups. For more information, read Groups naming policy .
Microsoft 365 Group Expiration Policy configured	Whether a Group Expiration Policy has been defined for Microsoft 365 Groups. This enables your organization to automatically remove inactive Teams. It's turned off by default. This test queries Azure AD via the Microsoft Graph and reports whether the value has been modified from the default. For more information, read Microsoft 365 group expiration policy .

Assessments for meetings and conferencing

In addition to the [Assessment tests for all workloads](#), the following additional assessments are run for the meetings and conferencing workload:

ASSESSMENT TEST	WHAT IT TELLS YOU
Audio Conferencing licenses	Whether you have an active subscription with Audio conferencing licenses. This is a prerequisite if you're deploying Audio conferencing bridges. Queries the Microsoft Graph to see whether you have Audio Conferencing licenses (with at least one license available to assign) For more information, read Teams add-on licensing .
Stream licenses	Whether you have an active subscription with Microsoft Stream licenses. This is a prerequisite if you want to turn on Meeting Recording. Queries the Microsoft Graph to see whether you have Microsoft Stream licenses (with at least one license available to assign). For more information on Stream and how to turn it on, read Teams cloud meeting recording .

Assessments for Skype for Business Upgrade

In addition to the [Assessment tests for all workloads](#), Skype for Business Upgrade also includes assessments used in the meetings and conferencing plan.

Advisor for Teams bot

Once Advisor for Teams creates your Deployment team, the Advisor bot delivers the following message in the General channel:

Welcome to your Deployment team for Microsoft Teams!

The purpose of this team is to walk you through your organization's Teams rollout by giving you all the resources you need and providing a collaboration space for the project team. Each channel created using Advisor for Teams includes a step-by-step Planner plan and other resources such as a Forms users survey that can be used throughout your rollout. At any point, you can go back and review the tenant readiness assessment or add additional workload plans using the Teams admin center.

Call to action

- If you're new to Teams or Planner, check out our [Teams walkthrough](#) and watch the [Planner quick-start videos](#).
- Head over to your Deployment team in Teams. Select your workload channel (for example, Chat, teams, channels, and apps), and select the **Planner** tab to get started.

To learn more about Advisor for Teams, read [Use Advisor for Teams to roll out Microsoft Teams](#).

IMPORTANT

The Advisor for Teams Bot is only used to send a welcome message to your Deployment team. No additional data is collected.

IMPORTANT

The Advisor for Teams bot is turned on by default. Don't turn it off if you use or plan on using Advisor for Teams.

Advisor for Teams and Microsoft 365 learning pathways

[Microsoft 365 learning pathways](#) is an on-demand learning solution that you can customize to train your users, and increase usage and adoption of Teams in your organization. Use learning pathways together with Advisor for Teams to get your users up and running quickly and drive adoption.

Learning pathways gives you a SharePoint Online site template and the ability to easily build a learning site for your users. You can customize the learning pathways training portal to include training and support content specific to your users' needs. Use the Teams playlists from the Microsoft online catalog and add your own.

You can build a learning site in learning pathways, and then add it as a tab to a channel in teams for quick and easy access by users.

For example, use Advisor for Teams together with learning pathways to train your help desk and Champions, and then let learning pathways support training your end users. Build a learning site to help onboard your help desk and Champions to Teams, and then add it as a tab to each workload channel that you're rolling out. Your help desk and Champions can then create a support page on the learning pathways training portal with links and custom playlists to support your users on Teams. This support page can be added to a channel in any team to help train your end users.

The following is an overview of how you can use Advisor for Teams together with learning pathways.

Get started in learning pathways

To get started with learning pathways, check out [Get started with learning pathways](#).

To set up a new learning pathways solution in your environment, see [Provision a new learning pathways solution](#).

Create a learning plan

Plan your learning content

Before you build your site in learning pathways, take some time to review and collect the learning resources and capabilities available to you. With learning pathways, you can use content from the Microsoft 365 training page and add content that you create to tailor the site to your unique needs.

To learn more, see [Plan your learning pathways content](#) and [Resources for supporting your remote workforce](#).

Explore Teams content in learning pathways

Learning pathways provides a SharePoint site with a web part that's connected to an online catalog. The

Microsoft 365 training page, which hosts the web part, shows all the training available in learning pathways. Have a look around to get familiar with what's available and how content is organized.

[Go to your learning pathways site](#), select **Microsoft 365 training**, and then select **Microsoft Teams** to see all the Teams training playlists in the online catalog. Select a playlist and then select the **Next** and **Previous** buttons to navigate through it. You can also click the down arrow to view the contents of the playlist and go to a specific topic.

Take an inventory of Teams learning resources in your organization

Review the Teams learning content that's already available in your organization. For example, you may have already developed custom onboarding, training, or support content for Teams. Your existing SharePoint assets can be mixed with Microsoft content in a playlist to build a targeted playlist for your organization.

Build your site in learning pathways

The [Admin Success Center](#) in learning pathways provides guidance and resources to help you plan and customize learning pathways in your organization. Learn how to [customize the site](#), show and hide content, build custom playlists, and more.

To access the Admin Success Center, on the learning pathways Home page, select **Admin Success Center**.

Add your site to Teams

When your site is ready, add it to a channel in any team for quick and easy access.

1. In Teams, go to the team, and then select a channel.
2. At the top of the channel page, select **+** (**Add a tab**).
3. Select **SharePoint Pages**, and then select **Add a page from any SharePoint site**.
4. Paste the URL of your learning pathways site, and then select **Save**.

To learn more, see [Add a SharePoint page or list to a channel in Teams](#).

Train your support team

Use the resources in your learning pathways site to onboard your help desk and Champions to Teams. Get them ready with the tools and information they need to support your users on Teams.

For guidance and resources on preparing your help desk and Champions for Teams, see [Train your org](#) and [Build Champions](#).

As the go-to contact for your users for "how to" questions, your help desk and Champions can use the learning pathways site to train users and as an alternative to creating support tickets. Encourage your help desk and Champions to [customize your learning pathways site](#) by building a training and support page, and then [add it as a tab to a channel](#) in a team for users to self-serve.

Drive adoption

After you have customized your site and put together your learning plans, consider how you'll drive awareness with your users to encourage them to use learning pathways for ongoing learning.

Use your communication channels to promote the site and generate awareness. For example, include a standard tagline such as "Check out our training and support site for how to get productive with Teams" in communications to your users.

Engage your users by highlighting the ways they can collaborate in Teams, and then direct them to the learning pathways site to learn how.

Check out these resources, which include guidance, adoption kits, best practices, and more, to help you implement a successful rollout and adoption plan.

- [Drive adoption of learning pathways](#)
- [Adopt Teams](#)

- [Adoption resources for Teams](#)

Frequently asked questions

What are the licensing requirements for Advisor for Teams

At a minimum, you'll need Microsoft 365 Business Basic so you can take advantage of the Advisor for Teams integration with Forms and Planner.

Can I delete the Deployment team

After Advisor for Teams has created your Deployment team, manage the team like any other team - including the ability to delete it. Be aware that, if you don't delete the team by using the Teams admin center, the Teams admin center will show that the team still exists.

Can I add or remove channels in the Deployment team

Yes, once the Deployment team has been created, you'll manage the channels the same way as any other team.

Can I add or remove project team members in the Deployment team

Yes, once the Deployment team has been created, you'll manage it the same way as any other team.

Can I modify the Planner plans

Yes, after Advisor for Teams has created your Deployment team, you should update the Planner plan so it best supports your Teams rollout. You can modify anything - buckets, tasks, task details - just like any other Planner plan.

Can I modify the Forms survey

Yes, after Advisor for Teams has created your Deployment team, you can modify the Forms survey as needed.

Are there any differences between Advisor for Teams in GCC

Yes, user survey Forms are created but are not pinned in plan channels as the Teams Forms app is not available in GCC presently.

What information is Advisor for Teams collecting about my organization

Advisor for Teams requests your agreement to collecting non-EUII (end user identifying information). The information that is collected is in the form of telemetry that provides feedback to Microsoft on how well Advisor for Teams is driving successful outcomes and where it may need to be improved. This same data is used to identify opportunities for Microsoft to proactively engage with your organization in an effort to assist with your deployment.

Can I use Advisor for Teams with FastTrack

Yes, FastTrack leverages Advisor for Teams for all customers looking to deploy Teams. They can assist with the initial setup of your Deployment team using Advisor for Teams (if required) and also provide as-needed support on specific topics during your Teams rollout.

Can I use Advisor for Teams with a partner

Yes, you can use Advisor for Teams while also using a deployment partner for your Teams deployment. If your partner is a CSP and manages your tenant on your behalf, they can use Advisor for Teams to create your Deployment team and assist you with executing the overall project. Additionally, you can work with any partner by adding those individuals as guests in your Deployment team, to allow them to participate as a member of the overall project team.

How do I use Planner

Check out [Microsoft Planner help](#) and the [Planner quick-start videos](#).

How do I use Forms

Go to the [Forms help center](#).

[Best practices for organizing teams in Teams](#)

[Product names and service plan identifiers for licensing](#)

Use the Network planner for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Network Planner is a new tool that is available in the Teams admin center. It can be found by going to **Planning** > **Network planner**. In just a few steps, the Network Planner can help you determine and organize network requirements for connecting Microsoft Teams users across your organization. When you provide your network details and Teams usage, the Network Planner calculates your network requirements for deploying Teams and cloud voice across your organization's physical locations.

Network planner allows you to:

- Create representations of your organization using sites and Microsoft recommended personas (office workers, remote workers, and Teams room system).

NOTE

The recommended personas were developed based on data from Teams best use scenarios and typical usage patterns. However, you can create up to three custom personas in addition to the three recommended personas.

- Generate reports and calculate bandwidth requirements for Teams usage.

To use Network planner, you must be a Global Administrator, Teams Administrator, or Teams Communications Administrator.

Create a custom persona

Follow these steps to create a custom persona:

1. Go to the Network planner in the Microsoft Teams admin center.
2. On the **Personas** tab, click + **Custom persona**.

3. In the **New custom persona** pane, add a name and description for the new persona.
4. Select the permissions that this persona will use within the organization.
5. Click **Save**.

Build your plan

Follow these steps to begin building your network plan:

1. Go to the Network planner in the Microsoft Teams admin center.
2. On the **Network Plan** tab, click **Add a network plan**.
3. Enter a name and description for your network plan. The network plan will appear in the list of available plans.
4. Click the plan name to select the new plan.
5. Add sites to create a representation of your organization's network setup.

Depending on your organization's network, you may want to use sites to represent a building, an office location, or something else. Sites might be connected by a WAN to allow sharing of internet and/or PSTN connections. For best results, create sites with local connections before you create sites that remotely connect to the internet or PSTN.

To create a site:

- a. Add a name and description for your site.
- b. Under **Network settings**, add the number of network users at that site (required).
- c. Add network details: WAN-enabled, WAN capacity, internet egress (**Local** or **Remote**), and PSTN egress (none, local, or remote).

NOTE

You must add WAN and internet capacity numbers to see specific bandwidth recommendations when you generate a report.

- d. Click **Save**.

Create a report

After you add all sites, you can create a report, as follows.

1. On the **Reports** tab, click **Start a report**.
2. For each site you create, distribute the number of users across the available personas. If you use the Microsoft recommended personas, the number will be distributed automatically (80% office worker and 20% remote worker).
3. After you complete the distribution, click **Generate report**.

The generated report will show the bandwidth requirements in several different views so that you can clearly understand the output:

- A table with individual calculations will display bandwidth requirements for each permitted activity.
- An additional view will show the overall bandwidth needs with recommendations.

4. Click **Save**. Your report will be available on the reports list for later viewing.

Example scenario

For an example of how to use the Network planner to set up a network plan and generate a report using these steps, download the [Network planner How-To PowerPoint deck](#) (English only).

Proxy servers for Teams or Skype for Business Online

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article provides guidance about using a proxy server with Teams or Skype for Business.

Not using a proxy server is recommended

When it comes to Teams or Skype for Business traffic over proxies, Microsoft recommends bypassing proxies. Proxies don't make Teams or Skype for Business more secure because the traffic is already encrypted.

And having a proxy can cause issues. Performance-related problems can be introduced to the environment through latency and packet loss. Issues such as these will result in a negative experience in such Teams or Skype for Business scenarios as audio and video, where real-time streams are essential.

If you need to use a proxy server

Some organizations have no option to bypass a proxy for Teams or Skype for Business traffic. If that's the case for you, the problems mentioned above need to be kept in mind.

Microsoft also strongly recommends:

- Using external DNS resolution
- Using direct UDP based routing
- Allowing UDP traffic
- Following the other recommendations in our networking guidelines: [Prepare your organization's network for Teams](#)

Following this guidance should minimize potential problems.

Plan for Microsoft 365 Groups when creating teams in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When considering the use of Microsoft 365 Groups or when creating teams, consider what the team will be used for, who should have access, and what outcome the team will expect to achieve. Pay special attention to the number of channels you create as people can quickly become overrun by content spread too thin (across too many channels).

There are two scenarios that warrant some discussion around planning of Microsoft 365 Groups and their impact on (or by) Microsoft Teams:

- First, since customers could have existing investments in Groups, we currently support both Public and Private groups, for the number of members currently supported, please see [Limits and specifications for Microsoft Teams](#). As mentioned previously, you want to manage the membership of people to a team using the Teams client rather than the Microsoft 365 admin center. Given this scenario, if people are used to threaded conversations in Microsoft 365 Groups, it is worthwhile noting that a Groups conversation is essentially email and not the same as a chat message in a Teams channel. Educate your people about this difference and suggest they adopt the more flexible chat message format in Teams versus emailing the Group using Outlook or OWA.
- Second, for customers who don't have existing Groups defined in Microsoft 365, you can either create them using the Microsoft 365 admin center, the Teams web, or desktop clients. As mentioned previously, manage all future membership to the Microsoft 365 group using the Teams client. Since membership to a team is also defining membership to Microsoft 365 Groups, you should prepare people for this change.

Teams respects Microsoft 365 Groups naming policy

Any Microsoft 365 Groups naming policy that has been set by your admin will be applied in Teams when users create or edit team names. This includes things like mandatory prefixes or suffixes and excluding banned words.

To learn more, read [Microsoft 365 Groups naming policy in Teams](#).

The following articles are a good place to find readiness and adoption content for your Microsoft 365 Groups:

- [Get more with groups in Outlook](#)
- [Add or remove members from Microsoft 365 Groups using the Microsoft 365 admin center](#)
- [Restore a deleted group](#)

Plan for lifecycle management in Teams

12/7/2021 • 9 minutes to read • [Edit Online](#)

Teams provides a rich set of tools to implement collaboration lifecycle management processes for your organization. This article guides IT pros through the right questions to determine their requirements for lifecycle management, and the tools to use to meet them.

Planning for lifecycle management is important, because it means you're building a plan to get your work done effectively. Most projects consist of a beginning, middle, and end. Teams do too, but they can be constructed and used in such a variety of ways that it's not always obvious which stage of their lifecycle they're in. Having a plan for lifecycle management will help you track your organization's projects as they go through these stages.

TIP

Watch the following session to learn about more about lifecycle in Microsoft Teams: [Governance, management and lifecycle in Microsoft Teams](#)

Lifecycle concepts

The following concepts and definitions all affect the decisions you make for lifecycle management.

Teams

A *team* is a collection of people, content, and tools that facilitate collaboration. A team defines who its members are, and the permissions and policies that apply to those members. Teams are built on Microsoft 365 Groups, and changes to Microsoft 365 group membership sync to the team. Like other Microsoft 365 Groups, Teams come auto-provisioned with an Exchange mailbox, a SharePoint site, a OneNote notebook, and other assets within Microsoft 365 or Office 365. [Learn more about Microsoft 365 Groups](#).

Channels

Channels are the collaboration spaces within a team where the actual work is done. Each channel represents a different topic or workstream within the overall team. For each channel, a folder is automatically created on the SharePoint site to store all files shared to that channel, making it easy for users to find and work on the documents they care about. Channels can also be extended with apps that are relevant to the particular workstream—for example, you can add a Power BI dashboard to a channel to track the success of one aspect of your project.

Team access types

These determine who can join the team:

- *Private* teams are restricted to team members approved by the team owner(s). This is a typical setting for project teams and virtual teams in a large organization.
- *Public* teams are open for anyone in the organization to join directly. This is useful for collaboration on topics of general interest to people in different departments working on different projects. This is a good default setting for smaller organizations.

Team user types and admin roles

Team user types determine how much control a team member has:

- *Team creator* has permissions to create a group or team in the directory. The admin can constrain this user

type to a subset of admins or users. For more information, see [Manage who can create Microsoft 365 Groups](#). Team creators automatically become an owner of the team.

- *Team owner* manages membership and settings for the team. There can be as many as 100 team owners per team.
- *Team member* is a member of your organization who participates in a team.
- *Guest* is a user who's external to your organization. Anyone with an email address can be invited as a guest if your organization has enabled [guest access](#).

NOTE

You can learn more about team owner and team member capabilities in the article [Assign role and permissions in Microsoft Teams](#).

Teams admin roles determine what capabilities each admin role holder has. These are described in the following article: [Use Microsoft Teams administrator roles to manage Teams](#).

IT decisions to make before getting started

Before you roll Teams out to your organization, implement any governance policies that your organization has decided it requires. These can include items like naming conventions, expiration policies, retention policies, and more. Generally speaking, it's much easier to implement these requirements prior to scaling your deployment across your organization.

For more information, see [Plan for governance in Teams](#).

Teams lifecycle stages

Generally speaking, a team has a purpose that's aligned with a project or accomplishing a goal. Even if a team was formed based on a shared interest, the team membership will probably change over time and the discussion might grow stale—only to surface again in a slightly different way in a different team.

Each team has a beginning, when the team is created and the channels are set up; a middle, when the team is used and collaboration occurs to match the rhythm of the workflow; and—sometimes—an end, when the team has completed its purpose and reached the end of its useful life.

For more information, see [Manage teams in the Microsoft Teams admin center](#).

Stage 1: Beginning

Create the team

The first step is to define the goal of the team (which can range from business processes to org structure to projects, or simply creating an open, unstructured collaboration hub). Defining the team goal goes hand in hand with identifying the right people. As far as practicable, it's a good idea to foster open collaboration by aiming for broad membership.

Team owners invite team members, set the team picture and description, and can set permissions for individual members.

TIP

It's optimal to identify at least two team owners, to account for absence or reassignment.

Team origins

Teams can originate from a variety of methods, including:

- Create the team from scratch. Add members by using individual email aliases or usernames, or expand a distribution list.
- Create the team from an existing team, and use its channel configuration and any app configuration as a template. You can optionally also use its membership list.
- Add a team to an existing Microsoft 365 group, which also gives the team access to its mailbox and SharePoint site.
- Use the Microsoft Graph Teams APIs or PowerShell cmdlets to create teams. The APIs can programmatically create teams based on Global Address Book attributes (such as region or department) or business processes (client engagements or classroom rosters, for example).

Use these links to get more information about organizing your teams:

- [Best practices for organizing teams in Teams](#)
- [Deploy chat, teams, channels, & apps](#)
- [Deploy meetings & conferencing](#)
- [Deploy cloud voice](#)

 <p>Decision points</p>	<ul style="list-style-type: none"> • What's the purpose of the team? • Who belongs on the team? • Will the team be private or public? • Can new members add themselves or do team owners add them? • Who will have permissions to create channels or add tabs, bots, and connectors?
 <p>Next steps</p>	<ul style="list-style-type: none"> • Create the team. • Plan for channels.

Set up channels

Any team owner or member with appropriate permissions can create channels in a team. It's important to consider the goal of each channel—options include collaboration around projects, discussions of topics, or areas of common interest. By default, every team includes a General channel; most teams need more than this, and members will create additional channels. It's likely that the set of channels will grow organically as new topics or projects arise, and discussions might outgrow the channel they began in.

To spark interest, the channel owner can post a welcome message, upload relevant documents to the **Files** tab, or add tabs or connectors to the channel. The owner also sets the channel description, and can "auto-favorite" important channels so they're listed by default for all team members.

Consider channel names before creating them as renaming a channel in the team will not rename the corresponding folder in the SharePoint document library which can lead to end-user confusion.

 <p>Decision points</p>	<ul style="list-style-type: none"> • What initial channels will be added to the team? • What guidance, if any, will be provided for adding new channels? (Will they be set up by project, by topic, or ...?)

 Next steps	<ul style="list-style-type: none"> • Create initial channels. • Post a welcome message. • Start collaborating.

Stage 2: Middle

As the teamwork begins, the team membership probably begins to evolve, along with the channel hierarchy. Unless the team needs to be strictly controlled and locked down, it's a good idea to encourage exploration even if it leads to dead ends. As users get more comfortable, they can experiment with @team mentions, marking channels as favorite, and using the General channel to get comfortable with posting. Each team is different; let usage guide the evolution of the design. Monitor the usage and health of the team via Teams reporting capabilities.

Trust, tolerance, and a spirit of collaboration grow organically as key group communications are initiated and sustained in Teams. Team members see the usefulness of group conversations over one-on-one chats. Individual teams tend to develop their own personality, aided by fun features like Giphys and stickers. At the same time, it's important that rogue or rude behavior be discouraged any time it occurs.

Because teams are living organisms, they occasionally need to be checked on and cared for. These are some best practices:

- Use champions to sustain usage if it starts to drop, and also to discover and propagate creative new behaviors.
- Manage guests judiciously, making sure their access ends when the business need ends.
- Encourage members to use threaded conversations with subject lines to improve visibility and attention with scrolling through a channel.
- Let channels evolve with business needs, adding new ones as necessary and allowing old ones to fade (or consider archiving or deleting them if they contain sensitive or ephemeral data, based on your retention requirements).
- Carve out new teams as larger groups or interest-based areas emerge.
- Try different channel collaborations, such as channel meetings or tab conversations around documents.
- Use the Microsoft Teams mobile app to increase engagement.

 Decision points	<ul style="list-style-type: none"> • Who will monitor usage to identify problems? • What metrics will be used to determine whether a team is healthy? • Identify any teams that have reached the end of their useful life. • Identify unhealthy teams that still serve a purpose but need revitalizing.
 Next step	<ul style="list-style-type: none"> • Implement a process to monitor individual team health.

Stage 3: End

When the work of a team has run its course, it's important to formally acknowledge that it's over. This gives team members a sense of closure and also prevents anyone from accessing outdated, stale information. You can use the team itself to conduct closure rituals like postmortems and executive summaries.

You can delete teams that you know you don't need (for example, a team created purely for testing or a team that contains sensitive data). Teams are actually deleted with a "soft delete" that IT can reverse for up to 30 days. Deleting teams doesn't affect any chats or content that were retained in accordance with compliance policies. Channels also have a "soft delete" and can be reversed for up to 21 days after deletion. Deleting a channel will not delete the folder or its contents from the SharePoint document library.

You can also use expiration and retention policies in addition to archiving capabilities to reduce exposure from teams that aren't active any longer or whose owners have left the organization.

Retention policies applied to Teams or associated services such as SharePoint may prohibit the deletion of teams. Additionally, consider that content in a team is often more than just files in the SharePoint document library; it is conversations, Planner boards, wikis, Forms results, recorded meetings, OneNote notebooks, and various others.

For information about setting up expiration and retention policies, see [Overview of security and compliance in Microsoft Teams](#).

 Decision points	<ul style="list-style-type: none">• Define what the end of a team's life looks like.• Decide whether to keep the content of a team available, and for how long.
 Next steps	<ul style="list-style-type: none">• Document best practices and lessons learned.• Archive data, if necessary.

Related topics

[Governance quick start for Teams](#)

Plan for governance in Teams

12/7/2021 • 7 minutes to read • [Edit Online](#)

Teams provides a rich set of tools to implement any governance capabilities your organization might require. This article guides IT pros to ask the right questions to determine their requirements for governance, and how to meet them.

TIP

Watch the following session to learn about more about Governance in Microsoft Teams: [Governance, management and lifecycle in Microsoft Teams](#)

Group and team creation, naming, classification, and guest access

Your organization might require that you implement strict controls on how teams are named and classified, whether guests can be added as team members, and who can create teams. You can configure these areas by using Azure Active Directory (Azure AD) and sensitivity labels.

-	-	-
	Decision points	<ul style="list-style-type: none">• Does your organization require a specific naming convention for teams?• Do team creators need the ability to assign organization-specific classifications to teams?• Do you need to restrict the ability to add guests to teams on a per-team basis?• Does your organization require limiting who can create teams?
	Next steps	<ul style="list-style-type: none">• Document your organization's requirements for team creation, naming, classification, and guest access.• Plan to implement these requirements as a part of your Teams rollout.• Communicate and publish your policies to inform Teams users of the behavior they can expect.

NOTE

To help you plan ahead, [learn more about setting these policies and what licenses they require](#).

NOTE

Limiting group and team creation can slow your users' productivity, because many Microsoft 365 and Office 365 services require that groups be created for the service to function. For additional information, visit [Plan for governance in Teams](#).

Additional information

After you've determined your requirements, you can implement them by using Azure AD controls. For technical guidance on how to implement these settings, see:

- [Azure Active Directory cmdlets for configuring group settings](#)
- [Enforce a naming policy for Microsoft 365 groups in Azure Active Directory](#)
- [Microsoft 365 Groups naming policy](#)
- [Use sensitivity labels to protect content in Microsoft Teams, Microsoft 365 groups, and SharePoint sites](#)
- [End of lifecycle options for groups, teams, and Yammer](#)

Group and team expiration, retention, and archiving

Your organization might have additional requirements for setting policies for expiration, retention, and archiving teams and teams data (channel messages and channel files). You can configure group expiration policies to automatically manage the lifecycle of the group and retention policies to preserve or delete information as needed, and you can archive teams (set them to read-only mode) to preserve a point-in-time view of a team that's no longer active. Note that teams that are archived continue to have the expiration policy applied and may be deleted unless excluded or renewed.

-	-
 Decision points	<ul style="list-style-type: none">• Does your organization require specifying an expiration date for teams?• Does your organization require specific data retention policies be applied to teams?• Does your organization expect to require the ability to archive inactive teams to preserve the content in a read-only state?
 Next steps	<ul style="list-style-type: none">• Document your organization's requirements for team expiration, data retention, and archiving.• Plan to implement these requirements as part of your Teams rollout.• Communicate and publish your policies to inform Teams users of the behavior they can expect.

TIP

Use the following table to capture your organization's requirements.

CAPABILITY	DETAILS	AZURE AD PREMIUM LICENSE REQUIRED	DECISION
------------	---------	--------------------------------------	----------

CAPABILITY	DETAILS	AZURE AD PREMIUM LICENSE REQUIRED	DECISION
Expiration policy	Manage the lifecycle of Microsoft 365 groups by setting an expiration policy.	P1	TBD
Retention policy	Retain or delete data for a specific time period by setting retention policies for Teams in the Security & compliance center. Note: Using this feature requires licensing of Microsoft 365 or Office 365 Enterprise E3 or above.	No	TBD
Archive and restore	Archive a team when it's no longer active but you want to keep it around for reference or to reactivate in the future.	No	TBD

NOTE

Group expiration is an Azure AD Premium feature. For this feature to be available, your tenant must have a subscription to Azure AD Premium and licenses for the administrator who configures the settings and the members of the affected groups.

Additional information

For technical guidance on how to implement these settings, see:

- [Set up Microsoft 365 groups expiration.](#)
- [Set up Teams retention policies.](#)
- [Archive or restore a team.](#)

Group and team membership management

Consistently managing members of project based, or restricted groups are necessary for teams that require rapid onboarding and offboarding of users and guests. Your organization may also need to make sure all current members have the business justification to be in a team. Managing members can be hard because team owners can leave and users don't usually leave groups on their own accord when a project ends or when they change roles. The best way to manage group membership that allows users to get access when needed but ensure the group doesn't have a risk of inappropriate access is through two distinct processes: entitlement management and access reviews.

[Entitlement management](#) allows you to delegate to someone, such as a project manager, to collect all the resources that are needed, including teams memberships, into a single package. They can also define who can make requests: either users in your tenant or from other connected organizations. The project manager will receive access requests in their email and approve or deny requests in the MyAccess portal. Administrators can configure the conditions of access to include an expiry date or period by when the user or guest will be removed from the team unless access is renewed. Administrators can also set up the groups associated with teams to take part in access reviews. For [access reviews](#), the group owners will receive regular reminders to review the members of a team. Access reviews include recommendations, which makes it easier for group owners to go through their regular attestation process.

-	-	-
	Decision points	<p>Does your organization require a consistent process for managing membership of one or more teams?</p> <p>Does your organization require owners, or the members themselves, to justify their continued membership of one or more teams on a regular basis?</p> <p>Does your organization require approval for users and guests to request access to resources including teams, groups, SharePoint sites, and apps?</p>
	Next steps?	<p>Document your organizations requirements for each team or specific teams for membership expiry.</p> <p>Plan how your organization can bundle teams, groups, SharePoint sites, and apps together in access packages.</p> <p>Plan which people, such as the requestor's manager, a project manager, a sponsor for a connected organization or a security officer in your organization will need to approve or deny access requests.</p>

TIP

Use the following table to capture your organization's requirements.

CAPABILITY	DETAILS	AZURE AD PREMIUM LICENSE REQUIRED	DECISION
Access reviews	Setup access reviews to recertify the membership of specific teams at regular interval	P2	TBD
Entitlement management	Setup access package to allow users and guests to request access to teams	P2	TBD

NOTE

To help you plan ahead, [learn more about what licenses they require](#).

Additional information

For technical guidance on how to implement these settings, see:

- [Entitlement management](#)
- [Access reviews](#)

Teams feature management

Another important aspect of governance and lifecycle management for Teams is the ability to control what features your users will have access to. You can manage messaging, meeting, and calling features, either at the Microsoft 365 or Office 365 organization level or per-user.

-	-
 Decision points	<ul style="list-style-type: none">• Does your organization require limiting Teams features for your entire tenant?• Does your organization require limiting Teams features for specific users?
 Next steps	<ul style="list-style-type: none">• Document your organization's requirements for limiting Teams features at the tenant and user level.• Plan to implement your specific requirements as part of your Teams rollout.• Communicate and publish your policies to inform Teams users of the behavior they can expect.

Teams feature management focus areas

Teams provides granular capabilities for controlling messaging, meeting, calling, and live event features and more, via policies. Different policies can be applied to all users by default or per user as required by your organization.

For detailed lists of all settings, including technical guidance on how to implement them for your organization, see the following articles:

- [Manage Microsoft Teams settings for your organization](#)
- [Manage Teams during the transition to the new Microsoft Teams admin center](#)
- [Private channels in Microsoft Teams](#)
- [Manage meeting policies in Teams](#)
- [Manage messaging policies in Teams](#)
- [Manage your apps in the Microsoft Teams admin center](#)

Additionally, you can set up moderation for a channel and give moderator capabilities to certain users so that they can control who can create channel posts and respond to them. See [Set up and manage channel moderation in Microsoft Teams](#) for more information.

Security and compliance

Teams is built on the advanced security and compliance capabilities of Microsoft 365 and Office 365 and supports auditing and reporting, compliance content search, e-discovery, Legal Hold, and retention policies.

IMPORTANT

If your organization has compliance and security requirements, review the in-depth content provided about this topic in the article [Overview of security and compliance in Microsoft Teams](#).

Related topics

[Governance quick start for Teams](#)

[Microsoft 365 licensing guidance for security & compliance](#)

Set up Microsoft Teams in your enterprise

12/7/2021 • 14 minutes to read • [Edit Online](#)

Use the information in this article to guide you through the deployment of Teams in your organization.

NOTE

If you haven't done so already, we strongly suggest that you begin your Teams deployment with a pilot. A pilot will allow you and a few early adopters to get familiar with Teams and its features before your planning and eventual roll out. For more information about how to start your pilot, check out [Get started with Microsoft Teams](#).

Before you roll out Teams broadly, make sure your organization is ready by reviewing the items in [Make sure you're ready](#).

Plan your deployment

Before you start deploying Teams, make sure you've completed your planning process. Your planning process should include:

- Understanding Teams architecture
- Reviewing and understanding Teams workloads and how they work with Microsoft 365
- Calculated network requirements and ensuring your network and Internet connection have the hardware and capacity required to support critical requirements like real-time communications
- Understanding regulatory and compliance requirements for information stored in Teams and other Microsoft 365 services
- Creating an adoption plan to help users understand the benefits of using Teams

We strongly recommend using the [Teams advisor](#) to help you with your deployment. For details about how the Teams advisor works, see [Use Advisor for Teams to help you roll out Microsoft Teams](#).

TIP

See how you can use Teams advisor to help you plan your Teams deployment by completing the [Roll out using the Teams advisor](#) module on Microsoft Learn.

For information about planning for Teams, see [Teams enterprise deployment overview](#).

Workloads

There are lots of ways you can customize Teams. The following sections show you how to set up each Teams workload: **chats, teams and channels**; **meetings and conferencing**; and **Phone System**. The order in which you set up each workload is up to you. While we recommend setting up the chats, teams, and channels workload first, you can start with meetings and conferencing or even Phone System.

- [Chat, teams, and channels](#)
- [Meetings and audio conferencing](#)
- [Phone System and PSTN connectivity](#)

Chat, teams, and channels, are the cornerstone of Teams. **Chat** lets one or more users talk to each other, share

files, and meet privately. **Teams**, which can be visible to everyone in your organization or only to those in the team, let the right people collaborate whatever the task or occasion, whether it's a long-running project or planning for a birthday party. **Channels** within teams can segment topics, projects, departments, or anything else make sense for your team. For details about chat, teams, and channels, check out [Overview of teams and channels](#).

TIP

See how you can manage team roles, access, and messaging policies by completing the [Manage Microsoft Teams](#) module on Microsoft Learn.

Administration and team ownership

DECISION	DESCRIPTION
Who should be Teams administrators?	<p>Admin roles can be used to grant specific permissions to people who you want to administer Teams. Small businesses may not need these extra roles because the same person may be responsible for all aspects of Teams. You can always add or remove administrators later on.</p> <p>Use Microsoft Teams administrator roles to manage Teams</p>
Who should be Team owners and members?	<p>Team owners control who can access a team and its channels. They can decide whether a team or channel is public (to the organization) or private and can set up policies like whether a channel should be moderated. Members can access the team and its channels (unless a channel is set to private and they're not a member of that channel) and can be designated as moderators.</p> <p>Assign team owners and members in Microsoft Teams</p>

Default settings and lifecycle policies

DECISION	DESCRIPTION
What messaging policies should be applied?	<p>Messaging policies control which chat and channel messaging features (such as who can use chat, who can edit and delete sent messages, and so on) are available to users in Teams. Teams has a global policy that applies to everyone. All of the features in the global policy are On by default.</p> <p>If you want the same policy to apply to everyone, all you need to do is make changes to this global policy (for example, turn off meme support in conversations).</p> <p>If you want different policies for different groups of people (for example, one policy for office workers and another for factory workers), you can create and assign policies. When you assign a policy to a user, the global policy no longer applies to them.</p> <p>Manage messaging policies in Teams</p>

DECISION	DESCRIPTION
What Team settings should be applied?	<p>Teams settings let you set up your teams for features such as email integration, cloud storage options, organization tab, meeting room device setup, and search scope. When you make changes to these settings, they apply to all the teams in your organization.</p> <p>Teams settings</p>

External and guest access

DECISION	DESCRIPTION
Should external access be enabled?	<p>External access lets anyone in another organization talk to people in your organization. This is useful when you have a close relationship with another organization, such as a supplier, and want to make it easy for people in either organization to chat with each other, hold meetings, and so on.</p> <p>External access is different than guest access. External access gives everyone in an organization access to interact with people in your organization. Guest access invites specific individuals access to interact with people in your organization.</p> <p>External access is turned Off by default.</p> <p>Manage external access in Microsoft Teams</p>
Should guest access be enabled?	<p>Guest access lets people in your organization invite people outside your organization access your teams and channels. Guest access is often used to collaborate with people outside your organization who don't have a formal relationship with yours. For example, you might invite a project planner to work on a project temporarily.</p> <p>Guest access is different than external access. Guest access invites specific individuals access to interact with people in your organization. External access gives everyone in another organization access to interact with people in your organization.</p> <p>Guest access is turned Off by default.</p> <p>Turn on or turn off guest access to Microsoft Teams</p>

Security

Teams is designed and developed in compliance with the [Microsoft Trustworthy Computing Security Development Lifecycle \(SDL\)](#). To conform to the SDL, Teams incorporates industry standard security technologies as a fundamental part of its architecture, including:

- Designing threat models that features are then tested against
- Incorporating security-related improvements into the coding process and practices
- Creating build-time tools to detect buffer overruns and other potential security threats before code can be checked into the product

Although Teams follows a "Trustworthy by Design" methodology, it's impossible to design against all unknown security threats. For this reason, it's important to understand how Teams works and interacts with other systems.

It's also important to understand how common threats, such as IP address spoofing, denial-of-service attacks, man-in-the-middle attacks, and so on, work so that you can design your network and Teams configuration to reduce the chances of these attacks happening.

To understand how Teams incorporates security fundamentals into its design, and to read more about common threats, see [Security and Microsoft Teams](#).

Compliance

Teams and Microsoft 365 provide many tools that can help you conform to regulatory requirements where your company and users are located. See the following articles for information on how to configure each compliance feature in Teams:

FEATURE	DESCRIPTION
Information barriers	Prevents individuals or groups from communicating with, or finding in the user picker, each other.
Retention policies	Lets you control how long data in Teams should be kept or whether data must be removed after a certain time.
Communication compliance	Helps reduce communication risks by identifying, and taking action on, offensive, profane, and harassing language; adult racy, and gory images; and the sharing of sensitive information.
Policy-based recording for calls and meetings	Lets you control when, or whether, calls and meetings should be automatically recorded and stored for later processing, retention, or analysis.
Sensitivity labels	Helps you to protect and regulate access to sensitive information by creating labels that enforce selected privacy options.
Data Loss Prevention	Lets you create rules that determine how certain information, such as social security numbers, credit card numbers, and so on, should be handled. You can prevent the sending of certain information, prevent it from leaving your organization, and so on.
eDiscovery	Helps you search for, and retrieve, content in your organization when your organization receives discovery demands in legal proceedings.
Legal hold	Helps you retain information in your organization, even if it's deleted by a user, when required during legal proceedings so that it can be discovered during eDiscovery investigations.
Content search	Provides a way to query Teams information spanning Exchange, SharePoint Online, and OneDrive for Business.
Auditing	Lets you see information about a specified action, including who performed the action, when the action was performed, the IP address that was used, and so on. Action include the creation or deletion of teams, creation of channels, changed settings in Teams, and so on.

FEATURE	DESCRIPTION
Customer key	Lets you create a data encryption policy using encryption keys you provide.

Clients

When you're ready for your users to start using Teams, they can install the Teams client on their Windows, Mac, or Linux PC, or on their Android or iOS device. Users can download the Teams client directly from <https://teams.microsoft.com/downloads>.

Make sure everyone who will be using Teams has a Teams license. For more information about assigning a Teams license, see [Manage user access to Teams](#).

TIP

Get recommendations on how to plan your Teams client deployment by completing the [Deploy Microsoft Teams clients](#) module on Microsoft Learn.

If your organization uses Microsoft Endpoint Configuration Manager, Group Policy, or a third-party distribution mechanism, to deploy software to your user's computers, see [Install Microsoft Teams using Microsoft Endpoint Configuration Manager](#).

If you want detailed information about deploying Teams clients, see [Get clients for Microsoft Teams](#).

Training

For information on how to train your users and admins to use Teams, see [Microsoft Teams training](#).

Adopt Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

NOTE

For an overview of making the transition to remote learning and resources to help you get started, see [Get started with Microsoft Teams for remote learning](#).

If you want to roll out Teams starting with chat, teams & channels, and meetings, use our prescriptive [Get started guidance](#), which is designed to get you up and running quickly. If you're a large organization with a hybrid or on-premises Skype for Business configuration, or if you want to roll out voice features (such as Microsoft 365 or Office 365 calling plans or phone system), you can start with our Get started guidance, but you'll need the additional guidance below, under [Deeper adoption guidance](#).

	Quick start		Introduction to teams and channels		Plan your first teams
	Empower your champions		Training		Tools and Downloads

Deeper adoption guidance

Adoption plans can be simple to complex, depending on your environment. For large-scale deployments, step through the guidance below to ensure your organization has a smooth transition to Teams.

	Start Get started Understand teams and channels Create your first teams Assess cultural and organizational readiness		Experiment Create your champions program Governance quick start Define usage scenarios Onboard early adopters and gather feedback Onboard support		Scale Define outcome and success Optimize feedback and reporting Drive awareness and implement training Schedule service health reviews

Get started driving adoption of Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

By driving adoption of Microsoft Teams, you can deliver an excellent user experience and increased business value inside your company. Our goal is to get you up and running quickly so that you can begin your journey with Teams. This guide focuses on user adoption of Teams and has dependencies on your environment's technical readiness, which is addressed in other sections of our documentation.

Adoption prerequisites

Before getting started, make sure that:

- [Teams is installed](#) and [licenses are assigned](#) in your environment. At a minimum licenses should be assigned to your core team and to the early adopters who will participate in this initial project phase.
- You've downloaded the desktop and mobile applications.

Adoption framework

Microsoft 365 and Office 365 have an adoption framework that applies to major workloads in the service. This framework addresses the core steps that any organization should take to support cloud services. To learn more about the overall adoption framework, see [Microsoft Enterprise documentation and resources](#).

In this Teams adoption plan, we've organized the steps in phases and provided specific Teams guidance as outlined in [Adoption phases](#), next.

Adoption phases

Every adoption project varies in size and complexity based on your environment, but the initial steps are identical across the board. We believe that breaking the process down into three distinct phases—startup, experiment, and enable—will streamline adoption for everyone.

- **Start** - In this first phase, you'll gather your team together, set up your initial teams, and use Teams to begin planning Teams adoption. This approach will increase your technical familiarity with the product and help you to build the skills necessary to successfully complete subsequent phases.
- **Experiment** - In this phase of controlled growth, you'll bring your internal champions and early adopters onboard. You'll speak with your business users to identify scenarios that would immediately benefit from the collaboration and communications capabilities that Teams provides. You'll gather feedback that will inform your broad-scale adoption phase, and you'll make service decisions about governance and lifecycle management that will ensure a successful deployment.
- **Scale** - This is the broad-scale deployment phase in which you'll turn on Teams capabilities for all your employees. In this phase, the size of your organization will determine whether this is a "go big" project that will turn on Teams for all employees simultaneously or if you'll approach this by region, business unit, or other method of segmenting your employee population. In this phase you'll move to a continuous delivery model. Employees, leaders, and business units will want to expand their use of Teams and will require training and your engagement to understand how to best use Teams and other features of Microsoft 365 or Office 365.

Each of these adoption phases depends on your technical and environmental readiness for Teams. Let's get started!

Microsoft Teams adoption phase 1 - Start

12/7/2021 • 2 minutes to read • [Edit Online](#)

You'll start your Teams adoption with the following activities:

- [Validate adoption prerequisites.](#)
- [Assemble your team.](#)
- [Understand teams and channels.](#)
- [Set up your first teams on Teams](#) to build your technical knowledge.
- [Assess your organization's readiness for change.](#)

The primary goal of this phase is to ensure your readiness for the experimentation phase. You will also determine if you need assistance from Microsoft or from our network of skilled partners.

Validate adoption prerequisites

Review our [adoption prerequisites](#) and work with the technical team to meet them if necessary. We'll address deeper technical requirements within each adoption scenario.

Assemble your team

The table below lists the core roles for your project team. In a smaller organization, some of these roles may be carried out by the same person.

ROLE	RESPONSIBILITIES	DEPARTMENT
Executive Sponsor ¹	Communicate high-level vision. Connect Teams implementation to core mission and priority initiatives at the company.	Executive Leadership
Success Owner ¹	Ensure the business goals are realized from the Teams rollout.	Any department
Program Manager ¹	Oversee the entire Teams launch execution and rollout process.	IT
Champions ¹	Help evangelize Teams, support skill building, and provide usage insights.	Multiple departments
Training Lead	Manage and communicate training content about Teams.	IT or other
Department Leads (Stakeholders) ²	Identify how specific departments will use Teams and encourage engagement.	Any department (management)
IT Specialists ¹	Oversee all technical aspects of implementation, including integrations.	IT

ROLE	RESPONSIBILITIES	DEPARTMENT
Communication Lead ²	Oversee company-wide communications about Teams.	Corporate Communications, IT, or other
Community Manager	Manage day-to-day Yammer network activity. Provide guidance and best practices.	Multiple departments

¹These roles are essential to the success of your project.

²These roles are important for the overall program success.

In most cases, this initial team should be a small group of like-minded people who are interested in Teams and may also be accountable for its implementation. As your adoption plan moves on to additional phases, you will include more people in your team. We also suggest that you take advantage of the Microsoft resources that are available to assist you.

Additional resources

The [Microsoft Technical Community](#) delivers peer-provided insights into adoption and technical issues for many Microsoft 365 and Office 365 products. We suggest that you join the following communities:

- [Microsoft Teams Technical Community](#) – Get product questions answered, learn from other Teams customers, and follow our blog to stay up to date on new features and use cases for Teams.
- [Champions Program](#) and the Driving Adoption community – Learn from your peers about how to best drive adoption of Microsoft 365 or Office 365 workloads such as Teams, SharePoint, Yammer, and other products. Open to IT Pros, business users, the “accidental” developer, and anyone interested in driving adoption of cloud services.

Next: [Understand teams and channels](#)

Understand teams and channels in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

The concepts of teams and channels are fundamental to a healthy, productive implementation of Microsoft Teams.

- A team is a collection of people, content, and tools that work together to produce a business outcome for your company. Teams are built on Microsoft 365 Groups, and changes to Microsoft 365 group membership sync to the team.
- Channels are the collaboration spaces within a team in which the actual work is done.

To read more about teams and channels, see the [Overview of teams and channels in Microsoft Teams](#). For comprehensive Teams adoption guidance, get the [Teams Adoption Guide](#). To learn more about Teams and Microsoft 365 Groups, see [Microsoft 365 Groups and Microsoft Teams](#) and [Learn more about Microsoft 365 Groups](#).

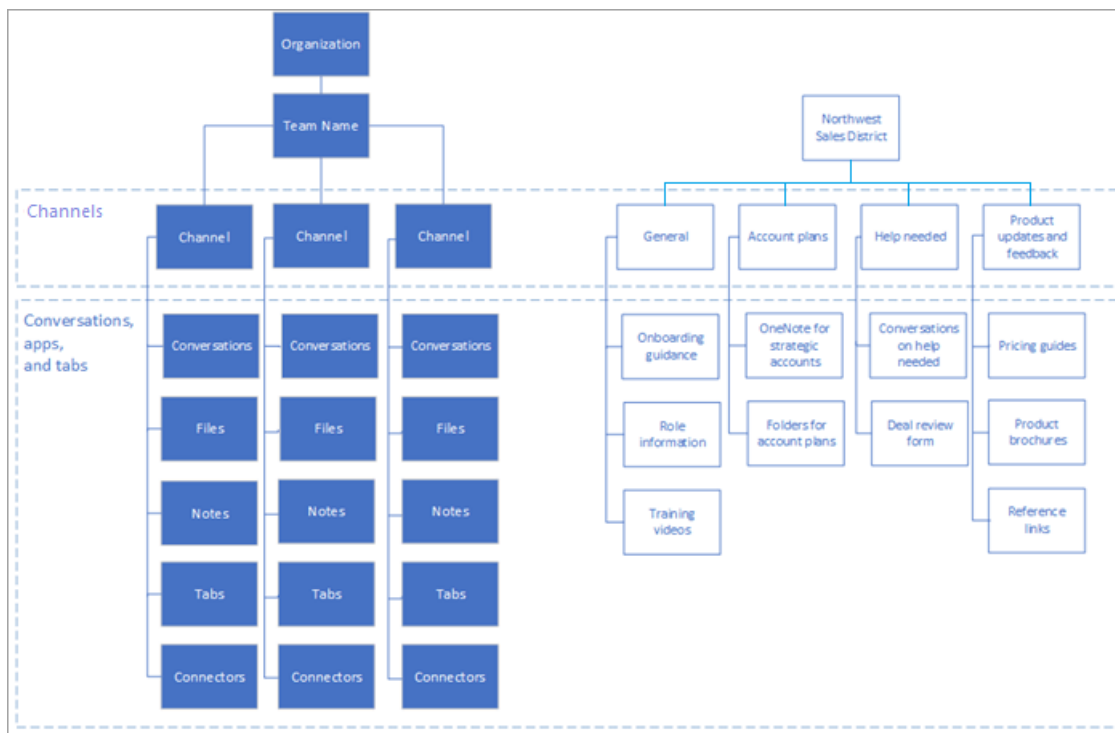

View this short video	https://www.youtube.com/embed/WkAVgNKn0hs

Team access types determine who can join a team:

- *Private* teams are restricted to team members approved by the team owner(s). This is a typical setting for project teams and virtual teams in a large organization.
- *Public* teams are open to anyone in the organization, and users can join them directly. Public teams are useful for collaboration on topics of general interest to people in different departments or to people who are working on different projects. This is a good default setting for smaller organizations.

Use Teams to drive cross-organization collaboration

It's a best practice to use teams to improve cross-organization collaboration, and many projects will lend themselves to this model. In addition, leaders or divisions inside of an organization might want a dedicated team for their own people. Consider the organizational and project models shown in the following illustration.

In an organizational team (shown on the left), key information about the way that organization runs its business, team events, core strategies, and other operational information, such as business reviews, might be shared. For the team shown on the right, the district's information is broken down into channels that represent the categories of work that are being accomplished by that team. Members of this team may or may not report to the same person, but they are all engaged in driving the results for the district.

You will work more on the structure of your teams in [phase 2](#) of your implementation.

 Next: [Create your first teams](#)

Create your first teams in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

The best way to drive adoption of Teams is to use the product. We recommend that you manage your Microsoft 365 or Office 365 deployment with Teams. You should also create a community of employees who are focused on teamwork and productivity. (These initial teams may change over time.) Some suggested teams are:

TEAM NAME	PROPOSED CHANNEL NAMES
Get to know Teams	General Say hi How do I? Feedback Ideas for future teams Support
Microsoft Teams Implementation	General Awareness and Adoption Business Engagement Early Adopter Program Feedback and Insights Security and Compliance Strategy and Planning Service Health and Incidents Training Watercooler Chat
Teamwork Champions	General Best Practices, Training, and How To Champion Corner Feedback and Support Program Leads Social Hub

Within Microsoft Teams, the [tab gallery](#) gives you access to all Microsoft 365 or Office 365 and third-party apps that have been turned on by the administrator. To get the most value from your product, we suggest pinning key resources as tabs in each of the appropriate channels. See the example below.

In your initial teams, we suggest pinning the following items for easy reference in your team channels. These assets are in addition to your OneNote notebook sections. If you're working with our FastTrack team, they will assist you in configuring these first teams.

TEAM/CHANNEL NAME	PINNED TAB
Microsoft Teams Deployment	

TEAM/CHANNEL NAME	PINNED TAB
General	Web tab: Teams documentation
Awareness and adoption	Teams Adoption Hub Microsoft Teams Customer Success Kit
Business engagement	Wiki – Engagement guidance Form – Request for Teams consultation List – Engagement requests
Early adopters	Pinned feedback community OneNote for FAQ and common themes
Feedback and reporting	Pinned Microsoft 365 or Office 365 usage report (for Microsoft 365 or Office 365 admins only)
Security and compliance	Microsoft Trust Portal Security and compliance documentation Roadmap
Strategy and planning	Collaboration North Star PowerPoint Service Adoption Project Plan
Training	Custom learning training portal Teams online training
Teamwork Champions	
General	Use for program announcements Pin champion program overview
Best practices	Best practices for teams, channels, and chats PowerPoint Team lifecycle
Champion Corner	Meeting notes and presentations
Social Hub	RSS connector: Teams blog and driving adoption blog
Training and How To	Your training portal link

Making the switch to Microsoft Teams

As you begin to use Teams, it will be important for you and the rest of the project team to commit to using Teams chat, channels, and resources to run your project. Your own usage of Teams is critical to the quality of your adoption project. We recommend that you resist fragmenting your project by continuing to have conversations with the core project team in email. By switching to Teams you will model the behavior you ultimately want your employees to embrace. Set the tone, go first, and begin to enjoy having your project information in one place!

Next: [How ready is your organization for Microsoft Teams?](#)

How ready is your organization for Microsoft Teams?

12/7/2021 • 4 minutes to read • [Edit Online](#)

Now that your project team has come together and you are beginning to see what Teams can do for your organization, it's important to assess your organization's readiness for the Teams transition. To assess your readiness, you will need to:

1. Assess your stakeholders.
2. Identify early adopters.
3. Evaluate the organization's readiness for change.

Assess your stakeholders

List the core stakeholders and business leaders in your organization. For each individual, ask the following questions:

1. Is this leader friendly to new technology?
2. Rate this leader's satisfaction with your current technology.
3. Is this leader willing to use unsanctioned technology to accelerate results or create a better experience for his/her team members?
4. Is this leader under a high degree of pressure to deliver key business results?
5. Will this leader be willing to evangelize his/her experience with Teams to assist in the transition?
6. Does this leader have a positive relationship with key members of the existing project team?
7. Does this leader like to be viewed as an "agent of change" within the organization?

You can add additional questions that are relevant to your organization. For your initial two phases (startup and experiment), you'll see leaders who are friendly to change, somewhat dissatisfied with current technology, and that you have a good relationship with. These leaders should be brought into the core project team as business advisors and may have projects that will be essential for your experimentation phase. It is important to select impactful, real world situations to experiment with, and avoid high risk projects for your initial experiments.

NOTE

While it's possible to assign a score to this sort of questionnaire that would minimize the impact of the human element of relationships within your organization, driving change depends on the chemistry of the team as much as their technical skill or business acumen. Review this list with your team members to discuss the "fit" of your various leaders with this project as you select projects and staff for subsequent phases.

Identify early adopters

Early adopters share certain traits no matter what size or industry your organization may be. Typically, early adopters share these traits:

- Interested in technology
- Willing to be a part of change
- Seeking to make improvements
- Collaborative by nature

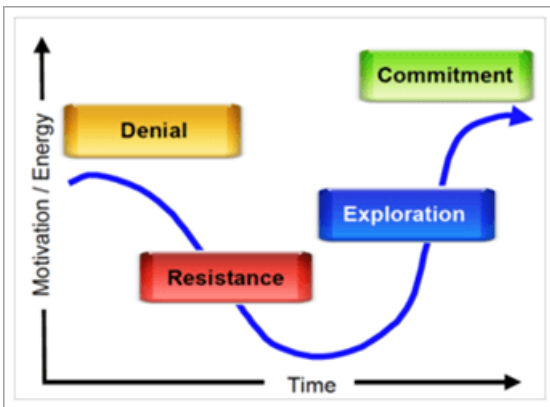

- Willing to share their observations and learnings with the group
- Are risk takers; that is, they're willing to try something to see if it works

Use a simple form in Microsoft 365 or Office 365 to allow these individuals to opt into your early adopter program for Teams. Depending on the size and complexity of your organization, you may choose to enable some or all of these individuals for your experimentation phase. In this program, they are agreeing to actively participate in your experimentation phase and provide regular feedback to the project team. Avoid having individuals who simply want to test drive new technology. Let them know that by giving this active feedback, they are helping to craft the outcome of your project. You will use this list of people in [Phase 2 - experiment](#).

Our Early Adopter Program Guide is a helpful resource for kicking off this program in your environment.

Assess your organization's readiness for change

Change is a human process that has nothing to do with technology. There is behavioral psychology and neuroscience that educates us about the natural resistance to change. To make change acceptable, it's critical to anticipate the needs of your users, express your understanding of their situation, and create solutions that improve that situation. Even in doing so you will encounter natural resistance to change.

Every organization approaches change differently, depending on region, work style, professional profile, and other elements of the organization. To assess your organization's readiness, see [Assess organizational change readiness](#). Use the guidelines to answer the following questions:

1. What percentage of users fall into each bucket? (*Change resistance*)

- **Early adopters:** request the solution before it's available.
- **Informed users:** use the solution once its value is proven.
- **Dissenters:** push back on any change.

TIP

Early adopters make great pilot testers and peer champions. Users who are slow to adopt new tools require additional encouragement and more time to adjust.

2. What is the users' competency for change? (*Training*)

- **Self starters** require only a link to a video.
- **Team builders** do well with group training.
- **One-to-one learners** require personal support.

TIP

Tailor the type and amount of training to competency and personas. Keep training updated as new features come online.

3. In addition to this service deployment, how many other changes are happening? (*Adaptability*)

Changes could include Office/Windows upgrades, office moves, mergers, reorgs, and so on.

- None
- 1-3 changes
- More than 3 changes

TIP

Too much change can impede acceptance and productivity. If more than 3 changes are underway, consider spacing them out or creating a theme to bundle changes together.

Combine this data with the stakeholder profiles and employees who wish to opt in for the early adopter program. This will let you identify groups that are ready for and can absorb change alongside their existing duties. This method will allow you to create partners in change.

You can use internal champions to address the problem of having different change types. Here, feedback is the key to success: encourage people to share their challenges and needs. Embrace disrupters and dissenters by giving these individuals or groups a seat at the table during experimentation. This best practice will pave the way for a smoother broad deployment of your collaboration improvements.

Next: [Microsoft Teams adoption phase 2: Experiment](#)

Microsoft Teams adoption phase 2 - Experiment

12/7/2021 • 2 minutes to read • [Edit Online](#)

You are now armed with a great project team and critical information about your organization, and you are ready to experiment with Teams. We recommend experimenting with 2 to 3 real world projects within a group that is led by a stakeholder with whom you have a positive relationship and in whose organization there are a sufficient number of early adopters to provide meaningful feedback. Whether your organization is large or small, we recommend completing this phase to gain insight into how Teams can improve your collaboration beyond using its chat and file storage features.

You will complete the following steps in this phase:

1. [Create your champions program.](#)
2. [Complete your governance quick start.](#)
3. [Define your use cases.](#)
4. [Finalize early adopter program participants.](#)
5. [Set up your feedback channels.](#)
6. [Bring your support staff on board.](#)

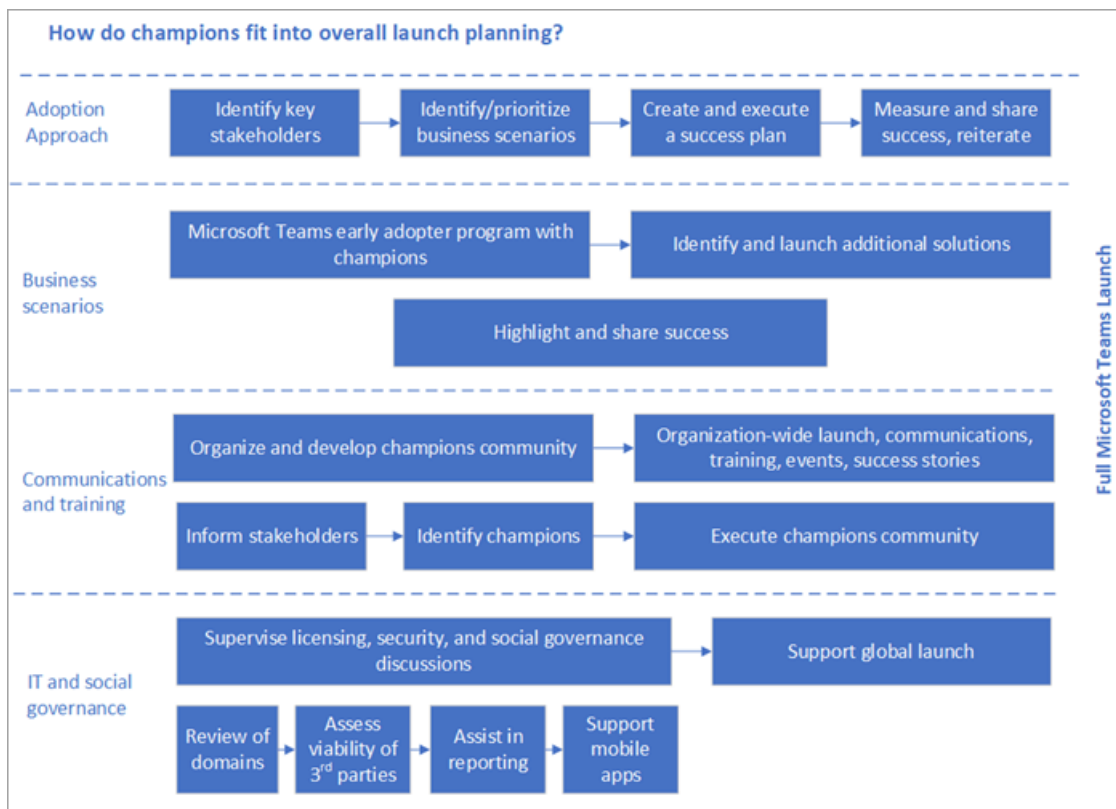

Next: [Create your champions program](#)

Create your champions program for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Champions are essential to driving awareness, adoption, and education in your organization. A champion is a person, primarily motivated by helping others, who is interested in new technology (specifically Teams) and helping other employees use it in alignment with your best practices. Depending on the size of your organization you may have this as a formal part of the person's role, but often employees take on this role themselves because of their core motivation to help others.

Champions will fit into your overall launch planning in a variety of ways as shown below.

Champions should:

- Be formally trained to increase their depth and breadth of knowledge
- Be encouraged and empowered to guide, teach, and train their peers
- Have consistent and positive reinforcement that affirms the impact of their efforts
- Have a clear plan to execute

Use our [Champions Program Guide](#) to build this program in your organization. Our best practices for this community are:

- Join the [Champions Program](#). Make sure that at a minimum the leaders of the Champions program (and potentially all company champions) are members of the program. This free, monthly community call will provide valuable information for running your own program and getting the most from Teams and other Microsoft 365 or Office 365 services. Program materials can be reused in your own internal program.
- Use the Teamwork Champion team: Your champions should use the team you have setup for them for all program communications, feedback, and to find resources. In doing this they will become increasingly

familiar with the product and its benefits.

- Hold regular monthly meetings: Promote enthusiasm and cohesiveness of your community by holding regular monthly meetings. These can be a combination of in person and virtual meetings, but their consistency is key to having a thriving champions community.

TIP

To help build your agendas, schedule your meetings for the week after the public community call.

- Be clear about program requirements: Some champion programs require that members attend the monthly meetings, hold office hours for the group of users they support, and provide training to new users. Whatever your requirements, make sure that champions are clear on how to successfully participate in the program.
- Visibly reward your champions: Your champions will give you important insights into the progress and potential pitfalls of your project. Reward them often for their participation. Small gestures go a long way, and often employees are not looking for monetary gain but appreciate recognition for their contributions. Find appropriate and fun ways to thank your community.
- Train champions early and often: Your program kick off and monthly meetings can be used to build skills in your champion community. Use these opportunities to bring them on board, conduct their initial training, encourage them to attend our courses, and make sure they are ready to support their employees as they move forward in the experimentation phase.

Next: [Complete the governance quick start](#)

Governance quick start for Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

The following activities will happen simultaneously, and they may involve all or part of your key team. As a best practice, defer large-scale governance and security conversations for after you have completed your initial experimentation with Teams. It is important to understand how governance decisions may impact the end-user experience and will simplify the decisions you will need to make at that later date. For this phase there are some decisions that need to be made. To successfully make them you will first need to answer the following questions:

- Which stakeholder from your earlier assessment is a good candidate to participate in this limited business onboarding?
- Has this individual (or group of individuals) suggested use cases that would be good candidates for this phase?
- Do they have enough interest from employees in their organization to be early adopters and give you meaningful and regular feedback?

To learn more, read [Plan for governance in Teams](#) and [Plan for lifecycle management in Teams](#).

Decisions

Make the following decisions (at this point, these decisions apply only to Phase 2):

Decision 1: Who can create teams

For the purposes of this phase you can restrict who is able to create teams to the early adopter population in addition to your core project team. This will allow your early adopters to create additional teams if needed. Monitoring this behavior will give you key information for your broad deployment.

Decision 2: Teams naming conventions

You will likely want to implement some naming conventions for your broad deployment of Teams, and check for duplicate names. In Phase 2 we suggest that you implement a manual naming convention for your initial projects only. The best practice for this is to conduct an interactive onboarding with the early adopter project team and allow them to select their own name. This will give you insight into how employees think about their work and will be essential in creating a larger scale naming convention at a later time. (Additional information on the elements of an interactive onboarding will appear later in this guide.)

Decision 3: Guest access

Depending on the scope and type of your project and the nature of your industry, enabling secure collaboration with partners or vendors may be an essential capability you want to test. You can limit who can add guests to teams by using the appropriate tenant controls, and limit which teams are open to guests by using sensitivity labels. You can additionally ensure that guests adhere to organizational security requirements such as the use of Multi-Factor Authentication (MFA).

Decision 4: Approved apps

The best case use of Teams includes the integration of other apps into the experience. At a minimum your technical team should enable the first party and featured apps in your Teams experience. Depending on your use case and other apps used in your organization, you may opt to include additional apps as a part of your controlled experiment. Be sure to vet any third party apps to ensure they adhere to your organization's security and compliance requirements.

Decision 5: Are meetings included in your test?

The Teams meeting experience is high quality, supports video chatting, and brings your employees together to be more effective. Consult with your technical team to make sure that your environment is ready to include simple VoIP meetings. Enabling audio conferencing or voice services would normally be excluded from this phase of your experimentation; however, that depends on your core project team, your technical readiness, and the state of other voice/meeting services in your organization. Technical readiness should include things such as meeting room equipment, end-user devices and accessories, and the network. We recommend including video chats and VoIP meetings in your experimentation to gain more value from your Teams implementation.

Decision 6: Content management and structure

Teams works best when users work end-to-end within the platform - instead of requiring them to continually switch back to legacy systems and services - and offers new ways of working that differ from how users are accustomed. As part of your experiment, work with your participants to consider team structures and channels that embrace the multi-modal ways of collaborating within Teams, and avoid simply replicating existing folder and storage structures. Additionally, consider any compliance requirements for content stored outside of existing supported systems such as records management or backup systems.

Decision 7: Data security

In preparation for your broad deployment you may opt to use security labels to classify the types of teams in your environment. For the purposes of this experiment we recommend that you refer to [Plan for Governance in Teams](#) and ensure that a basic retention policy has been set on Teams data in your Microsoft 365. You may need to coordinate this work with your technical team because Microsoft 365 administrator rights are required to complete this work.

Decision 8: Length of your experiment

A successful Teams implementation proceeds at a healthy pace to ensure appropriate momentum, focus, and learnings. We recommend that this phase of your project be 60 days in length to ensure that your early adopters complete sufficient business cycles. Extending experimentation for too lengthy a time increases the risk of a failed change program; however, this time will vary for every organization.

Next: [Define usage scenarios](#)

Define usage scenarios for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Make sure that you understand the business projects (scenarios) that will be in scope for this phase of your implementation. Take a look at this list of example scenarios that are great candidates for an early adopter program. You can get started with easy wins such as:

- Personal productivity
- Modern project management
- Modern meetings

Modernizing Core Scenarios		
Project Management	Personal Productivity	Modern Meetings
Enable	Empower	Extend
<ul style="list-style-type: none">• Access Office and 3rd party apps making true hub for teamwork• Hold all conversations in team/channel driving transparency• Pin important apps and documents to drive visibility• Streamline doc versioning	<ul style="list-style-type: none">• Personal apps organize notes & tasks in one place• Send online and offline messages alleviating tracking people down• Persistent conversation with file attach reducing need to search multiple places or ending up with multiple versions	<ul style="list-style-type: none">• Build momentum pre-meeting with chat and content sharing• Connect with video, app sharing on any device to ensure alignment• Record for absent attendees• Capture notes and actions for easy follow-up

Additional scenarios to consider are:

- Employee engagement and communication
- Bring campaigns to market faster
- Increase sales productivity and grow revenue
- Streamline business reviews

Microsoft Teams use cases for every scenario		
Customer Support <ul style="list-style-type: none">• Enable continuous knowledge sharing between shifts• Provide visibility into customer escalations• Search for solutions across conversations• Speed up issue resolution with various subject matter experts	Engineering <ul style="list-style-type: none">• Enable continuous discussion across a distributed team• Discuss ideas and requirements, gather inputs in the open• Store standard documentation and files• Integrate with developer tools like Jira	Finance <ul style="list-style-type: none">• Prepare earnings release with cross-functional stakeholders• Streamline data consolidation and analysis• Store budgeting documentation and files• Share economic trends and news
Human Resources <ul style="list-style-type: none">• Drive alignment on job descriptions and streamline interview processes• Plan and prepare new employee onboarding• Engage distributed employees in training• Share department resources and documentation	Marketing <ul style="list-style-type: none">• Coordinate campaigns and event tasks• Share the latest content drafts for feedback• Get automated reports from analytics tools• Prepare marketing launch across multiple stakeholders	Sales <ul style="list-style-type: none">• Get quick answers from PMs and Sales Ops• Share key customer wins• Get lead notifications and deal mentions• Share latest company, product and competitor news
Operations & Project Management <ul style="list-style-type: none">• Streamline project communication and tools• Provide status updates, get feedback, coordinate tasks• Share files and collaborate on deliverables• Get new project members up to speed quickly		

Think of this scenario modernization motion as a cumulative process – get things going with more basic

scenarios to create enthusiasm, familiarity, and credibility with this new way of working. Then move on to more ambitious areas of impact. As more impact with Microsoft Teams is demonstrated to your business colleagues, more of them will get engaged and momentum will build. For many of our customers, once they get this process going they find that business stakeholders approach them after learning how their colleagues got value from Microsoft Teams.

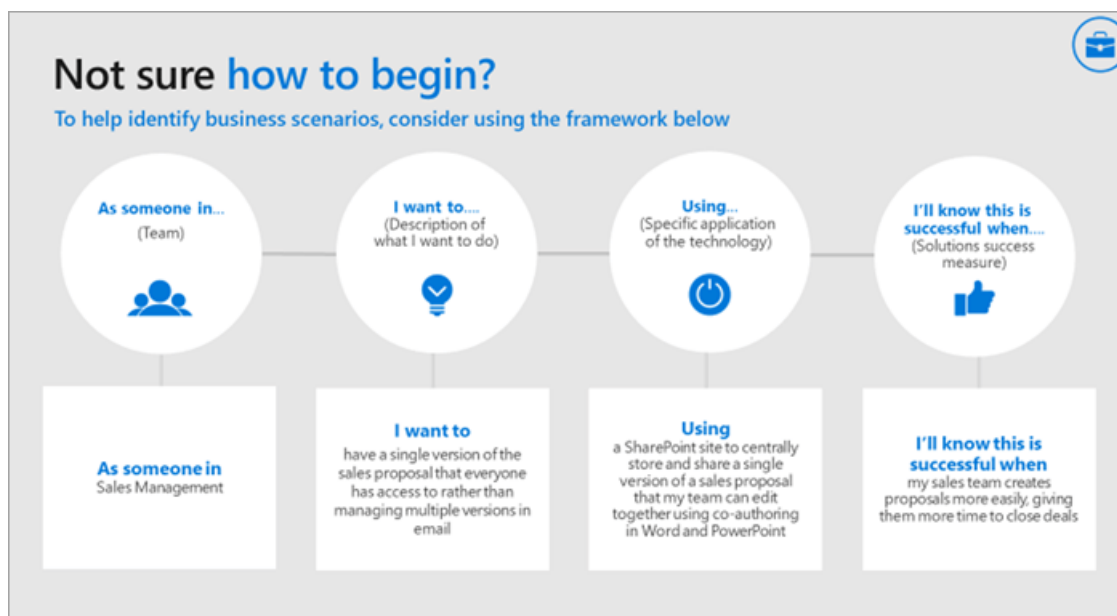

Interview business stakeholders

To confirm the selection of these early projects we recommend meeting directly with the stakeholders you identified earlier in this process. Your goal at this point is to listen and learn additional information about their business. Consider the following questions to drive the conversation:

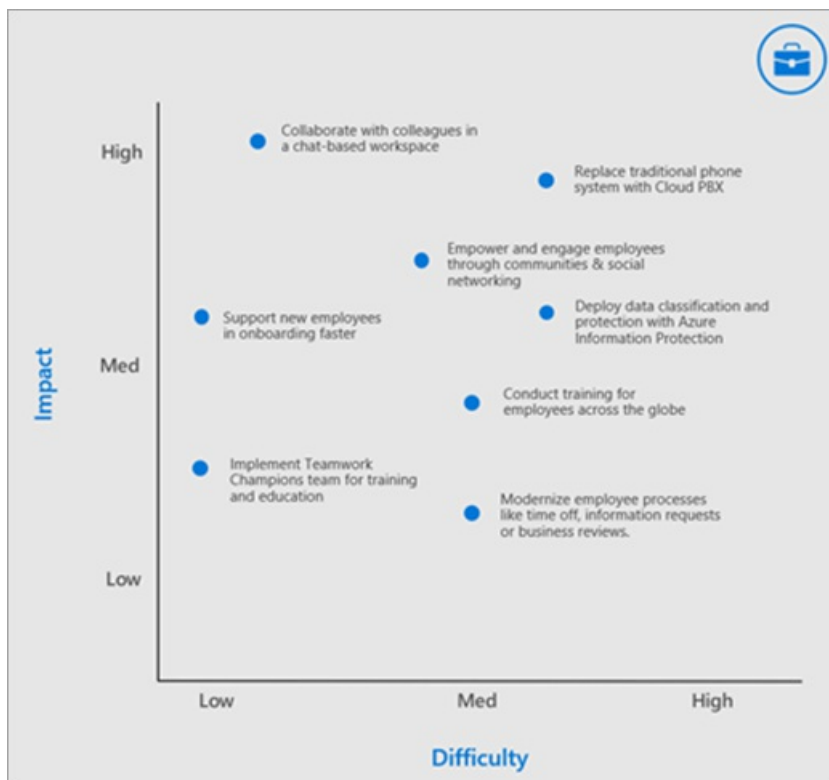

- What are some of the organization's challenges or pain points related to communication and collaboration?
- What are the areas in which your organization would like to improve?
- What are the organization's strategic initiatives or current transformation projects that Teams can support?
- What methods of communication and collaboration are typically better received by your organization than others?
- What is the process for drafting, distributing, and sharing information?

Map and prioritize business scenarios

To be sure that you have the right information about the business scenario, consider using the following format to document the scenario from the perspective of the employee completing the work and the business owner of the process. Both perspectives are required to craft a successful path forward.

After speaking to one or more business stakeholders you can prioritize your scenarios based on impact vs. difficulty. (Your scenarios may be in addition to the scenarios we suggest above.) Appropriate candidates for your experimentation phase should have higher impact and low to medium difficulty. This will ensure your project isn't affected by scope creep or technical difficulties before you are able to show the value of your work. An example chart is shown below.

NOTE

We are always eager to learn about how our customers use Teams in new and innovative ways. Share your #TeamsStories with us in our [Driving Adoption discussion forum](#). Include the hashtag #TeamsStories in your post. We are always interested in how you use Teams in your organization.

Next: [Onboard early adopters and gather feedback.](#)

Onboard early adopters and gather feedback for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Return to the list of employees who expressed interest in your early adopter program. Decide which of these individuals should participate in your initial experiments with Teams. It may be all or a portion of the people who are interested. Even if you do not select them for these initial projects, continue communicating with them so they remain interested and will be willing to participate in the future. They will be a part of the onboarding process for the projects you selected based on your discussions with business stakeholders, your technical team, and your prioritization exercise shown above.

Complete the following steps with these early adopters:

1. Send an invitation email to them to invite them into the community,
2. Host a kick-off call to share with them the goals and outcomes of the early adopter program,
3. Ensure access to the feedback channel of your teamwork champions team and any other internal social networking tools you may use.
4. Consider creating periodic surveys for them to complete that will gather targeted information.

Gather feedback

Use the components of Microsoft 365 or Office 365 to gather feedback for your project.

 **Decision:** If your organization already has an investment in a Yammer network, you can use it as a feedback forum for your early adopter program. If not, and your early adopter program has less than 5000 members, create a team in Teams to gather feedback and provide training.

NOTE

Some organizations will combine the channels for early adopter feedback into the teamwork champions program team. This is a good approach because many early adopters may become champions in the future, and it will build a stronger community.

 Next: [Onboard support](#).

Onboard support for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

To ensure that the early adopter and champions teams will have the appropriate support as they start using Teams, meet with your support staff and review the capabilities of Teams. Key members of the support organization may want to join your early adopter program. Encourage their use of Teams in their own scenarios. Take them through the basic onboarding of the product by using our online training resources.

- [Foundations - Core Components of Microsoft Teams](#)
- [Troubleshooting Teams](#)
- [Known issues and troubleshooting](#)
- [Microsoft Teams training](#)

Next: [Microsoft Teams adoption phase 3: Scale.](#)

Microsoft Teams adoption phase 3 - Scale

12/7/2021 • 2 minutes to read • [Edit Online](#)

In this phase, you will use your learnings, talented project team, and relationships with stakeholders, champions, and early adopters to support the broad scale enablement of Teams for your organization. You will complete the following steps as you prepare for continued business engagement regarding your organizations use of Microsoft Teams:

1. Define outcomes and success measures.
2. Select service strategy.
3. Engage stakeholders.
4. Design and launch an awareness campaign.
5. Design and launch a training program.
6. Understand reporting tools.
7. Prepare for ongoing business engagement.
8. Prepare for ongoing service health & adoption reviews.

Next: [Define outcomes and success](#)

Define outcomes and success for your Microsoft Teams adoption

12/7/2021 • 8 minutes to read • [Edit Online](#)

For every business scenario or service you modernize, it is critical to define what success looks like for your business. You will have gathered that information for your initial scenarios as you mapped them in your prior phase. As you prepare for your scale implementation, you will need to revisit and expand these important success criteria.

What follows is a recommended strategy for mapping these criteria. There are many valid approaches to this step. You can follow our guide or follow the guide of the Microsoft partner you may be working with. Whatever method you choose, make sure that your business outcomes are supported by the technical implementation of your services and overall objectives of your organization.

There are four categories of outcomes that can be prioritized for your business. They are interconnected and form the foundation of the modernization and digital transformation that individual employees will experience.

Example of outcomes in each category are:

- **Organizational**
 - Cultural transformation
 - Employee retention
 - Talent acquisition
 - Social engagement
 - Operational agility
- **Cultural**
 - Employee sentiment
 - Employee recommendations
 - Customer feedback
 - Innovation measures (for example, idea forum contributions, hackathons, product innovation engagements)
- **Tangible**
 - Customer experience impacts (faster service, reduction in service incidents, customer referral/loyalty program participation)
 - Cost savings
 - Revenue generation
 - Data security
 - Process simplification

- Retirement of legacy systems
- **Individual**
 - Use of desired tools
 - Employee morale
 - Employee productivity
 - Employee engagement
 - Idea generation

In general, you should think of these measures aggregating to create a change quotient for your company in this manner:

$$\frac{\text{Tangible Measures}}{\text{Individual Sentiment}} = \text{Change Quotient}$$

Select a service enablement strategy

Teams is a transformative technology, so depending on the size of your organization and your existing technologies, you may take different approaches. Consider these strategies:

TEAMS FIRST	TEAMS CORE	TEAMS GO BIG	SKYPE SIDE BY SIDE	MIGRATION
Lead cloud deployment with Teams	Lead collaboration scenario enablement with Teams	All employees on Teams and organization-wide teams	Enable Teams and Skype for Business	Migrate users from Skype for Business to Teams
<ul style="list-style-type: none"> - Applicable to new or low usage Microsoft 365 or Office 365 customers - Lead with Teams in customer-specific scenario - Highlight integrated user experience and accelerated time to value for Microsoft 365 or Office 365 - Conduct planning workload enablement together to avoid serial implementation 	<ul style="list-style-type: none"> - Enable Teams along with OneDrive and SharePoint Online - Create a company intranet to share news resources and video with Microsoft Stream <p>Better together:</p> <ul style="list-style-type: none"> Teams SharePoint Yammer Planner PowerApps 	<ul style="list-style-type: none"> - For customers with less than 5000 seats (current limitation) - Enable cross organization collaboration with one team for all - Automate common tasks (vacation requests, employee surveys, executive engagement) 	<ul style="list-style-type: none"> - Use Teams Core tactics to accelerate collaboration - Highlight meeting scenario guidance based on size and feature set required - Use Skype for Business for enterprise calling, interoperability, and hybrid scenarios - Use public roadmap for capability planning. 	<ul style="list-style-type: none"> - Plan move to Teams from Skype for Business by creating service strategy roadmap for the customer - Attach to feature release schedule - Recommend including Side by Side and Teams Core to ease transition

The following are our recommendations for most customer organizations. However, there are exceptions. To get guidance for any scenario not covered here, ask your questions in our Driving Adoption community or reach out to the FastTrack team or Microsoft partner network.

- **Choose Teams First or Teams Core:** Most organizations have an existing investment in Microsoft technology. You may be enabling more than one workload at a time, such as Exchange Online, OneDrive for Business, or SharePoint. In these cases, selecting Teams First or Teams Core is a wise choice. It will enable your users to get used to the enhanced collaboration experience of Teams. Your collaboration project team can then plan to roll out additional capabilities and the training and support required for them to be successful.
- **Choose Teams Go Big:** In new Microsoft 365 or Office 365 customer organizations it is often best to

take a Teams Go Big approach to minimize the change fatigue caused by learning new technology multiple times. You'll get the greatest benefit by enabling Teams for both core collaboration and meetings, SharePoint, OneDrive, Planner, and other workloads, and allowing your employees to learn about them in the context of your Teams deployment.

Teams Go Big is also the preferred enablement strategy for organizations under 1,000 employees who want to simplify their employee communication and engagement. Using the organization-wide team can bring people together to review common tasks and initiatives on any device.

- **Choose Side by Side:** For organizations that are using Skype for Business for audio conferencing, support for conference room devices, or cloud voice capabilities, we recommend running Teams and Skype side by side to familiarize your employees with the core collaboration features, while planning your migration off of Skype for Business at a time that is convenient for your company. Note that running both clients side by side can introduce user confusion about which tool to use, so we recommend keeping this phase in your adoption journey short.
- **Choose Migration:** Migrating from Skype for Business to Teams has additional components from a technical perspective, but the user adoption journey has the same components as a Teams Go Big implementation. In addition, you will be educating people about the Teams meeting experience and interface, the new persistent chat behavior, and other elements of the experience that are different from Skype for Business.

For each enablement strategy, it's essential to work closely with your technical readiness team to ensure that your environment will deliver a great employee experience.

Decision: Select an enablement strategy that will best support your business outcomes for Microsoft Teams and that can be enabled by your technical implementation team. This is a joint decision between IT leadership, program management leads, and user adoption specialists. This decision often rests with the executive stakeholder who is the ultimate success owner for Microsoft Teams or collaboration services in your organization.

Best Practice: Enablement strategies can be appropriate for a given phase of your project or divisional implementation schedule. Use key personas and their needs to make selections. Work closely with your technical implementation team to ensure a high-quality experience for your users.

Engage stakeholders

Communication and managing expectations are key elements in a successful change project. It's important to regularly communicate your overall vision and your progress toward that goal to your stakeholders and others in your organization.

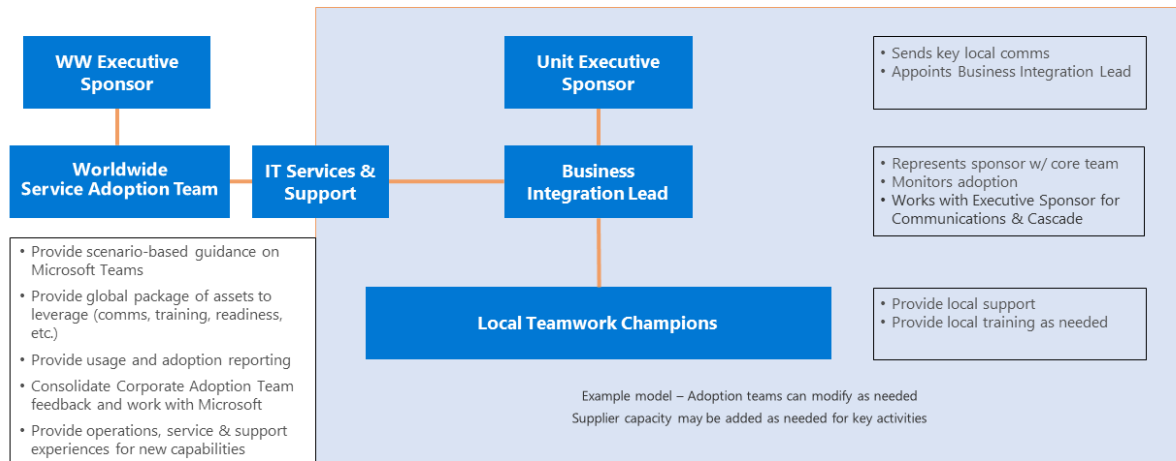

Decision: Decide your rhythm and method for communicating with your stakeholders in alignment with your company culture. Target your communications to the various levels of engagement and interest across your organization.

Option: To create an ongoing knowledge base of information about your project, consider using news pages in your SharePoint communication site. Your news page library (site pages in the SharePoint site associated with your planning team) can be made public so they can be shared with all interested parties.

Expand your implementation team

In a large organization you should try to incorporate many different roles in your broad enablement phase. This may include additional business sponsors, IT support staff, additional members in your champion community, and in some cases formal change management or training personnel. The illustration below shows a large scale adoption team that allows for a separation of duties.

Large Scale Corporate Adoption Team Model

EXAMPLE

In a smaller organization one or more of these roles might be performed by a single individual, but the skills required remain the same. Technical, communication and training skills are important in a successful change project.

Expand your governance and information management policies

Once you've selected your enablement strategy you'll be ready to revisit and scale governance decisions you made in Phase 1. Revisit decisions 1 through 6 from the [Governance quick start](#) to expand these policies in alignment with the business users who will be using Teams.

TEAM LEVEL	SCOPE/PURPOSE	STANDARD MEMBERSHIP	DURATION
Level 1	The authoritative team for a division or business unit	Usually restricted to official members of this division/unit	In perpetuity for as long as the division exists (for example, IT department, Human Resources, Marketing)
Level 2	Project, service, or initiative teams with a smaller scope	Normally cross-organizational and may include guests	For as long as that project or service is being worked on
Level 3	Point in time projects	Small tight knit team with individual scope; may include guests	Short lifecycle tied to core deliverable

Example team level provisioning and management best practices:

TEAM LEVEL	WHO CREATES?	LABELS AND RETENTION	CONSIDERATIONS
Level 1 - Divisional	IT or champion for that group to name it properly	Confidential with standard retention policy applied and 1 year renewal policy	Think of this like reserving a domain name. You want control of how division teams are named and what's included. Design the team before adding additional users.

TEAM LEVEL	WHO CREATES?	LEVELS AND RETENTION	CONSIDERATIONS
Level 2 - Project/service	Project owner or champion	Confidential or highly confidential depending on content. May have a retention policy. 6 month renewal.	Before creating this, think just beyond the boundary of the project or service you are working on. Would it make more sense to combine forces with another team? Make every effort to minimize the number of teams individual users have to visit when working on the same project or service.
Level 3 – Small on-demand project team	Anyone in the organization	General label with standard retention and 6 month renewal. May include naming convention (prefix/suffix)	Self-service on demand teams. Frictionless provisioning. These facilitate smooth collaboration and communications for small project teams looking to get immediate value from company provided services.

Streamline business engagement

An essential part of driving digital transformation and usage in Microsoft Teams is working with your business units to understand what needs, opportunities, and difficulties they have. While similar to the traditional IT to business conversation, your focus should be on what is needed. Listen before moving to technical requirements. In many cases, out of the box features in Teams will meet the needs of your organization.

Best practice: Before you consider developing a custom solution, be sure that your organization is fully using the out-of-the-box capabilities of Microsoft 365 or Office 365. Custom solution development always incurs long term cost for your IT and support departments.

Take the following steps to streamline your work with business units. Recognize that in very large, multi-national corporations this process may continue long after your first large scale deployment of Microsoft Teams:

1. Meet with key influencers within a business unit before engaging the executive to gain insight and alignment.
2. Understand their current solutions for common scenarios (email, SharePoint, Yammer, and other products).
3. Start small by selecting scenarios that map to high impact, low/medium difficulty as you scale,
4. Capture feedback and develop champions with business unit knowledge to support the transition,
5. Set up monthly check points to discuss progress and prioritize the backlog of additional projects.

 Next: [Optimize feedback and reporting](#)

Optimize feedback and reporting for your Microsoft Teams adoption

12/7/2021 • 2 minutes to read • [Edit Online](#)

Ensure that you are getting signals back from your service and your employees by following our best practices for user feedback and service health reporting. In some cases, you may need administrator rights to access certain service usage and health reports. If you are not the Microsoft 365 or Office 365 administrator for your organization, work with that individual to be granted the report reader role in the Microsoft 365 admin center to access some of this data.

Incorporating feedback

Throughout your experiment phase you will be capturing information about how people have used the product and their experience. Use this information now to adjust your awareness and training programs as you plan to expand its use across your business units. Some common example questions might be:

- When do I use this new tool alongside my existing technology?
- Who is approved to use this tool with me?
- Is it safe for highly confidential information?
- Who do I speak with to learn more about Microsoft Teams?
- Something's not working. How do I get help?

Invest in your champions

As you prepare to scale your usage of Microsoft Teams, recruit additional champions in each business unit or group you are expanding to. Enroll these enthusiastic people in your service training program, and standardize how and when you meet with them.

Be clear in your champions program design what your employees will get and what they are expected to give if they become champions. Common program requirements are scheduled office hours, participation in monthly community calls, and participation in internal online communities to support your transition to these new experiences.

Best Practice: Hold a monthly Teams meeting for your internal champions. Split your agenda between teaching new features, addressing feedback, and providing self service tools for your employee community.

Best Practice: Have representatives from your internal support department or IT Helpdesk join your champions community to stay up to date on new information about your Teams usage.

Service reporting

There are three types of reporting you should review as you deploy and adopt Microsoft Teams:

- [Service health](#) – from Microsoft 365, Office 365, and your internal IT support department.
- [Microsoft 365 Reports in the admin center](#) – from Microsoft 365 or Office 365 view [Microsoft 365 Reports in the admin center - Microsoft Teams user activity](#). You may also use information from other systems within your organization.
- Service satisfaction – Gathered from internal community forums and surveys on specific experiences

Next: [Drive awareness and implement training](#)

Drive awareness and implement training for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Awareness and training are the marketing and communications segment of your overall adoption strategy. This will ensure that your employees are aware of the new capabilities of Microsoft Teams and its underlying Microsoft 365 or Office 365 services and apps.

For both your initial pilots and your eventual company-wide roll out, your internal communications should be a priority. They should include:

- Internal awareness materials such as posters, digital signage and events.
- Self-help and training information in a single location.

For your pilot phases these are the minimum steps for success:

- Have a regular scheduled meeting with your project stakeholders for updates.
- Make self-help documentation available, including product videos.
- Hold a kick-off meeting with the pilot users to get them excited about their participation. The importance of creating a sense of community with enthusiasm can't be overstated.

Once you have worked through the initial pilot, you can expand the efforts above to reach your entire organization. Depending on your size, this may take time and be approached in phases by region, user profile, or organization. During this larger scale roll out, encourage the involvement of the communicators in your organization. We recommend these individuals be involved early and often as you use the available adoption materials or design your own.

If your company has a central intranet portal for news, information, or support, you can use it as a hub for information about this roll out. Providing widely available self-help information, training, and written guidance lets users quickly come onboard. Many users will simply jump in once Teams becomes available and we encourage this. We also know that each individual learns in different ways; a central information portal can support all styles of learning within your organization.

Implement end-user training

Use our resources to deliver end-user training as people begin to use Microsoft Teams and other Microsoft 365 or Office 365 services. Visit our resource pages to learn more:

- [Instructor-led end-user training for Teams](#)
- [Administrator training for Teams](#)
- [Online End-user video training](#)
- [Coffee in the Cloud online training for champions & IT pros](#)
- [Adoption Tools](#)

Measure and share success

As with any communications and adoption campaign, you will want to identify your success measurements up front. Consider these:

- Active users in the product

- Views of your information webpages
- Questions in your user community
- Views of your training videos
- Attendance at learning events

Share the insights you get from your feedback channels with the hashtag #TeamsStories for easy retrieval. Share a #TeamsStory per month on your intranet to highlight employees who are embracing the change to increase productivity and collaboration in your environment. Also share them with us in our Driving Adoption forum on the Microsoft Technical Community. Sharing these real world examples from within your own company is extremely valuable to realizing sustained change over time with your user community.

[Learn more about the Microsoft Teams usage reports in the Microsoft 365 admin center.](#)

Next: [Schedule service health reviews](#)

Schedule service health reviews for your Microsoft Teams adoption

12/7/2021 • 2 minutes to read • [Edit Online](#)

In collaboration with your technical implementation team, plan to hold monthly service health reviews for Teams. In these reviews you will share insights on the following measures:

- **Service usage** – Active usage data, and may include information about services deprecated or consumption reduced as a result of moving to Teams. Typically led by service manager or product owner for collaboration services.
- **Service health** – Call quality, meeting health and overall service health. Review of any support incidents and helpdesk ticket levels. Security and governance topics. Typically led by information protection and support teams.
- **Capability/project roadmap** – What is the schedule of remaining employee onboarding or further collaboration improvement projects? What additional features is your organization going to enable? Typically led by service manager or product owner for collaboration services in collaboration with key business stakeholders.
- **Awareness campaign and training success measure update** – Includes reach, participation, key feedback themes, and open issues. Include key wins and success stories.

This monthly review can be quite formal in large organizations or virtual in smaller companies. It is important to share and monitor this data to ensure a healthy and every increasingly vibrant implementation of Microsoft Teams.

Get clients for Microsoft Teams

12/7/2021 • 11 minutes to read • [Edit Online](#)

Microsoft Teams has clients available for desktop (Windows, Mac, and Linux), web, and mobile (Android and iOS). These clients all require an active internet connection and do not support an offline mode.

NOTE

For details about each clients' capabilities on different platforms, see [Teams features by platform](#).

Effective November 29, 2018, you'll no longer be able to use the Microsoft Teams for Windows 10 S (Preview) app, available from the Microsoft Store. Instead, you can now download and install the Teams desktop client on devices running Windows 10 S mode. To download the desktop client, go to <https://teams.microsoft.com/downloads>. MSI builds of the Teams desktop client are not yet available for devices running Windows 10 S mode.

For more information about Windows 10 S mode, see [Introducing Windows 10 in S mode](#).

Desktop client

TIP

Watch the following session to learn about the benefits of the Windows Desktop Client, how to plan for it, and how to deploy it: [Teams Windows Desktop Client](#)

The Microsoft Teams desktop client is a standalone application and is also [available in Microsoft 365 Apps for enterprise](#). Teams is available for 32-bit and 64-bit versions of Windows (8.1 or later), ARM64 for Windows 10 on ARM, and Windows Server (2012 R2 or later), as well as for macOS and Linux (in `.deb` and `.rpm` formats). On Windows, Teams requires .NET Framework 4.5 or later; the Teams installer will offer to install it for you if you don't have it. On Linux, package managers such as `apt` and `yum` will try to install any requirements for you. However, if they don't then you will need to install any reported requirements before installing Teams on Linux.

The desktop clients provide real-time communications support (audio, video, and content sharing) for team meetings, group calling, and private one-on-one calls.

Desktop clients can be downloaded and installed by end users directly from <https://teams.microsoft.com/downloads> if they have the appropriate local permissions (admin rights are not required to install the Teams client on a PC but are required on a Mac).

NOTE

For more details about installing Teams on a Chromebook, please see [How to install and run Microsoft Office on a Chromebook](#).

IT admins can choose their preferred method to distribute the installation files to computers in their organization. Some examples include Microsoft Endpoint Configuration Manager (Windows) or Jamf Pro (macOS). To get the MSI package for Windows distribution, see [Install Microsoft Teams using MSI](#).

NOTE

Distribution of the client via these mechanisms is only for the initial installation of Microsoft Teams clients and not for future updates.

Windows

The Microsoft Teams installation for Windows provides downloadable installers in 32-bit and 64-bit architecture.

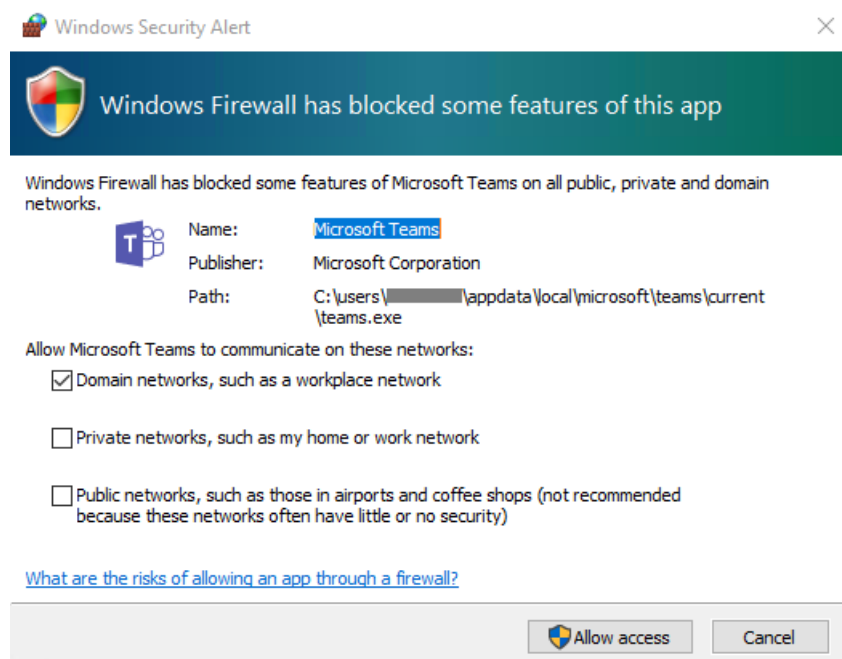

NOTE

The architecture (32-bit vs. 64-bit) of Microsoft Teams is agnostic to the architecture of Windows and Office that is installed. We recommend the 64-bit version of Microsoft Teams on 64-bit systems.

The Windows client is deployed to the AppData folder located in the user's profile. Deploying to the user's local profile allows the client to be installed without requiring elevated rights. The Windows client leverages the following locations:

- %LocalAppData%\Microsoft\Teams
- %LocalAppData%\Microsoft\TeamsMeetingAddin
- %AppData%\Microsoft\Teams
- %LocalAppData%\SquirrelTemp

When users initiate a call using the Microsoft Teams client for the first time, they might notice a warning with the Windows firewall settings that asks for users to allow communication. Users might be instructed to ignore this message because the call will work, even when the warning is dismissed.

NOTE

Windows Firewall configuration will be altered even when the prompt is dismissed by selecting "Cancel". Two inbound rules for teams.exe will be created with Allow action for both TCP and UDP protocols.

If you want to prevent Teams from prompting users to create firewall rules when the users make their first call from Teams, use the [Sample PowerShell script - inbound firewall rule](#) below.

Mac

Mac users can install Teams by using a PKG installation file for macOS computers. Administrative access is required to install the Mac client. The macOS client is installed to the /Applications folder.

Install Teams by using the PKG file

1. From the [Teams download page](#), under **Mac**, click **Download**.
2. Double click the PKG file.
3. Follow the installation wizard to complete the installation.
4. Teams will be installed to /Applications folder. It is a machine-wide installation.

NOTE

During the installation, the PKG will prompt for admin credentials. The user needs to enter the admin credentials, regardless of whether or not the user is an admin.

If a user currently has a DMG installation of Teams and wants to replace it with the PKG installation, the user should:

1. Exit the Teams app.
2. Uninstall the Teams app.
3. Install the PKG file.

IT admins can use managed deployment of Teams to distribute the installation files to all Macs in their organization, such as Jamf Pro.

NOTE

If you experience issues installing the PKG, let us know. In the **Feedback** section at the end of this article, click **Product feedback**.

Linux

Users will be able to install native Linux packages in `.deb` and `.rpm` formats. Installing the DEB or RPM package will automatically install the package repository.

- DEB `https://packages.microsoft.com/repos/ms-teams stable main`
- RPM `https://packages.microsoft.com/yumrepos/ms-teams`

The signing key to enable auto-updating using the system's package manager is installed automatically. However, it can also be found at: <https://packages.microsoft.com/keys/microsoft.asc>. Microsoft Teams ships monthly and if the repository was installed correctly, then your system package manager should handle auto-updating in the same way as other packages on the system.

NOTE

If you find a bug, submit it using `Report a Problem` from within the client. For known issues, see [Support Teams in your organization](#). For Teams for Linux support you can use the [Linux forum support channel on Microsoft Q&A](#). Be sure to use the `teams-linux` tag when posting questions.

Install Teams using DEB package

1. Download the package from <https://aka.ms/getteams>.
2. Install using one of the following:
 - Open the relevant package management tool and go through the self-guided Linux app installation process.

- Or if you love Terminal, type: `sudo dpkg -i **teams download file**`

You can launch Teams via Activities or via Terminal by typing `teams`.

Install Teams using RPM package

1. Download the package from <https://aka.ms/getteams>.
2. Install using one of the following:
 - Open the relevant package management tool and go through the self-guided Linux app installation process.
 - Or if you love Terminal, type: `sudo yum install **teams download file**`

You can launch Teams via Activities or via Terminal by typing `teams`.

Install manually from the command line

Install manually on Debian and Ubuntu distributions:

```
curl https://packages.microsoft.com/keys/microsoft.asc | sudo apt-key add -

sudo sh -c 'echo "deb [arch=amd64] https://packages.microsoft.com/repos/ms-teams stable main" >
/etc/apt/sources.list.d/teams.list'

sudo apt update
sudo apt install teams
```

Install manually on RHEL, Fedora and CentOS based distributions:

```
sudo rpm --import https://packages.microsoft.com/keys/microsoft.asc

sudo sh -c 'echo -e "[teams]\nname=teams\nbaseurl=https://packages.microsoft.com/yumrepos/ms-teams\nenabled=1\nngpgcheck=1\nngpgkey=https://packages.microsoft.com/keys/microsoft.asc" >
/etc/yum.repos.d/teams.repo'

sudo dnf check-update
sudo dnf install teams
```

Alternatively, to use yum instead of dnf:

```
yum check-update
sudo yum install teams
```

Install manually on openSUSE based distributions:

```
sudo rpm --import https://packages.microsoft.com/keys/microsoft.asc

sudo sh -c 'echo -e "[teams]\nname=teams\nbaseurl=https://packages.microsoft.com/yumrepos/ms-teams\nenabled=1\nautorefresh=1\nkeeppackages=0\ntype=rpm-md\nngpgcheck=1\nngpgkey=https://packages.microsoft.com/keys/microsoft.asc" > /etc/zypp/repos.d/teams.repo'

sudo zypper refresh
sudo zypper install teams
```

Web client

The web client (<https://teams.microsoft.com>) is a full, functional client that can be used from a variety of browsers. The web client supports Calling and Meetings by using webRTC, so there is no plug-in or download required to run Teams in a web browser. The browser must be configured to allow third-party cookies.

Teams fully supports the following Internet browsers, with noted exceptions for calling and meetings. This table applies to operating systems running on desktop computers.

BROWSER	CALLING - AUDIO, VIDEO, AND SHARING	MEETINGS - AUDIO, VIDEO, AND SHARING ^{1 2 3}
Internet Explorer 11	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on IE11 without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p> <p>Microsoft 365 apps and services will not support Internet Explorer 11 starting August 17, 2021 (Microsoft Teams will not support Internet Explorer 11 earlier, starting November 30, 2020). Learn more. Please note that Internet Explorer 11 will remain a supported browser. Internet Explorer 11 is a component of the Windows operating system and follows the Lifecycle Policy for the product on which it is installed.</p>
Microsoft Edge, RS2 or later	Fully supported, except no outgoing sharing ⁴	Fully supported, except no outgoing sharing
Microsoft Edge (Chromium-based), the latest version plus two previous versions	Fully supported	Fully supported
Google Chrome, the latest version plus two previous versions	Fully supported	<p>Fully supported</p> <p>Sharing is supported without any plug-ins or extensions on Chrome version 72 or later.</p>
Safari 14+	<p>1:1 calls not supported. Group calls fully supported.</p> <p>Video: Fully supported</p> <p>Sharing: Fully supported</p>	<p>Meetings: Fully supported</p> <p>Video: Fully supported</p> <p>Sharing: Fully supported</p>
Safari 13.1+	<p>1:1 calls not supported. Group calls supported with full audio support.</p> <p>Video: Incoming only</p> <p>Sharing: Fully supported</p>	<p>Meetings are supported with full audio support.</p> <p>Video: Incoming only</p> <p>Sharing: Fully supported</p>

BROWSER	CALLING - AUDIO, VIDEO, AND SHARING	MEETINGS - AUDIO, VIDEO, AND SHARING
Firefox, the latest version plus two previous versions	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on Firefox without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p>
Safari versions before 13	Not supported	<p>Meetings are supported only if the meeting includes PSTN coordinates. To attend a meeting on Safari without PSTN coordinates, users must download the Teams desktop client.</p> <p>Video: Not supported</p> <p>Sharing: Incoming sharing only (no outgoing)</p> <p>Safari is enabled on versions higher than 11.1 in preview. While in preview, there are known issues with Safari's Intelligent Tracking Prevention.</p>

¹ To [give and take control of shared content during sharing](#), both parties must be using the Teams desktop client. Control isn't supported when either party is running Teams in a browser. This is due to a technical limitation that we're planning to fix.

² Blur my background isn't available when you run Teams in a browser. This feature is only available in the Teams desktop client.

³ Teams meetings on browsers are limited to a single incoming video feed of active speaker.

⁴ Edge RS2 or later doesn't support sending real-time audio and video traffic through HTTP proxies.

NOTE

As long as an operating system can run the supported browser, Teams is supported on desktop computers. For example, running Firefox on the Linux operating system is an option for using Teams.

For mobile operating systems, we recommend that you run the Teams app, available from the Android and iOS stores. Running Teams in a mobile operating system is supported, but many features are unavailable.

The web client performs browser version detection upon connecting to <https://teams.microsoft.com>. If an unsupported browser version is detected, it will block access to the web interface and recommend that the user download the desktop client or mobile app.

Mobile clients

The Microsoft Teams mobile apps are available for Android and iOS, and are geared for on-the-go users participating in chat-based conversations and allow peer-to-peer audio calls. For mobile apps, go to the relevant mobile stores Google Play and the Apple App Store. The Windows Phone App was retired July 20, 2018 and may no longer work.

In China, here's how to [get Teams for Android](#).

Supported mobile platforms for Microsoft Teams mobile apps are the following:

- **Android:** Support is limited to the last four major versions of Android. When a new major version of Android is released, the new version and the previous three versions are officially supported.
- **iOS:** Support is limited to the two most recent major versions of iOS. When a new major version of iOS is released, the new version of iOS and the previous version are officially supported.

NOTE

The mobile version must be available to the public in order for Teams to work as expected.

Mobile apps are distributed and updated through the respective mobile platform's app store only. Distribution of the mobile apps via MDM or side-loading is not supported by Microsoft. Once the mobile app has been installed on a supported mobile platform, the Teams Mobile App itself will be supported provided the version is within three months of the current release.

	Decision Point	Are there any restrictions preventing users from installing the appropriate Microsoft Teams client on their devices?
	Next Steps	If your organization restricts software installation, make sure that process is compatible with Microsoft Teams. Note: Admin rights are not required for PC client installation but are required for installation on a Mac.

Client update management

Clients are currently updated automatically by the Microsoft Teams service with no IT administrator intervention required. If an update is available, the client will automatically download the update and when the app has idled for a period of time, the update process will begin.

Client-side configurations

Currently, there are no supported options available to configure the client either through the tenant admin, PowerShell, Group Policy Objects or the registry.

Notification settings

There are currently no options available for IT administrators to configure client-side notification settings. All notification options are set by the user. The figure below outlines the default client settings.

Sample PowerShell script - inbound firewall rule

This sample script, which needs to run on client computers in the context of an elevated administrator account, will create a new inbound firewall rule for each user folder found in c:\users. When Teams finds this rule, it will prevent the Teams application from prompting users to create firewall rules when the users make their first call from Teams.

```

<#
.SYNOPSIS
    Creates firewall rules for Teams.

.DESCRIPTION
    (c) Microsoft Corporation 2018. All rights reserved. Script provided as-is without any warranty of any
    kind. Use it freely at your own risks.
    Must be run with elevated permissions. Can be run as a GPO Computer Startup script, or as a Scheduled
    Task with elevated permissions.
    The script will create a new inbound firewall rule for each user folder found in c:\users.
    Requires PowerShell 3.0.
#>

#Requires -Version 3

$users = Get-ChildItem (Join-Path -Path $env:SystemDrive -ChildPath 'Users') -Exclude 'Public', 'ADMINI~*'
if ($null -ne $users) {
    foreach ($user in $users) {
        $progPath = Join-Path -Path $user.FullName -ChildPath
        "AppData\Local\Microsoft\Teams\Current\Teams.exe"
        if (Test-Path $progPath) {
            if (-not (Get-NetFirewallApplicationFilter -Program $progPath -ErrorAction SilentlyContinue)) {
                $ruleName = "Teams.exe for user $($user.Name)"
                "UDP", "TCP" | ForEach-Object { New-NetFirewallRule -DisplayName $ruleName -Direction
                Inbound -Profile Domain -Program $progPath -Action Allow -Protocol $_ }
                Clear-Variable ruleName
            }
        }
        Clear-Variable progPath
    }
}
}

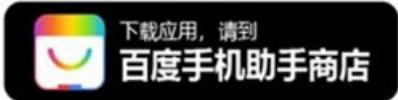

```

Get Microsoft Teams for Android in China

12/7/2021 • 2 minutes to read • [Edit Online](#)

If you're in China, use the links in this article to get Microsoft Teams for Android through one of several stores in China.

STORE	QR CODE
Lenovo: https://aka.ms/TeamsLenovo	 <p>The QR code is for the Lenovo application store. Above it is a black banner with a green icon and the text '下载应用, 请到 联想应用商店' (Download app, please go to Lenovo application store).</p>

Hardware requirements for Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

All of the requirements in the following sections apply to both the Microsoft Teams desktop app and the Teams Web app.

Hardware requirements for Teams on a Windows PC

COMPONENT	REQUIREMENT
Computer and processor	Minimum 1.1 GHz or faster, 2 core Note: For Intel processors, the maximum speed achieved using Intel Turbo Boost Technology (Max Turbo Frequency) must be considered
Memory	4.0 GB RAM (Teams requires a dedicated 4 GB of RAM over and above any other system requirements)
Hard disk	3.0 GB of available disk space
Display	1024 x 768 screen resolution
Graphics hardware	Windows OS: Graphics hardware acceleration requires DirectX 9 or later, with WDDM 2.0 or higher for Windows 10 (or WDDM 1.3 or higher for Windows 10 Fall Creators Update)
Operating system	Windows 11, Windows 10 (excluding Windows 10 LTSC), Windows 10 on ARM, Windows 8.1, Windows Server 2019, Windows Server 2016, Windows Server 2012 R2. Note: We recommend using the latest Windows version and security patches available.
.NET version	Requires .NET 4.5 CLR or later
Video	USB 2.0 video camera
Devices	Standard laptop camera, microphone, and speakers

COMPONENT	REQUIREMENT
Video calls and meetings	<ul style="list-style-type: none"> Requires 2-core processor. For higher video/screen share resolution and frame rate, a 4-core processor or better is recommended. Background video effects require Windows 10 or a processor with AVX2 instruction set. See Hardware decoder and encoder driver recommendations for a list of unsupported decoders and encoders. Joining a meeting using proximity detection in a Microsoft Teams Room requires Bluetooth LE, which requires Bluetooth to be enabled on the client device, and for Windows clients it also requires the 64-bit Teams client. This feature is not available on 32-bit Teams clients.
Teams live events	<p>If you are producing a Teams live event, we recommend using a computer that has a Core i5 Kaby Lake processor, 4.0-GB RAM (or higher), and hardware encoder. See Hardware decoder and encoder driver recommendations for a list of unsupported decoders and encoders.</p>

Hardware requirements for Teams on a Mac

COMPONENT	REQUIREMENT
Computer and processor	Intel Core Duo processor
Memory	4.0 GB RAM (Teams requires a dedicated 4 GB of RAM over and above any other system requirements)
Hard disk	1.5 GB of available disk space
Display	1280 x 800 or higher resolution
Operating system	One of the three most recent versions of macOS. You can find information about the latest macOS versions, and how to upgrade your version of macOS, here . For example, when a new version of macOS is released, the new version and the two immediately preceding it become the supported versions.
Video	Compatible webcam
Voice	Compatible microphone and speakers, headset with microphone, or equivalent device
Video calls and meetings	<ul style="list-style-type: none"> Requires 2-core processor. For higher video/screen share resolution and frame rate, a 4-core processor or better is recommended. Joining a meeting using proximity detection in a Microsoft Teams Room is not available on macOS.

Hardware requirements for Teams on Linux

COMPONENT	REQUIREMENT
Computer and processor	1.6 GHz (or higher) (32-bit or 64-bit), 2 core
Memory	4.0 GB RAM (Teams requires a dedicated 4 GB of RAM over and above any other system requirements)
Hard disk	3.0 GB of available disk space
Display	1024 x 768 screen resolution
Graphics hardware	128 MB graphics memory
Operating system	Linux distribution capable of installing DEB or RPM.
Video	USB 2.0 video camera
Devices	Standard laptop camera, microphone, and speakers
Voice	Compatible microphone and speakers, headset with microphone, or equivalent device
Video calls and meetings	<ul style="list-style-type: none">• Requires 2-core processor. For higher video/screen share resolution and frame rate, a 4-core processor or better is recommended.• Joining a meeting using proximity detection in a Microsoft Teams Room is not available on Linux.
Supported Linux distributions	Ubuntu 18.04 LTS, 20.04 LTS, Fedora 30 Workstation, RHEL 8 Workstation, CentOS 8
Supported Desktop environment	GNOME, KDE
Supported Display server	X11

Hardware requirements for Teams on mobile devices

You can use Teams on these mobile platforms:

- Android: Compatible with Android phones and tablets.

Support is limited to the **last four** major versions of Android. For example, when a new, major version of Android is released, the Android requirement is the new version and the three most recent versions that precede it.

- iOS: Compatible with iPhone, iPad, and iPod touch.

Support is limited to the **two** most recent major versions of iOS. For example, when a new, major version of iOS is released, the iOS requirement is the new version and the most recent versions that preceded it. The optional **Blur my background** video effect on iOS requires an operating system of iOS 12 or later, compatible with the following devices: iPhone 7 or later, iPad 2018 (6th generation) or later, and the iPod touch 2019 (7th generation).

NOTE

For the best experience with Teams, use the latest version of iOS and Android.

Hardware requirements for Teams in a Virtual Desktop Infrastructure (VDI) environment

See [Teams for Virtualized Desktop Infrastructure](#) for requirements for running Teams in a virtualized environment.

[Hardware requirements for the Teams app](#)

Install Microsoft Teams using Microsoft Endpoint Configuration Manager

12/7/2021 • 5 minutes to read • [Edit Online](#)

TIP

Watch the following session to learn about the benefits of the Windows Desktop Client, how to plan for it and how to deploy it: [Teams Windows Desktop Client](#).

To use Microsoft Endpoint Configuration Manager, or Group Policy, or any third-party distribution mechanisms for broad deployment, Microsoft has provided MSI files (both 32-bit and 64-bit) that admins can use for bulk deployment of Teams to select users or computers. Admins can use these files to remotely deploy Teams so that users do not have to manually download the Teams app. When deployed, Teams will auto launch for all users who sign in on that machine. (You can disable auto launch after installing the app. [See below](#).) We recommend that you deploy the package to the computer, so all new users of the machine will also benefit from this deployment.

These are the links to the MSI files:

ENTITY	32-BIT	64-BIT	ARM64
Commercial	32-bit	64-bit	ARM64
U.S. Government - GCC	32-bit	64-bit	ARM64
U.S. Government - GCC High	32-bit	64-bit	ARM64
U.S. Government - DoD	32-bit	64-bit	ARM64

To ensure a successful deployment, be aware of the following:

- Install the 64-bit version of Teams on 64-bit operating systems. If you try to install the 64-bit version of Teams on a 32-bit operating system, the installation won't be successful and currently you won't receive an error message.
- Teams can also be included with a deployment of Microsoft 365 Apps for enterprise. For more information, see [Deploy Microsoft Teams with Microsoft 365 Apps for enterprise](#).
- To learn more about Microsoft Endpoint Configuration Manager, see [What is Configuration Manager?](#)

Deployment procedure (recommended)

1. Retrieve the latest package.
2. Use the defaults prepopulated by the MSI.
3. Deploy to computers when possible.

How the Microsoft Teams MSI package works

PC installation

The Teams MSI will place an installer in Program Files. Whenever a user signs into a new Windows User Profile, the installer will be launched and a copy of the Teams app will be installed in that user's `AppData` folder. If a user already has the Teams app installed in the `AppData` folder, the MSI installer will skip the process for that user.

Do not use the MSI to deploy updates, because the client will auto update when it detects a new version is available from the service. To re-deploy the latest installer use the process of redeploying MSI described below. If you deploy an older version of the MSI package, the client will auto-update (except in VDI environments) when possible for the user. If a very old version gets deployed, the MSI will trigger an app update before the user is able to use Teams.

IMPORTANT

The default location is C:\Program Files (x86)\Teams Installer on 32-bit operating systems and C:\Program Files\Teams Installer on 64-bit operating systems. We don't recommend that you change the default install locations, as this could break the update flow. Having too old a version will eventually block users from accessing the service.

Target computer requirements

- .NET framework 4.5 or later
- Windows 8.1 or later
- Windows Server 2012 R2 or later
- 3 GB of disk space for each user profile (recommended)

VDI installation

For complete guidance on how to deploy the Teams desktop app on VDI, see [Teams for Virtualized Desktop Infrastructure](#).

Clean up and redeployment procedure

If a user uninstalls Teams from their user profile, the MSI installer will track that the user has uninstalled the Teams app and no longer install Teams for that user profile. To redeploy Teams for this user on a particular computer where it was uninstalled, do the following:

IMPORTANT

The next steps contain information about how to modify the registry. Make sure that you back up the registry before you modify it and that you know how to restore the registry if a problem occurs. For more information about how to back up, restore, and modify the registry, see [Windows registry information for advanced users](#).

1. Uninstall the Teams app installed for every user profile. For more information, see [Uninstall Microsoft Teams](#).
2. Delete the directory recursively under `%localappdata%\Microsoft\Teams\`.
3. Delete the `HKEY_CURRENT_USER\Software\Microsoft\Office\Teams\PreventInstallationFromMsi` registry value.
4. Redeploy the MSI package to that particular computer.

TIP

You can also use our [Teams deployment clean up script](#) to complete steps 1 and 2.

Prevent Teams from starting automatically after installation

The default behavior of the MSI is to install the Teams app as soon as a user signs in and then automatically start Teams. If you don't want Teams to start automatically for users after it's installed, you can use Group Policy to set

a policy setting or disable auto launch for the MSI installer.

Use Group Policy (recommended)

Enable the **Prevent Microsoft Teams from starting automatically after installation** Group Policy setting. You can find this policy setting in User Configuration\Policies\Administrative Templates\Microsoft Teams. This is the recommended method because you can turn off or turn on the policy setting according to your organization's needs.

When you enable this policy setting before Teams is installed, Teams doesn't start automatically when users log in to Windows. After a user signs in to Teams for the first time, Teams starts automatically the next time the user logs in.

To learn more, see [Use Group Policy to prevent Teams from starting automatically after installation](#).

Caution

If you've already deployed Teams and want to set this policy to disable Teams autostart, first set the Group Policy setting to the value you want, and then run the [Teams autostart reset script](#) on a per-user basis.

Disable auto launch for the MSI installer

You can disable auto launch for the MSI installer by using the **OPTIONS="noAutoStart=true"** parameter as follows.

For the 32-bit version:

```
msiexec /i Teams_windows.msi OPTIONS="noAutoStart=true" ALLUSERS=1
```

For the 64-bit version:

```
msiexec /i Teams_windows_x64.msi OPTIONS="noAutoStart=true" ALLUSERS=1
```

When a user logs in to Windows, Teams is installed with the MSI and a shortcut to start Teams is added to the user's desktop. Teams won't start until the user manually starts Teams. After the user manually starts Teams, Teams automatically starts whenever the user logs in.

Note that these examples also use the **ALLUSERS=1** parameter. When you set this parameter, Teams Machine-Wide Installer appears in Programs and Features in Control Panel and in Apps & features in Windows Settings for all users of the computer. All users can then uninstall Teams if they have admin credentials on the computer.

NOTE

If you run the MSI manually, be sure to run it with elevated permissions. Even if you run it as an administrator, without running it with elevated permissions, the installer won't be able to configure the option to disable auto start.

Turn on Teams in your organization

12/7/2021 • 2 minutes to read • [Edit Online](#)

IMPORTANT

The Microsoft Teams admin center is gradually replacing the Skype for Business admin center, and we're migrating Teams settings to it from the Microsoft 365 admin center. If a setting has been migrated, you'll see a notification and then be directed to the setting's location in the Teams admin center. For more information, see [Manage Teams during the transition to the Teams admin center](#).

By default, Teams is turned on for all organizations. If you used Teams during the preview period, the setting stays the same as what you set during your Teams preview.

As an administrator for your organization, you can assign user licenses to control individual access to Teams, and you can allow or block what content sources can be used in Teams. See [Manage Microsoft Teams settings for your organization](#) or [Admin settings for apps in Microsoft Teams](#) for more information.

To learn more about managing individual licenses, read [Microsoft Teams service description](#).

Turn Teams on or off for your entire organization

Tenant-level control for Teams was removed effective August 2018. Control access to Teams in your organization with user-level licensing. To learn more, see [Manage user access to Teams](#).

How Microsoft Teams uses memory

12/7/2021 • 2 minutes to read • [Edit Online](#)

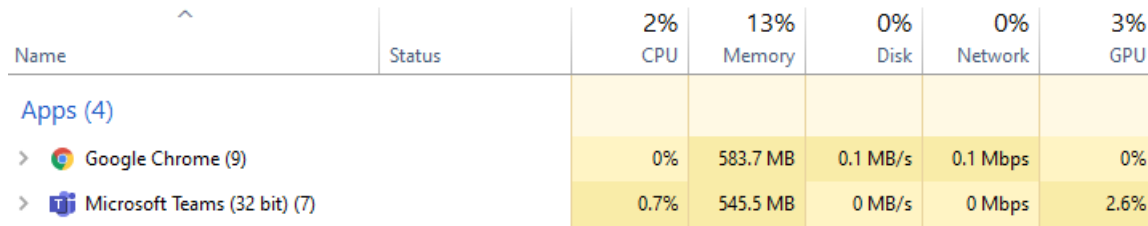

Some Microsoft Teams users have questions about how Teams uses memory. This article describes how memory is used by Teams, and why the Teams desktop application (app) and the Teams web app do not prevent other apps and workloads on the same computer from having enough memory to run optimally. Teams is designed to use modern web technology. To achieve this, the Teams desktop client was developed on Electron, which uses Chromium for rendering. This is the same rendering engine behind many of today's most popular browsers, including Edge and Chrome.

How Teams works

Teams being designed on Electron allows for faster development, and it also maintains parity between Teams versions across different operating systems (Windows, Mac, and Linux). This parity is possible because Electron and Chromium maintain a similar code base across all versions. Another advantage of this architecture is there's a similar memory usage profile between the Teams web app and the desktop version. Both the web app and the desktop versions use memory in a similar way to how a browser would use it. More information about Electron is available at [their Web site](#).

See [Chromium Memory Usage](#) and [Key Concepts in Chrome Memory](#) for more information.

The following image shows side-by-side memory usages of the Teams desktop app for Windows and the Teams Web app (in this example, running in Google Chrome).

The image is a screenshot of the Windows Task Manager 'Performance' tab, specifically the 'Memory' section. It shows a table of running applications with their respective CPU, Memory, Disk, Network, and GPU usage. The table has columns for Name, Status, CPU, Memory, Disk, Network, and GPU. The data is as follows:

Name	Status	2% CPU	13% Memory	0% Disk	0% Network	3% GPU
Apps (4)						
> Google Chrome (9)		0%	583.7 MB	0.1 MB/s	0.1 Mbps	0%
> Microsoft Teams (32 bit) (7)		0.7%	545.5 MB	0 MB/s	0 Mbps	2.6%

Memory usage in Teams

It is important to understand the *expected* behavior of Teams when it comes to system memory, and to know the symptoms of truly problematic system memory issues.

Expected memory usage by Teams

Whether you're running the Teams desktop app or the Teams web app, Chromium detects how much system memory is available and utilizes enough of that memory to optimize the rendering experience. When other apps or services require system memory, Chromium gives up memory to those processes. Chromium tunes Teams memory usage on an ongoing basis in order to optimize Teams performance without impacting anything else currently running.

In this way, similar Chromium workloads can utilize varying amounts of memory, depending on the amount of system memory that is available.

The following graph depicts memory usage by Teams on four separate systems, each with different amounts of memory available. Each of the systems is processing similar workloads (same apps open and running).

When computers have more memory, Teams will use that memory. In systems where memory is scarce, Teams will use less.

Symptoms of system memory issues

If you see one or more of the following symptoms on your computer, you could have a serious system memory issue:

- High memory use when multiple large applications are running simultaneously.
- Slow system performance or applications hanging.
- Sustained overall system memory usage of 90% or higher across all apps. With this amount of memory usage, Teams should be giving memory back to other apps and workloads. Sustained memory usage of 90% could mean Teams isn't giving memory back to the system, which indicates a problem.

The following images show examples of views in Task Manager when system memory usage is abnormally high.

Open Resource Monitor

Microsoft 365 and Office 365 URLs and IP address ranges

12/7/2021 • 2 minutes to read • [Edit Online](#)

Go to [Microsoft 365 and Office 365 URLs and IP address ranges](#) for a detailed and up-to-date list of the URLs, IP addresses, ports, and protocols that must be correctly configured for Teams. Microsoft is continuously improving the Microsoft 365 and Office 365 services and adding new functionality, which means the required ports, URLs, and IP addresses may change over time. We recommend that you [subscribe via RSS](#) to receive notifications when this information is updated or changed.

The Teams calling and meetings experience is built on the next generation cloud-based infrastructure that is also used by Skype and Skype for Business. These technology investments include Azure-based cloud services for media processing and signaling, H.264 video codec, SILK and Opus audio codec, network resiliency, telemetry, and quality diagnostics. As such, there are URLs and IPs that are required that may be associated with both Skype and Skype for Business.

For all Microsoft 365 and Office 365 workloads, the recommended connection method to Teams services is bypassing the forward proxy where possible. When a proxy server sits between a client and the Office 365 data centers, media might be forced over TCP instead of UDP, which would impact media quality. Download sample proxy PAC files that can be used to configure traffic bypass from [Managing Microsoft 365 and Office 365 endpoints](#).

If your networking and security policies require Microsoft 365 or Office 365 traffic to flow through a proxy server, make sure that the above requirements are already met before deploying Teams into production. For more information, read [Proxy Servers for Teams or Skype for Business Online](#).

Teams for Virtualized Desktop Infrastructure

12/7/2021 • 21 minutes to read • [Edit Online](#)

This article describes the requirements and limitations for using Microsoft Teams in a virtualized environment.

What is VDI?

Virtual Desktop Infrastructure (VDI) is virtualization technology that hosts a desktop operating system and applications on a centralized server in a data center. This enables a fully personalized desktop experience to users with a fully secured and compliant centralized source.

Microsoft Teams in a virtualized environment supports chat and collaboration. And with the Azure Virtual Desktop, Citrix, and VMware platforms, calling and meeting functionality is also supported.

Teams in a virtualized environment supports multiple configurations. These include VDI, dedicated, shared, persistent, and non-persistent modes. Features are in continuous development and are added on a regular basis, and functionality will expand in the coming months and years.

Using Teams in a virtualized environment might be somewhat different from using Teams in a non-virtualized environment. For example, some advanced features might not be available in a virtualized environment, and video resolution might differ.

To ensure an optimal user experience, follow the guidance in this article.

NOTE

For details about Teams VDI on different platforms, see [Teams features by platform](#).

Teams on VDI components

Using Teams in a virtualized environment requires the following components.

- **Virtualization broker:** The resource and connection manager to the virtualization provider, such as Azure
- **Virtual desktop:** The Virtual Machine (VM) stack that runs Microsoft Teams
- **Thin client:** The endpoint that the user physically interfaces with
- **Teams desktop app:** The Teams desktop client app

Teams on VDI requirements

Virtualization provider requirements

The Teams desktop app was validated with leading virtualization solution providers. With multiple market providers, we recommend that you consult your virtualization solution provider to ensure that you meet the minimum requirements.

Currently, Teams on VDI with audio/video (AV) optimization is certified with Azure Virtual Desktop, Citrix, and VMware. Review the information in this section to ensure that you meet all requirements for proper functionality.

Platforms certified for Teams

The following platforms have virtual desktop infrastructure solutions for Teams.

PLATFORM	SOLUTION
	Azure Virtual Desktop
	Citrix Virtual Apps and Desktops
	VMware Horizon

Azure Virtual Desktop

Azure Virtual Desktop provides AV optimization for Teams on VDI. To learn more and requirements and installation, see [Use Teams on Azure Virtual Desktop](#).

Citrix Virtual Apps and Desktops requirements

Citrix Virtual Apps and Desktops (formerly known as XenApp and XenDesktop) provides AV optimization for Teams on VDI. With Citrix Virtual Apps and Desktops, Teams on VDI supports calling and meeting functionality in addition to chat and collaboration.

You can download the latest version of Citrix Virtual Apps and Desktops at [the Citrix downloads site](#). (You'll need to sign in first.) The necessary components are bundled into the [Citrix Workspace app \(CWA\)](#) and Virtual Delivery Agent (VDA) by default. You don't need to install any additional components or plugins on CWA or the VDA.

For the latest server and client requirements, see [this Citrix website](#).

VMware Horizon Workspace and Desktop requirements

VMware Horizon is a modern platform for secure delivery of virtual desktops and apps across the hybrid cloud. To offer a great end-user experience, VMware Horizon provides media optimization for Teams. This optimization improves overall productivity across virtual desktops and apps, and enhances user experience when calling and meeting using Teams.

You can download the latest version of VMware Horizon from the [VMware Downloads](#) page. The required media optimization components are part of the Horizon Agent and Horizon Client by default and there's no need to install any additional plug-in to use the optimization feature for Teams.

To get the latest requirements and instructions on how to configure media optimization for Teams, see [this VMware website](#).

Install or update the Teams desktop app on VDI

You can deploy the Teams desktop app for VDI using a per-machine installation or per-user installation using the MSI package. Deciding on which approach to use depends on whether you use a persistent or non-persistent setup and the associated functionality needs of your organization.

For a dedicated persistent setup, either approach would work. However, for a non-persistent setup, Teams requires a per-machine installation in order to work efficiently. See the [Non-persistent setup](#) section.

With per-machine installation, automatic updates are disabled. This means that to update the Teams app, you must uninstall the current version to update to a newer version. With per-user installation, automatic updates are enabled. For most VDI deployments, we recommend you deploy Teams using per-machine installation.

To update to the latest Teams version, start with the uninstall procedure followed by latest Teams version deployment.

For Teams AV optimization in VDI environments to work properly, the thin-client endpoint must have access to

the internet. If internet access isn't available at the thin-client endpoint, optimization startup won't be successful. This means that the user is in a non-optimized media state.

Dedicated persistent setup

In a dedicated persistent setup, users' local operating system changes are retained after users log off. For persistent setup, Teams supports both per-user and per-machine installation.

The following is the recommended minimum VM configuration.

PARAMETER	WORKSTATION OPERATING SYSTEM	SERVER OPERATING SYSTEM
vCPU	2 cores	4,6, or 8 It's important to understand the underlying non-uniform memory access (NUMA) configuration and configure your VMs accordingly.
RAM	4 GB	512 to 1024 MB per user
Storage	8 GB	40 to 60 GB

Non-persistent setup

In a non-persistent setup, users' local operating system changes are not retained after users log off. Such setups are commonly shared multi-user sessions. VM configuration varies based on the number of users and available physical box resources.

For a non-persistent setup, the Teams desktop app must be installed per-machine to the golden image. (To learn more, see the [Install or update the Teams desktop app on VDI](#) section.) This ensures an efficient launch of the Teams app during a user session.

Using Teams in a non-persistent setup also requires a profile-caching manager, for efficient Teams runtime data synchronization. Efficient data synchronization ensures that the appropriate user-specific information (such as a user's data, profile, or settings) is cached during the user's session. Make sure data in these two folders are synched:

- C:\Users\username\AppData\Local\Microsoft\IdentityCache (%localAppdata%\Microsoft\IdentityCache)
- C:\Users\username\AppData\Roaming\Microsoft\Teams (%appdata%\Microsoft\Teams)

NOTE

A roaming folder (or, if you are using folder redirection, a caching manager) is required to ensure that the Teams app has the runtime data and files required to run the application. This is necessary to mitigate network latency issues or network glitches, which would otherwise cause application errors and a slow experience due to unavailable data and files.

There are a variety of caching manager solutions available. For example, [FSLogix](#). Consult your caching manager provider for specific configuration instructions.

Teams cached content exclusion list for non-persistent setup

Exclude the following from the Teams caching folder, %appdata%\Microsoft\Teams. Excluding these items helps reduce the user caching size to further optimize your non-persistent setup.

- .txt files
- Media-stack folder
- meeting-addin\Cache (%appdata%\Microsoft\Teams\meeting-addin\Cache)

Microsoft 365 Apps for enterprise considerations

Consider the following when you deploy Teams with Microsoft 365 Apps for enterprise on VDI.

New deployments of Teams through Microsoft 365 Apps for enterprise

Before you deploy Teams through Microsoft 365 Apps for enterprise, you must first uninstall any pre-existing Teams apps if they were deployed using per-machine installation.

Teams through Microsoft 365 Apps for enterprise is installed per-user. To learn more, see the [Install or update the Teams desktop app on VDI](#) section.

Teams deployments through Microsoft 365 Apps for enterprise updates

Teams is also being added to existing installations of Microsoft 365 Apps for enterprise. Since Microsoft 365 Apps for enterprise installs Teams per-user only, see the [Install or update the Teams desktop app on VDI](#) section.

Using Teams with per-machine installation and Microsoft 365 Apps for enterprise

Microsoft 365 Apps for enterprise doesn't support per-machine installations of Teams. To use per-machine installation, you must exclude Teams from Microsoft 365 Apps for enterprise. See the [Deploy the Teams desktop app to the VM](#) and [How to exclude Teams deployment through Microsoft 365 Apps for enterprise](#) sections.

How to exclude Teams deployment through Microsoft 365 Apps for enterprise

To learn more about Teams and Microsoft 365 Apps for enterprise, see [How to exclude Teams from new installations of Microsoft 365 Apps for enterprise](#) and [Use Group Policy to control the installation of Teams](#).

Deploy the Teams desktop app to the VM

1. Download the Teams MSI package that matches your VDI VM operating system using one of the following links:

- [32-bit version](#)
- [64-bit version](#)

NOTE

For government clouds, see [Install Microsoft Teams using Microsoft Endpoint Configuration Manager](#) for the download links to the MSI files.

The minimum version of the Teams desktop app that's required is version 1.3.00.4461. (PSTN hold isn't supported in earlier versions.)

2. Install the MSI to the VDI VM by running one of the following commands:

- Per-user installation (default)

```
msiexec /i <path_to_msi> /l*v <install_logfile_name> ALLUSERS=1
```

This process is the default installation, which installs Teams to the %AppData% user folder. At this point, the golden image setup is complete. Teams won't work properly with per-user installation on a non-persistent setup.

- Per-machine installation

```
reg add "HKLM\SOFTWARE\Microsoft\Teams" /v IsWVDEnvironment /t REG_DWORD /d 1 /f
```

This process adds a required registry key to the machine that lets the Teams installer know it is a VDI instance. Without it, the installer will error out, stating: "Installation has failed. Cannot install for all users when a VDI environment is not detected."

```
msiexec /i <path_to_msi> /l*v <install_logfile_name> ALLUSER=1 ALLUSERS=1
```

This process installs Teams to the Program Files (x86) folder on a 64-bit operating system and to the Program Files folder on a 32-bit operating system. At this point, the golden image setup is complete. Installing Teams per-machine is required for non-persistent setups.

The next interactive logon session starts Teams and asks for credentials.

NOTE

These examples also use the **ALLUSERS=1** parameter. When you set this parameter, Teams Machine-Wide Installer appears in Programs and Features in Control Panel and in Apps & features in Windows Settings for all users of the computer. All users can then uninstall Teams if they have admin credentials. It's important to understand the difference between **ALLUSERS=1** and **ALLUSER=1**. The **ALLUSERS=1** parameter can be used in non-VDI and VDI environments, while the **ALLUSER=1** parameter is used only in VDI environments to specify a per-machine installation.

3. Uninstall the MSI from the VDI VM. There are two ways to uninstall Teams.

- PowerShell script: You can use [this PowerShell script](#) to uninstall Teams and remove the Teams folder for a user. Run the script for each user profile in which Teams was installed on the computer.
- Command line: Run the following command.

```
msiexec /passive /x <path_to_msi> /!v <uninstall_logfile_name>
```

This process uninstalls Teams from the Program Files (x86) folder or Program Files folder, depending on the operating system environment.

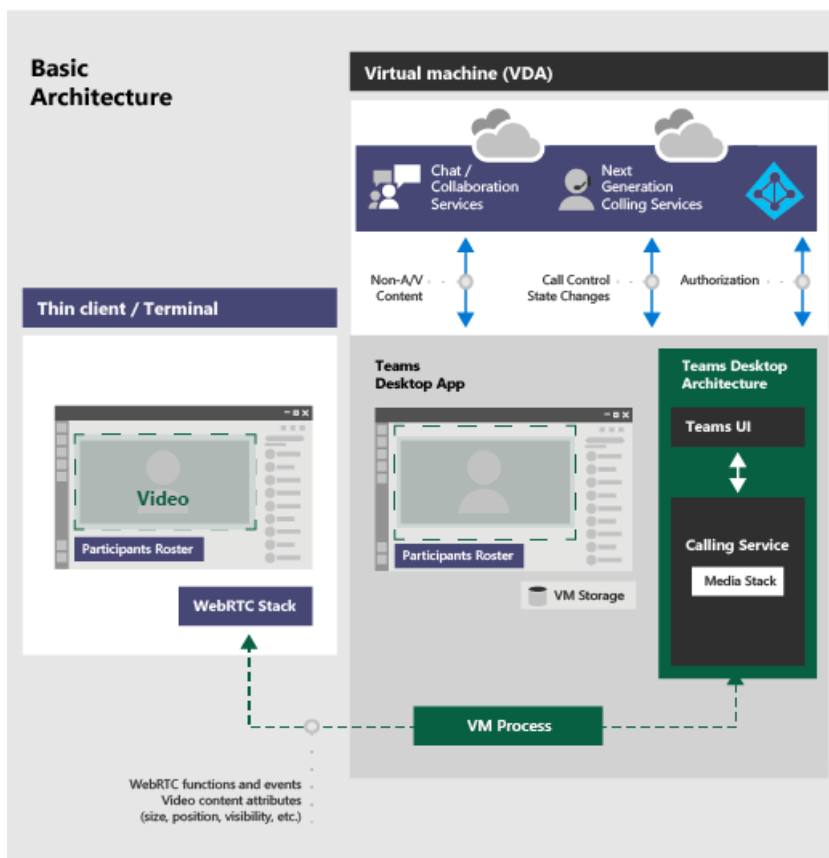

Teams on VDI performance considerations

There are a variety of virtualized setup configurations, each with a different focus for optimization. For example, a configuration might focus on user density. When planning, consider the following to help optimize your setup based on your organization's workload needs.

- Minimum requirement: Some workloads might require a setup using resources that are above the minimum requirements. For example, workloads for developers who use applications that demand more computing resources.
- Dependencies: These include dependencies on infrastructure, workload, and other environmental considerations outside the Teams desktop app.
- Disabled features on VDI: Teams disables GPU-intensive features for VDI, which can help improve transient CPU utilization. The following features are disabled:
 - Teams CSS animation
 - Giphy auto-start

Teams on VDI with calling and meetings

In addition to chat and collaboration, Teams on VDI with calling and meetings is available with supported virtualization provider platforms. Supported features are based on the WebRTC media stack and virtualization provider implementation. The following diagram provides an overview of the architecture.

IMPORTANT

If you currently run Teams without AV optimization in VDI and you use features that are not supported yet for optimization (such as Give and take control when app sharing), you have to set virtualization provider policies to turn off Teams redirection. This means that Teams media sessions won't be optimized. For steps on how to set policies to turn off Teams redirection, contact your virtualization provider.

Network requirements

We recommend that you evaluate your environment to identify any risks and requirements that can influence your overall cloud voice and video deployment. Use the [Skype for Business Network Assessment Tool](#) to test whether your network is ready for Teams.

To learn more about how to prepare your network for Teams, see [Prepare your organization's network for Teams](#).

Migrate from Skype for Business on VDI to Teams on VDI

If you're migrating from Skype for Business on VDI to Teams on VDI, besides the differences between the two applications, there are some differences when VDI is also implemented. Some capabilities that aren't currently supported in Teams VDI that are in Skype for Business VDI are as follows:

- Per-platform policy to disable some AV features in VDI
- Give and take control when app sharing
- Screen share from chat without audio
- Simultaneous video and screen sharing send and receive

Teams on Chrome browser versus Teams desktop app for VDI

Teams on Chrome browser doesn't provide a replacement for the Teams desktop app for VDI with AV optimization. The chat and collaboration experience works as expected. When media is needed, there are some experiences that might not meet user expectations on the Chrome browser:

- The audio and video streaming experience might not be optimal. Users might experience delays or reduced

quality.

- Device settings aren't available in browser settings.
- Device management is handled through the browser and requires multiple settings in browser site settings.
- Device settings might also need to be set in Windows device management.

Teams on VDI with chat and collaboration

If your organization wants to only use chat and collaboration features in Teams, you can set user-level policies to turn off calling and meeting functionality in Teams.

Set policies to turn off calling and meeting functionality

You can set policies by using the Microsoft Teams admin center or PowerShell. It might take some time (a few hours) for the policy changes to propagate. If you don't see changes for a given account immediately, try again in a few hours.

Calling policies: Teams includes the built-in DisallowCalling calling policy, in which all calling features are turned off. Assign the DisallowCalling policy to all users in your organization who use Teams in a virtualized environment.

Meeting policies: Teams includes the built-in AllOff meeting policy, in which all meeting features are turned off. Assign the AllOff policy to all users in your organization who use Teams in a virtualized environment.

Assign policies using the Microsoft Teams admin center

To assign the DisallowCalling calling policy and the AllOff meeting policy to a user:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**.
2. Select the user by clicking to the left of the user name, and then click **Edit settings**.
3. Do the following:
 - a. Under **Calling policy**, click **DisallowCalling**.
 - b. Under **Meeting policy**, click **AllOff**.
4. Click **Apply**.

To assign a policy to multiple users at a time:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then search for the users or filter the view to show the users you want.
2. In the ✓ (check mark) column, select the users. To select all users, click the ✓ (check mark) at the top of the table.
3. Click **Edit settings**, make the changes that you want, and then click **Apply**.

Or, you can also do the following:

1. In the left navigation of the Microsoft Teams admin center, go to the policy you want to assign. For example:
 - Go to **Voice > Calling policies**, and then click **DisallowCalling**.
 - Go to **Meetings > Meeting policies**, and then click **AllOff**.
2. Select **Manage users**.
3. In the **Manage users** pane, search for the user by display name or by user name, select the name, and then click **Add**. Repeat this step for each user that you want to add.
4. When you're finished adding users, click **Save**.

Assign policies using PowerShell

The following example shows how to use the [Grant-CsTeamsCallingPolicy](#) to assign the DisallowCalling calling policy to a user.

```
Grant-CsTeamsCallingPolicy -PolicyName DisallowCalling -Identity "user email id"
```

To learn more about using PowerShell to manage calling policies, see [Set-CsTeamsCallingPolicy](#).

The following example shows how to use the [Grant-CsTeamsMeetingPolicy](#) to assign the AllOff meeting policy to a user.

```
Grant-CsTeamsMeetingPolicy -PolicyName AllOff -Identity "user email id"
```

To learn more about using PowerShell to manage meeting policies, see [Set-CsTeamsMeetingPolicy](#).

Migrate Teams on VDI with chat and collaboration to optimize Teams with calling and meetings

If you have an existing implementation of Teams on VDI with chat and collaboration in which you had set user-level policies to turn off calling and meeting functionality, and you're migrating to Teams with AV optimization, you must set policies to turn on calling and meeting functionality for those Teams on VDI users.

Set policies to turn on calling and meeting functionality

You can use the Microsoft Teams admin center or PowerShell to set and assign calling and meeting policies to your users. It can take some time (a few hours) for policy changes to propagate. If you don't see changes for a given account immediately, try again after a few hours.

Calling policies: Calling policies in Teams control which calling features are available to users. Teams includes the built-in AllowCalling calling policy, in which all calling features are turned on. To turn on all calling features, assign the AllowCalling policy. Or, create a custom calling policy to turn on the calling features that you want and assign it to users.

Meeting policies: Meeting policies in Teams control the types of meetings that users can create and the features that are available to meeting participants that are scheduled by users in your organization. Teams includes the built-in AllOn meeting policy, in which all meeting features are turned on. To turn on all meeting features, assign the AllOn policy. Or, create a custom meeting policy to turn on the meeting features that you want and assign it users.

Assign policies using the Microsoft Teams admin center

To assign the AllowCalling calling policy and the AllOn meeting policy to a user:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**.
2. Select the user by clicking to the left of the user name, and then click **Edit settings**.
3. Do the following:
 - a. Under **Calling policy**, click **AllowCalling**.
 - b. Under **Meeting policy**, click **AllOn**.
4. Click **Apply**.

To assign a policy to multiple users at a time:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then search for the users or filter the view to show the users you want.
2. In the ✓ (check mark) column, select the users. To select all users, click the ✓ (check mark) at the top of the table.
3. Click **Edit settings**, make the changes that you want, and then click **Apply**.

Or, you can also do the following:

1. In the left navigation of the Microsoft Teams admin center, go to the policy you want to assign. For example:
 - Go to **Voice > Calling policies**, and then click **AllowCalling**.
 - Go to **Meetings > Meeting policies**, and then click **AllOn**.
2. Select **Manage users**.
3. In the **Manage users** pane, search for the user by display name or by user name, select the name, and then click **Add**. Repeat this step for each user that you want to add.
4. When you're finished adding users, click **Save**.

Assign policies using PowerShell

The following example shows how to use the [Grant-CsTeamsCallingPolicy](#) to assign the AllowCalling calling policy to a user.

```
Grant-CsTeamsCallingPolicy -PolicyName AllowCalling -Identity "user email id"
```

To learn more about using PowerShell to manage calling policies, see [Set-CsTeamsCallingPolicy](#).

The following example shows how to use the [Grant-CsTeamsMeetingPolicy](#) to assign the AllOn meeting policy to a user.

```
Grant-CsTeamsMeetingPolicy -PolicyName AllOn -Identity "user email id"
```

To learn more about using PowerShell to manage meeting policies, see [Set-CsTeamsMeetingPolicy](#).

Control fallback mode in Teams

When users connect from an unsupported endpoint, the users are in fallback mode, in which AV isn't optimized. You can disable or enable fallback mode by setting one of the following registry DWORD values:

- HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Teams\DisableFallback
- HKEY_CURRENT_USER\SOFTWARE\Microsoft\Office\Teams\DisableFallback

To disable fallback mode, set the value to **1**. To enable audio only, set the value to **2**. If the value isn't present or is set to **0** (zero), fallback mode is enabled.

This feature is available in Teams version 1.3.00.13565 and later.

Disable audio and video settings for VDI

Teams VDI policies are available in the Microsoft Teams module. These policies are active and enforced on non-optimized VDI environments.

- New-CsTeamsVdiPolicy
- Grant-CsTeamsVdiPolicy
- Remove-CsTeamsVdiPolicy
- Set-CsTeamsVdiPolicy

NOTE

This is only for non-optimized environments.

Update a module name

```
update-Module -Name MicrosoftTeams -AllowPrerelease
```

```
<# Import and connect to online (CSOnline runs the policies) #>
Import-Module microsoftTeams
if( -not $sess){
    $session = New-CsOnlineSession
    $pss = Import-PSSession $session
}
<# Check out the commands #>
Get-Command -Noun *VDI*
<#
```

Set policies to limit calling features

When users with this VDI Policy setting -DisableCallsAndMeetings \$true to sign in to Teams on VDI, they shouldn't be able to:

- Make calls.
- Join meetings.
- Do a screen share from chat.

All types of calling should be disabled.

NOTE

This is only for non-optimized environments.

```
#>
New-CsTeamsVdiPolicy -Identity DisableCallsAndMeetingsTrue -DisableCallsAndMeetings $true -
DisableAudioVideoInCallsAndMeetings $false
<# Assign Policy #>
$user = 'meganb@jvteams.xyz'
Grant-CsTeamsVdiPolicy -Identity $user -PolicyName DisableCallsAndMeetingsTrue
<# wait for some time until the policy is applied #>
get-CSOnlineUser -identity $user | FL UserPrincipalName, *vdi*
<#
Show all Policies
#>
Get-CsTeamsVdiPolicy | FT Iden*, Disable*
<#
```

When users with the VDI Policy setting -DisableAudioVideoInCallsAndMeetings \$true sign in to Teams on VDI, they should be able to:

- Do a screen share from chat.
- Join a meeting and share a screen. Move their audio to a phone.
- Users shouldn't be able to do a person-to-person audio and video call from VDI.

NOTE

This is only for non-optimized environments.

```
#>
$PolName = "DisableCallsAndMeetingsAV"
New-CsTeamsVdiPolicy -Identity $PolName -DisableCallsAndMeetings $false -DisableAudioVideoInCallsAndMeetings
$true
Grant-CsTeamsVdiPolicy -Identity $user -PolicyName $PolName
<# wait for some time until the policy is applied #>
get-CSOnlineUser -identity $user | FL UserPrincipalName, *vdi*
<# ## Cleanup afterwards #>
$cleanup = $false
if($cleanup){
    "Doing cleanup"
    # de-assign policy from user
    Grant-CsTeamsVdiPolicy -Identity $user -PolicyName $null
    get-CSOnlineUser -identity $user | FL UserPrincipalName, *vdi*
    # remove Policies
    Get-CsTeamsVdiPolicy | ?{$_.identity -ne 'Global'} | remove-csTeamsVdiPolicy
}
```

Known issues and limitations

Client deployment, installation, and setup

- With per-machine installation, Teams on VDI isn't automatically updated in the way that non-VDI Teams clients are. You have to update the VM image by installing a new MSI as described in the [Install or update the Teams desktop app on VDI](#) section. You must uninstall the current version to update to a newer version.
- In Citrix environments, if the user disconnects from the Virtual Machine while Teams is running, Teams updates can result in the user to be in a non-optimized state for AV when they reconnect. We recommend that users quit Teams before they disconnect from Citrix Virtual Machine to avoid this scenario.
- Teams should be deployed either per user or per machine. Deployment of Teams for concurrent per user and per machine is not supported. To migrate from either per machine or per user to one of these modes, follow the uninstall procedure and redeploy to either mode.
- Azure Virtual Desktop doesn't support macOS and Linux-based clients at this time.
- Fast tenant switch can result in calling-related issues on VDI such as screen sharing not available. Restarting the client will mitigate these issues.

Calling and meetings

The following calling and meeting features are not supported:

- Any multi-window functionality like the new meeting experiences or any functionality that comes with the new meeting experience
- Enhanced emergency services
- HID buttons and LED controls between the Teams app and devices
- Background blur and effects
- Broadcast and live event producer and presenter roles
- Location-Based Routing (LBR)
- PSTN call ringback tone
- Shared system audio/computer sound
- Media bypass for Direct Routing
- Zoom control

NOTE

We're working on adding calling and meeting features that are currently only available in non-VDI environments. These might include more admin control over quality, additional screen sharing scenarios, and advanced features recently added to Teams. Contact your Teams representative to learn more about upcoming features.

The following are known issues and limitations for calling and meetings:

- Interoperability with Skype for Business is limited to audio calls; there is no video modality.
- Incoming and outgoing video stream resolution is limited to 720p resolution.
- Only one video stream from an incoming camera or screen share stream is supported. When there's an incoming screen share, that screen share is shown, instead of the video of the dominant speaker.
- Teams doesn't switch to use the last audio device that a user selected, if the device is disconnected, and then reconnected.
- Live events are not optimized.
- Outgoing screen sharing:
 - Application sharing is not supported.
- Give control and take control:
 - Not supported during a screen sharing or application sharing session.
 - Supported during a PowerPoint sharing session.

For Teams known issues that aren't related to VDI, see [Support Teams in your organization](#).

Troubleshooting

Troubleshoot Citrix components

Teams crashes or the Teams sign in screen is blank

This is a known issue with Citrix VDA versions 1906 and 1909. To work around this issue, add the following registry DWORD value, and set it to 204 (hexadecimal).

HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CtxHook\Applnit_Dlls\SfrHook\Teams.exe

Then, restart VDA. To learn more, see this Citrix support article, [Troubleshooting HDX optimization for Teams](#).

Teams in Remote Desktop Services

12/7/2021 • 3 minutes to read • [Edit Online](#)

This article describes the requirements and limitations for using Microsoft Teams in a remote desktop services (RDS) environment.

What is RDS?

Remote Desktop Services (RDS) is the platform of choice for building virtualization solutions for every end customer need. RDS lets you deliver individual virtualized applications, provide secure mobile and remote desktop access, and provide end users the ability to run their applications and desktops from the cloud.

RDS offers deployment flexibility, cost efficiency, and extensibility. RDS is delivered through a variety of deployment options, including Windows Server 2016 for on-premises deployments, Microsoft Azure for cloud deployments, and a robust array of partner solutions. Depending on your environment and preferences, you can set up the RDS solution for session-based virtualization, as a virtual desktop infrastructure (VDI)

Currently, Teams in a remote desktop services environment is available with support for collaboration and chat functionality. To ensure an optimal user experience, follow the guidance in this article.

Teams on RDS with chat and collaboration

If your organization wants to only use chat and collaboration features in Teams, you can set user-level policies to turn off calling and meeting functionality in Teams.

Set policies to turn off calling and meeting functionality

You can set policies by using the Microsoft Teams admin center or PowerShell. It might take some time (a few hours) for the policy changes to propagate. If you don't see changes for a given account immediately, try again in a few hours.

Calling policies: Teams includes the built-in DisallowCalling calling policy, in which all calling features are turned off. Assign the DisallowCalling policy to all users in your organization who use Teams in a virtualized environment.

Meeting policies: Teams includes the built-in AllOff meeting policy, in which all meeting features are turned off. Assign the AllOff policy to all users in your organization who use Teams in a virtualized environment.

Assign policies using the Microsoft Teams admin center

To assign the DisallowCalling calling policy and the AllOff meeting policy to a user:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**.
2. Select the user by selecting to the left of the user name, and then select **Edit settings**.
3. Do the following steps:
 - a. Under **Calling policy**, select **DisallowCalling**.
 - b. Under **Meeting policy**, select **AllOff**.
4. Select **Apply**.

To assign a policy to multiple users at a time:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then search for the users or filter

the view to show the users you want.

2. In the ✓ (check mark) column, select the users. To select all users, select the ✓ (check mark) at the top of the table.
3. Select **Edit settings**, make the changes that you want, and then select **Apply**.

Or, you can also do the following steps:

1. In the left navigation of the Microsoft Teams admin center, go to the policy you want to assign. For example:
 - Go to **Voice > Calling policies**, and then select **DisallowCalling**.
 - Go to **Meetings > Meeting policies**, and then select **AllOff**.
2. Select **Manage users**.
3. In the **Manage users** pane, search for the user by display name or by user name, select the name, and then select **Add**. Repeat this step for each user that you want to add.
4. When you're finished adding users, select **Save**.

Assign policies using PowerShell

The following example shows how to use the [Grant-CsTeamsCallingPolicy](#) to assign the DisallowCalling calling policy to a user.

```
Grant-CsTeamsCallingPolicy -PolicyName DisallowCalling -Identity "user email id"
```

To learn more about using PowerShell to manage calling policies, see [Set-CsTeamsCallingPolicy](#).

The following example shows how to use the [Grant-CsTeamsMeetingPolicy](#) to assign the AllOff meeting policy to a user.

```
Grant-CsTeamsMeetingPolicy -PolicyName AllOff -Identity "user email id"
```

To learn more about using PowerShell to manage meeting policies, see [Set-CsTeamsMeetingPolicy](#).

Teams update process

12/7/2021 • 2 minutes to read • [Edit Online](#)

The Teams web app is updated weekly.

Teams desktop client updates are released every two weeks after rigorous internal testing and validation through our Technology Adoption Program (TAP). The update usually takes place on a Tuesday. If a critical update is required, Teams will bypass this schedule and release the update as soon as it's available.

The desktop client updates itself automatically. Teams checks for updates every few hours behind the scenes, downloads it, and then waits for the computer to be idle before silently installing the update.

Users can also manually download updates by selecting **Check for updates** on the **Profile** drop-down menu on the top right of the app. If an update is available, it will be downloaded and silently installed when the computer is idle.

Users need to be signed in for updates to be downloaded.

Starting July 31, 2019, Teams client updates use lower network bandwidth during the update. This update is turned on by default and requires no action from admins or users.

What about updates to Microsoft 365 Apps for enterprise?

Teams is installed by default with new installations of Microsoft 365 Apps for enterprise as described in [Deploy Microsoft Teams with Microsoft 365 Apps for enterprise](#).

Teams follows its own update process as outlined above. Teams doesn't follow the update process for the other Offices apps, such as Word and Excel. To learn more, read [Overview of update channels for Microsoft 365 Apps for enterprise](#).

What about updates to Teams on VDI?

Teams clients on Virtual Desktop Infrastructure (VDI) aren't automatically updated the way that non-VDI Teams clients are. You have to update the VM image by installing a new MSI as described in the instructions to [Install Teams on VDI](#). You must uninstall the current version to update to a newer version.

Can admins deploy updates instead of Teams auto-updating?

Teams doesn't give admins the ability to deploy updates through any delivery mechanism.

Servicing agreement

As a modern online service, the Teams client auto-updates every two weeks. Because Teams is governed by the Modern Lifecycle Policy, it's expected that users remain on the most up-to-date version of the desktop client. Auto-updates ensure that users have the latest capabilities, performance enhancements, security, and service reliability.

To identify when desktop clients fall out of date, an in-app alert will be displayed if the user's current version is between one and three months old, and if there's a new version available. This in-app messaging encourages users to update to the latest version of Teams or, if necessary, to reach out to their IT admin to do so. Users on Teams desktop clients that are more than three months old will see a blocking page that gives the options to update now, reach out to their IT admin, or continue to Teams on the web.

Teams desktop clients on Government Clouds currently have an exception to this servicing agreement until further notice.

For information on new version releases, check [Message Center](#) or go to **Help > What's new** in the client.

Troubleshoot Microsoft Teams installation and update issues on Windows

12/7/2021 • 6 minutes to read • [Edit Online](#)

This article provides guidance for how to diagnose and troubleshoot installation and update issues for the Teams desktop client app running on Windows.

Check whether Teams is updated successfully

Follow these steps to check whether a Teams update is successfully installed.

1. In Teams, select your profile picture, and then click **About** > **Version**.
2. On the same menu, click **Check for updates**.
3. Wait for the banner at the top of the app to indicate that a "refresh" of Teams is needed. The link should be shown about a minute later as this process downloads the new version of Teams. The banner also lets you know if you're already running the latest version in which case, no update is necessary.
4. Click the refresh link in the banner.
5. Wait until Teams restarts, and then repeat step 1 to see whether the app is updated.

If you see a failure message or if the version number is the same as in step 4, the update process failed.

Troubleshoot installation and update issues

Troubleshoot installation issues

When Teams is installed, the Teams installer logs the sequence of events to %LocalAppData%\SquirrelTemp\SquirrelSetup.log. The first thing to look for is an error message or a call stack near the end of the log. Note that call stacks at the beginning of the log may not mean that an installation issue exists. It can be easier to compare your log against the log from a successful installation (even on another machine) to see what's expected.

If SquirrelSetup.log doesn't indicate the cause or if you need more information to troubleshoot the issue, see [Collect and analyze application and system logs](#).

Troubleshoot update issues

When Teams is successfully installed, the log location switches from %LocalAppData%\SquirrelTemp to %LocalAppData%\Microsoft\Teams. At this location, there are two log files of interest, SquirrelSetup.log and logs.txt.

- The SquirrelSetup.log file at this location is written by Update.exe, which is an executable that services the Teams app.
- The Logs.txt file is used by the Teams app (specifically Teams.exe) to record significant application events. It will likely contain failure information.

These log files contain personally identifiable information (PII) and so they're not sent to Microsoft.

Teams can automatically start the update process (depending on the policy) or users can manually check for updates by going to their profile picture > **Check for updates**. Both methods use the following sequence of events.

1. **Check for updates.** Teams makes a web request and includes the current app version and deployment ring

information. The goal of this step is to get the download link. A failure at this step is logged in Logs.txt.

2. **Download update.** Teams downloads the update by using the download link obtained from step 1. When the download is complete, Teams calls Update.exe to stage the download. A download failure is also logged in Logs.txt.
3. **Stage the update.** The downloaded content is verified and unpacked into an intermediate folder, %LocalAppData%\Microsoft\Teams\stage), which is done by Update.exe. Failures at this step are logged in SquirrelTemp.log.
4. **Install the update.** There are multiple ways to start Teams. The system automatically starts Teams when a user logs in or you can start Teams through a shortcut. In this step, Update.exe checks for the presence of the staging folder, verifies the content again, and performs file operations to un-stage the app. The old application folder in %LocalAppData%\Microsoft\Teams\current is backed up to %LocalAppData%\Microsoft\Teams\previous and the stage folder is renamed to "current". Failures at this step are logged in SquirrelTemp.log.

If SquirrelTemp.log or Logs.txt don't contain sufficient information to determine the underlying cause and you need more information to troubleshoot the issue, go to [Collect and analyze application and system logs](#).

Collect and analyze application and system logs

This section describes how to collect and analyze application and system logs to get more comprehensive information to troubleshoot the issue. You'll use Sysinternals tools to complete these steps. To learn more, see [Windows Sysinternals](#).

Collect logs

1. Download the [Sysinternals tools](#).
2. Extract the zip file to the %TEMP% folder on your local drive.
3. Open an elevated command prompt, and then do the following:
 - a. Run the following to go to your TEMP folder:

```
cd /d %TEMP%
```

- b. Copy the setup and application logs. Note that depending on the point of failure, some of these logs may not be present.

```
copy %LocalAppData%\SquirrelTemp\SquirrelSetup.log SquirrelSetup.log
copy %AppData%\Microsoft\Teams\logs.txt logs.txt
copy %LocalAppData%\Microsoft\Teams\SquirrelSetup.log SquirrelSetup_Teams.log
```

- c. Run the following to capture the open handles.

```
handle > handles.txt
```

- d. Run the following to capture the opened DLLs.

```
listdlls -v Teams > dlls.txt
```

- e. Run the following to capture the drivers that are running.

```
driverquery /v > driverquery.txt
```

f. Run the following to capture the access control lists (ACLs) of the Teams folder.

```
icacls %LOCALAPPDATA%\Microsoft\Teams /save icacls.txt /T
```

Analyze logs (for advanced users)

A failed update can result in unpredictable app behavior. For example, users may be unable to exit Teams, have a stale version of Teams, or can't start Teams. If you experience an issue during an update, the first place to look to find the cause is SquirrelTemp.log. Here are the different types of update failures, listed from most common to least common, and how to analyze and troubleshoot them using logs.

Unable to exit Teams

As Teams determines that it needs to update itself to a newer version, it downloads and stages the new app, and then waits for an opportunity to restart itself the next time the machine is idle. A common issue during this process is when another process or a file system driver locks up the Teams.exe process, which prevents Teams.exe from exiting. As a result, the Teams app can't be replaced by the newly-downloaded and staged app.

Troubleshooting tips:

- To confirm that is the issue that you're experiencing, quit Teams (right-click Teams on the task bar, and then click **Quit**). Then, open Task Manager in Windows to see whether an instance of Teams is still running.
- If you're not on the computer that's having this issue, inspect the SquirrelTemp.log collected from the computer that's experiencing this issue and look for a "Program: Unable to terminate the process in the log" entry.
- To determine what's preventing Teams.exe from exiting, look at the DLLs.txt and Handles.txt logs. These tell you the processes that prevented Teams from exiting.
- Another culprit that can prevent Teams from exiting is the kernel-mode file system filter driver. Use the SysInternals tool, [ProcDump](#), to collect the kernel-mode process dump by running `procdump -mk <pid>`, where <pid> is the process ID obtained from Task Manager. You can also inspect the Driverquery.txt log file to see the active filter drivers that may interfere with Teams.
- To recover from this state, restart the computer.

File permissions

Teams creates a number of subfolders and files in the user's profile throughout the installation and update process. Because the app and the updater runs as a non-elevated user, read and write permissions must be granted on the following folders:

FOLDER	USED BY
%LocalAppData%\SquirrelTemp	Teams installer (for example, Teams_Windows_x64.exe) during installation phase
%LocalAppData%\Microsoft\Teams	Teams updater (Update.exe) to extract and stage the app package during update process
%AppData%\Microsoft\Teams	Teams app (Teams.exe) to save settings, app states, and the (pre-staged) downloaded update package

If Teams is denied access because it can't write to a file, another software application may be interfering or a security descriptor entry may be limiting write access to a folder.

Troubleshooting tips:

- Look for "access denied" evidence in SquirrelTemp.log or Logs.txt. Check these files to see whether there was an attempt to write to a file that failed.

- Open `icacls.txt` and look for the effective access control entry (ACE) that blocks write operations by a user who is not an admin. Typically, this is in one of the DACL entries. For more information, see the [icacls documentation](#).

File corrupted

In some cases, encryption software can change files in the `%LocalAppData%\Microsoft\Teams` folder, which can prevent Teams from starting. This can happen at any time, even when the app isn't being updated. Unfortunately, when a file is corrupted, the only way to recover from this state is to uninstall and re-install Teams.

NOTE

If you can't determine the underlying cause of the issue by using any of these steps, you may want to try a [Process Monitor](#) session. Process Monitor is a Sysinternals tool that records access to the registry and file system.

Key segments

TITLE	ABSTRACT	SPEAKERS
Creating a resilient, inclusive, and hybrid workplace with Microsoft Teams	Organizations are moving to a hybrid workplace to support the needs of remote and onsite employees. In the first part, learn how teams can stay connected through Teams meetings, virtual events, and calling, along with new device experiences. We'll show how the Teams platform can help streamline workflows, improve decision making, and integrate your ecosystem of applications. Also check out the second part of this series, session code DB158.	Nicole Herskowitz
Meet smarter, stay focused, and achieve more with Microsoft Teams meetings	Meetings are the cornerstone for how work gets done. Learn how Teams meetings can help you and your organization be more productive while adapting to a new way of working.	Shiraz Cupala
Microsoft Teams Calling Made Simple	Enterprise Calling in Teams is simple to deploy and use. Learn the basics of Teams Calling while finding out the latest in Calling such as new calling experiences and collaborative calling.	Paul Cannon, Laura Kramer, Barbara Kim
One place for admins to manage Microsoft Teams: What's new in Teams manageability	Teams admins have flexible and granular management capabilities. The capabilities lets them craft a custom experience for their organizations that best meets the needs of the business. In this session, we'll introduce the latest and greatest capabilities around our Team Admin Center portal, discuss what's new in policies, app management, device management, reporting, analytics and troubleshooting, and PowerShell.	Ronit Ben-Sheffer, Jamie Stark

TITLE	ABSTRACT	SPEAKERS
Scale and Customize Virtual Meetings and Events with Microsoft Teams	Meetings come in all shapes and sizes - learn how to use Teams to structure and manage your next large event. Teams can seamlessly scale with your organization's needs, providing ways to customize and deliver optimal attendee experiences for events of all sizes.	Christina Torok, Ashwin Appiah
Power modern meeting experiences across the hybrid workplace using Microsoft Teams devices	Introduction to Microsoft Teams devices. Teams devices are designed to help people maximize the power of Teams and bridge the gap between remote and shared workspaces. Learn about the devices designed to deliver people-centric meeting room experiences and reimaged personal workspaces enabling more inclusive and collaborative experiences with Microsoft Teams devices.	Kendra Baker, Greg Baribault
Transforming the modern workplace with Microsoft Teams Platform	Learn about all the new and existing extensibility points within the Teams platform. Discover how you can create powerful apps and solutions to solve your business needs.	Archana Saseetharan, Michal Lesiczka
Reimagining work with the Microsoft 365 Platform	The Microsoft 365 platform helps organizations tailor every facet of their environment to help people work and collaborate better. Discover how every app can go further by adding insights and relevant data from Microsoft Graph. Learn how every app can integrate with the flow of work across apps, including Microsoft Teams. See how apps can deliver unique, engaging experiences across devices. Take advantage of key building blocks that can speed app creation.	Yina Arenas, Mike Ammerlaan
Simplify work with low-code solutions for Microsoft Teams & Microsoft 365	Teams and Microsoft 365 are platforms for everyone, even if you don't have any professional development experience. Come see how low-code innovations for Teams and Microsoft 365 are making it easier for teams to build and use custom apps, bots, automation, and data to address challenging business processes.	Karan Nigam, Weston Lander

TITLE	ABSTRACT	SPEAKERS
Managing Security and Compliance in Microsoft Teams	Enabling secure, remote work is important. In this session, learn about the latest Teams features and functionalities across security and compliance. We'll cover how to use the intelligence and strength of Microsoft 365 within Teams to keep your organization secure and compliant. Topics include keeping your information protected against data leaks, enabling safe and inclusive meetings, and maintaining a compliant organization across world-wide regulations and business requirements.	John Gruszczyk

Pre-recorded sessions

Meetings, Calling, and Devices

TITLE	ABSTRACT	LEVEL	SPEAKERS
Innovation in Teams meetings and devices with intelligence	We're continuously innovating and reimagining meetings. Learn how we're bringing more intelligence in meetings and our latest innovation in devices that bring intelligence to life.	200	Shalendra Chhabra
Advanced calling capabilities	Go deeper with Calling as we explore the new calling experience. Receive further information on Collaborative Calling, e911, Location-Based Routing and other features. Learn how Calling is ready for your advanced scenarios no matter the size of your company.	200	Alan Xie, Roy Kuntz

TITLE	ABSTRACT	LEVEL	SPEAKERS
Microsoft Teams devices for shared spaces	Microsoft Teams devices are designed to help people maximize the power of Teams and bridge the gap between remote and shared workspaces. With Teams meetings features, customer-centric room experiences, and industry-leading hardware, users benefit from low-friction, inclusive, and interactive meetings. Meeting features are available whether users join remotely or in the meeting room. Learn how shared space devices like Microsoft Teams Rooms, collaboration bars and Surface Hub can help your teams stay connected and collaborative across the hybrid workplace.	200	Greg Baribault, Kendra Baker, Sandhya Rao
On Skype for Business? Design your path to Microsoft Teams	Join this session to learn and determine the most suitable approach based on your current Skype for Business implementation and business goals. Whether you're a Skype for Business Online or Server customer, we'll share hints, resources, and guidance to get to Microsoft Teams today.	200	Lisa McKee, Laszlo Somi
Modern innovation in Teams personal devices	Customers are looking for the right personal devices for Teams, especially as many of their employees are working remotely. Join us to learn about new innovations in Teams personal devices. We'll share our momentum in features and certified devices and our hints for remote work.	200	Sandhya Rao, Arash Ghanaie-Sichanie, Kruthika Ponnusamy
Master virtual breakout rooms in Microsoft Teams meetings	Join us to learn about the latest innovations with virtual breakout rooms in Teams. In this session, we'll highlight use cases and best practices for facilitating small group ideation, brainstorming, learning, and discussions with virtual breakout rooms.	200	James Skay, Nakul Madaan

TITLE	ABSTRACT	LEVEL	SPEAKERS
Make your Teams meetings safe and inclusive with meeting and video conferencing controls	Join this session to learn more about meetings safety, security, and moderation. We highlight the ability to hard mute all attendees, request to speak functionality, and configuring breakout rooms. We'll cover features such as reactions and raised hands that can help make meetings more inclusive.	200	Nakul Madaan, Rajiv Ramaiah
Microsoft Teams Calling and Meetings as a platform	Learn about Teams Calling and Meetings platform capabilities with updates to Microsoft Graph Cloud Communications APIs, Contact Center, and Compliance Recording. We'll share coming news in other platform experiences.	200	Srividhya Chandrasekaran, Mansoor Malik
Leverage Teams to deliver engaging virtual events for your employees, customers, and communities	Join this session to learn how Microsoft Teams can seamlessly scale to help deliver events of all types. Imagine company townhalls, training webinars, and online conferences. We'll also share vision and roadmap for features to help scale and customize your virtual meetings and events.	200	Christina Torok, Ashwin Appiah
Best practices for delivering more efficient and impactful meetings with Microsoft Teams	Teams Meetings are evolving and integrating deeply in the continuum of collaboration. We make meetings more productive, secure, and inclusive. Innovation in Teams will help you better prepare, execute, and streamline meetings. In this session, we'll showcase hints to help you get the most of your meetings and stay in the flow of work.	200	Shiraz Cupola

Get started on your upgrade from Skype for Business to Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Congratulations on your pending upgrade from Skype for Business to Microsoft Teams. Whether you're just getting started with Teams, already using Teams alongside Skype for Business, or ready to upgrade, we want to ensure you have everything you need to navigate a successful journey to Teams.

Whether you are upgrading from Skype for Business Online to Teams or from a Skype for Business on-premises environment to Teams, the upgrade framework will guide you through the process based on your business scenario. We also encourage you to visit the [Upgrade hub](#) for additional training and resources for implementing a successful upgrade from Skype for Business to Teams.

IMPORTANT

Skype for Business Online will be retired on July 31, 2021. If you haven't upgraded your Skype for Business Online users to Microsoft Teams before that date, they will be automatically scheduled for an [assisted upgrade](#). If you want to upgrade your organization to Teams yourself, we strongly recommend that you begin planning your upgrade path today. Remember that a successful upgrade aligns technical and user readiness, so be sure to leverage our [upgrade guidance](#) as you navigate your journey to Teams.

Keep reading for frequently-asked questions about upgrade.

Why upgrade to Microsoft Teams?

Microsoft Teams extends the capabilities of Skype for Business, bringing together chat, meetings, calling, collaboration, app integration, and file storage into a single interface. Teams helps streamline the way users get things done, improving user satisfaction and accelerating business outcomes. We're continually expanding Teams' capabilities to enable you to communicate and collaborate in new ways, break down organizational and geographical barriers, and drive efficiency in process and decision making. Learn more about the benefits of upgrading to Teams in the Forrester report: [Total Economic Impact of Microsoft Teams](#).

When should my organization migrate to Teams?

While the Skype for Business Online service will be fully functional through July 31, 2021, we strongly recommend that you begin your upgrade to Teams today. By starting your upgrade today, you'll have ample time to finish it prior to the retirement date. You can choose to upgrade to Teams using either the overlapping capabilities method ("Islands mode") or the select capabilities method. For more information about these methods, see [Choose your upgrade journey from Skype for Business to Teams](#).

Can we continue to use Skype for Business Online as we prepare for and execute our upgrade to Teams?

Yes, Microsoft offers several options for running Skype for Business Online and Teams together. These coexistence modes allow your users to become familiar with Teams today while helping accelerate your upgrade to Teams Only. For more information, see <https://aka.ms/SkypeToTeams-Coexist>.

Is Phone System available for Teams users?

Yes. Phone System is available to all Teams users after they are moved to TeamsOnly mode. In addition, Microsoft provides options for connecting to the Public Switched Telephone Network (PSTN) so that users can make phone calls anywhere in the world. For more information, see [Voice - Phone System and PSTN connectivity](#).

Can we continue to use our on-premises telephony infrastructure?

Yes. With Phone System Direct Routing, you can use Phone System with virtually any telephony carrier. With Direct Routing, you connect your own Session Border Controller (SBC) directly to Phone System. For more information, see [Phone System Direct Routing](#).

How is Microsoft helping customers with their migration to Teams?

Microsoft is committed to helping make your transition from Skype for Business to Teams a success. Microsoft is providing robust guidance built around a proven, end-to-end upgrade success framework designed to help you plan and execute the upgrade to Teams. Our guidance is designed for every stage of the upgrade journey, whether you are just getting started with planning, already running Teams alongside Skype for Business, or ready to upgrade to Teams.

To help facilitate your upgrade planning and implementation, Microsoft hosts complimentary live, interactive upgrade planning workshops, designed to help you get familiar with our upgrade framework, share insights into preparing your users for the upgrade, and identify the right path for your organization on your journey to Teams. Join us for an upgrade planning overview session: <https://aka.ms/SkypeToTeamsPlanning>.

Organizations using Skype for Business Online may be eligible for Microsoft-assisted upgrades to Teams to help make the successful transition from Skype for Business Online prior to the July 31, 2021 retirement of the service. Assisted upgrades reduce the number of technical tasks required of customers and allows for greater focus on organizational preparedness, user awareness, and Teams training.

Customers scheduled for assisted upgrades will receive notifications in both the Teams admin center as well as the Microsoft 365 Message Center three months before their upgrade date. For more information, see [Assisted upgrades from Skype for Business Online to Microsoft Teams](#).

Why do I need upgrade guidance? Can't I just delete/decommission Skype for Business?

Upgrading from Skype for Business to Teams is more than a technical migration. It represents a transformation in how users communicate and collaborate, and change is not always easy. The ideal upgrade approach should address the technical aspects of your upgrade as well as encourage user acceptance and adoption of Teams, driving a positive user experience and business outcome realization.

Where do I start planning for Teams/my upgrade to Teams?

Start your journey by familiarizing yourself with our upgrade success framework and associated resources. This guidance serves as the cornerstone for navigating your journey from Skype for Business to Teams.

[Learn about the Upgrade Framework](#) and join us for a [live upgrade planning overview](#) session.

IMPORTANT

Remember that a successful upgrade ensures both technical and user readiness, so be sure to leverage the guidance herein as you navigate your journey to Microsoft Teams.

TIP

Watch the following sessions to learn about the Upgrade from Skype for Business to Microsoft Teams:

- [Introduction to upgrade](#)
- [Plan your upgrade](#)
- [Coexistence and interoperability](#)
- [Administrator experience](#)

About the upgrade framework

12/7/2021 • 8 minutes to read • [Edit Online](#)

To help take the guesswork out of your upgrade journey, we've employed a proven framework for implementing change. As illustrated below, each step in the framework builds on the step prior and, for optimal results, we recommend following the steps in order.

Begin by bringing together the right stakeholders and defining your upgrade plan (e.g. scope, goals and timeline). With a plan in place, confirm your technical environment and your end-users are ready for Teams. Then, implement your upgrade in stages, moving from a pilot to an organization-wide upgrade when ready. Once your organization is on Teams, establish an operational plan that monitors for quality and accelerates user adoption.

Look for this framework graphic on related pages to identify where you are in the upgrade process.

Sample upgrade timeline

Your upgrade journey begins when you start planning for the change. Leveraging the success framework as a guideline, below is a sample timeline that take you from the pre-upgrade phase where you will plan and prepare for your upgrade, through the upgrade and into the post-upgrade operational phase, designed to sustain and amplify your outcomes.

NOTE

We understand that your journey to Teams might involve leveraging multiple [modes](#) and upgrading groups of users at different times, which will enable you to control the user upgrade experience while maintaining momentum with Teams.

To help demonstrate how your upgrade journey might unfold, we've provided a sample plan below that defines a journey going from Skype for Business Online to [lands mode](#) to Teams only. In addition, the sample plan outlines an organization that has divided their users into four upgrade groups, or [cohorts](#). Using this as a template, customize the plan to encompass your specific journey to Teams, incorporating the various [modes](#) you'll use and the number of upgrade groups you'll segment your users into.

Pre-upgrade

Prepare your organization for Teams. To help ensure a successful upgrade to Teams, it's important to allocate adequate time for preparation. Not only will your organization be able to quickly start realizing the value of Teams, you'll be able to accelerate your upgrade from Skype for Business as soon as Teams is ready for you. If you've already enabled Teams alongside Skype for Business, use these pre-upgrade activities as a checkpoint to validate your organization's readiness before you upgrade users to Teams.

TIP

Download the [Upgrade Success Kit](#) for template user readiness materials, such as communications and user surveys, in addition to a sample upgrade project plan and pilot test plan. Items that are available in the kit are marked with an asterisk (*) in the lists below.

Plan: Create your upgrade plan to help ensure your organization is set up for long-term success

STEP		SUMMARY	RESOURCE
1	Define your stakeholders	Assign project team members accountable for driving upgrade success.	Enlist your stakeholders
2	Define your project vision and scope	Design your "big picture" vision and current project scope to create a blueprint for your upgrade journey.	Project vision Project scope
3	Define your project goals	Set targeted goals that enable you to measure progress as well as project success.	Project goals
4	Identify risks and mitigation plans	Establish a mitigation plan to ensure you can quickly get your project back on track should issues arise.	Risks and mitigation
5	Define your timeline	Set a timeline and key milestones to help your project stay on time and on budget.	Timeline Upgrade Success Kit
6	Define the appropriate Skype for Business and Teams upgrade and coexistence strategy	Map your journey to ensure the best path from Skype for Business to Teams for your organization.	Understand Microsoft Teams and Skype for Business coexistence and interoperability Understand Phone System and PSTN connectivity options Choose your upgrade journey

Prepare: Evaluate your organization's readiness for Teams

STEP		SUMMARY	RESOURCE
1	Assess your environment and complete Teams technical onboarding	Ensure your environment is ready for Teams to help optimize the user experience and facilitate your upgrade over time.	Evaluate your environment before upgrading to Teams. Prepare your service for upgrading to Teams

STEP		SUMMARY	RESOURCE
2	Optimize network for Teams, particularly for real-time media scenarios	If you're deploying audio, video, or meetings, take these additional steps to optimize your network for that functionality.	Prepare your network for upgrading to Teams
3	Assess organizational change readiness and define teamwork scenarios	Understand your user base to prepare the right value messaging and level of education to facilitate and accelerate user adoption.	Organizational change readiness
4	Prepare a user readiness plan to define how you will communicate, train, and support users	Personalize your communications, training, and support plan to ensure optimal receptiveness to the new technology.	Prepare a user readiness plan Upgrade Success Kit
5	Announce the pending launch of Microsoft Teams	Communicate early to help users feel included, reduce confusion, and generate excitement.	Upgrade Success Kit
6	Prepare your IT staff for Teams	Confirm your technical and support staff has everything they need to ready and support your technical environment for Teams.	Prepare your IT staff for Microsoft Teams Upgrade Success Kit

Pilot: Run a pilot to confirm that your organization is ready and inform your optimal journey to Teams

STEP		SUMMARY	RESOURCE
1	Outline pilot logistics	Define formal pilot logistics to help validate your organization's readiness to upgrade or coexist.	Outline pilot logistics
2	Select your pilot participants and test scenarios	Identify users who can help validate teamwork scenarios and verify Teams readiness.	Select your pilot participants and test scenarios
3	Design your test plan and feedback survey	Identify clearly defined tasks for participants to complete and a way for them to share their feedback.	Design your test plan and feedback survey
4	Create your pilot communications plan	Educate pilot participants on what's happening, when, and why, and what's expected of them.	Create your communications plan Upgrade Success Kit
5	Conduct your pilot	Start your pilot, track progress and iterate as needed to optimize your pilot results.	Conduct your pilot

STEP		SUMMARY	RESOURCE
6	Assess learnings and evaluate your go-forward plan	Gather user feedback, network stats, and support tickets for analysis against your goals and determine your go-forward plan.	Assess learnings and evaluate your go-forward plan

Deploy: Run Teams in coexistence with Skype for Business

STEP		SUMMARY	RESOURCE
1	Announce the official launch of Teams	Generate excitement and momentum by sending an official launch announcement when Teams is ready.	Upgrade Success Kit
2	Implement your upgrade	The steps you take depend on your current deployment of Skype for Business.	Implement your upgrade
3	Stay informed about the Teams roadmap	Monitor the Teams roadmap to identify the right time for your organization to move to Teams.	Teams roadmap
4	Send additional communications and engage Teams champions to drive excitement and adoption of Teams	Encourage user adoption and maintain excitement for Teams with ongoing communications and champions.	Microsoft 365 Champions Program

Upgrade

Make the official move to Teams. When you upgrade your users, you move them into Teams only mode. Teams becomes their primary app for chat, meetings, calling, and collaboration, and access to the Skype for Business app is disabled. Although the technical aspects of this phase are quite simple, consider the effect the change might have on user experience and allow time for users to officially transition their activities from Skype for Business to Teams. To reduce users having different experiences with different clients, try to limit the end-to-end upgrade window to 45 days or so.

Upgrade: Implement your upgrade from Skype for Business to Teams

STEP		SUMMARY	RESOURCE
1	Confirm that you've completed the pre-upgrade activities described above	Help ensure upgrade success by confirming completion of all planning and preparation activities.	All the above

STEP		SUMMARY	RESOURCE
2	Initiate communications to users in your first upgrade group	Notify users that upgrades are starting, and keep them informed throughout the process.	Prepare a user readiness plan Upgrade Success Kit
3	Enable the coexistence mode to Teams Only for users in your first upgrade group	Follow steps appropriate to your Skype for Business environment to perform the technical user migration.	Upgrade from Skype for Business Online to Teams Upgrade from Skype for Business on-premises to Teams
4	Repeat the preceding upgrade activities for the remaining upgrade groups on a rolling cycle	Continue to drive your ongoing communications plan and upgrade user groups based on your plan.	
5	Send post-upgrade feedback surveys to all users	Use a feedback survey to capture feedback and insights from users.	Upgrade Success Kit

Post-upgrade

Maximize business value with Teams. After your organization is fully upgraded to Teams, take time to evaluate your success against your goals and implement a plan to continue forward momentum.

Operate: Measure the success of your upgrade

STEP		SUMMARY	RESOURCE
1	Assess your initial upgrade success	Evaluate progress against the goals you established in the pre-upgrade phase.	Project goals
2	Implement a mitigation plan for any goals that aren't on track	Define mitigation or course-correction strategies for goals that are not being met.	Project goals
3	Monitor for network health and quality	Implement a quality check and monitoring plan to help ensure a positive user experience as well as reduce calls to your support desk.	Monitor for network health and quality
4	Drive user momentum and adoption	Encourage user adoption and maintain excitement for Teams with an ongoing adoption plan.	Drive user momentum and adoption
5	Prepare for new functionality	Realize maximum value by establishing a change cycle for new innovations and product improvements.	Prepare for new functionality

NOTE

Our Upgrade content is continually evolving. Be sure to check back for the latest guidance, and read the [Teams blog](#).

IMPORTANT

Skype for Business Online will be retired on July 31, 2021, after which it will no longer be accessible or supported. To maximize benefit realization and ensure your organization has proper time to implement your upgrade, we encourage you to begin your journey to Microsoft Teams today. Remember that a successful upgrade aligns technical and user readiness, so be sure to leverage the guidance herein as you navigate your journey to Microsoft Teams.

Plan for your upgrade

12/7/2021 • 2 minutes to read • [Edit Online](#)

A healthy technical environment, sustained user adoption, and the realization of your business goals all begin with proper planning. A solid plan gives you a framework for your upgrade project and ensures that all stakeholders are working toward the same goals. By taking time to properly define success, you can measure results as you progress through your deployment and verify that you're achieving the outcomes you wanted. Planning your journey includes:

- [Enlisting your project stakeholders](#)
- [Defining the scope of your project](#)
- [Understanding coexistence and interoperability of Skype for Business and Teams](#)
- [Choosing your upgrade journey based on your business needs](#)
- [Planning a user pilot](#)

After you've planned your journey, you will read topics about [preparing your environment](#) and [preparing your organization](#) before you [implement your upgrade](#).

TIP

Join us for live, interactive workshops in which we'll share guidance, best practices, and resources designed to kick start upgrade planning and implementation.

Join the [Plan your upgrade](#) session first to get started.

Enlist your project stakeholders

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Project Stakeholders stage of your upgrade journey, the first and most essential activity you complete for your project's success.

From implementing project deliverables to driving accountability, your stakeholders hold the key to the success of your project. There are two groups of stakeholders you'll want to assign: (1) a *sponsorship coalition* that includes executive and project sponsors who have a vested interest in and influence on the project's success, and (2) the *project team*, consisting of the people responsible for ensuring technical and user readiness, who will complete the various tasks in the project plan. The common thread between these two groups is the *project manager*, who works to ensure that project tasks get completed on schedule and reports project status back to the coalition.

TIP

Take time to identify the ideal executive sponsor, someone who can help set the tone of your project, leads by example, and holds others accountable. This should be a senior manager or executive who has authority over the project scope and vision. They should also be the final decision-maker in removing blockers and resolving conflict to help keep the project on time and on budget.

Optionally, you can create a steering committee. Sometimes large or more complex projects end up with "too many cooks in the kitchen," resulting in disconnects among the stakeholder groups. For these projects, you might want to form a steering committee. A steering committee is responsible for driving decisions, providing strategic oversight, supporting the project's initiatives, and—when necessary—removing blockers. You can find more information about implementing a steering committee in the [steering committee guide](#).

 Decision points	<ul style="list-style-type: none">• Who are the right people to serve as your stakeholder team for this project?
 Next steps	<ul style="list-style-type: none">• Consider the scope of your project and assign the relevant stakeholders.• Use the following table as a guideline, but note that this list isn't all-inclusive. <p>Tip Build a responsible-accountable-consulted-informed (RACI) matrix to further distinguish those who will be held accountable from those who simply need to be kept informed in a particular area of the project.</p>
<ul style="list-style-type: none">• Decide whether to create a steering committee, and assign roles as appropriate.	

ROLES	RESPONSIBILITY
Sponsorship coalition	
Executive Sponsor	Drives overall messaging and accountability
Business Sponsor	Facilitates new technology requests for their business unit
Department Managers	Represents the teams most affected by this change
Human Resources Manager	Is accountable for talent management
Project Manager/Lead	Oversees the transition project, ensures completion of all tasks
Project team	
Collaboration Lead/ Architect	Creates and implements the solution architecture
Network Lead	Provides insights into network design and execution
Security Lead	Provides insights into security design, process, and implementation
Synchronous Communications Lead	Owns presence tooling such as chat, meetings, and calling
Asynchronous Collaboration Lead	Owns asynchronous tooling such as SharePoint, OneDrive, and so on
Telephony Lead	Provides insights into telephony design and implementation
Service Owner/ Quality Champion	Owns the operation of Teams all-up, including the quality of the user experience
Desktop and Devices Lead	Provides input into clients, devices, and desktop apps
IT Pro/Tenant Admin	Ensures the network readiness and Microsoft 365 admin center configurations are in place
Support/Help Desk Lead	Manages the readiness of your support desk
Change Management Lead	Oversees the user change management and adoption program
Marketing Lead	Designs and implements communications campaigns
Training Lead	Designs and implements training plans

After you've gathered your stakeholders, proceed to the next step: [Define your project scope](#).

Define your project scope

12/7/2021 • 7 minutes to read • [Edit Online](#)

This article is part of the Project Definition stage of your upgrade journey, an activity you complete after you create a sponsorship coalition and project team from the stakeholders you've identified are key to your project's success. Before proceeding, confirm that you've completed the following activities:

- [Enlisted project stakeholders](#)

Taking time to define your project vision, scope, goals, and governance will help ensure all project stakeholders are aligned and working toward the same end results. This is especially critical given that the technical readiness team and user readiness team will be working independently to pull their respective pieces together. After you complete this section, refer to it throughout your project to ensure you're on track to achieve the end state you wanted. Use the goals that you identify below to measure against your outcomes, and mitigate as needed.

 Decision points	<ul style="list-style-type: none">• What do you want to accomplish with this project (in other words, why are you doing it)?• What does success look like?• What are the risks, and what's your plan to mitigate those risks?
 Next steps	<ul style="list-style-type: none">• Discuss the following sections with your project team and sponsors.• Document your vision, scope, goals, and risks for this project.• Revisit your project team to validate that you've engaged the right team.

Project vision

Your vision is the "big picture" or eventual end-state that answers the question, "Why are we doing this project?" An ideal vision addresses your organization's business drivers and user value-add perspectives, as shown in the following examples:

- **Organization business driver:** Standardizing on Microsoft Teams aligns with our digital workplace transformation and enables us to drive operational efficiencies, eliminate redundant solutions, and save USD5 million.
- **User value-add:** Microsoft Teams (1) saves time by providing a single location for project notes, Office docs, team members, conversations, and meetings; (2) simplifies communication by using a centralized contact list and persistent chat tracking for quick access to your conversations, and (3) alleviates the frustration of trying to find that lost email attachment by storing and accessing files in one place.

Consider the following discussion points to help refine your vision:

- Description of the current business process
- Challenges with the existing business process
- How technology can help overcome these challenges
- The expected and measurable business outcomes if these challenges are overcome

TIP

Identify use cases and personas to further refine your project vision.

Project scope

Your vision might only be realized over time, through various phases. The project scope defines the focus of your project *at this time* and serves to keep your project team focused on their current tasks, enabling you to realize your long-term vision. For example, your scope might call for you to run a pilot, deploy a specific workload such as voice or meetings, or enable Teams alongside Skype for Business as you plan for your upgrade over time. As part of the project scope, you should assess:

- The various coexistence modes, and which would be optimal for your organization.
- The best way for Skype for Business and Teams to coexist before you move to Teams.
- Whether you should conduct a pilot to validate technical and user readiness in your organization.

Project goals

Your goals define the outcome you want and enable you to measure the success of the project. Goals can be defined as *objectives and key results* (OKRs), and the measures of project success can be defined as *key success indicators* (KSIs). It's essential that you get full participation from project stakeholders in defining OKRs and KSIs, to help ensure they feel a sense of ownership and align these measures of success to defined project tasks. Goals should include a mix of technical and user-focused success.

- **OKRs** contain the objectives you set at the beginning of the project and the key results you measure on a defined cadence (for example, monthly or quarterly). By reviewing your key results, you can ensure your project deliverables are on schedule, or identify and mitigate issues to get your project back on track. OKRs are typically categorized as "achieved" or "not achieved."
- **KSIs** measure quality and success of the key results and complement the binary nature of OKRs by detailing good and/or bad results. When defining KSIs, we recommend that you use "specific, measurable, assignable, realistic, time-related" (SMART) criteria:
 - Specific: target a specific area for improvement
 - Measurable: quantify, or at least suggest an indicator of, progress
 - Assignable: specify who will do it
 - Realistic: state what results can realistically be achieved, given available resources
 - Time-related: specify when the results can be achieved

The following table shows examples of OKRs and KSIs for the initial phases of a Skype for Business to Teams upgrade project.

OBJECTIVE	KEY RESULT	TO DO
-----------	------------	-------

OBJECTIVE	KEY RESULT	TO DO
Pilot Teams alongside Skype for Business, in collaboration-only mode	FY19Q2: 500-user pilot conducted and completed	<ul style="list-style-type: none"> Identify pilot users Create a pilot test plan Enable pilot users on Teams Implement the pilot Execute a pilot feedback survey Measure pilot success
Successfully run collaboration-only mode for all users in the organization alongside Skype for Business	<ul style="list-style-type: none"> 60% of Skype for Business users are using Teams within 30 days of rollout User satisfaction with Teams is $\geq 80\%$ 	<ul style="list-style-type: none"> Design and execute a broad communications and training plan Enable all users for Teams in collaboration-only mode Track usage monthly Gather user feedback Monitor network health/quality Mitigate as needed

TYPE	KEY SUCCESS INDICATOR	HOW MEASURED	SUCCESS CRITERIA	MEASURED
Network and quality	Percentage of poor audio calls should be minimal	Call Quality Dashboard (CQD)	<3% of poor calls with Teams	Weekly, then monthly
Usage and awareness	The chat, meetings, and calling experience is equal to or better than Skype for Business	Survey	80% agree or strongly agree	Weekly through pilot, post-rollout
Usage and adoption	Users actively use the solution	Microsoft 365 reports or CQD	90% participation from pilot users, better than the current solution	Weekly, then monthly
Usage and training	I had adequate training/help resources to successfully use Teams	Post-pilot survey	80% agree or strongly agree	Post-pilot, post-rollout
User satisfaction	I would recommend Teams to others	Net Promoter Score (NPS) via post-pilot survey	NPS > 0	Post-pilot, post-rollout
Business driver	Cost savings	Accounts Payable	\$X million cost expenditure in third-party solutions	Six months, then one year, then five years post-rollout

TIP

To help ensure your project stays on track, consider defining smaller, short-term milestones in addition to bigger, long-term goals. This can include metrics that you'll capture as part of your user pilot. When considering your timeline, use the [Microsoft 365 Roadmap](#) if you're waiting for features that aren't yet available in Teams.

Risks and mitigation

With any project, unforeseen events or other factors can arise and throw your project off track. It's important to proactively assess potential risks and define a mitigation plan for overcoming the issues that might arise, so your project can continue toward your goals. A *risk register* is an excellent tool for tracking project risks—along with how likely they are and their potential impact—and capturing your mitigation plan. The following table shows a sample risk register.

RISK	LIKELIHOOD	IMPACT	OVERALL	MITIGATION PLAN
Network quality	Medium	High	High	Execute a network planning exercise.
Low user adoption	High	High	High	Proactively work with users during the pilot and deployment phases; implement a targeted awareness and training campaign to create desire.

Timeline

As you scope your upgrade journey, be sure to set a timeline for key milestones (for example, enabling Teams alongside Skype for Business for all users) in addition to the completion date. A defined timeline helps your project team drive toward a consistent end state and informs the right work-back schedule, helping to ensure that your project stays on track. Consider a timeline that's not too accelerated (where tasks might be overlooked) or too distant (where momentum might be lost). The ideal timeline accounts for:

- **Product readiness for compliance and user scenario requirements:** Refer to the [product roadmap](#) to gauge when Teams will be ready for your organization.
- **Upgrade groups:** Determine whether you'll be enabling Teams or upgrading users by upgrade groups, which could affect the timeline of your overall upgrade journey.
- **Organizational factors such as change freeze, fiscal year end, deployment lifecycles:** Discuss and account for any internal processes that might influence your upgrade timeline.
- **Other changes that are occurring at or around the same time:** Consider bundling changes or spacing them out to facilitate a positive user experience and minimize any impact on productivity.
- **Resourcing:** Confirm resource allocation with your project stakeholders to ensure that the project team you've brought together has enough bandwidth to complete all necessary tasks.

As a reference point, a sample timeline is provided for the pre-upgrade, upgrade, and post-upgrade phases of the [Upgrade Pro journey](#), which we encourage you to adjust as needed to align with the specific needs of your organization.

After you've completed the activities described above, you should have a solid foundation for your project.

Continue with your [technical readiness](#) and [organizational readiness](#) planning activities.

Remember: Skype for Business Online will be retired on July 31, 2021. After that time, the Skype for Business Online service will no longer be accessible or supported. To maximize benefit realization and ensure your organization has proper time to complete your upgrade, we encourage you to begin your journey to Microsoft Teams today.

Understand Microsoft Teams and Skype for Business coexistence and interoperability

12/7/2021 • 23 minutes to read • [Edit Online](#)

This article is part of the Project Definition stage of your upgrade journey. Complete after you create a sponsorship coalition and project team and define the scope, goals, and plan for your project. Before proceeding, confirm that you've completed the following activities:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)

If your organization uses Skype for Business today and you are starting to use Teams alongside Skype for Business—or you are starting to upgrade to Teams—it's important to understand how the two applications coexist, when and how they interoperate, and how to manage your users' migration all the way to their eventual upgrade from Skype for Business to Teams.

TIP

Watch the following session to learn about [Coexistence and Interoperability](#).

Additionally, you can join us for live, interactive workshops in which we'll share guidance, best practices, and resources designed to kick start upgrade planning and implementation.

Join the [Plan your upgrade](#) session first to get started.

Coexistence of Teams and Skype for Business overview

The following sections describe the coexistence modes that are available when you decide to upgrade to Teams, and the capabilities each mode offers. In addition, we describe the interoperability (interop) that occurs between users on Skype-for-Business clients and users on Teams clients, and how interop is affected by the chosen coexistence mode.

Teams delivers collaboration capabilities, chat, calling, and meeting capabilities. Depending on how you choose to deploy Teams, these capabilities might overlap with the capabilities delivered by Skype for Business for a given user. The default mode is to run Teams alongside Skype for Business with the capabilities overlap. However, a user can be assigned one of several coexistence modes (also known as upgrade modes) that were designed to ensure that these capabilities don't overlap for that user (in which case interoperability between Teams and Skype for Business is available). For example, if you have significant Skype for Business Server on-premises assets with a complex Enterprise Voice deployment, but want your users to enjoy modern meetings as quickly as possible, you might want to evaluate [Meetings First](#) as an alternative path.

We recommend that you review the following coexistence modes to help determine which path is right for your organization.

IMPORTANT

Coexistence modes continue to exist after retirement of Skype for Business Online, however users homed online can only have a mode of TeamsOnly. It is no longer possible to assign any mode other than TeamsOnly to a user homed online. As was the case prior to retirement of Skype for Business Online, users homed on-premises can be assigned any mode *other than TeamsOnly*.

Islands mode

By default, users can run Teams alongside Skype for Business as two separate solutions that deliver similar and overlapping capabilities. The capabilities include presence, chat, calling, and meetings. Teams users also can take advantage of new collaboration capabilities such as teams and channels, access to files in Microsoft 365, and applications.

In this coexistence mode, called **Islands**, each of the client applications operates as a separate island. Skype for Business talks to Skype for Business, and Teams talks to Teams. Users are expected to run both clients at all times and can communicate natively in the client from which the communication was started. As such, there's no need for interoperability in **Islands** mode.

To avoid a confusing or regressed Skype for Business experience, the Skype for Business handles the following integrations that aren't handled in Teams **Islands** mode:

- External (federated) communications.
- PSTN voice services and voice applications, Office integration.
- HID controls for USB devices.
- Several other integrations.

Phone System isn't supported in Teams in **Islands** mode. **Islands** mode doesn't support Enterprise Voice client is Skype for Business.

IMPORTANT

In **Islands** mode, all messages and calls from federated users (people outside your organization) are delivered to Skype for Business. After upgrading to **Teams Only** mode, all messages and calls from outside your organization are delivered to Teams.

Teams Only

A **Teams Only** user (also called an *upgraded* user) has access to all the capabilities in Teams. They may retain the Skype for Business client to join meetings on Skype for Business that have been organized by non-upgraded users or external parties. An upgraded user can continue to communicate with other users in the organization who are still using Skype for Business by using the interoperability capabilities between Teams and Skype for Business (provided the Skype for Business users are not in **Islands** mode). However, an upgraded user can't initiate a Skype for Business chat, call, or meeting.

As soon as your organization is ready for some or all users to use Teams as their only communications and collaboration tool, upgrade those users to **Teams Only** mode. If you're upgrading from **Islands** mode, we advise that you first saturate Teams adoption throughout your organization before beginning the upgrade process. This adoption avoids broken communication scenarios due to **Islands** mode not providing interoperability.

When in **Teams Only** mode, Teams is the default app for the SIP/Tel protocol. Links in a user's contact card in Outlook for calling or chat will be handled by Teams.

For extra considerations about moving to **Teams Only** mode, see [Teams Only mode considerations](#).

Your organization is now using Microsoft Teams!

We'll help you find your contacts, chats, and more once you go to Teams.

If you need to join a Skype for Business meeting or see past conversations, go ahead and start Skype for Business. [Learn more](#)

Start Skype for Business

Go to Teams

Skype for Business only

In this coexistence mode, users remain in Skype for Business—not Teams—for chat, meeting, and calling capabilities, and they don't use Teams for teams and channels. This mode is available today; however, in the current implementation, teams and channels are not automatically turned off for the user. This can be achieved by using the App Setup policy to hide teams and files.

This mode can be used prior to starting a managed deployment of Teams to prevent users from starting to use Teams ahead of having built readiness. This mode is also a way to enable authenticated participation in Teams meetings for Skype for Business users, provided the users are licensed for Teams.

Skype for Business with Teams Collaboration

Use this mode to introduce Teams in your environment while you continue to use your existing investment in Skype for Business. Leave Skype for Business unchanged for chat, calling, and meeting capabilities. Add Teams collaboration capabilities:

- Teams and channels.
- Access to files in Microsoft 365 or Office 365.
- Applications. Teams communications capabilities—private chat, calling, and scheduling meetings.

Teams private chat, calling, and scheduling meetings are off by default in this mode.

Organizations with a starting point of Skype for Business Server on premises or hybrid should consider this mode as an alternative to **Islands** mode if they want to give their users interoperability and predictability for their communications, as well as having a predictable timeline for their upgrade to Teams (as opposed to relying on adoption saturation in **Islands** mode).

Skype for Business with Teams Collaboration and Meetings, also known as Meetings First

Use this coexistence mode to accelerate the availability of Teams meeting and collaboration capabilities in your organization. The coexistence mode lets your users take advantage of the superior Teams meetings experience:

- Great quality.
- Transcription and translation.
- Background blurring.
- Superior user experience across all platforms, including mobile devices and browsers.

Along with using Teams for teams and channels-based conversations in this mode, users will use Teams to schedule and conduct their meetings. Private chat and calling remain on Skype for Business. Teams and Skype for Business benefit from a range of "better together" capabilities, such as presence reconciliation, automatic hold/unhold, and HID device support across both applications. It's possible to hide teams and channels, if desired, using the App Setup policy.

This coexistence mode is especially useful for organizations with Skype for Business on-premises deployments with Enterprise Voice. These organizations are likely to take some time to upgrade to Teams and want to benefit from the superior Teams meetings as soon as possible.

TIP

To help identify the recommended upgrade mode based on the capabilities you want to enable in Teams while Skype for Business is still in use, leverage the [Skype to Teams Upgrade Wizard](#).

For more information about coexistence modes, prerequisites, and management, see [Migration and interoperability guidance for organizations using Teams together with Skype for Business](#) and [Setting your coexistence and upgrade settings](#).

DECISION POINT ICON	ICON DEFINITION	DESCRIPTION
	Decision point	<ul style="list-style-type: none">• Which coexistence mode(s) best fit your organization's and users' needs?
	Next step	<ul style="list-style-type: none">• Choose the best approach for your upgrade journey.

Interoperability of Teams and Skype for Business

Interoperability is the ability for Teams and Skype for Business users in the same organization to communicate across Teams and Skype for Business.

Interoperability is governed by the coexistence mode (also known as upgrade mode) of the receiver. There is no interoperability when the receiver is in **Islands** mode.

NOTE

When deployed in any coexistence mode except **Islands**, Teams and Skype for Business can [interoperate](#), enabling users to chat with and call one another, and ensuring that communications remain fluid across your organization during your upgrade journey to Teams. Coexistence modes govern interoperability. The coexistence mode of the receiver determines whether interoperability will be available. For example, if the receiver is in a mode in which chat is only available in one client (say, Teams), chat interoperability will generally be available in case the initiator uses the other client (in this case, Skype for Business) to start the chat. On the other hand, if the receiver is in the mode in which chat is available in both clients (Islands mode), interoperability won't be available for the chat. The message will be received by the receiver in the same client in which the initiator started the chat. Therefore, proper communication in **Islands** mode requires Teams adoption saturation; that is, all users actively using and monitoring both clients.

NOTE

To have the latest coexistence experience, the client version must be the latest available client in the user's Office deployment channel.

Native interop and interop escalation

There are two types of interop experiences: native and interop escalation.

- A *native interop* experience occurs in the client that the user is currently using. One user will be in the Skype for Business client, the other in Teams. A native interop experience won't take them to another client to communicate. The users will be able to conduct their conversation in the client they're currently using. The native interop experiences are one-to-one chat and calling.
- An *interop escalation* experience means that as part of helping users perform an advanced action (such as sharing their desktop), the client facilitates the creation of a meeting which users can join to continue the experience in that meeting. The meeting is created on the platform of the initiator of the action. The user or users who aren't on that platform receive a meeting join link. As they click this link, they are joined to the meeting in a compatible client (browser, web app, or full client, depending on configuration). Interop escalation from Skype for Business requires a recent client. Interop escalation from Teams is now available. Both are supported in interoperability experiences in-tenant, and for federated communication cross-tenants.

Native interop experiences

Depending on the coexistence modes assigned to users (as previously described), the following native interop experiences are available:

Skype for Business users can chat one-on-one with Teams users, and vice versa. An interop chat needs to go through an interop gateway that's part of Teams cloud services (and therefore only exists online). Interop chats are plain text: rich text and emoticons aren't supported. Users in Teams and in Skype for Business are notified that the conversation is an interop conversation.

Skype for Business users can make one-on-one voice and video calls to Teams users, and Teams users can do the same.

IMPORTANT

Interop experiences with an on-premises deployment of Skype for Business require that the on-premises environment is in hybrid mode with Teams. For details, [Configure hybrid connectivity between Skype for Business Server and Microsoft 365 or Office 365](#).

These interop experiences are available to and between users who have one of the following coexistence modes assigned: **Skype for Business with Teams Collaboration**, **Skype for Business with Teams Collaboration and meetings**, **Skype for Business Only**, or **Teams Only**. There is no interoperability to

users in **Islands** mode.

Native interop experience limitations

Because of the difference in protocols and technology, it is not possible to support all capabilities natively. Specifically, the following capabilities are not available:

- Markdown, rich text, and the full emoticon set aren't supported either from Teams or Skype for Business. Other native features of the compose box in Teams chats aren't supported.
- Screen sharing (desktop or app sharing) between Teams and Skype for Business isn't supported natively. However, it is supported through interop escalation.
- Group chats (multiple-party conversations) in Teams can only include participants who are using Teams.
- Multiple-party IM conversations (group chats) in Skype for Business can only include participants who are using Skype for Business. However, interop escalation to multiple-party is available from Skype for Business.
- Escalating an ongoing peer-to-peer voice or video call to a multiple-party call involving both Teams and Skype for Business users isn't supported.
- File transfer for two-party chats, or file attachment in group chats, from Teams to Skype for Business—and vice versa—aren't supported.
- There is no interoperability with Skype for Business Persistent Chat.

For all these limitations (except for Persistent Chat), one possible workaround is for one user to start a meeting and invite the other user to join it.

This workaround is the basis for interop escalation. In particular, screen sharing and escalation to multiparty are not achievable natively but they are supported via interop escalation.

Interop escalation experiences

Interop escalation consists in supplementing the native interop capabilities with managed escalations to meetings. Meetings offer rich experiences available to anyone, regardless of which client they have.

When interop escalation is triggered by the Teams user, a Teams meeting is created. When it is triggered by the Skype for Business user, a Skype for Business meeting is created. In both cases, the meeting created is a **Meet now** meeting, which is not reflected on the user's calendar.

The other party receives the meeting join link through interop chat and joins by clicking that link. If the Skype for Business user has a Teams account and is invited by the Teams user, they will join the meeting authenticated. Otherwise, they will join as an anonymous participant. Conversely, Teams users almost always have a Skype for Business account and a Skype for Business client they can use to join a Skype for Business meeting as an authenticated participant, but they might also join as an anonymous participant, for example using the Skype Meeting App.

Once the parties have joined the meeting, they can conduct any activity supported in meetings, such as desktop or content sharing, file sharing or transfer, adding other participants, and so on.

Interop escalation from Skype for Business

Interop and interop escalation from Skype for Business was updated in the July 2019 build of monthly C2R. Previously, Skype for Business did not have advance awareness that the remote party was using Teams. It only surmised that from the signaling received after a session was established.

When the signaling indicated that the response came from (or through) the interop gateway, it would display the yellow business bar (banner) indicating the other party was not using Skype for Business. With the evolution of our service, this resulted in false positives where Skype for Business users would see the business bar when they were connected to the Cloud Voicemail Service or other cloud voice services, rather than to an actual **Teams Only** user.

To prevent these false positives, the presence service is now informing the Skype for Business client when the other party is a **Teams Only** actual user. This allows Skype for Business to be aware that it needs to create an

interop conversation ahead of it having been created, and the conversation window to be specific to interop.

If the Skype for Business user wants to share their desktop for example, they are informed that we will start a meeting and guided through the steps.

Meanwhile, the Teams user receives an incoming chat message with the link to the meeting and are guided to join.

This escalation to a Skype for Business meeting is available for both in-tenant interop and cross-tenant federated calls and chats. It is on by default and there is no setting the admin has to provision.

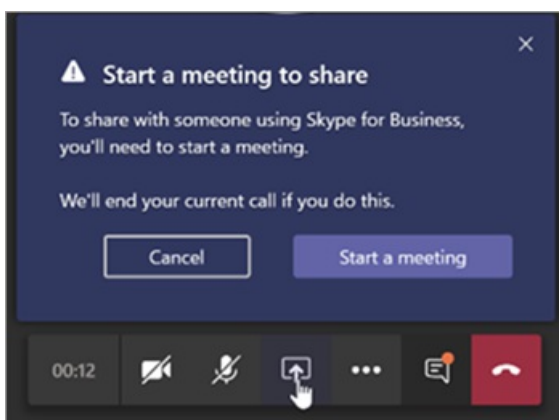

Interop escalation from Teams

Interop escalation from Teams to a Teams meeting is now available when the Teams user selects the desktop sharing button in an in-tenant interop thread with a Skype for Business user or in a cross-tenant interop federation thread. Interop escalation is supported from a 1:1 chat conversation or from a 1:1 call.

The capability is supported in the Teams desktop client for Windows, in the Teams desktop client for Mac, and in the Teams web client on browsers where content sharing is supported, while in communication with any Skype for Business client version.

In interoperability threads, and in federation interoperability threads, the Teams user now has the controls (button) to start content sharing. When the Teams user selects the button, they are presented with an additional menu that informs them that to share content, they will need to start a Teams meeting.

If the users were in a call, the menu also warns them that their current call between Teams and Skype for Business will be terminated as they are put into a Teams meeting. If they choose, they can warn the Skype for Business user prior to accepting.

Upon acceptance, they are put in the Teams meeting; they must start sharing from the sharing tray in the meeting.

Meanwhile, the Skype for Business user receives an incoming chat message with the link to the meeting and are guided to join.

This escalation to a Teams meeting is available for both in-tenant interop and cross-tenant federated calls and chats. It is on by default and there is no setting the admin has to provision. However, it is turned off for the user if the admin sets `-AllowPrivateMeetNow` in `CsTeamsMeetingPolicy` to `$false`.

After you review this article, see [Choose your upgrade journey](#), [Migration and interoperability guidance](#), [Coexistence with Skype for Business](#), and [Setting your coexistence and upgrade settings](#) for implementation details. We also recommend the following video: [Video: Manage Coexistence and Interoperability between SfB and Teams](#)

Technical details of Teams and Skype for Business coexistence

The following sections summarize behavior that may be experienced when running both Teams and Skype for Business clients in the same organization, regardless of what mode and what upgrade method is used:

- [Meetings](#)
- [Interoperability](#)
- [Interop versus native conversation threads](#)
- [Presence](#)
- [Federation](#)
- [Contacts](#)

Meetings

Regardless of their mode, users can always join any type of meeting they are invited to, whether it is Skype for Business or Teams. However, users must join the meeting with a corresponding client that matches the meeting type:

- If the meeting is a Teams meeting, all participants (whether they are TeamsOnly, Islands, or Skype for Business users) use the Teams client to join the meeting. If Teams is not installed, the user will be directed to the web, upon attempting to join a meeting.
- If the meeting is a Skype for Business meeting, all participants (whether they are TeamsOnly, Islands, or Skype for Business users) use the Skype for Business client to join the meeting. If the Skype for Business client is not installed, the user will be directed to the web to join via the Skype Meeting App.

When organizing meetings, the meeting type that gets scheduled is based on the mode of the organizer, as shown in the following table:

MODE OF ORGANIZER	BEHAVIOR
TeamsOnly, SfbWithTeamsCollabAndMeetings	All meetings scheduled in Teams. Skype for Business add-in is not available in Outlook.
SfbWithTeamsCollab, SfbOnly	All meetings scheduled in Skype for Business. Teams add-in is not available in Outlook.
Islands	By default, meetings can be scheduled in either Skype for Business or Teams. Both add-ins are available in Outlook. However, you can optionally require that users in Islands always schedule meetings in Teams by assigning them an instance of TeamsMeetingPolicy with the PreferredMeetingProviderForIslandsMode=Teams.

Interoperability

As described above in [Interoperability of Teams and Skype for Business](#), Teams supports interop with Skype for Business in certain scenarios. Interop communication refers to a chat or call between a Skype for Business user

and a Teams user. Interop communication is only possible between two users; multi-party chat/calling or adding additional users is not supported.

An interop chat or call between two users is created when each of the following are true:

- One user is using Teams and the other is using Skype for Business.
- The mode of the recipient of the initial communication is NOT Islands (otherwise the communication would land in the same client) if both users are in the same organization. In federated scenarios, the sending user is using Teams, and the recipient is not in TeamsOnly mode.
- The Teams user does NOT also have a Skype for Business account homed on-premises.

Within the interop communication, chat is plain-text only. In addition, file sharing and screen sharing are not possible *in the interop chat itself*. However, users in an interop conversation can easily achieve file and/or screen sharing by creating an on-demand meeting, from within the interop chat, as described below:

- If the Teams user attempts to share their screen, an on-demand Teams meeting is automatically created and an invite link to that meeting is sent to the Skype for Business user's client. Upon clicking the link, the Skype for Business user will open Teams and join the meeting. Both users are now in a Teams meeting and can share as needed.
- If the Skype for Business user is using a client from 2018 or later and attempts to share any content, an on-demand Skype for Business meeting is automatically created and an invite link to that meeting is sent to the Teams user's client. Upon clicking the link, the Teams user will attempt to join the Skype for Business meeting. If the Teams user has the Skype for Business client installed, it will open and the user is prompted to sign in (if not already signed in). If the Teams user does not have the Skype for Business client installed, the user will be prompted to use the web version. Once both users are signed in, they are in a Skype for Business meeting and can share as needed.

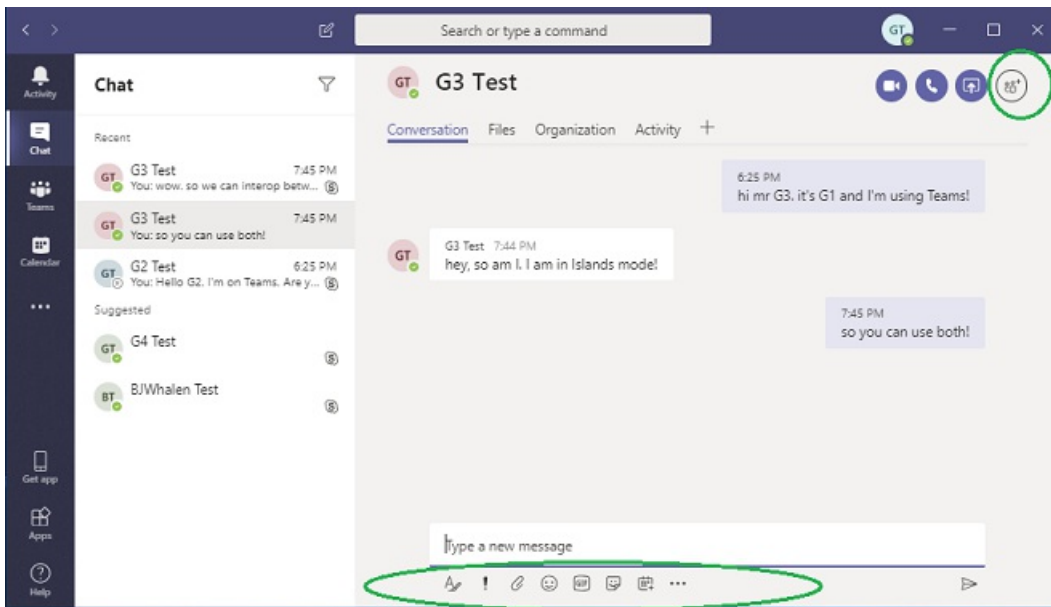

Interop versus native conversation threads

Because interop communications do not support all the features of native Teams conversation, the Teams client maintains separate conversation threads for Teams-to-Teams and Teams-to-Skype for Business communication. These conversations are rendered differently in the user interface: Interop threads can be differentiated from a regular native Teams thread by:

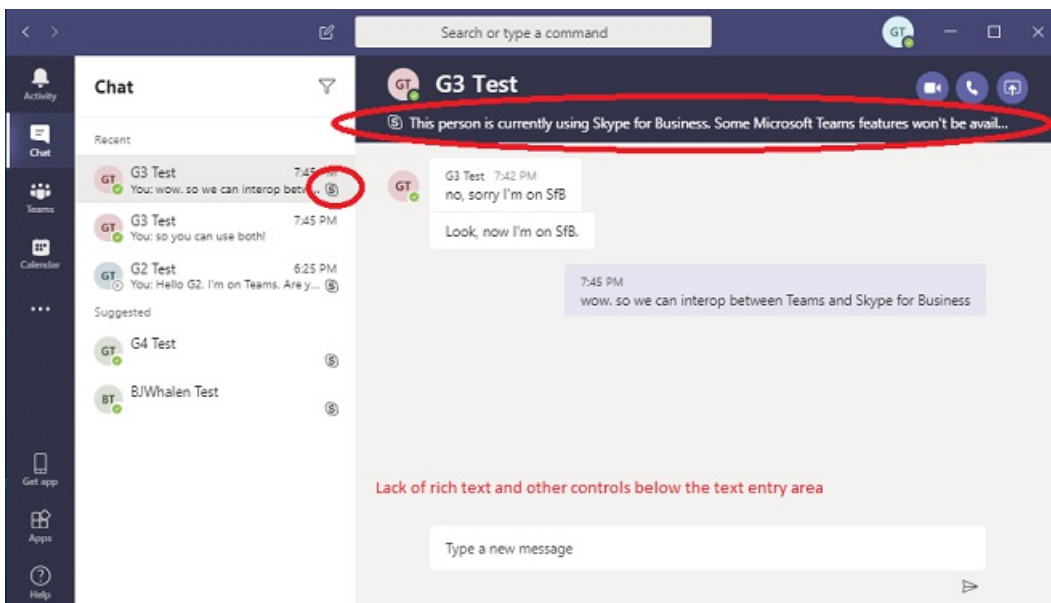

- Lack of controls for rich text, file/screen sharing, inability to add users.
- A modification to the target user's icon, showing an "S" for Skype for Business.

These differences are shown in the following screenshots:

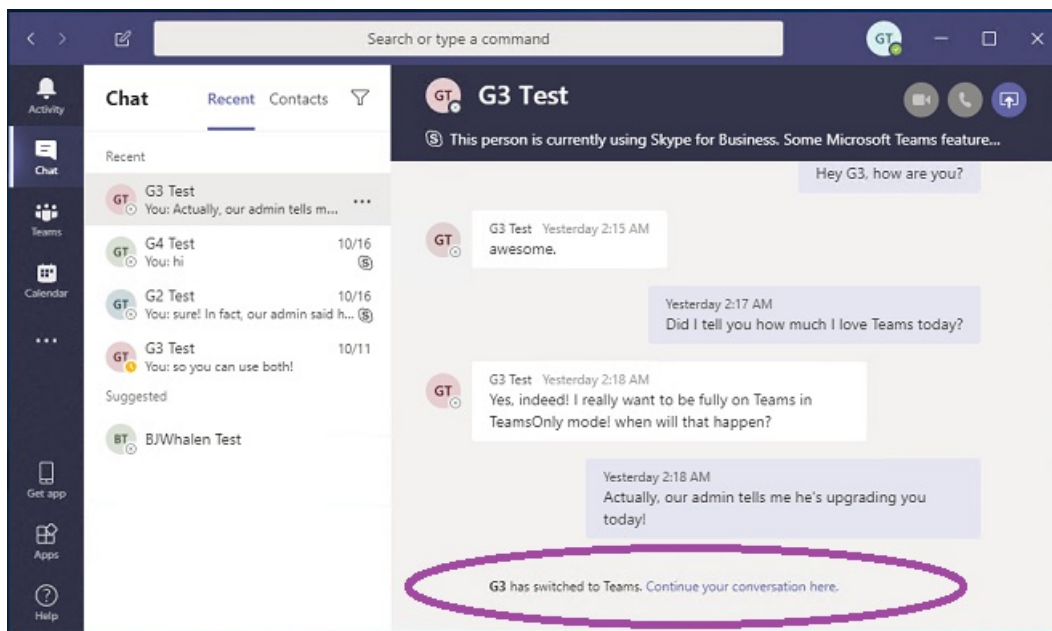

A native Teams-to-Teams conversation with User G3 Test

An interop conversation with the same User G3 Test

Once a conversation thread is created, its type never changes. Once created, an interop thread in Teams will always route to the target user's Skype for Business client. A native thread will always route to the target user's Teams client. If a recipient user's mode changes, existing Teams threads to that user will no longer function and a note will be displayed on that chat with a link to start a new native conversation as shown in the following screenshot.

Presence

Presence for a given user is based on the user's activity in the service via the client. The presence is then published for other users to see. Skype for Business and Teams are separate services with separate clients, so each service has its own presence state for a user. There is also synchronization between the presence services in Teams and in Skype for Business Online. This allows one service to potentially publish the presence of the user from the other service if needed.

Presence publishing behavior is based on the user's mode. There are three basic cases:

- If a user is in TeamsOnly mode, all other users see Teams presence for that user, regardless of which client they use.
- If a user is in any of the Skype for Business modes, all other users see Skype for Business presence for that user, regardless of which client they use.
- If a user is in Islands mode, presence published in Skype for Business and Teams are independent, so the presence shown to users within the same organization will depend on the client of the other user. Users in federated organizations will see presence of that user based on their Skype for Business activity, since federated traffic to an Islands mode user lands in Skype for Business.

For example, Assume User A is in Islands mode. If User A is active in Teams but is not signed in to Skype for Business, other users would see User A as active from their Teams client, but in their Skype for Business client they would see User A as offline. This is by design, since User A cannot be reached if they are not running the client.

Federation

Federation from Teams to another user using Skype for Business requires the Teams user to be homed online in Skype for Business. TeamsUpgradePolicy governs routing for incoming federated chats and calls. Federated routing behavior is the same as for same-tenant scenarios, except in Islands mode. When recipients are in Islands mode:

- Chats and calls initiated from Teams land in Skype for Business if the recipient is in a federated tenant.
- Chats and calls initiated from Teams land in Teams if the recipient is in the same tenant.
- Chats and calls initiated from Skype for Business always land in Skype for Business.

A federated chat can either be a native thread or an interop thread. See [Interop versus native conversation threads](#).

- If the receiver and sender are both in TeamsOnly upgrade mode, the conversation will be a native chat

experience which includes all the rich messaging and calling capabilities. To learn more, read [Native chat experience for external \(federated\) users in Teams](#).

- If either of the conversation participants is NOT in TeamsOnly upgrade mode, the conversation remains an interop experience with text-only messages. The user interface exposes federated chats in a similar manner to same-tenant interop threads, except there is a note indicating the user is external.

For more details, see [Manage external access in Microsoft Teams](#) and [Native chat experience for external \(federated\) users in Teams](#).

Contacts

Teams and Skype for Business have separate lists of contacts. This means that contact additions, removal, and modifications made in one system are not synchronized to the other system. However, contacts from Skype for Business are automatically copied over to Teams when either of two specific events occur:

- For any Skype for Business Online user, the first time they log onto Teams, contacts from Skype for Business will be copied over to Teams. This behavior is not available for users with an on-premises account in Skype for Business Server.
- After a user is upgraded to TeamsOnly (either via assigning TeamsUpgradePolicy or via Move-CsUser - MoveToTeams), the next time a user logs into Teams, existing contacts in Skype for Business will be merged with existing contacts already in Teams. This behavior happens whether the user was moved to TeamsOnly from on-premises or online.

In both cases, the transfer of contacts from Skype for Business to Teams is asynchronous so it may be a few minutes before contacts appear in Teams. The two events above are what trigger the copy.

PSTN considerations for upgrading to Teams from Skype for Business on-premises

12/7/2021 • 9 minutes to read • [Edit Online](#)

This article describes Public Switched Telephone Network (PSTN) considerations when upgrading to Teams.

IMPORTANT

Skype for Business Online will be retired on July 31, 2021. If you haven't upgraded your Skype for Business Online users to Microsoft Teams before that date, they will be automatically scheduled for an [assisted upgrade](#). If you want to upgrade your organization to Teams yourself, we strongly recommend that you begin planning your upgrade path today. Remember that a successful upgrade aligns technical and user readiness, so be sure to leverage our [upgrade guidance](#) as you navigate your journey to Teams.

In addition, the following articles describe important upgrade concepts and coexistence behaviors:

- [Coexistence of Teams and Skype for Business](#)
- [Coexistence modes - Reference](#)
- [Teams client experience and conformance to coexistence modes](#)

NOTE

- Using Phone System with Teams is only supported when the user's account is assigned a Teams upgrade policy with Teams Only mode.
- Using Phone System with Skype for Business is only supported when the user's account is assigned a Teams upgrade policy with an SfB mode.
- Phone System is not supported when the user's account is assigned a Teams upgrade policy with Islands mode.
- Any call forwarding, team-call group, and delegation settings from Skype for Business are not migrated and will need to be re-created for Teams.
- For a general overview of Microsoft Teams cloud voice features, and help deciding which Microsoft voice solution is right for your organization, see [Plan your Teams voice solution](#).

PSTN calling scenarios

There are four possible calling scenarios when moving to TeamsOnly mode:

- [A user in Skype for Business Online, with a Microsoft Calling Plan](#). Upon upgrade, this user will continue to have a Microsoft Calling plan.
- [A user in Skype for Business Online, with on-premises voice functionality](#) through Skype for Business on-premises or Cloud Connector Edition. The user's upgrade to Teams needs to be coordinated with migration of the user to Direct Routing to ensure the TeamsOnly user has PSTN functionality.
- [A user in Skype for Business on-premises with Enterprise Voice](#), who will be moving to online and keeping on-premises PSTN connectivity. Migrating this user to Teams requires moving the user's on-premises Skype for Business account to the cloud, and coordinating that move with migration of the user to Direct Routing.
- [A user in Skype for Business on-premises with Enterprise Voice](#), who will be moving to online and using a Microsoft Calling plan. Migrating this user to Teams requires moving the user's on-premises Skype for

Business account to the cloud, and coordinating that move with either A) the port of that user's phone number to a Microsoft Calling Plan or B) assigning a new subscriber number from available regions.

This article provides a high-level overview only. For more information, see [Phone System Direct Routing](#) and [Calling Plans](#).

From Skype for Business Online with Microsoft Calling Plans

This is the simplest upgrade scenario involving voice.

1. Make sure users have been assigned a Teams license. By default, when you assign a Microsoft 365 or Office 365 license, Teams is enabled, so unless you previously disabled the Teams license, no action should be necessary.
2. If users already have a Microsoft Calling Plan with a phone number, the only required change is to assign the user TeamsOnly mode in TeamsUpgradePolicy. Prior to assigning TeamsOnly mode, incoming PSTN calls will land in the user's Skype for Business client. After the upgrade to TeamsOnly mode, incoming PSTN calls will land in the user's Teams client.

From Skype for Business Online with on-premises voice

In this scenario, the user is already in Skype for Business Online, but their PSTN connectivity is on-premises, either using Skype for Business Server in hybrid mode or Cloud Connector Edition. Migrating these users to TeamsOnly mode with PSTN functionality means enabling them for Direct Routing, in which PSTN trunks connect directly to the Direct Routing service in the cloud, via your on-premises Session Border Controller (SBC).

The basic steps are listed below. Steps 1-4 are listed in the suggested sequence, but they can be done in any order. The key is that all of these should be completed before Step 5.

1. If you are setting the tenant-wide policy to one of the Skype for Business modes, be sure to grandfather any existing Islands users by explicitly assigning them Islands mode, as previously described.
2. Configure your tenant for Direct Routing. See [Summary of per-tenant configuration of Direct Routing](#).
3. If desired, configure various Teams policies for these users (for example, TeamsMessagingPolicy, TeamsMeetingPolicy, etc.). This can be done at any time, but if you want to ensure that users have the correct configuration when they are upgraded, it's best to do this before the user is upgraded to TeamsOnly mode.
4. Prepare select users for voice migration:
 - If necessary, assign the Teams license. Assuming the user is already functional in Skype for Business Online on-premises voice, the user already has Skype for Business Plan 2 as well as Microsoft Phone System. Leave both those plans enabled, including the Skype for Business Online Plan 2 license.
 - Assign the desired OnlineVoiceRoutingPolicy.
5. Upgrade the user: These steps should be coordinated.
 - In Microsoft 365 or Office 365, upgrade the user to TeamsOnly mode (Grant-CsTeamsUpgradePolicy).
 - On the SBC, configure voice routing to enable incoming calls by sending calls to Direct Routing instead of to the on-premises Mediation Server.

From Skype for Business Server on-premises, with Enterprise Voice, to Direct Routing

In this scenario, the user is still homed in Skype for Business on-premises, and their PSTN connectivity is also on-premises. Migrating these users to TeamsOnly mode with PSTN functionality means enabling them for Direct

Routing and then moving the user to the cloud.

The basic steps are listed below. Steps 1-5 are listed in the suggested sequence, but they can be done in any order. The key is that all of these should be completed before Step 6.

1. If you will be setting the tenant-wide policy to one of the Skype for Business modes, be sure to grandfather existing Islands users by explicitly assigning them Islands mode, as previously described.
2. If you haven't already done so, [configure the organization for Skype for Business hybrid](#).
3. Configure your tenant for Direct Routing. See [Summary of per-tenant configuration of Direct Routing](#).
4. If desired, configure various Teams policies for these users (e.g. TeamsMessagingPolicy, TeamsMeetingPolicy, etc.). This can be done at any time, but if you want to ensure that users have the correct configuration when they are upgraded, it's best to do this before the user is upgraded to TeamsOnly.
5. Assign the Microsoft 365 or Office 365 licenses if necessary. The user should have both Teams and Skype for Business Online Plan 2, as well as Phone System. If the Skype for Business Online Plan 2 is disabled, re-enable it.
6. Upgrade the user: These steps should be coordinated.
 - Using the on-premises Skype for Business tools, run Move-CsUser with -MoveToTeams switch. If you are using a version of Skype for Business Server that does not support the -MoveToTeams switch, first run Move-CsUser and then assign TeamsOnly mode in tenant remote PowerShell or Teams Admin Console.
 - On the SBC, configure voice routing to enable incoming calls by sending calls to Direct Routing instead of to the on-premises Mediation Server.
 - In Microsoft 365 or Office 365: Assign the relevant OnlineVoiceRoutingPolicy to enable outgoing calls.

From Skype for Business Server on-premises, with Enterprise Voice, to Microsoft Calling Plan

In this scenario, the user is still homed in Skype for Business on-premises, and their PSTN connectivity is also on-premises. Migrating these users to TeamsOnly mode with PSTN functionality means moving the user to the cloud and either porting their number from the old carrier to a Microsoft Calling plan or assigning the user a new number.

The basic steps are listed below. Steps 1-5 are listed in the suggested sequence, but they can be done in any order. The key is that all of these should be completed before Step 6.

1. If you will be setting the tenant-wide policy to one of the Skype for Business modes, be sure to grandfather existing Islands users by explicitly assigning them Islands mode, as previously described.
2. If you haven't already done so, [configure the organization for Skype for Business hybrid](#).
3. If desired, configure various Teams policies for these users (for example, TeamsMessagingPolicy, TeamsMeetingPolicy, etc.). This can be done at any time, but if you want to ensure that users have the correct configuration when they are upgraded, it's best to do this before the user is upgraded to TeamsOnly.
4. Assign the Microsoft 365 or Office 365 licenses if necessary. The user should have both Teams and Skype for Business Online Plan 2, as well as Phone System. If the Skype for Business Online Plan 2 is disabled, re-enable it.

5. Get phone numbers for your users. (For details see [Manage phone numbers for your organization](#).)
 - If you will be re-using the numbers, submit a porting request to your carrier.
 - Alternatively, you can acquire new numbers directly from Microsoft.
6. Upgrade the user and if needed assign LineUri. Using the on-premises Skype for Business tools, run Move-CsUser with the -MoveToTeams switch.
 - If you are porting numbers to Microsoft, you should coordinate the timing of this operation to occur when the port occurs.
 - If you are using new numbers from Microsoft, you'll need to change the LineUri for the user. This must be done after the user is moved online using Set-CsOnlineVoiceUser.

Summary of per-tenant configuration of Direct Routing

1. Ensure that your Session Border Controller (SBC) is supported with Direct Routing by reviewing [this list](#). You must also ensure that you have correct version of firmware.
2. Pair your on-premises SBC with the Teams Direct Routing service. For details, see [Pair the SBC to the Direct Routing service of Phone System](#).
3. This configuration is essentially a mirror of the on-premises configuration. The online configuration consists of:
 - OnlineVoiceRoutingPolicy (based on the on-premises VoiceRoutingPolicy if migrating users from Skype for Business Online, and based on VoicePolicy if migrating users from on-premises with Enterprise Voice).
 - OnlinePSTNUsage objects (based on on-premises PSTN usage).
 - OnlineVoiceRoute objects (based on-premises VoiceRoute).

For more information, see [Configure Direct Routing](#).

Manage EnterpriseVoiceEnabled property during migration

Whether using Direct Routing or a Microsoft Calling plan, a user must have EnterpriseVoiceEnabled=true in Azure AD for the user to have PSTN functionality. EnterpriseVoiceEnabled ("EV-enabled") is a property (not a policy) that exists in both an on-premises directory and in the cloud. The value in the cloud is what matters for Teams. The exact logic for how EV-enabled gets set to true depends on the following scenario:

- If the user is EV-enabled in on-premises Skype for Business Server and a Phone System license is assigned to the user prior to moving the user to the cloud with Move-CsUser, the online user will be provisioned with EV-enabled=true.
- If an existing TeamsOnly or Skype for Business Online user is assigned a Phone System license, EV-enabled is not set to true by default. This also is the case if an on-premises user is moved to the cloud prior to assigning the Phone System license. In either case, the admin must specify the following cmdlet:

```
Set-CsUser -EnterpriseVoiceEnabled $True
```

Choose your upgrade journey from Skype for Business to Teams

12/7/2021 • 18 minutes to read • [Edit Online](#)

This article is part of the Project Definition stage of your upgrade journey. Before proceeding, confirm that you've completed the following activities:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)

As an existing Skype for Business customer, your complete transition to Teams might take some time. However, you can begin realizing the value of Teams today, by enabling your users to use Teams alongside Skype for Business. Given that there's some overlapping functionality between the two apps, we recommend that you review the available coexistence and upgrade modes to help determine which path is right for your organization. For example, you might opt to enable all workloads on both solutions without interoperability. Or, you might decide to manage the user experience, either by gradually introducing Teams capabilities or by targeting groups of users for select capabilities, until your organization is ready to upgrade everyone to Teams. Use the outcome of your pilot to help assess the right upgrade journey for your organization.

IMPORTANT

Skype for Business Online will be retired on July 31, 2021, after which it will no longer be accessible or supported. To maximize benefit realization and ensure your organization has proper time to implement your upgrade, we encourage you to begin your journey to Microsoft Teams today.

This article outlines the various modes that enable you to manage which modalities in Skype for Business and Teams are available to your users. As with any deployment, we strongly encourage you to [pilot your intended plan](#) with a selected group of users before upgrading your organization to Teams. Remember, introducing new technology can be disruptive for users. Take time to assess user readiness and implement a communication and training plan prior to implementing any of the modes outlined herein.

TIP

Join us for live, interactive workshops in which we'll share guidance, best practices, and resources designed to kick start upgrade planning and implementation.

Join the [Plan your upgrade](#) session first to get started.

Upgrade journey building blocks

To formally prepare your organization for its journey to Teams, you need to start planning for the upgrade scenarios that will eventually let your organization fully embrace Teams as your sole communications and collaboration solution.

To help guide your decision-making process, familiarize yourself with the various modes, concepts, and terminology relevant to upgrading from Skype for Business to Teams. For more information, see [Microsoft Teams and Skype for Business coexistence and interoperability](#).

NOTE

You will also need to consider your voice migration scenarios. Phone System is Microsoft's technology for enabling call control and Private Branch Exchange (PBX) capabilities in the Microsoft 365 or Office 365 cloud. To connect Phone System to the Public Switched Telephone Network (PSTN) so that users can make phone calls around the world, you have options based on your business need. For more information on Phone System and PSTN connectivity options, see [Voice - Phone System and PSTN connectivity](#).

A user that has been migrated to Teams no longer uses a Skype for Business client except to join a meeting hosted in Skype for Business. All incoming chats and calls land in the user's Teams client, regardless of whether the sender uses Teams or Skype for Business. Any new meetings organized by the upgraded user will be scheduled as Teams meetings. If the user attempts to use the Skype for Business client, initiation of chats and calls is blocked¹. However, the user can (and must) still use the Skype for Business client to join meetings they are invited to.

Administrators manage their transition to Teams using the concept of [mode](#), which is a property of [TeamsUpgradePolicy](#). A user that has been migrated to Teams as described above is in "TeamsOnly" mode. For an organization that is migrating to Teams, the ultimate goal is to move all users to TeamsOnly mode.

There are two methods for migrating an existing organization with Skype for Business (whether online or on-premises) to Teams:

- **Overlapping capabilities method** (using Islands mode): Users in an existing Skype for Business organization are introduced to Teams so that they can use both clients side by side during a transitional phase. During this period, most--but not all--functionality of Teams is available to them. The mode for this configuration is referred to as Islands, and this is the default mode for any existing organization with Skype for Business. Once the organization is ready, the administrator moves the users to TeamsOnly mode.
- **Select capabilities method** (using one or more of the Skype for Business modes): The administrator manages the transition (from Skype for Business to Teams) of chat, calling, and meeting scheduling functionality for users in their organization. Each of these functions is available either in Skype for Business or Teams, but not both. Administrators use TeamsUpgradePolicy to control when to shift this functionality to Teams for their users. Users who are not yet in TeamsOnly mode continue to use Skype for Business for chat and calling, and the two sets of users can communicate via interop functionality. Administrators manage the transition by progressively migrating more users into TeamsOnly mode.

¹ Older Skype for Business clients that shipped before 2017 do not honor TeamsUpgradePolicy. Make sure you are using the latest Skype for Business client available in your Office channel.

After you understand and choose your upgrade method, you can learn about the [tools for managing your organization's upgrade to Teams](#).

Below are the key factors to help decide the appropriate path for your organization.

Overlapping capabilities method (using Islands mode)

With the overlapping capabilities method, users can use both Teams and Skype for Business clients for chat, VoIP calling, and meetings. In this method, chat and VOIP calling in Teams is intra-organization focused, while Skype for Business enables chat and VOIP/PSTN calling with external organizations (if configured). Meetings can be scheduled and attended in both products.

When using the overlapping capabilities method, the communication traffic for Skype for Business and Teams remains separate (even for the same user) and the two different clients never communicate with each other (for users within the same organization). User experiences are based on the recipient's configuration. For example, assume recipient User A is in Islands mode:

- Communication initiated from another user's Skype for Business client will always land in User A's Skype for Business client.
- Communication initiated from the Teams client from a *user in the same organization* will always land in User A's Teams client.
- Communication initiated from Teams client from a *user in an external organization* will always land in User A's Skype for Business client.

If you have assigned a Microsoft 365 or Office 365 license to your users, this will be the default upgrade experience for your organization. When you assign a Microsoft 365 or Office 365 license, both Teams and Skype for Business Online licenses are assigned by default.²

For this method to work effectively, all users must run both clients simultaneously. Incoming chats and calls from within the organization to a user in Islands mode can land in either the Skype for Business or Teams client—and this is not under the control of the recipient. It depends on what client the sender uses to initiate the communication. If the sender and recipient are in different organizations, incoming calls and chats to a user in Islands mode always land in the Skype for Business client.

For example, if an Islands mode recipient is signed in to Skype for Business but not Teams, and someone messages them from Teams, the Islands mode recipient will not see the message (but they will eventually get an email saying they missed a message in Teams). Likewise, if a user is running Teams but not Skype for Business, and someone messages that user from Skype for Business, the user will not see that chat. The behavior in each of these cases is similar for calling. If users do not run both clients, it can easily lead to frustration.

Presence also functions independently between Teams and Skype for Business when you use this upgrade method. This means other users may see different presence states for User A, depending on which client they use. For more details, see [Presence](#).

- Other users, when using Teams, will see presence based on User A's activity in Teams.
- Other users, when using Skype for Business, will see presence based on User A's activity in Skype for Business.

Once you are ready to upgrade users to TeamsOnly mode, you can upgrade users individually or you can upgrade the entire tenant at once using the tenant-wide policy³. Once a user is upgraded to TeamsOnly mode, they receive all incoming chats and calls in Teams. (Note that migration of Skype for Business meetings to Teams meetings is only triggered when applying TeamsUpgradePolicy to individual users, not on a per tenant basis. See [Meeting Migration](#) for details.)

However, non-upgraded recipients in Islands mode may continue to receive chats and calls from a TeamsOnly user in either their Skype for Business or Teams clients. For existing conversations the TeamsOnly user will reply to the client the sender initiated the chat or call from.

For new conversations from the TeamsOnly user's point of view, the chat or call will always go to the Islands mode users Teams client. This is because the Teams client maintains separate conversation threads for Teams-to-Teams and Teams-to-Skype for Business communication, even for the same user. To learn more, see [Teams Conversations - Interop versus native threads](#).

The following table summarizes the Teams experience for both Islands mode and TeamsOnly mode:

TEAMS EXPERIENCE	IN ISLANDS MODE	IN TEAMSONLY MODE
Incoming chats and calls received in:	Teams or Skype for Business	Teams
PSTN calls received in:	Skype for Business (Using PSTN functionality in Teams is not supported in Islands mode.)	Teams
Presence	Presence in Skype for Business and Teams is independent. Users may see different states for the same Islands user, depending on which client they use.	Presence is based solely on the user's activity in Teams. All other users, regardless of which client they use, see that presence.
Meeting scheduling	Users can schedule meetings in either Teams or Skype for Business. By default, they will see both add-ins in Outlook. You can set a Teams meeting policy to control whether users can only use the Teams Meeting add-in or both the Teams Meeting and Skype for Business Meeting add-ins. To learn more, see set the meeting provider for users in Islands mode .	Users only schedule meetings in Teams. Only the Teams add-in is available in Outlook.

The following table summarizes the pros and cons of using the overlapping capabilities method to migrate your organization to Teams.

PROS	CONS
Allows for rapid adoption within an organization.	Potential for end user confusion because there are two clients with similar functionality, but different user interfaces. Also, they have no control over which client the incoming chats/calls land in.
Allows users to learn and get familiar with Teams while still having full access to Skype for Business.	Potential for end user dissatisfaction due to missed messages if the user is not running both clients.
Minimal administration effort to get started in Teams.	Can be challenging to "get out of Islands" mode and move to TeamsOnly mode if users and those they regularly communicate with are not actively using Teams. For example, once a subset of users is upgraded to TeamsOnly mode, those users will only send in Teams. For the rest of the population in Islands mode, those messages will always land in Teams. But if some of that population is not running Teams, they will perceive these messages as missed.
Enables users to leverage capabilities to enhance teamwork that are not available in Skype for Business.	A user who is using Skype for Business on premises and Teams will not be able to communicate from Teams with another user who is using Skype for Business on premises but does not have Teams.
	When using Teams, users who have an on-premises account in Skype for Business Server do not have interop or federation support. This can potentially create confusion if you have a mix of Islands users--some who are homed in Skype for Business Online and some in Skype for Business on-premises.

² This is true even if the user is homed on-premises in Skype for Business Server. Whether the user is homed on-premises or online, leave the Skype for Business Online license enabled, because it is currently needed for full Teams functionality.

³ Note that migration of Skype for Business meetings to Teams meetings is only triggered when applying TeamsUpgradePolicy to individual users, not on a per tenant basis. See [Meeting migration](#) for details.

Select capabilities method (using Skype for Business modes)

Some organizations may prefer to provide their end users a more predictable experience as their organization transitions from Skype for Business to Teams. In this model, IT administrators use one of the Skype for Business modes in TeamsUpgradePolicy to explicitly designate which capabilities remain in Skype for Business prior to migrating to TeamsOnly mode. As they are ready to shift selected capabilities to TeamsOnly mode, the administrator updates the mode for those users to TeamsOnly. During this transition:

- Administrators have options to enable certain Teams capabilities for users while keeping chat and calling capabilities in Skype for Business before users move to TeamsOnly experience. Administration can enable Teams collaboration capabilities or Teams meetings + collaboration capabilities.
- Users still on Skype for Business receive all incoming chats and calls in their Skype for Business client, regardless of whether the communication originated from the other user's Teams or Skype for Business client. In addition, for these Skype for Business users, calling and chat functionality in the Teams client are disabled to help prevent end-user confusion and to ensure proper routing and presence.
- Users in TeamsOnly mode receive all incoming chats and calls in their Teams client and presence is provided by Teams, regardless of where the communication originated from: Teams, Skype for Business, or any kind of federated user.

Unlike the overlapping capabilities (Islands) method, in the select capabilities method, users using Skype for Business can communicate with users who are in TeamsOnly. Communication between a Skype for Business user and Teams user is known as [interoperability](#) or "interop". Interop communication is possible on a one-to-one basis for chats and calls between a user in Skype for Business and another user in Teams. In addition, invited users can always join either a Skype for Business or Teams meeting, however, they must use a client that corresponds to the type of meeting. For more information, see [Meetings](#).

For users in a select capabilities transition method, presence for a user is consistent regardless of which client is used by the other user. If the user is in one of the Skype for Business modes, all other users see presence based on that user's activity in Skype for Business. Similarly, if a user is in TeamsOnly mode, all other users see presence based on that user's activity in Teams. For details, see [Presence](#).

For an organization that has not yet started using Teams, the administrator should change the tenant-wide mode from Islands to SfbWithTeamsCollab. (For organizations that already have some Teams usage, the administrator should "grandfather" users already active in Teams to ensure this change does not apply to them. For details, see [A select capabilities method for an organization that is already using Teams in Islands mode](#).)

Guests user experiences will adhere to the coexistence mode assigned to the tenant. If you set a Skype for Business mode at the tenant level, guests can't chat, call, or show their presence. To learn more, read [Guest access in Teams](#).

When the mode changes from Islands to SfbWithTeamsCollab, a user that has never used Teams will see no difference in how they use Skype for Business. However, should that user start to use Teams, they would only be exposed to functionality such as Teams & Channel and Files. Chat, calling and meeting scheduling would not be available in Teams, since the administrator has (for now) designated Skype for Business as the desired client for those functions.

NOTE

When User A changes from Islands to one of the Skype for Business modes, the Teams client of any other user that communicates with User A needs to know that User A's mode changed so it can route the communication to the appropriate client for User A. For any users who have already established native Teams-to-Teams chats with User A, it can take up to 36 hours for these other users' Teams clients to be aware of the mode change from Islands to any Skype for Business mode. In contrast, changes for an existing user to TeamsOnly mode are discovered by other clients within 2 hours.

When administrators are ready, they can shift chat, calling, and meeting scheduling for a given user to Teams all at once by updating the user's mode to TeamsOnly.

Alternatively, the administrator can first shift only meeting scheduling to Teams, while leaving chat and calling functions in Skype for Business using the SfbWithTeamsCollabAndMeetings mode. This mode allows organizations to transition to Teams for meetings—if users are not yet ready to move to TeamsOnly mode (for example, if you are not yet ready to migrate existing PSTN functionality). This transitional scenario is referred to as [Meetings First](#).

TEAMS EXPERIENCE	IN SFBWITHTEAMSCOLLAB MODE	IN SFBWITHTEAMSCOLLABAN DMEETINGS MODE	IN TEAMSONLY MODE
Incoming chats and VOIP calls from users in your organization received in:	Skype for Business	Skype for Business	Teams
PSTN calls received in:	Skype for Business	Skype for Business	Teams
Presence	Skype for Business	Skype for Business	Teams
Meeting Scheduling	Skype for Business	Teams	Teams

The following table summarizes the pros and cons of using Skype for Business modes as a transitional step toward TeamsOnly mode.

PROS	CONS
Predictable routing for the end user. All calls and chats either land in Skype for Business or Teams (but not both), based on administrator selection.	Interop conversations lack support for rich text, file sharing, and screen sharing. This can be worked around leveraging Meet Now functionality to initiate a meeting.
May reduce end user confusion because a given functionality is only available in one client.	Before users are upgraded to TeamsOnly, they do not have access to Teams for common activities performed in Skype for Business such as chat and calling. Meaning, no side-by-side capability.
Administrator has control over the set of capabilities available to users while transitioning from Skype for Business to Teams. This control includes the ability to incrementally introduce Teams capabilities.	
Allows an organization to use Teams for meetings, even if it is not yet ready to move entirely to TeamsOnly mode.	
Presence of a given user as viewed by others is the same, regardless of which client they use.	

Summary of upgrade methods

The following table summarizes the upgrade methods:

OVERLAPPING CAPABILITIES (USING ISLANDS MODE)	SELECTED CAPABILITIES (USING SKYPE FOR BUSINESS MODES)
Prior to being upgraded to TeamsOnly, users must run both clients simultaneously since incoming chats and calls may land in either client.	Chats and calls only land in one client, based on the recipient's mode. Non-upgraded users may run both clients, but there is no functional overlap (calling and chat are not available in Teams). Administrators can also control whether users schedule meetings in Teams or Skype for Business.
Allows administrators to introduce overlapping functionality (chat, meetings, VOIP calling) in both Skype for Business and Teams to end users (allowing for side-by-side functionality), as well as new capabilities (Teams and Channels) in Teams.	Allows administrators to introduce select functionality of Teams to end users (Teams and Channels), without providing same functionality that also exists in Skype for Business.
Interop between Skype for Business and Teams does not exist while both users are in Islands mode. Once some users are upgraded to TeamsOnly interop conversation may occur between those users and others users who are still in Islands mode. However, Islands users could choose to use Teams and avoid the interop conversation.	Interop is required for communication between Skype for Business and Teams users.

NOTE

If you are unable to follow supported methods for migrating your Skype for Business Server users to Teams, it would be possible to transition your users to Teams by removing Skype for Business Server and all related user attributes in Active Directory. Once the users Azure Active Directory attributes have been cleared of the Skype for Business Server attributes and DNS records have been re-pointed to Microsoft 365 or Office 365, it would then be possible to license the users in Microsoft 365 or Office 365 and upgrade them to Teams.

IMPORTANT

With the cutover migration, contact data and meetings data will not be migrated from on premises environment to Microsoft Teams.

Decision point

Which upgrade journey is suitable to your organization's business requirements?

Next step

Identifying your current deployment model, use case scenarios, and key considerations for your organization will inform the journey to Teams that's best suited to your organization.

Decision point

Which upgrade scenario is applicable to your organization?

Next steps

Decide the timeline of your organization's upgrade journey based on messaging, meetings, and calling business requirements.

Decide the required additional work to complete your upgrade journey.

After you've chosen the best upgrade journey for your organization, [perform your upgrade to Teams](#).

Conduct a user pilot

12/7/2021 • 6 minutes to read • [Edit Online](#)

This article is part of Deployment and Implementation stage of your upgrade journey, and shares insights for running an effective pilot. Before proceeding, confirm that you've completed the following activities:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)
- [Prepared your environment](#)
- [Prepared your organization](#)

By deploying new technologies, your organization can realize business value such as cost savings, security compliance, employee satisfaction, and operational efficiencies, but it can also affect your users' productivity and organizational infrastructure (your network). Before enabling new technology across your organization, conduct a formal user pilot. Just like you'd paint a small patch of color on a wall before painting the whole room, you'd test a broad rollout on a smaller scale by conducting a pilot to validate technical and user readiness, identify and mitigate issues, and help ensure a successful organization-wide implementation.

To achieve the most realistic results, the pilot should involve actual users, mimic how they communicate and collaborate, and verify both technical and user experiences. Whether your organization is considering running Skype for Business and Teams side by side, upgrading to Teams in the future, or deploying new functionality such a calling or conferencing, a pilot can help identify the right path forward for your organization. Sometimes considered Phase 1 of a rollout, the ideal pilot leverages the preparation you've already started and implements your defined plan with a targeted group of users.

 Decision point	<ul style="list-style-type: none">• How will you use a pilot to inform project direction?
 Next step	<ul style="list-style-type: none">• Use the guidance below to design and execute your formal pilot.

TIP

Use the sample [pilot resources](#) to help design your communications, test plan, and feedback survey.

1. Outline pilot logistics

A successful pilot has defined start and end dates, and [clearly defined goals](#) for measuring success. These goals should align with the scope of your broader project, as you documented when you [defined your project scope](#), and will be used to inform your path forward after your pilot is over. You should also ensure that you've

included the right stakeholders for the duration of the project. You'll want to be sure to allow enough time to run the pilot and assess its impact: we recommend a minimum of 30 days.

Start small, and add to your pilot as appropriate—whether by adding workloads or features, or additional users—making time to assess results and adjust your pilot as you iterate. You might even opt to run subsequent pilots as new Teams features are released per the roadmap.

2. Select your pilot participants and test scenarios

One of the most important tasks of pilot planning is thoughtful participant selection. Remember that Teams is optimized for teamwork, so be sure to select pilot participants not solely based on roles or personas but also based on their project and cross-team work. A great place to start is asking your stakeholders and department managers for real projects that you can validate in Teams. An example of a role-based project might be to use Teams with your sales organization to ensure that field reps can easily access the resources they need and share insights with other field members. An example of project-based work might be coordinating a product launch event with the marketing, training, public relations, and event planning teams. Whichever scenarios you select, the pilot should extend to key people in IT, training, and your helpdesk, so you can thoroughly validate the solution while fully optimizing project management resources.

TIP

When selecting your Teams pilot group participants, be sure to include top users of Skype for Business. Check with those users to understand how they use Skype for Business today, then build out a test plan to verify that Teams can meet their current needs.

3. Design your test plan and feedback survey

For a successful pilot experience, give your participants clearly defined tasks to complete along with a way for them to share their feedback. Group tasks together to offer real-world scenarios to your users, demonstrating relevancy to their daily activities. Let the use cases you defined in [Assess organizational change readiness](#) guide your test plan.

Your organization might choose to pilot all functionality at once, or use a gradual approach—for example, pilot collaboration first, then meetings, then chat and calling. Ensure that you have an open feedback channel to track progress and measure outcomes. Use a predefined survey as an easy way to capture and assess pilot results; the survey design should be based on the scenarios and features in your test plan.

4. Create your communications plan

It's crucial to the success of your pilot that you educate pilot participants on what's happening, when, and why, and what's expected of them. To drive excitement and maximum participation, be sure to include user value messaging in addition to links to training and support where users can get additional information as they progress through the pilot. Here are a few sample resources to get you started with your pilot communications plan:

- [Pilot resources](#), including email templates and sample feedback survey questions
- [Switch to Teams from Skype for Business](#), a quick-start guide designed to help Skype for Business users get started with Teams

5. Conduct your pilot

With all the logistics in place, you're now ready to begin your pilot. Conducting your pilot includes communicating with your users, monitoring your network and usage to ensure your network performance and call quality remain healthy, gathering feedback from participants, and reviewing helpdesk tickets for questions

related to Teams.

Tips for pilot success

The following tips can help ensure the success of your pilot:

- Before beginning your pilot, confirm that all pilot participants are enabled for the appropriate [coexistence mode]
- (<https://aka.ms/SkypeToTeams-SetCoexistence>) you want to validate.
- Weekly, throughout your pilot, meet with your project stakeholders to review user feedback, usage data, network data, and helpdesk tickets to ensure your pilot is running smoothly. Make any adjustments as needed.

Suggested timeline

Here's a suggested timeline for a 30-day pilot:

- One week before the pilot kickoff: Send initial communication to pilot users.
- Day 1: Send kickoff communication to pilot users.
- Day 7: Hold the first weekly project team checkpoint meeting.
- Day 14: Send mid-point communication to your pilot users, hold a weekly project team checkpoint meeting.
- Day 21: Hold a weekly project team checkpoint meeting.
- Day 30: Send final communication to your pilot users.
- Days 31–45: Assess pilot results, and plan for next steps.

6. Assess learnings and evaluate your go-forward plan

After your pilot is complete, it's time to gather all feedback surveys, final network stats, and support tickets for analysis against your goals and determine whether you'll implement your go-forward plan. You might find that your organization is ready for a broad deployment, or you want to extend your pilot to more users, or you want to revisit the pilot at a later date after any concerns you've identified have been mitigated. Remember that your pilot is a great way to predict technical and user outcomes in a *controlled* environment; be thoughtful about jumping ahead too quickly.

If your results indicate:

- **Your pilot goals (for example, user satisfaction and network quality) have been achieved**, you should be ready to proceed with the next phase of your rollout. Depending on the goals of your project, this could be one of the following:
 - Extending the pilot to additional participants
 - [Enabling Teams alongside Skype for Business \(Islands mode\) for some or all of your organization](#)
 - [Upgrading users from Skype for Business to Teams \(Teams only mode\) for some or all of your organization](#)
- **Your pilot didn't achieve the outcomes you wanted (for example, user satisfaction and network quality)**, take time to make the appropriate adjustments to your plan and revisit your pilot.

TIP

Enlist your pilot participants as peer champions to help evangelize and onboard new users to Teams. Peer champions can easily relate to other users, sharing their own experiences and learnings, and offering support and guidance to their colleagues. Learn more about [champions](#) and how you might use them within your own rollout.

Prepare your environment for upgrading to Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Technical Readiness stage of your upgrade journey, an activity you complete in parallel with the User Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

To drive a successful Teams upgrade in your organization, it's important that you validate your current Skype for Business environment and your network readiness. Preparing your current environment will help ensure a high-quality user experience now, in addition to improving the quality of the user experience in Teams. Taking time to plan individual steps can help accelerate your deployment and ensure that you haven't skipped any important action items.

Complete these activities in parallel with your user readiness preparation:

- [Prepare your IT staff](#) to help ensure they have what they need for a successful upgrade journey.
- Verify that your environment meets all [prerequisites](#), and understand dependencies among Microsoft 365 or Office 365 services and Teams.
- [Evaluate your environment](#) by performing environmental discovery by using a sample questionnaire to confirm your organization's readiness to undertake a successful upgrade journey to Teams.
- [Prepare your network](#) through planning, preparation, and taking any necessary remediation steps for your network to support Teams workloads.
- [Prepare your service](#) for rollout by using onboarding checklists to ensure that your Teams configuration is ready to support migrating your users from Skype for Business to Teams.

Prepare your IT staff for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Technical Readiness stage of your upgrade journey, an activity you complete in parallel with the User Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

Your Microsoft 365 or Office 365 organization admins, technical leads, and support desk are accountable for driving a high-quality user experience. This includes ensuring that your network is ready to support Teams, configuring Teams for your users, and being able to effectively troubleshoot and resolve issues that might arise.

Share the following resources with your IT staff members, and confirm that they're ready to support users before you begin your upgrade to Teams:

- [Admin training for Microsoft Teams](#)
- [Contact support for business products - Admin Help](#)
- [Troubleshoot connectivity issues with the Microsoft Teams client](#)
- [Use log files in troubleshooting Microsoft Teams](#)

 Decision points	<ul style="list-style-type: none">• Have you involved all support staff who are likely to be involved in deploying and supporting Teams?• Have you developed a training plan for onboarding additional staff as your upgrade progresses?
 Next steps	<ul style="list-style-type: none">• Verify that IT staff has the information they need.• Revisit your training and preparation plans as new features are released.

After you've prepared your IT staff for Teams, verify that your environment meets all [prerequisites](#).

Prerequisites and environmental dependencies for Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Technical Readiness stage of your upgrade journey, an activity you complete in parallel with the User Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

Teams combines multiple Microsoft 365 and Office 365 services, and is therefore dependent on the correct implementation and operation of these services. These services include—but aren't limited to—SharePoint Online, Exchange Online, and OneDrive for Business.

Although not all services are required, we highly recommend that you implement all of them. If you choose not to implement certain services, it will affect the functionality that Teams can offer your organization. For example, though you don't have to implement SharePoint Online, Teams does rely on SharePoint Online for certain functionality such as file sharing in group conversations, so not implementing this service will reduce the functionality offered through the client.

See the following articles to learn about prerequisites and how Teams interacts with other technologies:

- If your organization hasn't deployed any Microsoft 365 or Office 365 workloads, see [Get started](#).
- If your organization hasn't added or configured a verified domain for Microsoft 365 or Office 365, see [Domains FAQ](#).
- If your organization hasn't synchronized identities to Azure Active Directory, see [Identity models and authentication in Microsoft Teams](#).
- If your organization doesn't have Exchange Online, see [Understand how Exchange and Microsoft Teams interact](#).
- If your organization doesn't have SharePoint Online, see [Understand how SharePoint Online and OneDrive for Business interact with Microsoft Teams](#).
- To learn how [Microsoft 365 groups and Microsoft Teams interact](#).
- If your organization is an educational institution and you use a Student Information System, see [Welcome to Microsoft School Data Sync](#) before deploying Microsoft Teams.
- If your organization is considering Public Switched Telephone Network (PSTN) calling options, see [Voice - Phone System and PSTN connectivity](#), [Which Calling Plan is right for you](#), and [Phone System Direct Routing](#).

- To ensure all network requirements have been met before rolling out Teams, see [Prepare your organization's network for Microsoft Teams](#).
- If you are currently using Skype for Business Online Connector to manage your services, you will need to move to the Teams PowerShell module and update your existing PowerShell scripts. See [Move from Skype for Business Online Connector to the Teams PowerShell module](#) for more information.

After you've verified that your environment meets all applicable prerequisites, [evaluate your current environment for Teams](#).

Evaluate your environment before upgrading to Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Technical Readiness stage of your upgrade journey, an activity you complete in parallel with the User Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

This article gives an overview of the requirements for properly evaluating your current environment for operating Teams. By evaluating your environment, you identify risks and requirements that will influence your overall deployment. By identifying these items beforehand, you can adjust your planning to drive success.

Introduction to the Discovery Questionnaire

To achieve your objective key results (OKRs), you previously made key service decisions. The next step is to perform environmental discovery to evaluate all aspects relating to your IT infrastructure, networking, and operations to confirm that your organization is ready to implement the solution. Discovery is one of the very first, key steps that you take when planning for your journey to Teams. Environmental discovery must include a network readiness assessment to ensure your network can support upgrading to Teams. You perform a detailed discovery of your environment to better understand its current state and to reveal any difficulties or—even more important—possible blockers to the execution of your Teams rollout.

You identify technical risks as part of an environmental assessment and adoption readiness evaluation, and develop a mitigation plan for each identified risk. You should incorporate this information in the risk register.

All matters related to your existing collaboration infrastructure and Microsoft 365 or Office 365 organization, networking, endpoints, operations, and adoption and readiness are included as part of the environmental discovery questionnaire. Work with your project team to provide the requested information with as much detail as possible to facilitate your planning activities.

[The questionnaire](#) is divided into the following sections to confirm your organization's readiness for your Teams deployment in several major areas:

- Microsoft 365 or Office 365 organization details
- Existing collaboration platform summary
- Collaboration platform deployment details
- Networking and access to Microsoft 365 or Office 365 services
- Endpoints
- Operations
- Adoption and readiness

TIP

You can start by copying the questionnaire into a Microsoft Word document. Try to answer all questions and capture all details as you move through.

Decision point

- Who will be responsible for completing an environment assessment?

Next step

- Document the results of the environment assessment.

Project team

Ensure that you've engaged the right people for your project team. Verify the steps you completed in [Enlist your project stakeholders](#).

After you evaluate your environment, proceed to the next step: [Prepare your service](#).

Prepare your service for upgrading to Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Technical Readiness stage of your upgrade journey, an activity you complete in parallel with the User Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

This article gives an overview of the requirements for preparing your organization for collaboration and cloud voice services with Teams. By preparing properly, you can be sure you're ready to provide these capabilities to your organization.

Onboarding checklists and landing pages for Microsoft Teams rollout

The following checklists and landing pages walk you through the steps for deploying Microsoft Teams in your organization:

- [Prepare Microsoft 365 or Office 365 for Teams](#)
- [Configure Teams core capabilities](#)
- [Prepare your network](#)
- [Chat, teams, channels, and apps](#)
- [Meetings and audio conferencing](#)
- [Phone System and PSTN connectivity options](#)

The tasks and activities in these checklists are the core "to-do" items that apply to every deployment of collaboration and voice capabilities with Teams. You can customize the checklists to include the activities and tasks that are specific to your own Teams journey.

Use the provided checklists to track the status of each individual activity and task, and to be sure you haven't skipped any critical steps. Each activity includes a detailed description of required actions and references to additional information that you can use to complete that activity.

Although we recommend that you follow the checklists in order, the exact sequence will depend on the scope of your deployment and the configuration and complexity of your environment. They're organized to support either a "greenfield" Teams deployment (one with no previous Skype for Business Online presence) or upgrading from Skype for Business Online to Teams. If you're upgrading from Skype for Business Online, you might have already completed some of these activities and can ignore them now.

When you're onboarding users on a per-site basis, we highly recommended that you use the [Site Enablement Playbook for Voice \(Playbook\)](#) as a supplementary guide to these checklists.

NOTE

Most of the configuration settings are common between Teams and Skype for Business Online. You use the Microsoft Teams admin center to configure those settings.

Decision point

- Who will be responsible for overseeing the completion of the onboarding checklists?

Next steps

- Download the onboarding checklists.
- Work through the onboarding checklist items step-by-step in accordance with your organization's deployment plan.

Continue onboarding

After you complete this checklist, proceed to the next step: [Conduct a user pilot](#)

Prepare your organization

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the User Readiness stage of your upgrade journey, an activity you complete in parallel with the Technical Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

To realize maximum value from Teams, users must actually use it, but getting users to change the way they work isn't always easy. Taking time to understand your users and design the right readiness plan can help facilitate change and accelerate adoption of Teams. These activities should be completed in parallel with your technical readiness preparation:

- [Assessing organizational change readiness](#): This includes understanding who your users are, how they'll use the new technology, and how readily they adapt to change. This is also an opportunity to identify specific user profiles who would benefit from focused onboarding.
- [Preparing a user readiness plan](#): Consisting of awareness, training, and support activities, your readiness plan should address both your broad user base and targeted profiles, as identified in the [assessing change readiness](#) article.

TIP

Download the [Upgrade Success Kit](#) for template user readiness materials, such as communications and user surveys, in addition to a sample upgrade project plan and pilot test plan.

Assess organizational change readiness

12/7/2021 • 8 minutes to read • [Edit Online](#)

This article is part of the User Readiness stage of your upgrade journey, an activity you complete in parallel with the Technical Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

After you've secured your project team and defined your vision, scope, and goals, the next step on your upgrade journey is to ensure that your organization and users are ready for Teams—an activity that you complete in parallel with ensuring your technical readiness. To realize value from Teams, users must actually use it. Simply enabling Teams doesn't guarantee that you achieve your goal. Users have different use cases and varying learning styles, and they adapt to new technology at different speeds. The good news is that managing change isn't all that complicated, but it does take a focused effort. The guided discussions below are designed to help you understand your user base so that you can prepare the right level of education to facilitate and accelerate user adoption. There are two ways you should look at your user base:

- **Organizational change readiness:** Understanding how quickly (or not) users typically react to change. This information will help inform the amount of awareness, training, and value-selling you might need to do to drive user adoption.
- **Teamwork scenarios:** Understanding how users work will enable you to map Teams to their work activities, accelerating adoption and facilitating the shift away from Skype for Business.

NOTE

You can adapt the assessment activities given below to any change initiative in your organization. Simply address the questions based on the scope of your project. In the following discussions, "new solution" can apply to audio calling, audio conferencing, or your upgrade from Skype for Business to Teams.

Decision points

- What is the culture of your organization when it comes to change?
- How can the new technology optimize the way users work?
- Which users are likely to require special attention to get them to change the way they work?

Next steps

- Use the following guidance and associated activities to capture your organization's user readiness profile.

Organizational change readiness

By assessing your organization's readiness, you can determine how receptive (or not) your users are likely to be to changing the way they work and adopting new technology. Understanding how users react to change empowers your organization to proactively address concerns, adjust your rollout plan to get optimal buy-in, and identify users who can actually help you facilitate the change with their peers.

Activity

Use the following conversation starters to conduct an organizational readiness assessment and document the culture of your organization when it comes to change. This information can help inform how much awareness and training you might need to implement for your project. Don't worry about exact numbers. This exercise represents a general understanding of your organizational culture. If you need help getting started, simply evaluate a past rollout; this can help you anticipate how users might react to change and help you proactively address the reactions you expect.

What percentage of users fall into each bucket?

EARLY ADOPTERS	INFORMED USERS	LAGGARDS
These users request the solution before it's available.	These users accept the solution as soon as its value is demonstrated.	These users reject the solution, even when pushed into change.

TIP

Enlist your early adopters for your pilot testing in addition to serving as peer champions. Champions help evangelize new technology and lead by example to show their peers how to realize value. To learn more about creating a formal champions program, see the [Office adoption guide](#). Your laggards might need more convincing before they adopt a new technology. If more than 20 percent of your organization falls into this bucket, spend more time communicating the value messaging and delivering tailored training. In addition, support them through the change by opening a feedback loop to better understand and address their hesitations.

What percentage of users fall into each competency?

SELF-MOTIVATED	TEAM PLAYERS	HAND-HOLDING SEEKERS
These learners seek out resources, learn by doing.	These users enjoy group and interactive training; they'll go along with coworkers.	These users expect "white glove" or one-on-one assistance.

TIP

Not everyone learns the same way. For those who are self-motivated, point to Microsoft's online videos and training articles. If 20 percent or more are team players, enlist your training team or a partner to deliver live, interactive training (in person or online). Typically, you'll find executives or targeted roles in the hand-holding category. This is a critical group who would benefit from personalized, short training sessions. Enlist your champions to help deliver training to these users, for an optimal experience.

Assessing teamwork scenarios

Microsoft Teams expands the capabilities of Skype for Business, offering a comprehensive communication and collaboration solution. As you design your plan for upgrading users from Skype for Business to Teams, consider how you can use the power of teamwork collaboration to both excite users and facilitate their transition from Skype for Business to Teams.

At its core, teamwork is how people work together to get things done. It's about aligning the right people with

the relevant tools in a way that works for them. Teams brings people, conversations, files, and projects together into one workspace, creating a true hub for teamwork in your organization.

Understanding how user work and how they come together can help users visualize how they can use Teams, facilitating the shift away from Skype for Business. There are two core ways to think about teamwork scenarios: people-centric and project-centric.

- **Project-centric teamwork** centers on a specific project or initiative (for example, planning a product launch event). From scope planning to budget management to marketing efforts, project-centric teamwork helps align project workstreams, keeping everyone informed.
- **People-centric teamwork** revolves around people with similar responsibilities or attributes who might work on the same team (for example, the sales team, road warriors) or across teams (for example, peer champions). From chatting with a colleague to get an answer to a question to participating in a team meeting, people-centric activities include information sharing and rapport building.

To get the most out of Teams, build a teamwork strategy that includes both scenarios, helping users understand how Teams can work for them.

 Decision point	<ul style="list-style-type: none">• What relatable teamwork scenarios will you employ to help accelerate user adoption of Teams and facilitate your upgrade from Skype for Business?
 Next steps	<ul style="list-style-type: none">• Use the samples below to help craft your own teamwork scenarios. Document them in the Upgrade Workbook.• For additional scenarios and examples, go to the Productivity Library

Examples

Project-centric teamwork: Product launch event (for example: your organization is getting ready to launch a new product to the market and is planning a broad promotional event to drive awareness, generate leads, and encourage sales).

CONSIDERATION	NOTES
Core attributes	<ul style="list-style-type: none">• Cross-team stakeholders with various project workstreams• Frequent targeted meetings• Lots of pieces/people coming together (budget, schedules, presentations, registration, and so on)
Teamwork challenges today	<ul style="list-style-type: none">• Workstreams are working in silos with limited visibility into overall project status or cross-team efforts:<ul style="list-style-type: none">◦ Disconnected conversations and lack of "who's doing what"◦ Information tracked in various places with no cross-team visibility• Lost productivity time when bringing a new member on board or catching up from missing a meeting

CONSIDERATION	NOTES
Teamwork requirements	<ul style="list-style-type: none"> • Quick access to project schedule and task assignment • Open conversation channel to keep everyone in-the-know • Central location for current presentation files and other resources • Ability to bring new project team members up-to-speed quickly • Way to encourage and support one another to keep momentum
Teamwork in Teams	<ul style="list-style-type: none"> • Team/channels to organize project content and threaded conversations • SharePoint for hosting PPT files¹ • Planner/Trello for assigning individual project tasks and due dates¹ • Teams for online meetings • Teams mobile app for connecting on the go

¹ Supporting app integration or alignment in Teams.

People-centric teamwork: Sales team (for example: your regionally-dispersed sales team needs to stay connected from the road, remain aligned on the pipeline, and understand key offers and initiatives that can help drive toward annual quota targets)

CONSIDERATION	NOTES
Core attributes	<ul style="list-style-type: none"> • Work remotely (on the road, hotels, customer sites) • Relationship-focused – core external
Teamwork challenges today	<ul style="list-style-type: none"> • Repeated conversations with multiple field reps (chat, calls, meetings, etc) – can't get everyone together at once • Missed opportunities to learn from sales "wins" – word of mouth sharing only • Continually shuffling between applications: <ul style="list-style-type: none"> ◦ Sales Pipeline in Excel ◦ Trending in Power BI ◦ Sales collateral in email ◦ Customer demo resources on SharePoint ◦ 1:1 chats and point-in-time meetings ◦ Sales community outreach in Yammer
Teamwork requirements	<ul style="list-style-type: none"> • Quick access to sales collateral • Reach an expert quickly • Fast turn-around for questions and approvals • Sales meetings, pipeline reviews • Sales training resources • Customer database management

CONSIDERATION	NOTES
Teamwork in Teams	<ul style="list-style-type: none"> • Teams/channels by region or customer designed to focus content and conversations • SharePoint for collateral/resources¹ • XLS/Power BI for pipeline and databases¹ • Teams for online meetings • Teams mobile app for connecting on the go • Teams app integration with CRM system¹ • Yammer for broad-reach SME insights and information sharing*¹

¹ Supporting app integration or alignment in Teams.

Tips for identifying a "good fit" for your teamwork strategy

It could be easy to get carried away forming a teamwork strategy for every user, every team, and every project. Not every project or team requires a fully defined teamwork strategy. Here are some best practices for getting started:

- Consider cross-team projects that are just starting out or are upcoming.
 - Event planning – coordination from multiple teams (budget, logistics, presentations, and so on)
 - Pilot new product - share information, gather feedback in a controlled environment
- Identify user personas and core work groups, connecting the various ways they interact with one another into Teams
 - Sales teams/regions – road warriors, easy access resources, quick turn-around responses
 - HR – standardized processes across all divisions, consistent approach for hiring
 - Frontline workers – connection to their peers/management, access to procedures, NEO
- Keep these considerations in mind:
 - Start small. Save bigger, more complex projects for after you've vetted the teamwork model.
 - Focus on new projects. Avoid changing an existing project that's well underway as this may disrupt workflow.
 - Consider timing. Rolling out a new teamwork strategy to sales at the end of your fiscal year may not be ideal.
 - Iterate. No need to reinvent the wheel. When you find a teamwork structure that works, repeat it with other workgroups and projects. Define a template team and set guidelines to help users quickly assimilate into Teams and provide consistency.

Use the information you've gathered above to inform your [user readiness plan](#).

Prepare a user readiness plan

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the User Readiness stage of your upgrade journey, an activity you complete in parallel with the Technical Readiness stage. Before proceeding, confirm that you've completed these activities from previous stages:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)

An optimal user readiness plan incorporates how you'll communicate with, train, and support your users as you pilot, onboard, and upgrade to Teams. As you discovered in [Assess organizational change readiness](#), readiness is not one-size-fits-all. To ensure optimal receptiveness to the new technology, use a combination of broad-reach messaging (incorporating the vision/value messaging and universal use cases) and messaging, training, and support tailored to the personas and cohorts you've defined and also to your laggards, as appropriate. This personalized plan will help facilitate user adoption by enabling users to more quickly relate to Teams, while demonstrating that you understand their needs.

TIP

Download the [Upgrade Success Kit](#) for template user readiness materials, such as communications and user surveys, in addition to a sample upgrade project plan and pilot test plan.

Decision points

- How can you create a readiness plan to facilitate and accelerate user adoption of the new solution?
- Do you have the right awareness, training, and support resources that align with your users' ability to deal with change and the user personas you've defined?

Next step

- Use the list below to generate ideas for your readiness plan. Select the most relevant activities—or add your own—to design a readiness plan optimized for your organization. Remember to use a combination of broad-reach (for your whole organization) and targeted (for laggards or specific personas) campaigns for maximum results.

WHAT COMMUNICATION CHANNELS
WILL YOU LEVERAGE?

WHAT TRAINING CHANNELS WILL YOU
LEVERAGE?

WHAT SUPPORT CHANNELS WILL YOU
USE?

<ul style="list-style-type: none"> Email <p>Tip: Use our sample pilot, coexistence, and upgrade emails to customize your email campaign.</p> <ul style="list-style-type: none"> Posters and digital signage Launch events Department managers Champions Teams/channels Gamification 	<ul style="list-style-type: none"> Microsoft instructor-led training Microsoft-published online articles and videos Resources: <ul style="list-style-type: none"> Switch to Teams from Skype for Business Teams Video Training In-product assistance (Help) In-house training team Partner training team 	<ul style="list-style-type: none"> In-house helpdesk Outsourced support desk Self-service (intranet site) Online help and how-to Floor-walkers and champions Feedback loop (surveys, ratings)
---	---	---

After you've created your user readiness plan and associated resources, and your technical readiness is in place, proceed to [pilot Teams in your organization](#).

Overview of implementing your upgrade

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Deployment and Implementation stage of your upgrade journey.

Prerequisite planning activities

IMPORTANT

Before proceeding with your upgrade implementation, confirm that you've read the planning content starting with [Plan your upgrade](#) to ensure you've completed all prerequisite planning activities.

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)
- [Planned a user pilot](#)
- [Prepared your environment](#)
- [Prepared your organization](#)

Choose your upgrade starting point

The steps you take to perform your upgrade to Teams depends on your current deployment of Skype for Business:

Based on your current environment, choose your starting point:

- **If you are upgrading from Skype for Business Online to Teams**, follow the steps in [Upgrade from Skype for Business Online to Teams](#).
- **If you are upgrading from a Skype for Business on-premises environment**, you'll need to perform some extra steps to set up connectivity between your on-premises and online environments before you move your users to Teams. For more information, see [Upgrade Skype for Business on-premises to Teams](#).

IMPORTANT

Having the option to upgrade doesn't necessarily mean your organization is ready for this change. For the best user experience, confirm that Teams meets your collaboration and communication requirements, make sure that your network is ready to support Teams, and implement your user readiness plan before upgrading users to Teams.

Upgrade from Skype for Business Online to Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article is part of Deployment and Implementation stage of your upgrade journey. Before proceeding, confirm that you've completed the following activities:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)
- [Prepared your environment](#)
- [Prepared your organization](#)
- [Conducted a pilot](#)

Follow the guidance in this article if you have wholly deployed Skype for Business Online and want to upgrade your users from Skype for Business to Teams. You can upgrade users selectively or all-in, based on the upgrade journey that your organization has chosen, by assigning the appropriate coexistence and upgrade mode to your users.

IMPORTANT

Skype for Business Online will be retired on July 31, 2021, after which it will no longer be accessible or supported. To maximize benefit realization and ensure your organization has proper time to implement your upgrade, we encourage you to begin your journey to Microsoft Teams today. Remember that a successful upgrade aligns technical and user readiness, so be sure to leverage the guidance herein as you navigate your journey to Microsoft Teams.

Assign the coexistence and upgrade mode

You can upgrade your users to TeamsOnly mode by assigning the UpgradeToTeams instance of TeamsUpgradePolicy, which can be performed by using the Microsoft Teams admin center or a Skype for Business remote Windows PowerShell session. You can do this either on a per user basis, or on a tenant-wide basis if you want to upgrade the entire tenant in one step.

For more information, see [Setting your coexistence and upgrade settings](#) and [TeamsUpgradePolicy: managing migration and coexistence](#).

Upgrade all users to Teams at one time

Follow these steps to upgrade all of your users to Teams at one time.

Step 1: Notify the users of the change (optional)

1. In the Microsoft Teams admin center, select **Org-wide settings** > **Teams upgrade**.
2. Under **Coexistence mode**, change the **Notify Skype for Business users that an upgrade to Teams is available** switch to **On**.

Step 2: Set the coexistence mode to TeamsOnly for the organization

1. In the Microsoft Teams admin center, select **Org-wide settings**.
2. Select **Teams Only** mode from the **Coexistence mode** drop-down list.

Upgrade users in stages

Follow these steps if you want to gradually upgrade your users to TeamsOnly.

Step 1: Identify groups of users for upgrade

Often organizations may choose to upgrade their organizations in success waves of users. You'll want to identify these users first so you can easily search for them in the Microsoft Teams admin center. Alternatively, you may want to use PowerShell to more efficiently do this. Once you have identified the set of users for a given upgrade wave, continue with the remaining steps.

Step 2: Set notification for the users in the current upgrade wave (optional)

If using the Microsoft Teams admin center, you can configure TeamsUpgradePolicy for up to 20 user at once:

1. In the Microsoft Teams admin center, select **Users**, and find and multi-select the checkbox for up to 20 users who should be upgraded.
2. Select **Edit settings** in the upper left corner of the listview.
3. In the **Edit settings** pane on the right, under **Teams upgrade**, change **Notify the Skype for Business user** switch to **On**. Note: If the value of coexistence mode is "Use Org-wide settings", you won't see this switch, so you'll need to first explicitly set the Coexistence mode for these users to whatever the default value is for the org.

Alternatively, you may find it easier to enable notifications for groups of users at once using PowerShell.

Step 3: Set the coexistence mode for users to Teams Only

When you are ready to upgrade the users in the current wave to use Teams as their only application, set the Coexistence mode for the users to Teams Only.

If using the Microsoft Teams admin center, you can configure TeamsUpgradePolicy for up to 20 user at once:

1. In the Microsoft Teams admin center, select **Users**, and then select the checkbox for up to 20 users.
2. Select **Edit settings** in the upper left corner of the listview.
3. In the **Edit settings** pane on the right, under **Teams upgrade** section, set the coexistence mode to **Teams Only** in the drop-down list.

Alternatively, you may find it easier to upgrade groups of users at once using PowerShell.

Step 4: Repeat steps 1-3 for successive waves of users

As you validate your upgrade to Teams Only mode and are ready to expand, repeat the previous steps to apply TeamsOnly to more users.

Phone System and PSTN connectivity options

Phone System with Teams is supported after the user is in TeamsOnly mode. (If the user is in Islands mode, Phone System is only supported with Skype for Business.)

PSTN connectivity options

When considering Public Switched Telephone Network (PSTN) connectivity options, there are two possible scenarios when moving from Skype for Business Online to TeamsOnly mode:

- A user in Skype for Business Online, with a Microsoft Calling Plan. Upon upgrade, this user will continue to have a Microsoft Calling plan. This is the simplest scenario requiring only a couple of steps. For more

information, see [From Skype for Business Online with Microsoft Calling Plans](#).

- A user in Skype for Business Online, with on-premises voice functionality through Skype for Business on-premises or Cloud Connector Edition. The user's upgrade to Teams needs to be coordinated with migration of the user to Direct Routing to ensure the TeamsOnly user has PSTN functionality. For more information see, [From Skype for Business Online with on-premises voice](#).

Upgrade from Skype for Business on-premises to Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

This article is part of Deployment and Implementation stage of your upgrade journey. Before proceeding, confirm that you've completed the following activities:

- [Enlisted your project stakeholders](#)
- [Defined your project scope](#)
- [Understood coexistence and interoperability of Skype for Business and Teams](#)
- [Chosen your upgrade journey](#)
- [Prepared your environment](#)
- [Prepared your organization](#)
- [Conducted a pilot](#)

If you've deployed Skype for Business Server or Microsoft Lync on-premises and your organization wants to upgrade to Teams, follow the guidance in this article. You need to set up hybrid connectivity with your Microsoft 365 or Office 365 organization, and determine coexistence requirements if you are moving your users to Teams in phases.

Before you begin, IT Pros and administrators should review the [Important considerations for organizations with Skype for Business Server on-premises](#) later in this article.

IMPORTANT

Skype for Business Online will be retired on July 31, 2021, after which it will no longer be accessible or supported. To maximize benefit realization and ensure your organization has proper time to implement your upgrade, we encourage you to begin your journey to Microsoft Teams today. Remember that a successful upgrade aligns technical and user readiness, so be sure to leverage this guidance as you navigate your journey to Microsoft Teams.

Step 1: Configure hybrid connectivity

The key prerequisite for upgrading your on-premises users to Teams is to configure hybrid connectivity for your Skype for Business Server on-premises deployment.

Start by reading [Plan hybrid connectivity](#), and then follow the tasks outlined in [Configure hybrid connectivity](#).

Step 2: Set transitional coexistence mode (optional)

Coexistence and interoperability between Skype for Business and Teams clients and users are defined by Teams Upgrade modes. Hybrid organizations, as well as any organization created prior to Sept 3, 2019, are by default in Islands mode. Islands mode allows users to use both Teams and Skype for Business clients side by side. For an organization moving to Teams, TeamsOnly mode is the final destination for each user--though not all users need to be assigned TeamsOnly (or any other mode) at the same time.

Prior to users reaching TeamsOnly mode, organizations can optionally use any of the Skype for Business coexistence modes to ensure predictable communication between users who are in TeamsOnly mode and users who aren't yet. The purpose of the Skype for Business coexistence modes (SfBOnly, SfBWithTeamsCollab, SfBWithTeamsCollabAndMeetings) is to provide a simple, predictable experience for end users as organizations transition from Skype for Business to Teams. A user homed in Skype for Business Server on-premises can be assigned any mode other than TeamsOnly. Once a user is moved to the cloud, they are TeamsOnly. Cloud-only users cannot be assigned a mode other than TeamsOnly. (However, they can be moved back to on-premises, which would result in them receiving the tenant's global policy of TeamsUpgradePolicy.)

When a user is in any of the Skype for Business modes, all incoming chats and calls are routed to the user's Skype for Business client. To avoid end-user confusion and ensure proper routing, calling and chat functionality in the Teams client is disabled when a user is in any of the Skype for Business modes. Similarly, meeting scheduling in Teams is explicitly disabled when users are in the SfBOnly or SfBWithTeamsCollab modes, and explicitly enabled when a user is in the SfBWithTeamsCollabAndMeetings mode.

Depending on your requirements, you can assign the appropriate coexistence mode based on the upgrade path that your organization has chosen. For more information, see [Migration and interoperability guidance for organizations using Teams together with Skype for Business](#) and [Setting your coexistence and upgrade settings](#).

Step 3: Move users from Skype for Business on-premises to Teams Only

Microsoft has recently simplified the process to move users to TeamsOnly. This process is now a single step, regardless of which version of Skype for Business Server or Lync Server 2013 you are using. For more information, see [Move users between on-premises and the cloud](#) and [Move users from on-premises to Teams](#).

Step 4: Disable hybrid to complete your migration to the cloud

After you have moved all users from on-premises to the cloud, you can decommission the on-premises Skype for Business deployment. For more information, see [Disable hybrid to complete migration to the cloud](#).

Phone System and PSTN connectivity options

Phone System with Teams is supported after the user is in TeamsOnly mode. (If the user is in Islands mode, Phone System is only supported with Skype for Business.)

PSTN connectivity options

When considering Public Switched Telephone Network (PSTN) connectivity options, there are two possible scenarios when moving from Skype for Business on premises to TeamsOnly mode:

- A user in Skype for Business on-premises with Enterprise Voice, who will be moving to online and using a Microsoft Calling plan. Migrating this user to Teams requires moving the user's on-premises Skype for Business account to the cloud, and coordinating that move with either A) the port of that user's phone number to a Microsoft Calling Plan or B) assigning a new subscriber number from available regions. For more information, see [From Skype for Business Server on-premises, with Enterprise Voice, to Microsoft Calling Plan](#).
- A user in Skype for Business on-premises with Enterprise Voice, who will be moving to online and keeping on-premises PSTN connectivity. Migrating this user to Teams requires moving the user's on-premises Skype for Business account to the cloud, and coordinating that move with migration of the user to Direct Routing. For more information, see [From Skype for Business Server on-premises, with Enterprise Voice, to Direct Routing](#).

Important considerations for organizations with Skype for Business

Server on-premises

- The following articles describe important upgrade concepts and coexistence behaviors:
 - [Coexistence of Teams and Skype for Business](#)
 - [Coexistence modes - Reference](#)
 - [Teams client experience and conformance to coexistence modes](#)
- Setting up Skype for Business hybrid is a prerequisite to migrate to TeamsOnly mode. While it is possible for on-premises Skype for Business Server users to use Teams in Islands mode without hybrid, the transition to TeamsOnly mode cannot be made without moving the user to the cloud using `Move-CsUser`, for which hybrid connectivity is required. For more information, see [Configure hybrid connectivity](#). Also, the upcoming retirement of Skype for Business Online will not change this requirement. For organizations to move from Skype for Business Server to Teams, they must still set up and configure hybrid using the same toolset, *exactly as before the retirement*.
- To move an on-premises user to the cloud, use `Move-CsUser` in the on-premises administration tools. It is no longer required to specify the `-MoveToTeams` switch to move users directly from on-premises to TeamsOnly. When moving a user from on-premises to the cloud with `Move-CsUser`, users are now automatically assigned TeamsOnly mode and their meetings from on-premises are automatically converted to Teams meetings, just as if the `-MoveToTeams` switch had been specified, regardless of whether the switch is actually specified.
- If your organization has Skype for Business Server and you have not configured hybrid connectivity but you still want to use Teams, to administer Teams functionality you must use an administrative account that has an .onmicrosoft.com domain. Without hybrid connectivity, the administrative tools won't recognize your on-premises domains.
- Teams users who have a Skype for Business account on-premises (that is, they have not yet been moved to the cloud by using `Move-CsUser`) cannot interoperate with any Skype for Business users, nor can they federate with external users. This functionality is only available once the users are moved to the cloud and are TeamsOnly users.
- If you have any users with Skype for Business accounts on-premises or if you still have a lyncdiscover DNS record for an on-premises deployment, you cannot assign TeamsOnly mode at the tenant level. You must first move all users with on-premises Skype for Business accounts to the cloud using `Move-CsUser` and then follow the steps described in [Disable hybrid to complete migration to the cloud](#) which includes removal of DNS entries. `Grant-CsTeamsUpgradePolicy -PolicyName UpgradeToTeams` will not work at the tenant level if a lyncdiscover DNS record is detected that points to a location other than Office 365.
- You must ensure your users are properly synchronized into Azure AD with the correct Skype for Business attributes. These attributes are all prefixes with "msRTCSIP-". If users are not synchronized properly to Azure AD, the management tools in Teams will not be able to manage these users. (For example, you won't be able to assign Teams policies to on-premises users unless you are properly syncing these attributes.) For more information, see [Configure Azure AD Connect for Teams and Skype for Business](#).
- To create a new TeamsOnly in a hybrid organization, *you must first enable the user in Skype for Business Server on-premises*, and then move the user from on-premises to the cloud using `Move-CsUser`. Creating the user in on-premises first ensures that any other remaining on-premises Skype for Business users will be able route to the newly created user. Once *all* users have been moved online, it is no longer necessary to first enable users in on-premises.
- If you would like display notifications in the Skype for Business client for on-premises users, you must use `TeamsUpgradePolicy` in the on-premises toolset. Only the `NotifySfbUsers` parameter is relevant for on-premises users. On-premises users receive their mode from the online instances of `TeamsUpgradePolicy`. See the notes in [Grant-CsTeamsUpgradePolicy](#).

NOTE

Any new tenants created after Sept 3, 2019 are created as TeamsOnly tenants unless the organization already has an on-premises deployment of Skype for Business Server. Microsoft uses DNS records to identify on-premises Skype for Business Server organizations. If your organization has on-premises Skype for Business Server with no public DNS entries, you will need to call Microsoft Support to have your new tenant downgraded.

Upgrade strategies for IT administrators

12/7/2021 • 6 minutes to read • [Edit Online](#)

This article is for IT administrators who want to implement their upgrade to Teams from Skype for Business.

Before implementing your upgrade, we recommend the following articles which describe important upgrade concepts and coexistence behaviors:

- [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#)
- [Coexistence modes - Reference](#)
- [Teams client experience and conformance to coexistence modes](#)

Upgrade options

This section describes how to implement your upgrade by using one of the following upgrade options:

- [Overlapping capabilities upgrade \(using Islands mode\)](#)
- [A select capabilities upgrade for an organization that has not yet started using Teams](#)
- [A select capabilities upgrade for an organization that is already using Teams in Islands mode](#)

If you need more information about the options, make sure you have already read [Choose your upgrade journey from Skype for Business to Teams](#).

Overlapping capabilities upgrade (using Islands mode)

For the overlapping capabilities upgrade option:

- Consider this option if you can do a fast upgrade for your overall organization. Since there is potential risk of confusion for end users with running both clients, it's best if you can minimize the time period during which users must run both clients. You should ensure your users know to run both clients.
- This option is the out-of-the box model, and doesn't require administrator action to get started with Teams except to assign the Microsoft 365 or Office 365 license. If your users already have Skype for Business Online, you may already be in this model.
- It can be challenging getting out of overlapping capabilities mode and moving to TeamsOnly. Because upgraded users only communicate via Teams, any other user in the organization communicating with that user must be using Teams. If you have users that have not started using Teams, they will be exposed to missing messages. Furthermore, they won't see the TeamsOnly users online in Skype for Business. Some organizations choose to do a tenant-wide upgrade using the Tenant global policy to avoid this, however that requires upfront planning as well as waiting until all users are ready to be upgraded.

A select capabilities upgrade for an organization that has not yet started using Teams

If your organization does not yet have any active users in Teams, the first step is to set the default tenant-wide policy for TeamsUpgradePolicy to one of the Skype for Business modes, for example, SfbWithTeamsCollab. Users

who have not yet started using Teams won't notice any difference in behavior. However, setting this policy at the tenant level makes it possible to start upgrading users to TeamsOnly mode, and ensures that the upgraded users can still communicate with non-upgraded users. Once you have identified your pilot users you can upgrade them to TeamsOnly. If they are on-premises, use Move-CsUser. If they are online, simply assign them TeamsOnly mode by using Grant-CsTeamsUpgradePolicy. By default, any Skype for Business meetings scheduled by these users will be migrated to Teams.

Following are the key commands:

1. Set the tenant-wide default to mode SfbWithTeamsCollab as follows:

```
Grant-CsTeamsUpgradePolicy -PolicyName SfbWithTeamsCollab -Global
```

2. Upgrade the pilot users to TeamsOnly as follows:

- For a user who is online:

```
Grant-CsTeamsUpgradePolicy -PolicyName UpgradeToTeams -Identity $username
```

- For a user who is on-premises:

```
Move-CsUser -identity $user -Target sipfed.online.lync.com -MoveToTeams -credential $cred
```

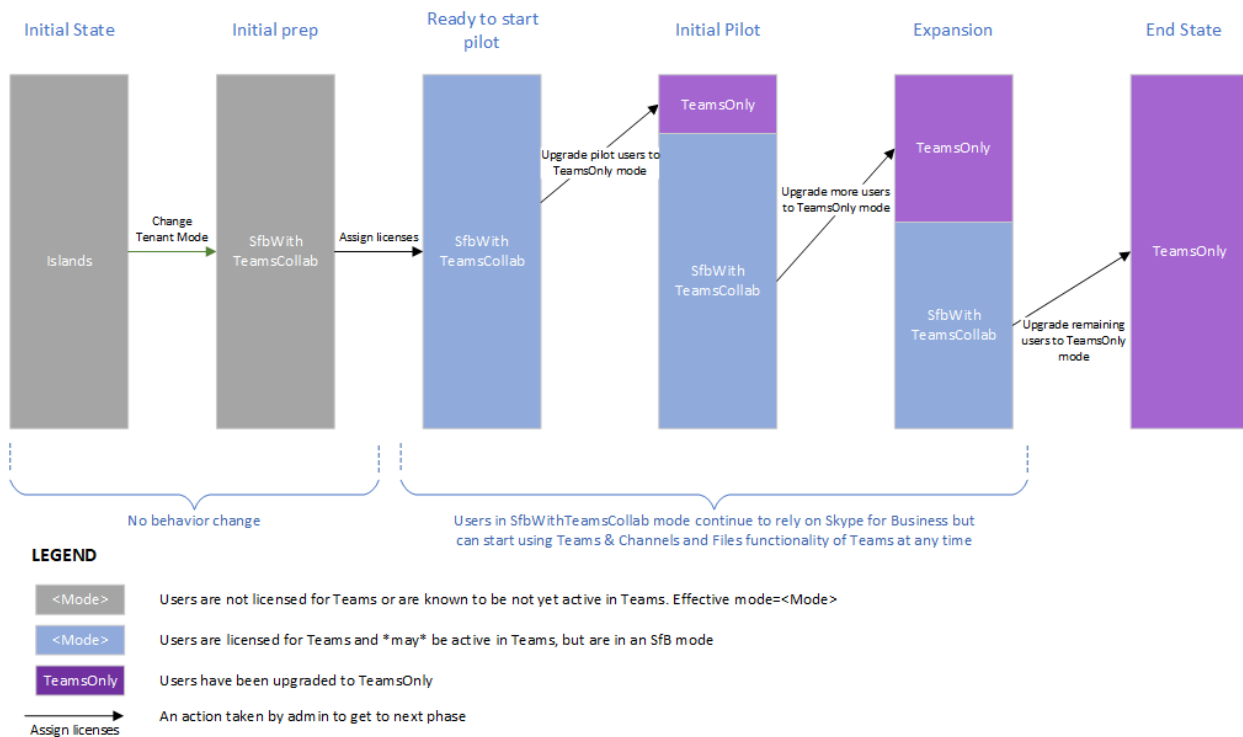

Notes

- Instead of setting the tenant-wide policy to SfbWithTeamsCollab, you could set it to SfbWithTeamsCollabAndMeetings. This causes all users to schedule all new meetings in Teams.
- By default, Skype for Business meetings are migrated to Teams when upgrading to TeamsOnly mode or when assigning SfbWithTeamsCollabAndMeetings mode.

NOTE

In preparation for the upcoming retirement of Skype for Business Online, Microsoft has simplified how organizations move to Teams. It is no longer required to specify the `-MoveToTeams` switch in `Move-CsUser` to move users directly from on-premises directly to TeamsOnly. Previously, if this switch was not specified, users transitioned from being homed in Skype for Business Server on-premises to Skype for Business Online, and their mode remained unchanged. Now when moving a user from on-premises to the cloud with `Move-CsUser`, users are automatically assigned TeamsOnly mode and their meetings from on-premises are automatically converted to Teams meetings, just as if the `-MoveToTeams` switch had been specified, regardless of whether the switch is actually specified. This behavior is available on all versions of Skype For Business Server and Lync Server 2013 (which never had support for `-MoveToTeams`).

The diagram below shows the conceptual phases of select capabilities upgrade for an organization with no prior usage of Teams. The height of the bars represents number of users. During any phase of the upgrade, all users can communicate with each other. Skype for Business users communicate with TeamsOnly users using Interop, and vice versa. Users in Islands mode must be sure to run both clients.

A select capabilities upgrade for an organization that is already using Teams in Islands mode

If some users in your organization are actively using Teams in Islands mode, you probably do not want to remove functionality from existing users. Therefore, an extra step is required before changing the tenant-wide policy. The solution is to “grandfather” these existing active Teams users into Islands mode, before setting the tenant-wide policy to SfbWithTeamsCollab. Once you’ve done that, you can proceed with deployment as above, however, you’ll have two groups of users who are moving to TeamsOnly: the users who were active in Teams will be in Islands mode, and the remaining users will be in SfbWithTeamsCollab mode. You can progressively move these users to TeamsOnly mode.

- Find users who are active in Teams as follows:
 - From the Microsoft 365 admin center, in the left-hand navigation, go to Reports, and then Usage.
 - In the “Select a report” dropdown, choose Microsoft Teams, and then User Activity. This will provide an exportable table of users who have been active in Teams.
 - Click Export, open Excel, and filter to show only the users who are active in Teams.
- For each active Teams user found in step 1, assign them Islands mode in remote PowerShell. This allows you to go to the next step, and ensures you don’t change the user experience.

```
$users=get-content "C:\MyPath\users.txt"
foreach ($user in $users){
  Grant-CsTeamsUpgradePolicy -identity $user -PolicyName Islands}
```

- Set the tenant-wide policy to SfbWithTeamsCollab:

```
Grant-CsTeamsUpgradePolicy -Global -PolicyName SfbWithTeamsCollab
```

- Upgrade selected users to TeamsOnly mode. You can choose to upgrade either users in Islands mode or SfbWithTeamsCollab mode, although you might want to prioritize upgrading the users in Islands mode first to minimize the potential for confusion that can arise when users are in Islands mode.

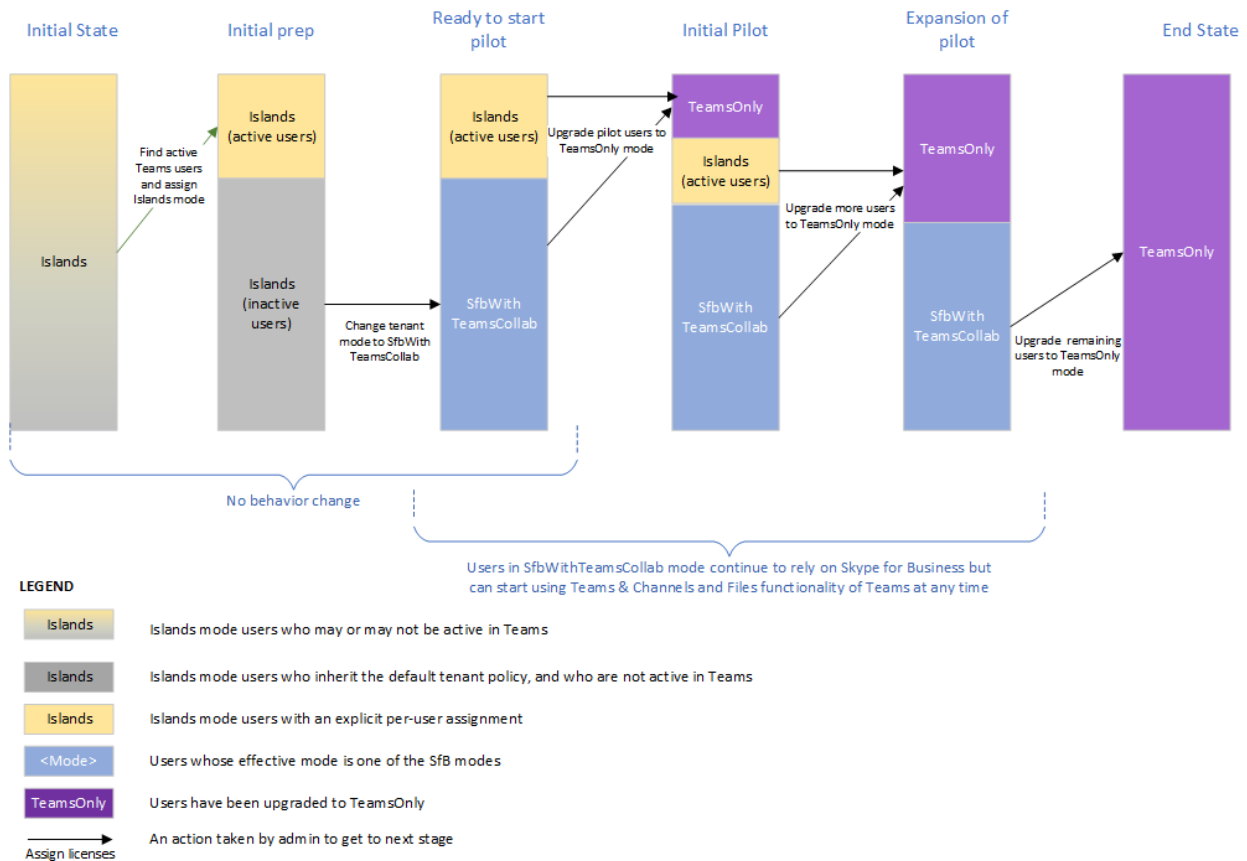

For users homed in Skype for Business Online:

```
Grant-CsTeamsUpgradePolicy -Identity $user -PolicyName UpgradeToTeams
```

For users homed in Skype for Business Server on-premises:

```
Move-CsUser -Identity $user -Target sipfed.online.lync.com -MoveToTeams -credential $cred
```

The diagram below shows the conceptual phases of a select capabilities transition in which there are active Islands users at the start. The height of the bars represents the number of users. During any phase of the upgrade, all users can communicate with each other. Skype for Business users communicate with TeamsOnly users using interop, and vice versa.

How to use Microsoft Teams effectively

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Operational Excellence stage of your upgrade journey, which begins as soon as you've completed your upgrade from Skype for Business to Teams.

Technology is innovating at an unprecedented pace. Staying current and enabling a modern workplace environment has become a standard in how organizations operate. As Microsoft Teams, Microsoft 365, and Microsoft's intelligent communication vision continue to unfold, having an operational plan in place will help ensure your organization is set up for long-term success. An optimal operational plan includes monitoring your environment for health and quality, continuing user momentum to optimize adoption, and planning for new functionality that will continue to come online over time.

Monitor for network health and quality

The status of your network affects the user experience. When a user has a poor experience (for example, call drops or lag time when joining meetings), they correlate this to the technology itself, leaving them with the impression that the technology doesn't work and opening the door for unsupported apps. Implementing a plan to monitor and mitigate network health will help ensure a positive user experience in addition to reducing calls to your support desk. For more information, see:

- [Operate your service](#)
- [Monitor and improve call quality](#)
- [Enhance your service](#)

Drive user momentum and adoption

To realize maximum benefit and business outcomes with Teams, users must actually use it. However, initial excitement tends to wane and users easily revert to old ways of working. Encourage user adoption and maintain excitement for Teams with an ongoing adoption plan, which can include:

- Enlisting peer champions to help evangelize and encourage fellow users.
- Checking the [Microsoft 365 Adoption Guide](#) for tips on boosting engagement and driving adoption.
- Leveraging the [Teams Customer Success Kit](#) to enhance awareness and share best practices.
- Implementing a formal [adoption and change management strategy](#) to help sustain adoption growth.

Prepare for new functionality

The lifecycle of any given technology has shifted to a dynamic growth cycle. This means that the Teams and Microsoft 365 roadmaps will continue to unfold, with new functionality lighting up on a regular cadence. Establishing a change cycle within your organization will ensure you're ready to manage continual collaboration improvements and realize maximum value. This can include:

- Monitor the Teams [roadmap](#).
- Implement a change planning form (as illustrated below) to prepare and implement new functionality. Be sure to include both technical and user readiness activities.

Skype for Business Online retirement

12/7/2021 • 5 minutes to read • [Edit Online](#)

In July 2019, we announced **Skype for Business Online will be retired on July 31, 2021**, giving our customers two years to plan their upgrades to Microsoft Teams, the core app for communication and collaboration in Microsoft 365. As Skype for Business Online is retired, we want to ensure customers have the information and resources they need to plan and execute a successful upgrade to Teams.

Why is Skype for Business Online retiring?

Since its introduction, Skype for Business Online has been a valuable tool for millions of people around the world. By combining instant messaging, calling, and video into one application, Skype for Business Online established new possibilities for business communications. Microsoft Teams is the next chapter in that vision.

The capabilities of Microsoft Teams go beyond those of Skype for Business Online. By combining chat, video, calling, document collaboration, and application integration into a single experience, Teams enables entirely new way of working. And ongoing platform innovation and development means Teams users benefit from richer performance, functionality, flexibility, and security.

Teams isn't just an upgrade for Skype for Business Online, it's a powerful tool that enables companies, schools, and organizations to become more agile and improve the efficiency of key workflows. Learn more about the potential benefits of Teams for your organization in the Forrester white paper, [The Total Economic Impact™ of Microsoft Teams](#).

For more information about the Skype for Business Online retirement, see [FAQ — Upgrading from Skype for Business to Microsoft Teams](#).

What this means for Skype for Business customers

After Skype for Business Online retires on July 31, 2021, the service will no longer be accessible. Until then, current Skype for Business Online customers will experience no change in service. As of September 1, 2019, all new Microsoft 365 customers have been onboarded directly to Teams for chat, meetings, and calling.

The time needed to fully upgrade to Teams will vary based upon the unique characteristics of the organization, including number of users, technical complexity, and internal adaptability to change. We strongly recommend that you begin your upgrade to Teams today. By starting your upgrade today, you'll have ample time to finish it prior to the retirement date. Beginning in August, Microsoft will provide an assisted upgrade process to help you move any remaining Skype for Business Online users to Teams Only.

Teams is available in most Microsoft 365 Business and Enterprise plans, and your existing licensing investments carry forward to Teams. Capabilities that are premium workloads in Skype for Business Online today will continue to be premium workloads in Teams. For example, if you have purchased Audio Conferencing standalone or as part of E5 with Skype for Business, Audio Conferencing will be enabled in Teams.

The Skype consumer service and Skype for Business Server are not affected by the retirement of Skype for Business Online. Customers with hybrid deployments of Skype for Business Server or Lync Server 2013 should review [Implications of the upcoming retirement of Skype for Business Online](#).

How Microsoft is helping customers upgrade to Teams

We strongly recommend that you begin your upgrade from Skype for Business Online to Teams today. By starting your upgrade today, you'll have ample time to finish it prior to the retirement date.

Take advantage of the resources available to help plan your Teams deployment and upgrade from Skype for Business:

- [Teams deployment and upgrade documentation](#) – Free technical guidance for IT administrators.
- [Teams upgrade planning workshops](#) – Free interactive upgrade planning workshops, where you'll receive guidance, best practices and resources designed to help you plan and implement your upgrade to Teams.
- [Assisted upgrades from Skype for Business Online to Microsoft Teams](#) – Automated program that assists you with the technical steps of upgrading Skype for Business Online users to Teams.
- [FastTrack for Microsoft 365](#) – Teams deployment assistance available for qualifying plans.
- [Teams live training](#) – Free online training classes designed to get your organization up and running with Teams.
- [Teams Chalk Talks](#) – Free online workshops for IT pros and decision makers sharing best practices for some of the most popular and compelling scenarios in Teams.
- [Microsoft Partners](#) – Microsoft solution providers can help you take full advantage of Teams.
- [Microsoft Teams blog](#) – Get the latest Teams news covering new features, adoption and usage resources, Teams devices, and integration with other business productivity applications.

If you're a current Skype for Business Online customer, start planning your upgrade to Teams today. We're excited for you to experience its powerful communication and collaboration capabilities, and we're committed to helping along the way.

What to expect post-retirement

It is no longer possible for users homed in the cloud to be assigned a mode other than TeamsOnly. Users that are TeamsOnly cannot be assigned any other coexistence mode.

In addition, Microsoft will provide assisted upgrades for Skype for Business Online users not in Teams Only mode at retirement. Customers will receive notifications in both the Teams admin center, and the Microsoft 365 Message Center, 90 days before their scheduled upgrade date to allow time for technical and user readiness.

After the assisted upgrade is complete, all online users will be in Teams Only mode. Users in Teams Only mode receive incoming chats and calls, and schedule meetings, in Teams. Users in Teams Only mode will not be able to initiate chats or calls or schedule meetings in Skype for Business Online. Teams Only users will still be able to join Skype for Business meetings scheduled by users still using Skype for Business Server.

For more information, see [Assisted Upgrades from Skype for Business Online to Microsoft Teams](#).

What organizations with hybrid configurations (Skype for Business Online and on-premises Skype for Business Server) can expect when Skype for Business Online retires

Hybrid customers with online and on-premises configurations will be required to upgrade online users from Skype for Business Online to Microsoft Teams by the July 31, 2021 retirement date. Microsoft will provide assisted upgrades to help upgrade remaining Skype for Business Online users to Teams Only mode after the retirement date.

Organizations with a hybrid configuration can continue to use Skype for Business and Teams side-by-side until they're ready to move to Teams Only mode. After the Skype for Business Online retirement date, when a Skype for Business Server user is moved to the cloud, that user will be in Teams Only mode.

For more information, see [Implications of the upcoming retirement of Skype for Business Online](#).

Assisted upgrades from Skype for Business Online to Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Microsoft offers assisted upgrades to Teams to help organizations make a successful transition from Skype for Business Online as the service retires July 31, 2021. Whether your organization is upgrading from a *Skype for Business Online* or *Skype for Business Online with hybrid* (users in both Skype for Business Online and Skype for Business Server) environment, assisted upgrades reduce the number of technical tasks you need to do and allow for greater focus on organizational preparedness, user awareness, and Teams training.

We recommend that you review our [upgrade guidance](#) before your upgrade. Our upgrade guidance includes recommended activities and helpful resources for completing an upgrade from Skype for Business Online to Teams. This guidance applies to any organization planning an upgrade to Teams, whether they manage all aspects of the upgrade or use the assisted process.

NOTE

If you're scheduled for an assisted upgrade to Teams, you can perform your own upgrade from Skype for Business Online before your scheduled upgrade date. For more information about how to manually upgrade to Teams, see our [upgrade guidance](#).

Assisted upgrades are not available for on-premises deployments of Skype for Business Server.

Notifications for scheduled customers

Skype for Business Online customers that are scheduled for assisted upgrades to Teams will receive a series of upgrade notifications. These notifications will begin 90 days before the scheduled upgrade date. These notifications will be delivered as *Plan for Change* posts in the Microsoft 365 Message Center, upgrade dashboard notifications in Teams admin center, and in-app flags to end users.

Upgrade notifications will include the scheduled date of the assisted upgrade, and will link to upgrade resources and training to help drive adoption and usage of Teams.

The assisted upgrade experience

Assisted upgrades will begin in August 2021 with tenant-specific dates shared in the scheduling notifications mentioned above.

Your assisted upgrade experience will differ slightly depending on whether you have a Skype for Business Online-only or a Skype for Business Online with hybrid environment:

- **Skype for Business Online-only** The assisted upgrade process will apply the `TeamsUpgradeOverridePolicy` policy to your organization. When this policy is applied, all your Skype for Business Online users will be placed in Teams Only mode.
- **Skype for Business Online with hybrid** Hybrid environments may have users that fall into one of the following categories:
 - On-premises users homed on Skype for Business Server
 - Skype for Business Online users that are in Teams Only mode
 - Skype for Business Online users that are **not** in Teams Only mode

If you have a mixture of users in each of the categories listed above, the assisted upgrade process will only switch Skype for Business Online users to Teams Only mode if they're not already in that mode. On-premises Skype for Business users won't be impacted by the assisted upgrade process.

NOTE

Don't worry if your assisted upgrade is scheduled for a date after July 31, 2021. Your organization will be able to use Skype for Business Online until your upgrade is complete.

The duration of the upgrade will vary by volume of users and the characteristics of the deployment. In most cases, users within a tenant will be upgraded within 24 hours of the start of the upgrade. During this time, end users will still have access to Skype for Business Online functionality. Once the upgrade has completed and users sign out of Skype for Business Online, they'll start using Teams for messaging, meetings, and calling.

The post-upgrade experience

When the assisted upgrade completes, the **Coexistence Mode** for upgraded users is set to Teams Only. We recommend that you review [Teams Only mode considerations](#) before your upgrade. The table below provides a high-level overview of the Teams Only user experience.

Chat and Calling

- All calls and chats are started and received in Teams
- Users can communicate (chat/call) with any Skype for Business user
- Organizations can enable Teams users to communicate with users of the Skype consumer service by managing [external access permissions](#)
- Teams users who attempt to sign in to Skype for Business Online are redirected to Teams

Meetings

- Users schedule all new meetings in Teams (plugin replaced)

Migrated Data

- Existing contacts from Skype for Business Online including federated (but no distribution lists)
- Contacts are migrated when users log into Teams for the first time.

IMPORTANT

Contacts must be migrated within 90 days of the completion of your upgrade.

- Existing Skype for Business Online meetings are converted to Teams meetings

IMPORTANT

Customers with pure Skype for Business Online configurations need to use the Meeting Migration Service (MMS) to migrate existing Skype for Business Online meetings to Teams meetings. We recommend using MMS prior to the assisted upgrade date. For more information about MMS, see [Using the Meeting Migration Service \(MMS\)](#).

If you have a Skype for Business Server hybrid deployment and upgrade to Teams, you can move users between Skype for Business Server and Teams after your upgrade is complete.

Tools for upgrading to Teams — for IT administrators

12/7/2021 • 5 minutes to read • [Edit Online](#)

This article describes tools for upgrading to Teams from Skype for Business.

Before beginning your upgrade, Microsoft recommends the following articles that describe important upgrade concepts and coexistence behaviors:

- [Coexistence of Teams and Skype for Business](#)
- [Coexistence modes - Reference](#)
- [Teams client experience and conformance to coexistence modes](#)

Tools for managing the upgrade

Whichever upgrade method you choose, for users that already have Skype for Business Online, you manage the transition to TeamsOnly using [TeamsUpgradePolicy](#), which controls a user's coexistence mode. For users with an on-premises account in Skype for Business Server, you also use `Move-CsUser` to [move them to the cloud](#). For more information on each of the modes, see [Coexistence modes](#).

NOTE

If you are currently using Skype for Business Online Connector to manage your services, you will need to move to the Teams PowerShell module and update your existing PowerShell scripts. See [Move from Skype for Business Online Connector to the Teams PowerShell module](#) for more information.

Whether you perform a select capabilities transition using Skype for Business modes or simply upgrade to TeamsOnly mode from the default Islands configuration, TeamsUpgradePolicy is the primary tool. Like any other policy in Teams, you can assign TeamsUpgradePolicy directly to a user. You can also set the policy as the tenant-wide default. Any assignment to a user takes precedence over the tenant default setting. You can manage the policy in the Teams Admin Console and in PowerShell.

You can assign any mode of TeamsUpgradePolicy, except for TeamsOnly mode, to users homed in Skype for Business on-premises. Conversely, users homed in the cloud can only be assigned TeamsOnly mode.

TeamsOnly mode can only be assigned to a user who is already homed in the cloud because interop and federation with Skype for Business users as well as Microsoft 365 Phone System functionality are only possible if the user is homed in Skype for Business Online. Further, **you can't assign TeamsOnly mode as the tenant-wide default if you have a Skype for Business on-premises deployment** (which is detected by presence of a lyncdiscover DNS record that points to location other than Office 365). For details, see [Disable your hybrid configuration to complete migration to Teams Only](#).

Users with Skype for Business accounts homed on-premises [must be moved online](#) to Teams Only mode using Move-CsUser in the Skype for Business on-premises toolset.

Unlike other policies, it is not possible to create new instances of TeamsUpgradePolicy in Microsoft 365 or Office 365. All the existing instances are built into the service. (Note that mode is a property within TeamsUpgradePolicy, rather than the name of a policy instance.) In some—but not all—cases, the name of the policy instance is the same as mode. In particular, to assign TeamsOnly mode to a user, you will grant the "UpgradeToTeams" instance of TeamsUpgradePolicy to that user. To see a list of all instances, you can run the following command:

```
Get-CsTeamsUpgradePolicy | ft Identity, Mode, NotifySfbUsers
```

To upgrade an online user to TeamsOnly mode, assign the "UpgradeToTeams" instance:

```
Grant-CsTeamsUpgradePolicy -PolicyName UpgradeToTeams -Identity $user
```

To upgrade an on-premise Skype for Business user to TeamsOnly mode, use Move-CsUser in the on-premises toolset:

```
Move-CsUser -identity $user -Target sipfed.online.lync.com -credential $cred
```

To change the mode for all users in the tenant, except those who have an explicit per-user grant (which takes precedence), run the following command:

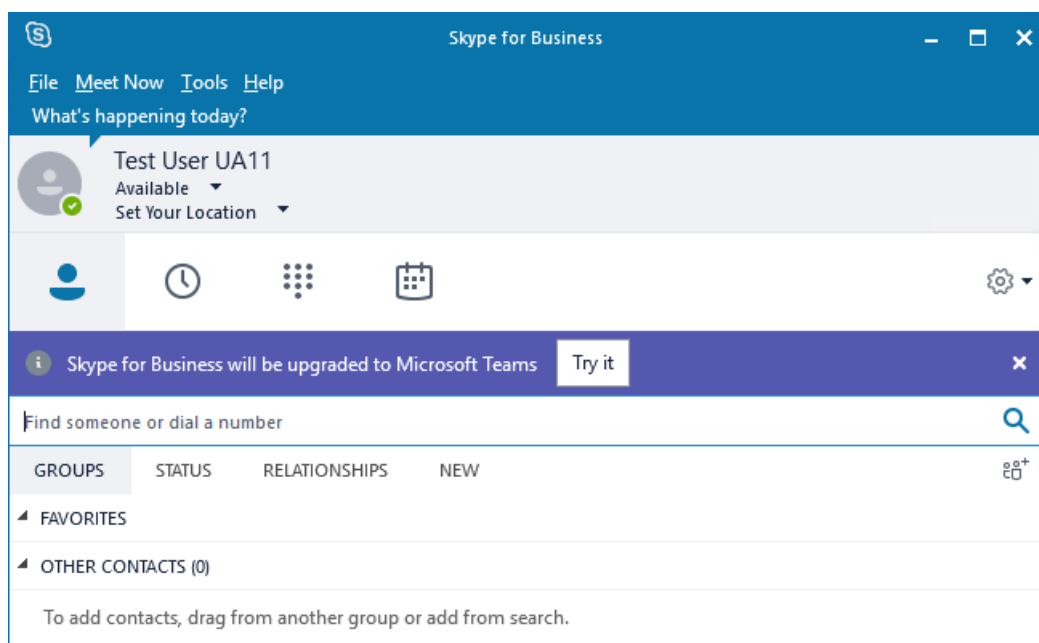

```
Grant-CsTeamsUpgradePolicy -PolicyName SfbWithTeamsCollab -Global
```

NOTE

If you have any users with Skype for Business accounts on-premises, you cannot assign TeamsOnly mode at the tenant level. You must move these users individually to Teams Only mode using Move-CsUser.

Using notifications in Skype for Business clients

Administrators have the option to provide end user notifications in the Skype for Business client to inform users that they will soon be upgraded to Teams, as shown in the following diagram. For example, a week before the administrator plans to upgrade a group of users to TeamsOnly mode, the administrator might want to turn on these notifications for that group of users. These notifications are enabled using an instance of TeamsUpgradePolicy with NotifySfbUsers=true. For all modes other than TeamsOnly, there are actually two instances per mode, corresponding to the two values of NotifySfbUsers. For all modes other than TeamsOnly, there are actually two instances per mode, corresponding to the two values of NotifySfbUsers.

If your users are homed in Skype for Business Online, simply assign the policy instance that has the same mode as the user, but with NotifySfbUsers=true.

If your users are homed in Skype for Business Server on-premises, you'll need to use the on-premises toolset and you'll need Skype for Business Server 2019 or CU8 for Skype for Business Server 2015. For users homed in Skype for Business Server on-premises, the mode property from the online instance of TeamsUpgradePolicy is honored, but the NotifySfbUsers property is not. If notifications are desired, you must create an on-premises instance of TeamsUpgradePolicy to control the client behavior.

In the on-premises PowerShell window, create a new instance of TeamsUpgradePolicy with NotifySfbUsers=true:

```
New-CsTeamsUpgradePolicy -Identity EnableNotification -NotifySfbUsers $true
```

Then, using the same on-premises PowerShell window, assign that new policy to the desired users:

```
Grant-CsTeamsUpgradePolicy -Identity $user -PolicyName EnableNotification
```

Meeting migration

When a user is migrated to TeamsOnly mode, by default their existing Skype for Business meetings that they organized will be converted to Teams. You can optionally disable the default behavior when assigning TeamsOnly mode to a user. When moving users from on-premises, meetings must be migrated to the cloud to function with the online user account, but if you do not specify -MoveToTeams, the meetings will be migrated as Skype for Business meetings, rather than converted to Teams.

When assigning TeamsOnly mode at the tenant level, meeting migration is not triggered for any users. If you wish to assign TeamsOnly mode at the tenant level and migrate meetings, you can use PowerShell to get a list of users in the tenant (for example, using Get-CsOnlineUser with whatever filters are needed) and then loop through each of these users to trigger meeting migration using Start-CsExMeetingMigration. For details, see [Using the Meeting Migration Service \(MMS\)](#).

Coexistence modes - Reference

12/7/2021 • 8 minutes to read • [Edit Online](#)

IMPORTANT

- After retirement of Skype for Business Online on July 31, 2021, it is no longer possible to assign a coexistence mode other than TeamsOnly to a user homed in the cloud. As was the case prior to retirement, users homed in Skype for Business Server on-premises can be assigned any mode *other than* TeamsOnly.

Coexistence modes provide a simple, predictable experience for end users as organizations transition from Skype for Business to Teams. For an organization moving to Teams, the TeamsOnly mode is the final destination for each user, though not all users need to be assigned TeamsOnly (or any mode) at the same time. Prior to users reaching TeamsOnly mode, organizations can use any of the Skype for Business modes (SfBOnly, SfBWithTeamsCollab, SfBWithTeamsCollabAndMeetings) to ensure predictable communication between users who are TeamsOnly and those who aren't yet.

From a technical perspective, a user's mode governs several aspects of the user's experience:

- Incoming routing:* In which client (Teams or Skype for Business) do incoming chats and calls land?
- Presence publishing:* Is the user's presence that is shown to other users based on their activity in Teams or Skype for Business?
- Meeting scheduling:* Which service is used for scheduling new meetings and ensuring that the proper add-in is present in Outlook? TeamsUpgradePolicy does not govern meeting join. Users can always *join* any meeting, whether it be a Skype for Business meeting or a Teams meeting.
- Client experience:* What functionality is available in Teams and/or Skype for Business client? Can users initiate calls and chats in Teams, Skype for Business, or both? Is Teams & Channels experience available?

For more information on routing and presence behavior based on mode, see [Coexistence with Skype for Business](#).

However, from an experience perspective, mode can be described as defining the experience for:

- Chat and Calling:* Which client does a user use?
- Meeting Scheduling:* Do users schedule new meetings as Teams or Skype for Business meetings?
- Availability of collaboration functionality in Teams client:* Is Teams & Channels and Files functionality available while users still have Skype for Business?

The modes are listed below. Cloud users must be TeamsOnly, and users homed on-premises must be any mode other than TeamsOnly.

MODE	CALLING AND CHAT	MEETING SCHEDULING ¹	TEAMS & CHANNELS	USE CASE
TeamsOnly² <i>Only possible if the user does not have an on-premises account in Skype for Business Server</i>	Teams	Teams	Yes	The final state of being upgraded. The default for new tenants, unless a hybrid configuration is detected.

MODE	CALLING AND CHAT	MEETING SCHEDULING	TEAMS & CHANNELS	USE CASE
Islands	Either	Either	Yes	Default configuration for hybrid organizations. Allows a single user to evaluate both clients side by side. Chats and calls can land in either client, so users must always run both clients. To avoid a confusing or regressed Skype for Business experience, external (federated) communications, PSTN voice services and voice applications, Office integration, and several other integrations continue to be handled by Skype for Business.
SfBWithTeamsCollabAndMeetings ²	Skype for Business	Teams	Yes	"Meetings First". Primarily for on-premises organizations to benefit from Teams meeting functionality, if they are not yet ready to move calling to the cloud.
SfBWithTeamsCollab	Skype for Business	Skype for Business	Yes	Alternate starting point for complex organizations that need tighter administrative control.
SfBOnly	Skype for Business	Skype for Business	No ³	Specialized scenario for organizations with strict requirements around data control. Teams is used only to join meetings scheduled by others.

Notes:

¹ The ability to join an existing meeting (whether scheduled in Teams or in Skype for Business) isn't governed by mode. By default, users can always join any meeting they have been invited to.

² By default, when assigning either TeamsOnly or SfbWithTeamsCollabAndMeetings to an individual user, any existing Skype for Business meetings scheduled by that user for the future are converted to Teams meetings. If desired, you can leave these meetings as Skype for Business meetings either by specifying `-MigrateMeetingsToTeams $false` when granting TeamsUpgradePolicy, or by unselecting the checkbox in the Teams Admin portal. The ability to convert meetings from Skype for Business to Teams is not available when granting TeamsUpgradePolicy on a tenant-wide basis.

³ Currently, Teams does not have the ability to disable the Teams and Channels functionality so this remains enabled for now.

Using TeamsUpgradePolicy

TeamsUpgradePolicy exposes two key properties: Mode and NotifySfbUsers.

PARAMETER	TYPE	ALLOWED VALUES (DEFAULT IN ITALICS)	DESCRIPTION
Mode	Enum	<i>Islands</i> TeamsOnly SfbOnly SfbWithTeamsCollab SfbWithTeamsCollabAndMeetings	Indicates the mode the client should run in.
NotifySfbUsers	Bool	<i>False</i> or true	Indicates whether to show a banner in the Skype for Business client informing the user that Teams will soon replace Skype for Business. This can't be true if Mode=TeamsOnly.

Teams provides all relevant instances of TeamsUpgradePolicy via built-in, read-only policies. Therefore, only Get and Grant cmdlets are available. The built-in instances are listed below.

IDENTITY	MODE	NOTIFYSFBUSERS
Islands	Islands	False
IslandsWithNotify	Islands	True
SfbOnly	SfbOnly	False
SfbOnlyWithNotify	SfbOnly	True
SfbWithTeamsCollab	SfbWithTeamsCollab	False
SfbWithTeamsCollabWithNotify	SfbWithTeamsCollab	True
SfbWithTeamsCollabAndMeetings	SfbWithTeamsCollabAndMeetings	False

IDENTITY	MODE	NOTIFYSFBUSERS
SfBWithTeamsCollabAndMeetingsWithNotify	SfBWithTeamsCollabAndMeetings	True
UpgradeToTeams	TeamsOnly	False
Global <i>Default</i>	Islands	False

These policy instances can be granted either to individual users or on a tenant-wide basis. For example:

- To upgrade a user (\$SipAddress) to Teams, grant the "UpgradeToTeams" instance:

```
Grant-CsTeamsUpgradePolicy -PolicyName UpgradeToTeams -Identity $SipAddress
```

- To upgrade the entire tenant, omit the identity parameter from the grant command:

```
Grant-CsTeamsUpgradePolicy -PolicyName UpgradeToTeams
```

The Teams client user experience when using Skype for Business modes

When a user is in any of the Skype for Business modes (SfBOnly, SfBWithTeamsCollab, SfBWithTeamsCollabAndMeetings), all incoming chats and calls are routed to the user's Skype for Business client. To avoid end-user confusion and ensure proper routing, calling and chat functionality in the Teams client is automatically disabled when a user is in any of the Skype for Business modes. Similarly, meeting scheduling in Teams is automatically disabled when users are in the SfBOnly or SfBWithTeamsCollab modes, and automatically enabled when a user is in the SfBWithTeamsCollabAndMeetings mode. For details, see [Teams client experience and conformance to coexistence modes](#).

NOTE

- Prior to delivery of the automatic enforcement of Teams and Channels, the SfBOnly and SfBWithTeamsCollab modes behave the same.

Detailed mode descriptions

MODE	EXPLANATION
------	-------------

MODE	EXPLANATION
<p>Islands (on-premises only)</p>	<p>A user runs both Skype for Business and Teams side by side. This user:</p> <ul style="list-style-type: none"> • Can initiate chats and VoIP calls in either Skype for Business or Teams client. Note: Users with Skype for Business homed on-premises cannot initiate from Teams to reach another Skype for Business user, regardless of the recipient's mode. • Receives chats & VoIP calls initiated in Skype for Business by another user in their Skype for Business client. • Receives chats & VoIP calls initiated in Teams by another user in their Teams client if they are in the <i>same tenant</i>. • Receives chats & VoIP calls initiated in Teams by another user in their Skype for Business client if they are in a <i>federated tenant</i>. • Has PSTN functionality as noted below: <ul style="list-style-type: none"> ◦ When the user is homed in Skype for Business on-premises and has Enterprise Voice, PSTN calls are always initiated and received in Skype for Business. ◦ When the user is homed on Skype for Business Online and has Microsoft Phone System, the user always initiates and receives PSTN calls in Skype for Business: <ul style="list-style-type: none"> ◦ This happens whether the user has a Microsoft Calling Plan, or connects to the PSTN network through either Skype for Business Cloud Connector Edition or an on-premises deployment of Skype for Business Server (hybrid voice). ◦ Note: Phone System Direct Routing is not supported in Islands mode. • Receives Microsoft Call Queues and Auto-Attendant calls in Skype for Business: <ul style="list-style-type: none"> ◦ Phone numbers assigned to Call Queues and Auto-Attendants cannot be Phone System Direct Routing numbers in Islands mode. • Can schedule meetings in Teams or Skype for Business (and will see both plug-ins by default). • Can join any Skype for Business or Teams meeting; the meeting will open in the respective client.

MODE	EXPLANATION
SfBOnly (on-premises only)	<p>A user runs only Skype for Business. This user:</p> <ul style="list-style-type: none"> • Can initiate chats and calls from Skype for Business only. • Receives any chat/call in their Skype for Business client, regardless of where initiated, unless the initiator is a Teams user with Skype for Business homed on-premises.* • Can schedule only Skype for Business meetings, but can join Skype for Business or Teams meetings. <p><i>* Using Islands mode with on-premises users is not recommended in combination with other users in SfBOnly mode. If a Teams user with Skype for Business homed on-premises initiates a call or chat to an SfBOnly user, the SfBOnly user is not reachable and receives a missed chat or call email.</i></p>
SfBWithTeamsCollab (on-premises only)	<p>A user runs both Skype for Business and Teams side by side. This user:</p> <ul style="list-style-type: none"> • Has the functionality of a user in SfBOnly mode. • Has Teams enabled only for group collaboration (Channels); chat/calling/meeting scheduling are disabled.
SfBWithTeamsCollab AndMeetings (on-premises only)	<p>A user runs both Skype for Business and Teams side by side. This user:</p> <ul style="list-style-type: none"> • Has the chat and calling functionality of user in SfBOnly mode. • Has Teams enabled for group collaboration (channels - includes channel conversations); chat and calling are disabled. • Can schedule only Teams meetings, but can join Skype for Business or Teams meetings.
TeamsOnly (cloud users only)	<p>A user runs only Teams. This user:</p> <ul style="list-style-type: none"> • Receives any chats and calls in their Teams client, regardless of where initiated. • Can initiate chats and calls from Teams only. • Can schedule meetings in Teams only, but can join Skype for Business or Teams meetings. • Can continue to use Skype for Business IP phones. <p><i>Using TeamsOnly mode in combination with other users in Islands mode is not recommended until Teams adoption is saturated; that is, all Islands mode users actively use and monitor both the Teams and Skype for Business clients. If a TeamsOnly user initiates a call or chat to an Islands user, that call or chat will land in the Islands user's Teams client; if the Islands user does not use or monitor Teams, that user will appear offline and will not be reachable by the TeamsOnly user.</i></p>

Using the Meeting Migration Service (MMS)

Teams client experience and conformance to coexistence modes

12/7/2021 • 3 minutes to read • [Edit Online](#)

The purpose of the Skype for Business coexistence modes (SfBOnly, SfBWithTeamsCollab, SfBWithTeamsCollabAndMeetings) is to provide a simple, predictable experience for end users as organizations transition from Skype for Business to Teams. For an organization moving to Teams, the **Teams Only** mode is the final destination for each user, though not all users need to be assigned **Teams Only** (or any other mode) at the same time. Prior to users reaching TeamsOnly mode, organizations can use any of the Skype for Business coexistence modes to ensure predictable communication between users who are **Teams Only** and those who aren't yet.

When a user is in any of the Skype for Business modes, all incoming chats and calls are routed to the user's Skype for Business client. To avoid end user confusion and ensure proper routing, calling and chat functionality in the Teams client is disabled when a user is in any of the Skype for Business modes. Similarly, meeting scheduling in Teams is explicitly disabled when users are in the SfBOnly or SfBWithTeamsCollab modes, and explicitly enabled when a user is in the SfBWithTeamsCollabAndMeetings mode.

Because presence is an indication of reachability through chat and calling, when chat and calling are disabled, self-presence in Teams (that is, the display of one's own presence in the Teams client in the user's picture) is also hidden.

How the available functionality in Teams client changes based on mode

The available functionality in Teams depends on the user's coexistence mode, as set by TeamsUpgradePolicy. The following table summarizes the behavior:

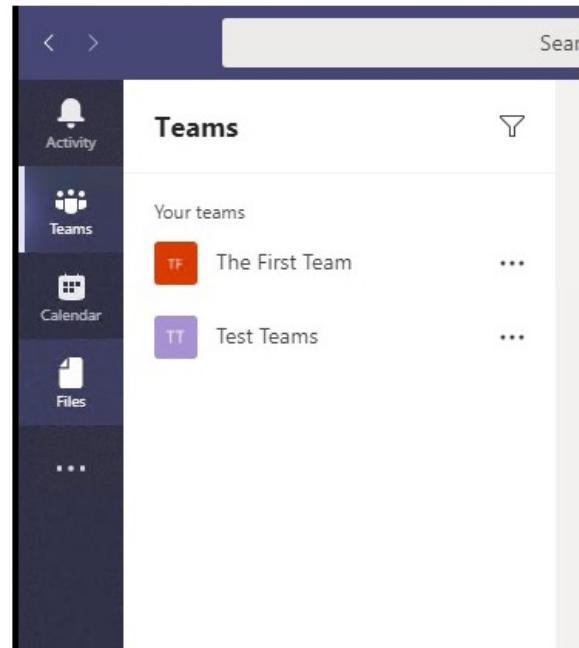

USER'S EFFECTIVE MODE	EXPERIENCE IN TEAMS CLIENT
Any Skype for Business mode	Calling, Chat, and self-presence are disabled.
SfBWithTeamsCollabAndMeetings	Meeting scheduling is available
SfBWithTeamsCollab or SfBOnly ¹	Meeting scheduling is not available

The following screenshots illustrate the difference between **Teams Only** or **Islands** mode and all other modes. Note that the chat and calling icons are available by default with **Teams Only** or **Islands** mode (left screenshot), but not with the other modes (right screenshot):

Mode = TeamsOnly or Islands

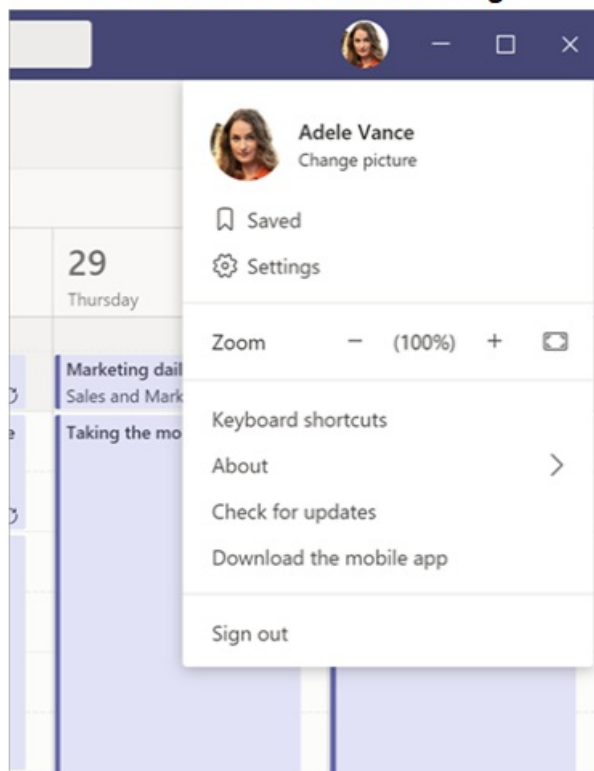

Mode = SfbOnly, SfbWithTeamsCollab, or SfbWithTeamsCollabAndMeetings

In addition, self presence is not available in the other modes, as shown here.

Mode = SfbOnly, SfbWithTeamsCollab, or SfbWithTeamsCollabAndMeetings

Note: ¹ At this time, SfbWithTeamsCollab and SfbOnly behave the same, but the intent is for SfbOnly mode to also disable Channels and Files functionality in Teams. In the interim, Channels can be hidden using the App Permissions policy.

Impact of Mode on other policy settings

As described above, a user's coexistence mode impact's what functionality is available in the user's Teams client. This means that the value of mode can take precedence over the value of other policy settings, depending on the

mode. Specifically, coexistence mode impacts whether the following policy settings are honored:

MODALITY (APP)	POLICY.SETTING
Chat	TeamsMessagingPolicy.AllowUserChat
Calling	TeamsCallingPolicy.AllowPrivateCalling
Meeting scheduling	TeamsMeetingPolicy.AllowPrivateMeetingScheduling TeamsMeetingPolicy.AllowChannelMeetingScheduling

Administrators need *not* explicitly set these policy settings when using co-existence mode, but it's important to understand that these settings effectively behave as follows for a given mode.

MODE	ALLOWUSERCHAT	ALLOWPRIVATECALLING	ALLOWPRIVATEMEETINGSCSCHEDULING	ALLOWCHANNELMEETINGSCSCHEDULING
TeamsOnly or Islands	Enabled	Enabled	Enabled	Enabled
SfBWithTeamsCollabAndMeetings	Disabled	Disabled	Enabled	Enabled
SfBWithTeamsCollab or SfBOnly	Disabled	Disabled	Disabled	Disabled

When using PowerShell, the `Grant-CsTeamsUpgradePolicy` cmdlet checks the configuration of the corresponding settings in TeamsMessagingPolicy, TeamsCallingPolicy, and TeamsMeetingPolicy to determine if those settings would be superseded by TeamsUpgradePolicy and if so, an informational message is provided in PowerShell. As noted above, is no longer necessary to set these other policy settings. The following is an example of what the PowerShell warning looks like:

```
Grant-CsTeamsUpgradePolicy -Identity user1@contoso.com -PolicyName SfBWithTeamsCollab
```

```
WARNING: The user 'user1@contoso.com' currently has enabled values for: AllowUserChat, AllowPrivateCalling, AllowPrivateMeetingScheduling, AllowChannelMeetingScheduling, however these values will be ignored. This is because you are granting this user TeamsUpgradePolicy with mode=SfBWithTeamsCollab, which causes the Teams client to behave as if they are disabled.
```

[Migration and interoperability guidance for organizations using Teams together with Skype for Business](#)

Set your coexistence and upgrade settings

12/7/2021 • 4 minutes to read • [Edit Online](#)

When you upgrade your Skype for Business users to use Teams, you have several options to help you make it a seamless process for your users. You have the option to make coexistence and upgrade settings for all of the users in your organization at once, or you can make settings changes for a single or set of users in your organization. Note that older versions of Skype for Business clients may not honor these settings. For more information about Skype for Business client versions, go to the [Skype for Business downloads and updates page](#).

You can get a better understanding of the modes that are available to you by reading [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#) or [Coexistence with Skype for Business](#).

IMPORTANT

Having the option to upgrade doesn't necessarily mean your organization is ready for this change. For the best user experience, confirm that Teams meets your collaboration and communication requirements, make sure that your network is ready to support Teams, and implement your user readiness plan before upgrading users to Teams.

Set upgrade options for all users in your organization

Using the Microsoft Teams admin center

1. In the [Microsoft Teams admin center](#), in the left navigation, go to **Org-wide settings** > **Teams upgrade**.
2. At the top of the **Teams upgrade** page, modify the following options as desired.
 - Set the **Coexistence** mode.
 - **Islands** - Use this setting if you want users to be able to use both Skype for Business and Teams simultaneously.
 - **Skype for Business only** - Use this setting if you want your users to only use Skype for Business.
 - **Skype for Business with Teams collaboration** - Use this setting if you want your users to use Skype for Business in addition to using Teams for group collaboration (channels).
 - **Skype for Business with Teams collaboration and meetings** - Use this setting if you want your users to use Skype for Business in addition to using Teams for group collaboration (channels) and Teams meetings.
 - **Teams only** - Use this setting if you want your users to use only Teams. Note that even with this setting, users can still join meetings hosted in Skype for Business.

IMPORTANT

You can only assign TeamsOnly mode to the entire tenant after both of the following steps have been completed:

- All on-premises users have been moved to Teams Only using Move-CsUser in the Skype for Business Server on-premises toolset.
- You have updated any Skype for Business DNS records to point to Microsoft 365.

For more detail, see [Disable your hybrid configuration to complete migration to Teams Only](#).

- Set **Notify Skype for Business users that Teams is available for upgrade**. If you turn this on, it will tell the Skype for Business users that they will soon be upgraded to the Teams app.
- Set the **Preferred app for users to join Skype for Business meetings**. This setting determines which app is used for joining Skype for Business meetings and is honored regardless of the value of coexistence mode.
 - **Skype Meetings app**
 - **Skype for Business with limited features**
- Set whether to **Download the Teams app in the background for Skype for Business users**. This setting silently downloads the Teams app for users running Skype for Business on Windows. It is honored only if coexistence mode for the user is Teams only or if notifications of pending upgrade are enabled in Skype for Business.

3. Click **Save** after you make your changes.

Set upgrade options for a single user in your organization

Using the Microsoft Teams admin center

1. In the left navigation, go to **Users**, and then select the user from the list.
2. On the **Account** tab for the user, under **Teams upgrade**, click **Edit**.
3. You can set the **Coexistence mode**. Modes other than Teams Only can only be applied to users homed in Skype for Business Server on-premises, and conversely only users homed in the cloud can have TeamsOnly mode. Choose from the following options:
 - **Use Org-wide settings** - Use this setting if you want the user to use the settings in the **Org-wide** settings.
 - **Islands** - Use this setting if you want the user to be able to use both Skype for Business and Teams.
 - **Skype for Business only** - Use this setting if you want the user to use Skype for Business.
 - **Skype for Business with Teams collaboration** - Use this setting if you want the user to use Skype for Business in addition to using Teams for group collaboration (channels).
 - **Skype for Business with Teams collaboration and meetings** - Use this setting if you want the user to use Skype for Business in addition to using Teams for group collaboration (channels) and Teams meetings.
 - **Teams only** - Use this setting if you want the user to use only Teams. The user will still be able to join Skype for Business meetings.
4. If you select any **Coexistence mode** other than **Use Org-wide settings**, you have the option to enable notifications in the user's Skype for Business app that upgrade to Teams is coming soon. You can enable this notification for the user by turning on the **Notify the Skype for Business user** option.
5. Click **Save** after you make your changes.

Plan the journey

Understand the coexistence and upgrade journey for Skype for Business and Teams

Migration and interoperability guidance for organizations using Teams together with Skype for Business

Decommission your on-premises Skype for Business environment

Meetings First

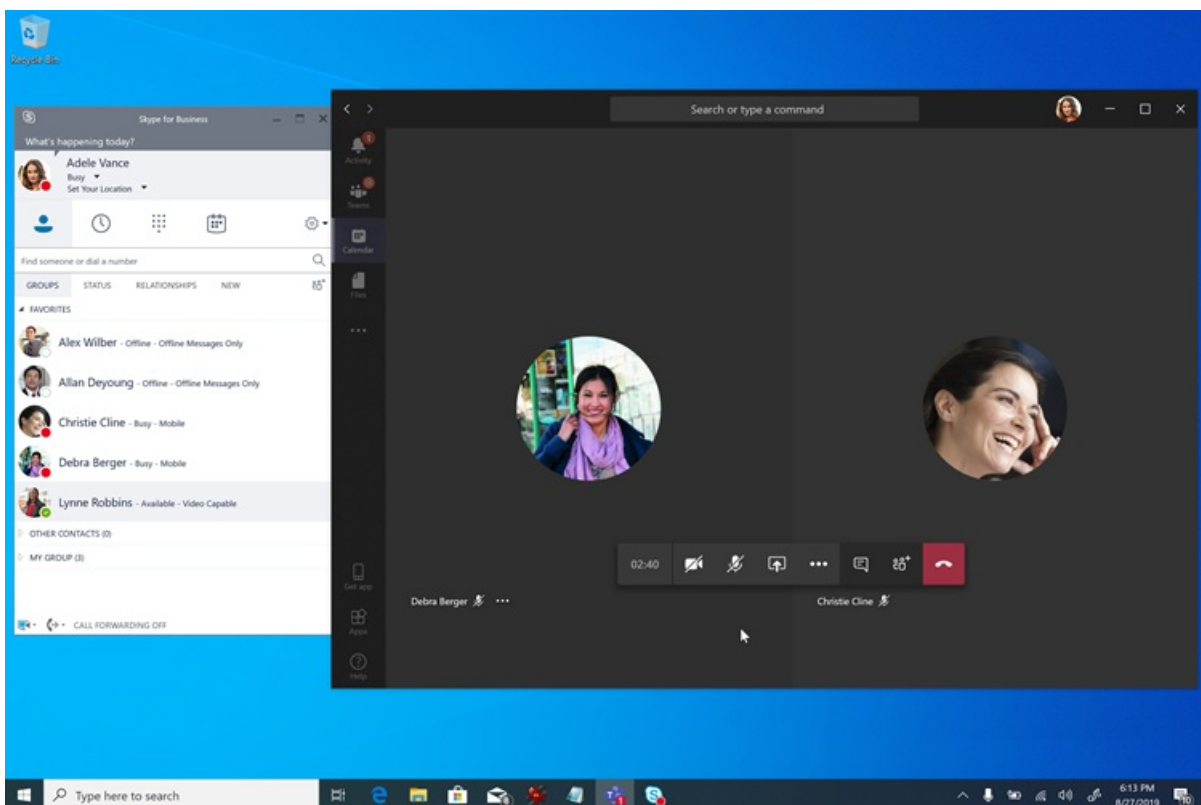

12/7/2021 • 6 minutes to read • [Edit Online](#)

"Meetings First" is targeted at and optimized for Skype for Business Server organizations with Enterprise Voice on premises who want to start using Teams meetings as rapidly as possible. For these organizations, Meetings First is an alternative to using **Islands** mode that prioritizes the Teams meetings experience.

What is Meetings First?

Meetings First is based on the **SfBWithTeamsCollabAndMeetings** coexistence mode. Meetings First isn't a product or a feature—it is a configuration that uses capabilities and features of Teams and Skype for Business to provide a uniquely tailored coexistence experience.

In Meetings First, users create their meeting in Teams, while continuing to use Skype for Business for chat, calling, and presence. There is no overlap of modalities between Teams and Skype for Business. Chat, calling, and presence are on in Skype for Business and off in Teams. This enables unique "better together" scenarios between Skype for Business and Teams that enhance the user's experience during coexistence, as well as interoperability scenarios with **Teams Only** users.

IMPORTANT

Meetings First is a better match for organizations who have no or few active Teams chat users. Active Teams chat users should not be switched to Meetings First mode, as they would lose the ability to chat in Teams and to access to their chat history. These users should be grandfathered in **Islands** mode instead, and Meetings First only granted to the users not yet active in chat in Teams.

Who should consider Meetings First?

Meetings First was designed for organizations who use Skype for Business Server with Enterprise Voice who want to accelerate their move to Teams meetings, especially those with strong IT discipline who want a managed, deterministic upgrade path to Teams.

For complex or large organizations, voice migrations are typically done on a site-by-site basis and might take a long time, potentially several years, resulting in extended coexistence scenarios. If that coexistence is in **Islands** mode, users will always have the choice of two meeting solutions (Skype for Business and Teams), which can result in confusing or suboptimal situations. Unlike voice migrations, meetings migrations can generally be completed across the entire company in a short amount of time. Organizations who want to completely switch to Teams meetings as quickly as possible (and without waiting for their voice migration to be complete) should consider Meetings First.

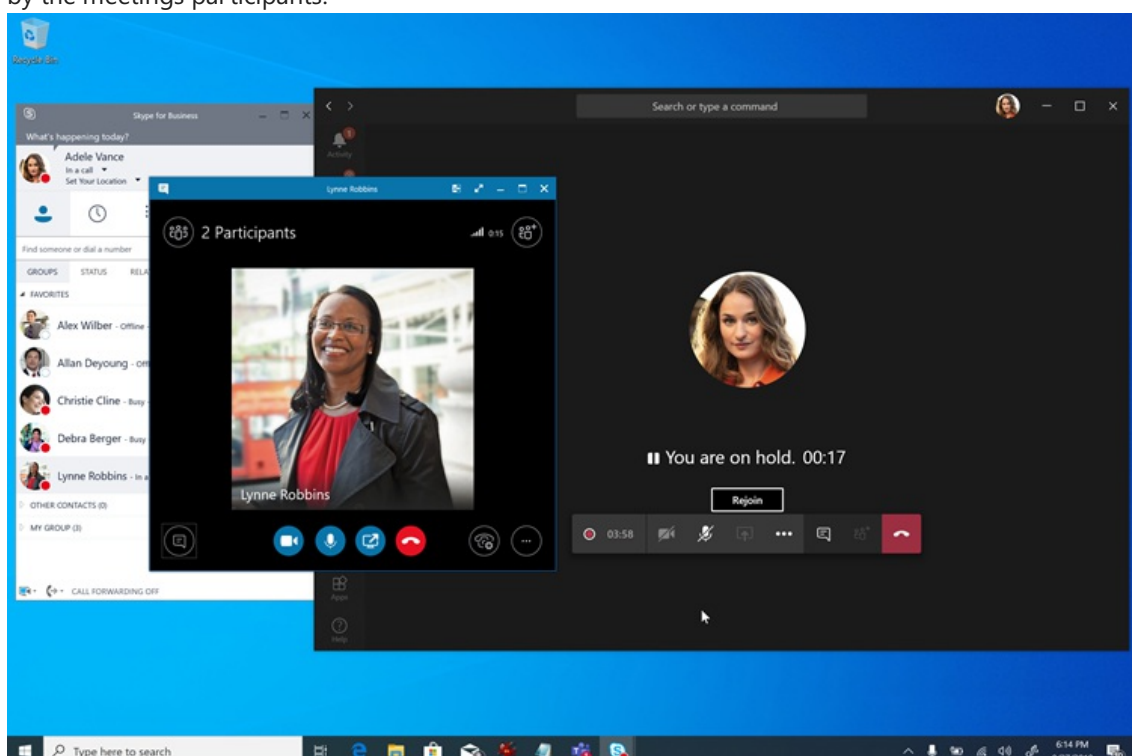

Meetings First might not be useful to organizations who have no Enterprise Voice users. These organizations should be able to upgrade to **Teams Only** as soon as they are able to adopt Teams meetings. They should consider skipping Meetings First.

In addition, Meetings First is useful to organizations whose scope is a pure-play meeting solution, for example when a "meetings-only" RFP is being issued.

Capabilities in Meetings First

Meeting First brings the following capabilities together:

- [Provision a Skype for Business Server \(on-premises\) user](#) with [Teams Audio Conferencing](#).
- [Meetings Migration Service](#): Meetings organized by the user will be migrated to the cloud and converted to Teams meetings as the user is promoted to Meetings First (requires Exchange Online).
- Streamlined user experience in Teams, centered on Teams meetings and teams and channels (which can, optionally, be hidden using the [App Permissions policy](#)); [Teams private chat](#), [calling](#), and [self-presence](#) are not exposed in Meetings First, enabling the deployment and adoption effort to fully focus on meetings.
- Superior [Teams meeting experience](#).
- "Better Together" between Teams and Skype for Business:
 - Automatic hold: When in a meeting in Teams, getting in a call in Skype for Business will place the Teams meeting on hold, and vice-versa. This prevents users from having their private calls overheard by the meetings participants.

- Presence reconciliation: Activity in Teams is reflected in the user's presence, which is the Skype for Business presence since chat and calling are in Skype for Business. Specifically, when Meetings First users are in a Teams meeting, their presence will be updated to reflect that. When they present their screen, their presence will be updated to show Do Not Disturb (based on their settings in Skype for Business).
- USB device HID control reconciliation (also available on Mac): The HID controls are honored by Teams while in Teams meetings and by Skype for Business in all other circumstances.
- Unless otherwise mentioned, Better Together capabilities require recent Windows desktop clients at this time.

Prerequisites for Meetings First

The only hard requirements for Meetings First are the same as the requirements for Teams with on-premises Active Directory and a Skype for Business on-premises deployment:

- [General pre-requisites for Teams](#), including
- [Identity and authentication in Teams](#) and
- [Configure Azure Active Directory for Teams and Skype for Business](#).

A [Skype for Business hybrid topology](#) is not required, but it is recommended. Some capabilities such as Meetings Migration Service and interoperability rely on that topology.

Meetings First is supported with any version of the Skype for Business Server (and known to work with the no-longer-supported Lync Server). It is supported with any supported Skype for Business client, however Better Together capabilities require a recent client.

Once these requirements are met (and not prior), the users can be [licensed for Microsoft 365 or Office 365 and Teams](#).

For the best Meetings First experience, users should be enabled for [Exchange Online, SharePoint Online, and OneDrive for Business](#), and Microsoft 365 group creation. Meetings First is supported for users whose mailbox is on Exchange on-premises, or who don't have SharePoint Online or OneDrive For Business, or Microsoft 365 group creation. However, their experience will be less complete. In particular, for organizations using Exchange Server on-premises, there might be (depending on the version of Exchange Server) some limitations to creating and viewing meetings from the Teams client, as well as with respect to compliance capabilities.

At minimum, users must be [licensed for Teams](#). In addition, they can be licensed for [Audio Conferencing](#), if needed.

We recommend you [grant SfBOnly or SfBWithTeamsCollab](#) mode as tenant default at the time you license the users. This ensures users would not start using Teams on their own in the default **Islands** mode prior to you being ready to launch Meetings First.

Meetings First is supported on full desktop clients (Windows and Mac), on browser clients, and on mobile clients. It is also compatible with [Microsoft Teams Rooms](#). Better Together requires the full desktop client.

Prepare for Teams meetings in Meetings First

For your users to have the best possible experience in Teams meetings, you should:

- Follow the steps in [Meetings and conferencing for Microsoft Teams](#), in particular.
- [Evaluate your environment](#).
- [Prepare your organization's network for Microsoft Teams](#).
- Upgrade your meeting rooms with Teams capable [meeting room devices and solutions](#), or use [Cloud Video Interop for Microsoft Teams](#) to enable your existing third-party rooms and devices to join Teams meetings.

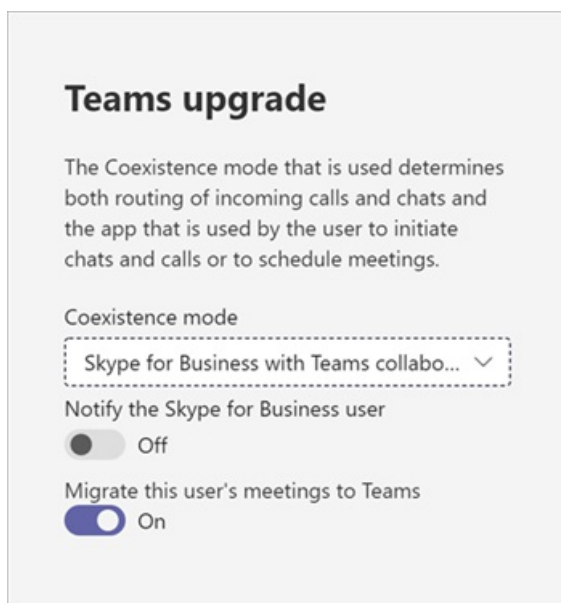

- Equip your users with [certified USB audio and video devices](#).
- Prepare to [drive awareness and adoption for Teams meetings](#).
- [Plan your service management](#).
- Familiarize yourself with the rich Call Analytics reports to [troubleshoot poor call quality](#).

You might consider running a moderate scale production ready pilot at this stage.

Configure users for Meetings First

Once you have licensed your users and prepared your organization for Teams meetings, it's time to enable your users for Meetings First. We've made it easy: one single setting will do it all!

All capabilities and user experiences in Meetings First, including the Teams client configuration and [auto-conformance](#) of the user experience, Meetings Migration Service, and Better Together capabilities, are configured by granting the user (or group of users, or tenant default) the [SfBWithTeamsCollabAndMeetings coexistence mode](#) either in the [Microsoft Teams admin center](#) or by using [PowerShell](#).

Optionally, should you want to hide the Teams and Channels application from the left navigation of your users' Teams client to further focus their experience on meetings, that can be achieved by using the [App Setup policy](#).

Reporting and Call Analytics

Reporting and Call Analytics for Teams meetings in Meetings First are unchanged from what they are in other modes.

Security and compliance in Microsoft Teams

12/7/2021 • 13 minutes to read • [Edit Online](#)

IMPORTANT

To learn how to best ensure **security while everyone's working from home during the COVID-19 outbreak**, read these articles:

- [Top 12 tasks for security teams to support working from home](#)
- [Optimize Microsoft 365 or Office 365 connectivity for remote users using VPN split tunnelling](#)
- Updated April 2, 2020: [Teams security guide](#)

Microsoft Teams is built on the Microsoft 365 and Office 365 hyper-scale, enterprise-grade cloud, delivering the advanced security and compliance capabilities our customers expect. For more information on planning for security in Microsoft 365 or Office 365, [the security roadmap](#) is a good place to start. For more information on planning for compliance in Microsoft 365 or Office 365, you can start with [Plan for security & compliance](#).

This article will provide further information about Teams-specific security and compliance. Don't miss these Microsoft Mechanics videos about security and compliance:

- [Microsoft Teams Essentials for IT: Security and Compliance](#) (12:42 min)
- [Microsoft Teams Controls for Security and Compliance](#) (10:54 min)

IMPORTANT

As a customer of Microsoft 365 or Office 365, you own and control your data. Microsoft does not use your data for anything other than providing you with the service that you have subscribed to. As a service provider, we do not scan your email, documents, or teams for advertising or for purposes that are not service-related. Microsoft doesn't have access to uploaded content. Like OneDrive and SharePoint in Microsoft 365, customer data stays within the tenant. You can check out more about our trust and security related information at the [Microsoft Trust Center](#). Teams follows the same guidance and principles as the Microsoft Trust Center.

Security

Teams enforces team-wide and organization-wide two-factor authentication, single sign-on through Active Directory, and encryption of data in transit and at rest. Files are stored in SharePoint and are backed by SharePoint encryption. Notes are stored in OneNote and are backed by OneNote encryption. The OneNote data is stored in the team SharePoint site. The Wiki tab can also be used for note taking and its content is also stored within the team SharePoint site.

Read [Identity models and authentication](#) for more insight into authentication and Teams, and [How modern authentication works](#) will help with modern authentication in particular.

Because Teams works in partnership with SharePoint, OneNote, Exchange, and more, you should be comfortable managing security in Microsoft 365 or Office 365 all-up. To learn more, read about [how to configure your Microsoft 365 or Office 365 organization for increased security](#).

NOTE

Currently, [private channels](#) supports limited security and compliance features. Support for the full set of security and compliance features in private channels is coming soon.

Advanced Threat Protection (ATP)

Advanced Threat protection (ATP) is available for Microsoft Teams, along with SharePoint and OneDrive, applications that integrate with Teams for content management. ATP allows you to determine if content in these applications is malicious in nature, and block this content from user access.

How the affected content is managed after detection is up to the settings you've selected in Microsoft 365 or Office 365. We strongly recommend you consider all applications when it comes to configuring ATP, and for further reading, [ATP for SharePoint, OneDrive, and Microsoft Teams](#) will have detailed information on how to get started.

Safe Links

While, at this time, Advanced Threat Protection (ATP) safe links are not available in Microsoft Teams, they are now in [public preview](#) through our Technology Adoption Program (TAP), and while a release date for general availability isn't set, we'll update this article when that time arrives. Meanwhile, for information on Microsoft 365 or Office 365 Safe Links, please review [ATP Safe Links](#). ATP Safe links is available in both [ATP Plan 1](#) and [ATP Plan 2](#).

Safe Attachments

Safe attachments is a feature designed to enhance user security by checking for, and detecting, malicious attachments. Global- or Security Administrators create [policies](#) for handling these suspected malicious attachments to prevent them from being sent to users, clicked, and acted upon. Safe attachment protection is available to SharePoint, OneDrive, and Microsoft Teams, and Microsoft 365 or Office 365 [Advanced Threat Protection Plan 1 and 2](#) have this capability. Read more about Safe Attachments and how they can help protect your organization in [Safe Attachments in Microsoft Defender for Office 365](#).

Secure Score

Microsoft Secure Score is a measurement of an organization's security posture, with a higher number indicating more improvement actions taken. It can be found in the [Microsoft 365 security center](#). Following the Secure Score recommendations can protect your organization from threats. From a centralized dashboard in the Microsoft 365 security center, organizations can monitor and work on the security of their Microsoft 365 identities, apps, and devices. Microsoft Teams now has recommendations on Secure Score and administrators are encouraged to monitor their security stance on the platform.

Secure Score helps organizations:

- Report on the current state of the organization's security posture.
- Improve their security posture by providing discoverability, visibility, guidance, and control.
- Compare with benchmarks and establish key performance indicators (KPIs).

How Conditional Access policies work for Teams

Microsoft Teams relies heavily on Exchange Online, SharePoint, and Skype for Business Online for core productivity scenarios, like meetings, calendars, interop chats, and file sharing. Conditional access policies that are set for these cloud apps apply to Microsoft Teams when a user directly signs in to Microsoft Teams - on any client.

Microsoft Teams is supported separately as a cloud app in Azure Active Directory conditional access policies. Conditional access policies that are set for the Microsoft Teams cloud app apply to Microsoft Teams when a user signs in. However, without the correct policies on other apps like Exchange Online and SharePoint, users may still be able to access those resources directly. For more information about setting up a conditional access policy

in the Azure portal, see [Azure Active Directory Quickstart](#).

Microsoft Teams desktop clients for Windows and Mac support modern authentication. Modern authentication brings sign-in based on the Azure Active Directory Authentication Library (ADAL) to Microsoft Office client applications across platforms.

Microsoft Teams desktop application supports AppLocker. For more information about AppLocker prerequisites, please see: Requirements to use [AppLocker](#).

Compliance

Teams has a wide range of information to help you with compliance areas, including communication compliance for channels, chats, and attachments, retention policies, Data Loss Protection (DLP), eDiscovery and legal hold for channels, chats and files, audit log search, as well as mobile application management with Microsoft Intune. We've provided some information on all these topics below, and you can go to the [Microsoft 365 compliance center](#) to manage these settings.

Information Barriers

Information barriers are policies put in-place by Teams administrators to do things like keep people or groups from communicating with one another (when there is no business need for them to do so, or a regulatory reason to block them from doing so), and it also allows you to set policies relating to things like lookups and eDiscovery (covered below). These policies can impact users in 1:1 chats, group chats, or at a team-level. The Information Barrier feature is available in the public cloud and starting January 2021 it has been rolled out to the GCC cloud.

For further reading on this topic, go to [Information barriers in Microsoft Teams](#).

Communication compliance

Communication compliance in Microsoft 365 allows you to add users to in-scope policies that can be configured to examine Microsoft Teams communications for offensive language, sensitive information, and information related to internal and regulatory standards. Chat communications and associated attachments in both public and private Teams channels, individual chats, and attachments can be scanned to help minimize communication risks in your organization. For more information on how you can configure policies to help you detect, capture, and take action for inappropriate Teams communications, see [Communication compliance in Microsoft 365](#).

Retention policies

Retention policies in Microsoft Teams allows you to both retain data that's important for your organization to keep, for regulatory, legal, business, or other reasons, and also to remove content and communications that are not relevant to be retained. You can also use retention policies to keep data for a period of time and then delete it. For further information, review [Retention policies in Microsoft Teams](#).

Sensitivity labels

Apply [sensitivity labels](#) to protect and regulate access to sensitive organizational content created during collaboration within teams. For example, apply labels that configure the privacy (public or private) of teams, control guest access and external sharing, and manage access from unmanaged devices. For further information, review [Sensitivity labels in Microsoft Teams](#).

Data Loss Prevention (DLP)

Data Loss Prevention (DLP) in Microsoft Teams, as well as the larger DLP story for Microsoft 365 or Office 365, revolves around business readiness when it comes to protecting sensitive documents and data. Whether you have concerns around sensitive information in messages or documents, DLP policies will be able to help ensure your users don't share this sensitive data with the wrong people.

For information on Data Loss Prevention in Teams, please review [DLP for Microsoft Teams](#). A good article for

O365 DLP concerns is [Overview of data loss prevention](#).

eDiscovery

Electronic discovery, or eDiscovery, is the electronic aspect of identifying, collecting and producing electronically stored information (ESI) in response to a request for production in a law suit or investigation. Capabilities include case management, preservation, search, analysis, and export of Teams data. This includes chat, messaging and files, meeting and call summaries. For Teams meetings and Calls, a summary of the events that happened in the meeting and call are created and made available in eDiscovery.

For more details about how to do Microsoft 365 or Office 365 eDiscovery in the security center and compliance center and run compliance content search for Teams content, please go to the links below:

- [eDiscovery](#)
- [Content Search](#)

We have a Teams-specific article for more information, [eDiscovery of guest-to-guest chats](#).

Customers can leverage eDiscovery or [Advanced eDiscovery](#) per their requirements. The following table outlines the differences between the two:

	EDISCOVERY	ADVANCED EDISCOVERY
Case Management	X	X
Access Control	X	X
Content Searches	X	X
Hold(s)	X	X
Export	X	X
Duplication Detection	-	X
Relevance Searches with Machine Learning	-	X
Unstructured Data Analysis	-	X

Legal Hold

During litigation, you may need all data associated with a user (custodian) or a Team to be preserved as immutable, so that it can be used as evidence for the case. You can do this by placing either a user (user mailbox) or a Team on legal hold. For a team legal hold, the team's mailbox can be put on the following holds:

- In-Place Hold (a subset of the mailbox or site collection through targeted queries or filtered content is put on hold), or
- Litigation Hold (the entire mailbox or site collection is placed on hold).

In either case, once the hold is set it ensures that, even if end users delete or edit channel messages that are in the group mailbox, immutable copies of that content are maintained and available through eDiscovery search. Legal holds are generally applied within the context of an eDiscovery case.

Please see [Overview of retention policies](#) to understand more about preservation and holds in the Microsoft 365 compliance center. For more Teams-specific information on legal hold, we also have [Place a Microsoft Teams user or team on legal hold](#) for you to learn more.

Compliance Content Search

Content search can be used to search for all Teams data through rich filtering capabilities. The resulting data can be exported to a specific container for compliance and litigation support. This can be done with or without an eDiscovery case. This enables compliance admins to gather Teams data across all users, review and export it for further processing. Please refer to [Content Search](#) to learn more about how to conduct a compliance content search for Microsoft Teams and other Microsoft 365 or Office 365 content in the Microsoft 365 compliance center.

TIP

Using content search, you can filter down to Microsoft Teams only content, such as Chat and Channel Messages, Meetings, and Calls, if necessary.

If you'd like further Teams-specific information on configuring content search, review [Content search in Microsoft Teams](#).

Auditing and Reporting

Audit log search plugs right into the Microsoft 365 compliance center and gives you the ability to set alerts, as well as report on audit events, by allowing the export of workload specific or generic event sets for admin use and investigation across an unlimited auditing timeline. You can set up alerts for all audit Log data within the Microsoft 365 compliance center, and filter and export this data for further analysis. Please refer to [Search the audit log](#) to learn more about how to conduct an Audit log search for Microsoft 365 or Office 365. To learn more about searching for Microsoft Teams events in the Microsoft 365 compliance center, we also have [Turn on auditing in Teams](#) for you to review.

Customer Key

Microsoft 365 offers an additional layer of encryption on top of service encryption for your content. Using keys you provide, Customer Key encrypts several different types of data in Microsoft Teams. Using Customer Key at the application level, Customer Key encrypts Teams files stored in SharePoint Online. For information, see [Service encryption with Customer Key](#).

Using Customer Key at the tenant level, Customer Key encrypts:

- Teams chat messages (1:1 chats, group chats, meeting chats, and channel conversations)
- Teams media messages (images, code snippets, videos, and wiki images)
- Teams call and meeting recordings stored in Teams storage
- Teams chat notifications
- Teams chat suggestions by Cortana
- Teams status messages For more information, see [Overview of Customer Key for Microsoft 365 at the tenant level](#) and read the Microsoft Teams blog that covers [Customer Key support for Microsoft Teams now in Public Preview](#). For information about the Microsoft Information Protection release that included Customer Key at the tenant level, read [Announcing new Microsoft Information Protection capabilities to know and protect your sensitive data](#).

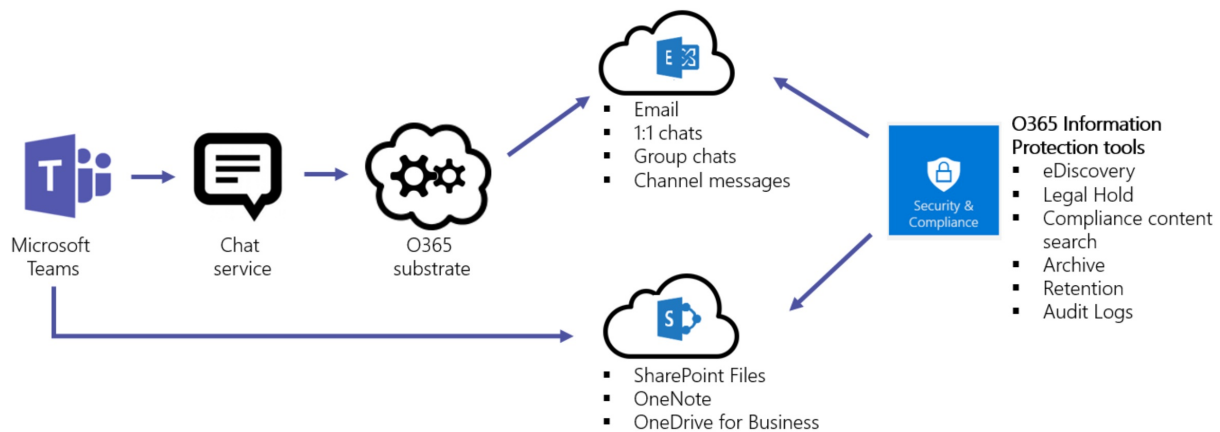

Privacy

At Microsoft, protecting your data is our highest priority. To learn about our privacy practices, read:

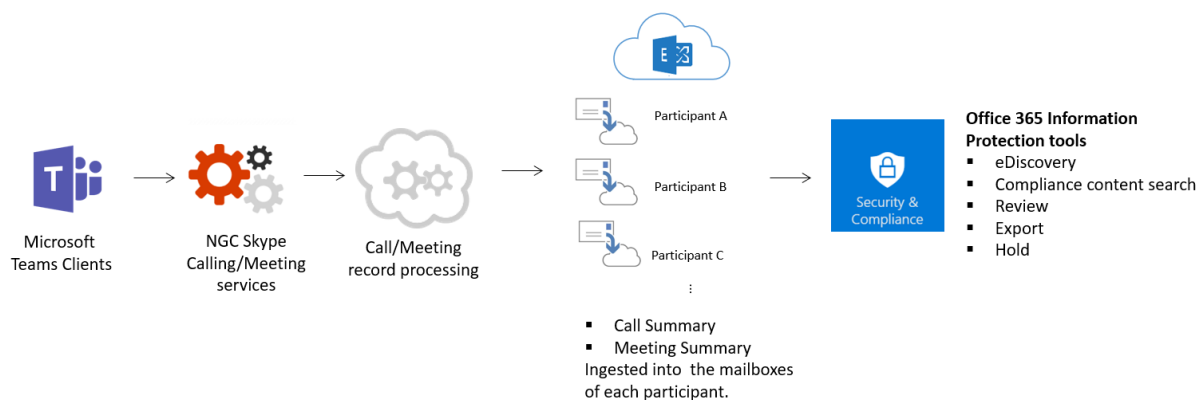

- [Privacy at Microsoft](#)
- [Our commitment to privacy and security in Microsoft Teams](#)
- [For IT professionals: Privacy and security in Microsoft Teams](#)

Information Protection Architecture

The following figure indicates the ingestion flow of Teams data to both Exchange and SharePoint for Teams Files and Messages.

The following figure indicates the ingestion flow of Teams Meetings and calling data to Exchange.

IMPORTANT

There can be up to a 24-hour delay to discover Teams content.

Licensing

When it comes to information protection capabilities, Microsoft 365 subscriptions, Office 365 subscriptions, and the associated standalone licenses will determine the available feature set.

For information on determining the licensing needs to implement features for security and compliance, please review the [licensing requirements](#) for security and compliance features.

NOTE

Content Search and eDiscovery do not need to be enabled in the Security & Compliance Center to work.

Location of data in Teams

Data in Teams resides in the geographic region associated with your Microsoft 365 or Office 365 organization.

To see what regions are supported currently, please review [Location of data in Microsoft Teams](#).

If you need to see which region houses data for your tenant, go to the [Microsoft 365 admin center](#) > **Settings** > **Organization profile**. Scroll down to **Data location**.

Data location

Office 365 has been built from the ground-up to provide enterprise-grade security, privacy and compliance capabilities. As part of our transparency principles we publish the location of your core customer data at rest here.

	Service Name	Region
	Exchange	North America
	SharePoint	North America
	Skype for Business	North America
	Microsoft Teams	North America

Compliance standards

Teams uses the following standards: [ISO 27001](#), [ISO 27018](#), [SSAE18 SOC 1 and SOC 2](#), [HIPAA](#), and [EU Model Clauses \(EUMC\)](#). Within the Microsoft compliance framework, Microsoft classifies Microsoft 365 and Office 365 applications and services into four categories. Each category is defined by specific compliance commitments that must be met for a Microsoft 365 or Office 365 service, or a related Microsoft service, to be listed in that category.

Details can be found in the [Data Protection Resources](#). Teams also supports Cloud Security Alliance compliance.

Security and Microsoft Teams

12/7/2021 • 21 minutes to read • [Edit Online](#)

IMPORTANT

The Teams service model is subject to change in order to improve customer experiences. For example, the default access or refresh token expiration times may be subject to modification in order to improve performance and authentication resiliency for those using Teams. Any such changes would be made with the goal of keeping Teams secure and Trustworthy by Design.

Microsoft Teams, as part of the Microsoft 365 and Office 365 services, follows all the security best practices and procedures such as service-level security through defense-in-depth, customer controls within the service, security hardening, and operational best practices. For full details, see the [Microsoft Trust Center](#).

Trustworthy by design

Teams is designed and developed in compliance with the Microsoft Trustworthy Computing Security Development Lifecycle (SDL), which is described at [Microsoft Security Development Lifecycle \(SDL\)](#). The first step in creating a more secure unified communications system was to design threat models and test each feature as it was designed. Multiple security-related improvements were built into the coding process and practices. Build-time tools detect buffer overruns and other potential security threats before the code is checked in to the final product. It's impossible to design against all unknown security threats. No system can guarantee complete security. However, because product development embraced secure design principles from the start, Teams incorporates industry standard security technologies as a fundamental part of its architecture.

Trustworthy by default

Network communications in Teams are encrypted by default. By requiring all servers to use certificates and by using OAuth, Transport Layer Security (TLS), and Secure Real-Time Transport Protocol (SRTP), all Teams data is protected on the network.

How Teams handles common security threats

This section identifies the more common threats to the security of the Teams Service and how Microsoft mitigates each threat.

Compromised-key attack

Teams uses the PKI features in the Windows Server operating system to protect the key data used for encryption for the TLS connections. The keys used for media encryptions are exchanged over TLS connections.

Network denial-of-service attack

A distributed denial-of-service (DDOS) attack occurs when the attacker prevents normal network use and function by valid users. By using a denial-of-service attack, the attacker can:

- Send invalid data to applications and services running in the attacked network to disrupt their normal function.
- Send a large amount of traffic, overloading the system until it stops responding or responds slowly to legitimate requests.
- Hide the evidence of the attacks.

- Prevent users from accessing network resources. Teams mitigates against these attacks by running Azure DDOS network protection and by throttling client requests from the same endpoints, subnets, and federated entities.

Eavesdropping

Eavesdropping occurs when an attacker gains access to the data path in a network and has the ability to monitor and read the traffic. Eavesdropping is also called sniffing or snooping. If the traffic is in plain text, the attacker can read the traffic when the attacker gains access to the path. An example is an attack performed by controlling a router on the data path.

Teams uses mutual TLS (MTLS) for server communications within Microsoft 365 and Office 365, and also uses TLS from clients to the service. MTLS makes eavesdropping difficult or impossible to achieve within the time period of a single conversation. TLS authenticates all parties and encrypts all traffic. While TLS doesn't prevent eavesdropping, the attacker can't read the traffic unless the encryption is broken.

The TURN protocol is used for real-time media purposes. The TURN protocol doesn't mandate the traffic to be encrypted and the information that it's sending is protected by message integrity. Although it's open to eavesdropping, the information it's sending, that is, IP addresses and port, can be extracted directly by looking at the source and destination addresses of the packets. The Teams service ensures that the data is valid by checking the Message Integrity of the message using the key derived from a few items including a TURN password, which is never sent in clear text. SRTP is used for media traffic and is also encrypted.

Identity spoofing (IP address spoofing)

Spoofing occurs when the attacker identifies and then uses an IP address of a network, computer, or network component without being authorized to do so. A successful attack allows the attacker to operate as if the attacker is the entity normally identified by the IP address.

TLS authenticates all parties and encrypts all traffic. Using TLS prevents an attacker from performing IP address spoofing on a specific connection (for example, mutual TLS connections). An attacker could still spoof the address of the Domain Name System (DNS) server. However, because authentication in Teams is performed with certificates, an attacker would not have a valid certificate required to spoof one of the parties in the communication.

Man-in-the-middle attack

A man-in-the-middle attack occurs when an attacker reroutes communication between two users through the attacker's computer without the knowledge of the two communicating users. The attacker can monitor and read the traffic before sending it on to the intended recipient. Each user in the communication unknowingly sends traffic to and receives traffic from the attacker, all while thinking they are communicating only with the intended user. This scenario can happen if an attacker can modify Active Directory Domain Services to add their server as a trusted server or modify DNS configuration to get clients to connect through the attacker on their way to the server.

Man-in-the-middle attacks on media traffic between two endpoints participating in Teams audio, video, and application sharing, is prevented by using SRTP to encrypt the media stream. Cryptographic keys are negotiated between the two endpoints over a proprietary signaling protocol (Teams Call Signaling protocol) which uses TLS 1.2 and AES-256 (in GCM mode) encrypted UDP/TCP channel.

Real-time Transport Protocol (RTP) replay attack

A replay attack occurs when a valid media transmission between two parties is intercepted and retransmitted for malicious purposes. Teams uses SRTP with a secure signaling protocol that protects transmissions from replay attacks by enabling the receiver to maintain an index of already received RTP packets and compare each new packet with packets already listed in the index.

Spim

Spim is unsolicited commercial instant messages or presence subscription requests, like spam, but in instant

message form. While not by itself a compromise of the network, it's annoying in the least, can reduce resource availability and production, and can possibly lead to a compromise of the network. An example is users spimming each other by sending requests. Users can block each other to prevent spimming, but with federation, if a malicious actor establishes a coordinated spim attack, it can be difficult to overcome unless you disable federation from the partner.

Viruses and worms

A virus is a unit of code whose purpose is to reproduce more, similar code units. To work, a virus needs a host, such as a file, email, or program. Like a virus, a worm is a unit of code that reproduces more, similar code units, but that unlike a virus doesn't need a host. Viruses and worms primarily show up during file transfers between clients or when URLs are sent from other users. If a virus is on your computer, it can, for example, use your identity and send instant messages on your behalf. Standard client security best practices such as periodically scanning for viruses can mitigate this issue.

Security Framework for Teams

This section gives an overview of fundamental elements that form a security framework for Microsoft Teams.

Core elements are:

- Azure Active Directory (Azure AD), which provides a single trusted back-end repository for user accounts. User profile information is stored in Azure AD through the actions of Microsoft Graph.
 - There may be multiple tokens issued which you may see if tracing your network traffic. Including Skype tokens you might see in traces while looking at chat and audio traffic.
- Transport Layer Security (TLS), and mutual TLS (MTLS) which encrypt instant message traffic and enable endpoint authentication. Point-to-point audio, video, and application sharing streams are encrypted and integrity checked using Secure Real-Time Transport Protocol (SRTP). You may also see OAuth traffic in your trace, particularly around negotiating permissions while switching between tabs in Teams, for example to move from Posts to Files. For an example of the OAuth flow for tabs, [see this document](#).
- Teams uses industry-standard protocols for user authentication, wherever possible.

The next sections discuss some of these core technologies.

Azure Active Directory

Azure Active Directory functions as the directory service for Microsoft 365 and Office 365. It stores all user directory information and policy assignments.

Certificate Revocation List (CRL) Distribution Points

Microsoft 365 and Office 365 traffic takes place over TLS/HTTPS encrypted channels, meaning that certificates are used for encryption of all traffic. Teams requires all server certificates to contain one or more CRL distribution points. CRL distribution points (CDPs) are locations from which CRLs can be downloaded for purposes of verifying that the certificate hasn't been revoked since the time it was issued and the certificate is still within the validity period. A CRL distribution point is noted in the properties of the certificate as a URL and is secure HTTP. The Teams service checks CRL with every certificate authentication.

Enhanced Key Usage

All components of the Teams service require all server certificates to support Enhanced Key Usage (EKU) for server authentication. Configuring the EKU field for server authentication means that the certificate is valid for authenticating servers. This EKU is essential for MTLS.

TLS and MTLS for Teams

TLS and MTLS protocols provide encrypted communications and endpoint authentication on the Internet. Teams uses these two protocols to create the network of trusted servers and to ensure that all communication over that network is encrypted. All communication between servers occurs over MTLS. Any remaining or legacy SIP communication from client to server occurs over TLS.

TLS enables users, through their client software, to authenticate the Teams servers to which they connect. On a TLS connection, the client requests a valid certificate from the server. To be valid, the certificate must have been issued by a Certificate Authority (CA) that is also trusted by the client and the DNS name of the server must match the DNS name on the certificate. If the certificate is valid, the client uses the public key in the certificate to encrypt the symmetric encryption keys to be used for the communication, so only the original owner of the certificate can use its private key to decrypt the contents of the communication. The resulting connection is trusted and from that point is not challenged by other trusted servers or clients.

Server-to-server connections rely on mutual TLS (MTLS) for mutual authentication. On an MTLS connection, the server originating a message and the server receiving it exchange certificates from a mutually trusted CA. The certificates prove the identity of each server to the other. In the Teams service, this procedure is followed.

TLS and MTLS help prevent both eavesdropping and man-in-the middle attacks. In a man-in-the-middle attack, the attacker reroutes communications between two network entities through the attacker's computer without the knowledge of either party. TLS and Teams' specification of trusted servers mitigate the risk of a man-in-the middle attack partially on the application layer by using encryption that is coordinated using the Public Key cryptography between the two endpoints. An attacker would have to have a valid and trusted certificate with the corresponding private key and issued to the name of the service to which the client is communicating to decrypt the communication.

Teams data is encrypted in transit and at rest in Microsoft data centers. Microsoft uses industry standard technologies such as TLS and SRTP to encrypt all data in transit between users' devices and Microsoft data centers, and between Microsoft data centers. Data in transit includes messages, files, meetings, and other content. Enterprise data is also encrypted at rest in Microsoft data centers so that organizations can decrypt the content if needed, to meet security and compliance obligations through methods such as eDiscovery. For more information about encryption in Microsoft 365, see [Encryption in Microsoft 365](#)

Encryption in Teams

There are multiple layers of encryption at work within Microsoft 365. Encryption in Teams works with the rest of Microsoft 365 encryption to protect your organization's content. This article describes encryption technologies that are specific to Teams. For an overview of encryption in Microsoft 365, see [Encryption in Microsoft 365](#).

Traffic encryption

All server-to-server traffic requires MTLS, regardless of whether the traffic is confined to the internal network or crosses the internal network boundary. This table summarizes the protocols used by Teams.

TRAFFIC TYPE	ENCRYPTED BY
Server-to-server	MTLS
Client-to-server, for example, instant messaging and presence	TLS
Media flows, for example, audio and video sharing of media	TLS
Audio and video sharing of media	SRTP/TLS
Signaling	TLS
Client-to-client enhanced encryption (for example, end-to-end encryption calls)	SRTP/DTLS

Teams uses TLS and MTLS to encrypt instant messages.

Media encryption

Call flows in Teams are based on the [Session Description Protocol \(SDP\) RFC 4566](#) offer and answer model over HTTPS. Once the callee accepts an incoming call, the caller and callee agree on the session parameters.

Media traffic is encrypted by, and flows between, the caller and callee using Secure RTP (SRTP), a profile of Real-time Transport Protocol (RTP) that provides confidentiality, authentication, and replay attack protection to RTP traffic. SRTP uses a session key generated by a secure random number generator and exchanged using the signaling TLS channel. In most cases, client to client media traffic is negotiated through client to server connection signaling, and is encrypted using SRTP when going directly from client to client.

In normal call flows, negotiation of the encryption key occurs over the call signaling channel. In an end-to-end encrypted call, the signaling flow is the same as a regular one-to-one Teams call. However, Teams uses DTLS to derive an encryption key based on per-call certificates generated on both client endpoints. Since DTLS derives the key based on the client certificates, the key is opaque to Microsoft. Once both clients agree upon the key, the media begins to flow using this DTLS-negotiated encryption key over SRTP.

To protect against a man-in-the-middle attack between the caller and callee, Teams derives a 20-digit security code from the SHA-256 thumbprints of the caller's and callee's endpoint call certificates. The caller and callee can validate the 20-digit security codes by reading them to each other to see if they match. If the codes don't match, then the connection between the caller and callee has been intercepted by a man-in-the-middle attack. If the call has been compromised, users can end the call manually.

Teams uses a credentials-based token for secure access to media relays over TURN. Media relays exchange the token over a TLS-secured channel.

Federal Information Processing Standard (FIPS)

Teams uses FIPS compliant algorithms for encryption key exchanges. For more information on the implementation of FIPS, see [Federal Information Processing Standard \(FIPS\) Publication 140-2](#).

User and Client Authentication

A trusted user is one whose credentials have been authenticated by Azure AD in Microsoft 365 or Office 365.

Authentication is the provision of user credentials to a trusted server or service. Teams uses the following authentication protocols, depending on the status and location of the user.

- **Modern Authentication (MA)** is the Microsoft implementation of OAUTH 2.0 for client to server communication. It enables security features such as multifactor authentication and Conditional Access. To use MA, both the online tenant and the clients need to be enabled for MA. The Teams clients across PC and mobile, and the web client, [all support MA](#).

NOTE

If you want more information on Azure AD authentication and authorization methods, this article's Introduction and 'Authentication basics in Azure AD' sections will help.

Teams authentication is accomplished through Azure AD and OAuth. The process of authentication can be simplified to:

- User sign in > token issuance > next request use issued token.

Requests from client to server are authenticated and authorized by Azure AD with the use of OAuth. Users with valid credentials issued by a federated partner are trusted and pass through the same process as native users. However, further restrictions can be put into place by administrators.

For media authentication, the ICE and TURN protocols also use the Digest challenge as described in the IETF TURN RFC.

Windows PowerShell and Team Management Tools

In Teams, IT Admins can manage their service via the Microsoft 365 admin center or by using Tenant Remote PowerShell (TRPS). Tenant admins use Modern Authentication to authenticate to TRPS.

Configuring access to Teams at your Internet boundary

For Teams to function properly, for example, for users to be able to join meetings, customers need to configure their internet access such that outbound UDP and TCP traffic to services in the Teams cloud is allowed. For more information, see [Office 365 URLs and IP address ranges](#).

UDP 3478-3481 and TCP 443

The UDP 3478-3481 and TCP 443 ports are used by clients to request service for audio visuals. A client uses these two ports to allocate UDP and TCP ports respectively to enable these media flows. The media flows on these ports are protected with a key that is exchanged over a TLS protected signaling channel.

Federation safeguards for Teams

Federation provides your organization with the ability to communicate with other organizations to share IM and presence. In Teams federation is on by default. However, tenant admins have the ability to control federation through the Microsoft 365 admin center.

Addressing threats to Teams Meetings

There are two options to control who arrives in Teams meetings and who will have access to the information you present.

1. You can control who joins your meetings through settings for the **lobby**.

"WHO CAN BYPASS THE LOBBY" SETTING OPTIONS AVAILABLE IN MEETING OPTIONS PAGE	USER TYPES JOINING THE MEETING DIRECTLY	USER TYPES GOING TO THE LOBBY
People in my organization	- In-tenant - Guest of tenant	- Federated - Anonymous - PSTN dial-in
People in my organization and trusted organizations	- In-tenant - Guest of tenant - Federated	- Anonymous - PSTN dial-in
Everyone	- In-tenant - Guest of tenant - Federated Anonymous - PSTN dial-in	

2. The second way is through **structured meetings** (where Presenters can do about anything that should be done, and attendees have a controlled experience). After joining a structured meeting, presenters control what attendees can do in the meeting.

ACTIONS	PRESENTERS	ATTENDEES
Speak and share their video	Y	Y
Participate in meeting chat	Y	Y
Change settings in meeting options	Y	N

ACTIONS	PRESENTERS	ATTENDEES
Mute other participants	Y	N
Remove other participants	Y	N
Share content	Y	N
Admit other participants from the lobby	Y	N
Make other participants presenters or attendees	Y	N
Start or stop recording	Y	N
Take control when another participant shares a PowerPoint	Y	N

Teams provides the capability for enterprise users to create and join real-time meetings. Enterprise users can also invite external users who don't have an Azure AD, Microsoft 365, or Office 365 account to participate in these meetings. Users who are employed by external partners with a secure and authenticated identity can also join meetings and, if promoted to do so, can act as presenters. Anonymous users can't create or join a meeting as a presenter, but they can be promoted to presenter after they join.

For Anonymous users to be able to join Teams meetings, the Participants meetings setting in the Teams Admin Center must be toggled on.

NOTE

The term *anonymous users* means users that are not authenticated to the organizations tenant. In this context all external users are considered anonymous. Authenticated users include tenant users and Guest users of the tenant.

Enabling external users to participate in Teams meetings can be useful, but entails some security risks. To address these risks, Teams uses the following safeguards:

- Participant roles determine meeting control privileges.
- Participant types allow you to limit access to specific meetings.
- Scheduling meetings is restricted to users who have an AAD account and a Teams license.
- Anonymous, that is, unauthenticated, users who want to join a dial-in conference, dial one of the conference access numbers. If the "Always allow callers to bypass the lobby" setting is turned *On* then they also need to wait until a presenter or authenticated user joins the meeting.

Caution

If you do not wish for Anonymous users (users you don't explicitly invite) to join a meeting, you need to ensure the **Anonymous users can join a meeting** is set to **Off** for the **Participant** meeting section.

It's also possible for an organizer to configure settings to let Dial-in callers be the first person in a meeting. This setting is configured in the Audio Conferencing settings for users and would apply to all meetings scheduled by the user.

NOTE

For more information on Guest and External Access in Teams, see this [article](#). It covers what features guest or external users can expect to see and use when they login to Teams.

If you're recording meetings and want to see a permissions matrix around accessing the content, consult [this article](#) and its matrix.

Participant roles

Meeting participants fall into three groups, each with its own privileges and restrictions:

- **Organizer** The user who creates a meeting, whether impromptu or by scheduling. An organizer must be an authenticated in-tenant user and has control over all end-user aspects of a meeting.
- **Presenter** A user who is authorized to present information at a meeting, using whatever media is supported. A meeting organizer is by definition also a presenter and determines who else can be a presenter. An organizer can make this determination when a meeting is scheduled or while the meeting is under way.
- **Attendee** A user who has been invited to attend a meeting but who is not authorized to act as a presenter.

A presenter can also promote an attendee to the role of presenter during the meeting.

Participant types

Meeting participants are also categorized by location and credentials. You can use both of these characteristics to decide which users can have access to specific meetings. Users can be divided broadly into the following categories:

- **Users that belong to the tenant.** These users have a credential in Azure Active Directory for the tenant.

People in my organization – These users have a credential in Azure Active Directory for the tenant. *People in my organization* includes invited Guest accounts.

Remote users – These users are joining from outside the corporate network. They can include employees who are working at home or on the road, and others, such as employees of trusted vendors, who have been granted enterprise credentials for their terms of service. Remote users can create and join meetings and act as presenters.

- **Users that do not belong to the tenant.** These users do not have credentials in Azure AD for the tenant.

Federated Users - Federated users have valid credentials with federated partners and are therefore treated as authenticated by Teams, but are still external to the meeting organizer tenant. Federated users can join meetings and be promoted to presenters after they have joined the meeting, but they can't create meetings in enterprises with which they are federated.

Anonymous Users - Anonymous users do not have an Active Directory identity and are not federated with the tenant.

Many meetings involve external users. Those same customers also want reassurance about the identity of external users before allowing those users to join a meeting. The next section describes how Teams limits meeting access to those user types that have been explicitly allowed, and requires all user types to present appropriate *credentials* when entering a meeting.

Participant admittance

Caution

If you do not want Anonymous users (users you don't explicitly invite) to join a meeting, you need to ensure the **Anonymous users can join a meeting** is set to **Off** for the **Participant** meeting section.

In Teams, anonymous users can be transferred to a waiting area called the lobby. Presenters can then either *admit* these users into the meeting or *reject* them. When these users are transferred to the lobby, the presenter and attendees are notified, and the anonymous users must then wait until they are either accepted or rejected, or their connection times out.

By default, participants dialing in from the PSTN go directly to the meeting once an authenticated user joins the meeting, but this option can be changed to force dial-in participants to go to the lobby.

Meeting organizers control whether participants can join a meeting without waiting in the lobby. Each meeting can be set up to enable access using any one of the following methods:

The defaults are:

- *People in my Organization* - Everyone external to the organization will wait in the lobby until admitted.
- *People from my organization and trusted organizations* - Authenticated users and external users from Teams and Skype for Business domains that are in the external access allowlist can bypass the lobby. All other users will wait in the lobby until admitted.
- *Everyone* - All meeting participants bypass the lobby once an authenticated user has joined the meeting.

Presenter capabilities

Meeting organizers control whether participants can present during a meeting. Each meeting can be set up to limit presenters to any one of the following options:

- *People in my organization* - All in tenant users, including guests, can present
- *People in my organization and trusted organizations* - All in tenant users, including guests, can present and external users from Teams and Skype for Business domains that are in the external access allowlist can present.
- *Everyone* - All meeting participants are presenters.

Modify while meeting is running

You can modify the meeting options while a meeting is on-going. The change, when saved, will be noticeable in the running meeting within seconds. It also affects any future occurrences of the meeting.

Use end-to-end encryption for one-to-one Microsoft Teams calls (Public preview)

12/7/2021 • 5 minutes to read • [Edit Online](#)

IMPORTANT

The Teams service model, and its encryption support, is subject to change in order to improve customer experiences. For example, the service regularly deprecates cipher suites that are no longer considered secure. Any such changes would be made with the goal of keeping Teams secure and Trustworthy by Design. In addition, all customer content in Microsoft data centers is encrypted. For information about encryption layers in Microsoft 365, see [Encryption in Microsoft 365](#).

End-to-end encryption, or E2EE, happens when content is encrypted before it's sent and decrypted only by the intended recipient. With end-to-end encryption, only the two endpoint systems are involved in encrypting and decrypting the call data. No other party, including Microsoft, has access to the decrypted conversation.

With this public preview release, we're rolling out E2EE for unscheduled one-to-one calls. Only the real-time media flow, that is, video and voice data, for one-to-one Teams calls are end-to-end encrypted. Both parties must turn on this setting to enable end-to-end encryption. [Encryption in Microsoft 365](#) protects chat, file sharing, presence, and other content in the call.

If you don't enable end-to-end encryption, Teams still secures a call or meeting using encryption based on industry standards. Data exchanged during calls is always secure while in transit and at rest. For more information, see [Media encryption for Teams](#).

During an end-to-end encrypted call, Teams secures the following features:

- Audio
- Video
- Screen sharing

The following advanced features aren't available during an E2EE call:

- Live captions and transcription
- Call transfer
- Call merge
- Call park
- Consult then transfer
- Call companion and transfer to another device
- Adding a participant
- Recording

Also, if your organization uses compliance recording, end-to-end encryption isn't available. For more info on how Teams supports compliance recording, see [Introduction to Teams policy-based recording for callings & meetings](#).

Configure end-to-end encryption for Microsoft Teams

Complete these tasks so your users can place end-to-end encrypted calls.

- Enable end-to-end encryption for your organization by creating one or more policies that define who can use end-to-end encryption. Before you start, make sure that your work or school account has been assigned the Teams or global administrator role. For information, see [Use Microsoft Teams administrator roles to manage Teams](#). When you're ready to set up E2EE, you can use the Teams admin center or Microsoft PowerShell.
- Switch on end-to-end encrypted calls in Teams settings on your device. Each user needs to complete this task, but they only need to do it on one device. Teams synchronizes this setting across supported end points for each user. For instructions, see [Use end-to-end encryption for Teams calls](#).

Use the Teams admin center to configure end-to-end encryption

The global, organization-wide, default policy specifies that end-to-end encryption is disabled. Users in your organization will automatically get the global policy unless you create and assign a custom policy. To enable end-to-end encryption, create a new encryption policy or modify the global default policy. To enable end-to-end encryption using the Teams admin center, complete these steps.

1. Using a work or school account that has been assigned the Teams or global administrator role, sign in to the [Teams admin center](#).
2. Go to **Other settings** > **Enhanced encryption policies**.
3. Either choose the default policy or choose **Add** to add a new policy and then name the new policy.
4. To enable end-to-end encryption for your users, for **End-to-end call encryption**, choose **users can turn it on**, and then choose **Save**.

To disable end-to-end encryption, choose **Turn it off for everyone**.

Once you've finished setting up the policy, assign the policy to users, groups, or your entire tenant the same way you manage other Teams policies. For information about using policies in Teams, see [Manage Teams with policies](#).

Use Microsoft PowerShell to configure end-to-end encryption

You can manage end-to-end encryption policies using Microsoft PowerShell and the Teams admin center. Several end-to-end encryption cmdlets are included in the Teams PowerShell module and documented in the [Microsoft Teams cmdlet reference](#). This article lists the cmdlets you can use and provides simple example configurations. These configurations use the default, global policy. Your organization might require more complex policy configuration. Complete information about these cmdlets is provided in the cmdlet reference.

End-to-end encryption PowerShell cmdlets:

- [Get-CsTeamsEnhancedEncryptionPolicy](#) returns information about the Teams enhanced encryption policies in your organization.
- [Grant-CsTeamsEnhancedEncryptionPolicy](#) assigns and unassigns existing enhanced encryption policies to a user. Use `$NULL` to unassign all policies from a user.
- [New-CsTeamsEnhancedEncryptionPolicy](#) creates a new Teams enhanced encryption policy.
- [Remove-CsTeamsEnhancedEncryptionPolicy](#) deletes an enhanced encryption policy from your organization. You can't delete the global, default policy.
- [Set-CsTeamsEnhancedEncryptionPolicy](#) updates values in an existing Teams enhanced encryption policy.

Your work or school account needs the Teams or global administrator role to configure end-to-end encryption.

To enable end-to-end encryption for your entire tenant using the global policy

By default, end-to-end encryption is disabled. To enable end-to-end encryption for the entire tenant by setting the default global policy, run the [Set-CsTeamsEnhancedEncryptionPolicy](#) cmdlet as follows.

```
Set-CsTeamsEnhancedEncryptionPolicy -Identity Global -CallingEndToEndEncryptionEnabledType DisabledUserOverride
```

Where:

- `Global` means that you're setting this configuration on the global, organization-wide default policy.
- `DisabledUserOverride` means that E2EE is disabled in Teams by default, but users can override the default and turn on E2EE in their Teams settings.

To disable end-to-end encryption for your entire tenant using the global policy

By default, end-to-end encryption is disabled. If you've made changes to the global policy, you can change the setting back by running the [Grant-CsTeamsEnhancedEncryptionPolicy](#) cmdlet as follows.

```
Grant-CsTeamsEnhancedEncryptionPolicy -Identity Global -CallingEndToEndEncryptionEnabledType Disabled
```

Where:

- `Global` means that you're setting this configuration on the global, organization-wide default policy.
- `Disabled` means that you're disabling E2EE for everyone and users can't turn it on in their Teams settings.

To enable end-to-end encryption for a single user

To enable end-to-end encryption for a user, run the [Grant-CsTeamsEnhancedEncryptionPolicy](#) cmdlet as follows.

```
Grant-CsTeamsEnhancedEncryptionPolicy -Identity "username" -PolicyName "policyname"
```

Where:

- `username` is the name of the user.
- `policyname` is the name you want to use for the policy. Policy names can't contain spaces, for example, ContosoE2EEUserPolicy.

Users still need to switch on end-to-end encrypted calling in their Teams settings before they can make an end-to-end encrypted call. For instructions, see [Use end-to-end encryption for Teams calls](#).

For example:

```
Grant-CsTeamsEnhancedEncryptionPolicy -Identity "kenmeyer@contoso.onmicrosoft.com" -PolicyName "ContosoE2EEUserPolicy"
```

To unassign an end-to-end encryption policy from a single user

Users can have one and only one encryption policy assigned to them at a time. When you unassign a policy from a user, the user is then assigned the global, organization-wide, default policy. You can't unassign the default policy. To unassign an end-to-end encryption policy from a user, run the [Grant-CsTeamsEnhancedEncryptionPolicy](#) cmdlet as follows.

```
Grant-CsTeamsEnhancedEncryptionPolicy -Identity "kenmeyer@contoso.onmicrosoft.com" -PolicyName $NULL
```

Switch on end-to-end encryption on your device

For instructions, see [Use end-to-end encryption for Teams calls](#).

Azure Sentinel and Microsoft Teams

12/7/2021 • 7 minutes to read • [Edit Online](#)

IMPORTANT

Azure Sentinel now has an integrated connector. For more information, see [Connect Office 365 Logs to Azure Sentinel](#). This is the recommended route for collecting these logs and supersedes the collection methods described below.

Teams serves a central role in communication and data-sharing in the Microsoft 365 Cloud. Since Teams touches on so many technologies in the Cloud, it can benefit from human and automated analysis. This applies to both *hunting in logs*, and *real-time monitoring of meetings*. Azure Sentinel offers admins these solutions.

NOTE

Need a refresher on Azure Sentinel? [This article](#) is just the thing.

Sentinel and Microsoft Teams Activity Logs

This article focuses on collecting Teams activity logs in Azure Sentinel.

Sentinel lets administrators do security management in one location. This includes managing:

- Third-party devices
- Microsoft Threat Protection
- Microsoft 365 Workloads

Sentinel workbooks and runbooks can make security monitoring *systematic*. A good first step in this process is collecting the logs needed analysis.

NOTE

More than one Microsoft 365 subscription can be surfaced in the same instance of Azure Sentinel. This will allow for [realtime monitoring](#) and hunting for threats in historical log files. Administrators will be able to hunt using [cross-resource queries](#), that is within a single resource group, across resource groups, or in another subscription.

Step 1: Collect Teams logs: Enable Audit logs in Microsoft 365

Because Teams logs activity through Microsoft 365, audit logs aren't collected by default. Turn on this feature with [these steps](#). Teams data is collected in the Microsoft 365 audit under *Audit.General*.

Step 2: Connect Office 365 logs to Azure Sentinel

Azure Sentinel provides a built-in connector for Office 365 logs, which enables you to ingest Teams data into Azure Sentinel together with other Office 365 data.

In Azure Sentinel, enable the Office 365 data connector. For more information, see the [Azure Sentinel documentation](#).

Helpful hunting KQL queries

Use these queries to familiarize yourself with your Teams data and Teams environment. Knowing how the environment should look and behave is a good first step in recognizing suspicious activity. From there, you can branch out into threat hunting.

Federated external users query

Get the list of Teams sites that have federated external users. These users have a domain name and/or a UPN suffix that isn't owned by your organization.

In this example query, the organization owns contoso.com.

```
OfficeActivity
| where TimeGenerated > ago(7d)
| where Operation =~ "MemberAdded"
| where parse_json(Members)[0].Role == 3
| project TeamName, Operation, UserId, Members
| mv-expand bagexpansion=array Members
| evaluate bag_unpack(Members)
```

TIP

To learn more about External and Guest access types in Teams see [Communicate with users from other organizations](#), or the [Participant Types](#) section in the Teams Security Guide.

Who recently joined / Whose role changed

Query a specific user to check if they were added to a Teams channel in the last seven days, or within a week:

```
OfficeActivity
| where TimeGenerated > ago(7d)
| where Operation =~ "MemberAdded"
| where Members has "<DisplayName>" or Members has "<UserPrincipalName>"
| project TeamName, Operation, UserId, Members
```

Query whether a user's role changed for a Team in the last seven days:

```
OfficeActivity
| where TimeGenerated > ago(7d)
| where Operation =~ "MemberRoleChanged"
| project TeamName, Operation, UserId, Members
| mv-expand bagexpansion=array Members
| evaluate bag_unpack(Members)
| where Role == '1'
```

External users from unknown or new organizations

In Teams, you can add external users to your environment or channels. Organizations often have a limited number of key partnerships and add users from among these partners. This KQL looks at external users added to teams who come from organizations that haven't been seen or added before.

For more information, see the query in the [Azure Sentinel community git hub](#).

External users who were added and then removed

Attackers with some level of existing access may add a new external account to Teams to access and exfiltrate data. They may also quickly remove that user to hide that they made access. This query hunts for external accounts that are added to Teams and swiftly removed to help identify suspicious behavior.

For more information, see the query in the [Azure Sentinel community git hub](#).

New bot or application added

Teams can include apps or bots in a Team to extend the feature set (including custom apps and bots). In some cases, an app or bot can be used for *persistence* in Teams without needing a user account, and can access files and other data. This query hunts for apps or bots that are new to Teams.

For more information, see the query in the [Azure Sentinel community git hub](#).

User accounts who are Owners of large numbers of Teams

Attackers looking to elevate their privileges may assign themselves Owner privileges of a large number of diverse teams. *Usually*, users create and own a few teams around specific topics. This KQL query looks for suspicious behavior.

For more information, see the query in the [Azure Sentinel community git hub](#).

Many Team deletions by a single user

Attackers can cause disruptions and jeopardize projects and data by deleting multiple teams. Since teams are usually deleted by individual Owners, central deletion of many teams can be a sign of trouble. This KQL looks for single users who delete multiple teams.

For more information, see the query in the [Azure Sentinel community git hub](#).

Expanding your threat hunting opportunities

Combining queries from resources like Azure Active Directory (Azure AD), or other Office 365 workloads can be used with Teams queries. For example, combine the detection of suspicious patterns in Azure AD SigninLogs, and use that output while hunting for Team Owners.

```

let timeRange = 1d;
let lookBack = 7d;
let threshold_Failed = 5;
let threshold_FailedwithSingleIP = 20;
let threshold_IPAddressCount = 2;
let isGUID = "[0-9a-z]{8}-[0-9a-z]{4}-[0-9a-z]{4}-[0-9a-z]{4}-[0-9a-z]{12}";
let azPortalSignins = SigninLogs
| where TimeGenerated >= ago(timeRange)
// Azure Portal only and exclude non-failure Result Types
| where AppDisplayName has "Azure Portal" and ResultType !in ("0", "50125", "50140")
// Tagging identities not resolved to friendly names
| extend Unresolved = iff(Identity matches regex isGUID, true, false);
// Lookup up resolved identities from last 7 days
let identityLookup = SigninLogs
| where TimeGenerated >= ago(lookBack)
| where not(Identity matches regex isGUID)
| summarize by UserId, lu_UserDisplayName = UserDisplayName, lu_UserPrincipalName = UserPrincipalName;
// Join resolved names to unresolved list from portal signins
let unresolvedNames = azPortalSignins | where Unresolved == true | join kind= inner (
    identityLookup ) on UserId
| extend UserDisplayName = lu_UserDisplayName, UserPrincipalName = lu_UserPrincipalName
| project-away lu_UserDisplayName, lu_UserPrincipalName;
// Join Signins that had resolved names with list of unresolved that now have a resolved name
let u_azPortalSignins = azPortalSignins | where Unresolved == false | union unresolvedNames;
let failed_signins = (u_azPortalSignins
| extend Status = strcat(ResultType, ": ", ResultDescription), OS = toString(DeviceDetail.operatingSystem),
Browser = toString(DeviceDetail.browser)
| extend FullLocation = strcat(Location, '|', LocationDetails.state, '|', LocationDetails.city)
| summarize TimeGenerated = makelist(TimeGenerated), Status = makelist(Status), IPAddresses =
makelist(IPAddress), IPAddressCount = dcount(IPAddress), FailedLogonCount = count()
by UserPrincipalName, UserId, UserDisplayName, AppDisplayName, Browser, OS, FullLocation
| mvexpand TimeGenerated, IPAddresses, Status
| extend TimeGenerated = todatetime(toString(TimeGenerated)), IPAddress = toString(IPAddresses), Status =
toString(Status)
| project-away IPAddresses
| summarize StartTime = min(TimeGenerated), EndTime = max(TimeGenerated) by UserPrincipalName, UserId,
UserDisplayName, Status, FailedLogonCount, IPAddress, IPAddressCount, AppDisplayName, Browser, OS,
FullLocation
| where (IPAddressCount >= threshold_IPAddressCount and FailedLogonCount >= threshold_Failed) or
FailedLogonCount >= threshold_FailedwithSingleIP
| project UserPrincipalName);
OfficeActivity
| where TimeGenerated > ago(time_window)
| where Operation =~ "MemberRoleChanged"
| mv-expand bagexpansion=array Members
| evaluate bag_unpack(Members)
| where Role == '2'
| where Members in (failed_signins)

```

Also, you can make the SigninLogs detections specific to Teams by adding a filter for only Teams-based logons by using:

```

| where AppDisplayName has 'Teams'

```

To help explain using *where AppDisplayName has Teams* further, the KQL you see below demonstrates a successful logon from one IP address with failure from a different IP address, but scoped to *only* Teams sign-ins:

```

let timeFrame = 1d;
let logonDiff = 10m;
SigninLogs
| where TimeGenerated >= ago(timeFrame)
| where ResultType == "0"
| where AppDisplayName has "Teams"
| project SuccessLogonTime = TimeGenerated, UserPrincipalName, SuccessIPAddress = IPAddress,
AppDisplayName, SuccessIPBlock = strcat(split(IPAddress, ".")[0], ".", split(IPAddress, ".")[1])
| join kind= inner (
    SigninLogs
    | where TimeGenerated >= ago(timeFrame)
    | where ResultType !in ("0", "50140")
    | where ResultDescription !~ "Other"
    | where AppDisplayName startswith "Microsoft Teams"
    | project FailedLogonTime = TimeGenerated, UserPrincipalName, FailedIPAddress = IPAddress,
AppDisplayName, ResultType, ResultDescription
) on UserPrincipalName, AppDisplayName
| where SuccessLogonTime < FailedLogonTime and FailedLogonTime - SuccessLogonTime <= logonDiff and
FailedIPAddress !startswith SuccessIPBlock
| summarize FailedLogonTime = max(FailedLogonTime), SuccessLogonTime = max(SuccessLogonTime) by
UserPrincipalName, SuccessIPAddress, AppDisplayName, FailedIPAddress, ResultType, ResultDescription
| extend timestamp = SuccessLogonTime, AccountCustomEntity = UserPrincipalName, IPCustomEntity =
SuccessIPAddress

```

Important information and updates

Thank you for content collaboration, **Pete Bryan, Nicholas DiCola, and Matthew Lowe**. Pete Bryan, and people he collaborates with, continue to develop detection and hunting queries for Teams.

Stay in touch with this [Git Hub](#) repository for updates.

Watch for updates to the [parser](#) and [logic app](#) used in this article.

You should also join (and contribute to) the [Azure Sentinel community](#). We are actively looking for feedback on this article, so please use the feedback option below. Thank you & Happy hunting.

[What is Azure Sentinel?](#)

Identity models and authentication for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams supports all the identity models that are available with Microsoft 365 and Office 365, which include:

- **Cloud-only:** User accounts are created and managed in Microsoft 365 or Office 365 and stored in Azure Active Directory (Azure AD). User sign-in credentials (account name and password) are validated by Azure AD.
- **Hybrid:** User accounts are typically managed in an on-premises Active Directory Domain Services (AD DS) forest. Depending on the configuration, credential validation can be done by Azure AD, AD DS, or a federated identity provider. This model uses directory synchronization from AD DS to Azure AD with Azure AD Connect.

For more information, see [Microsoft 365 identity models and Azure AD](#).

Configurations

Depending on your organization's decisions of which identity model and configuration you use, the implementation steps may vary.

If you haven't already deployed Microsoft 365 or Office 365 and an identity model, use this table.

IDENTITY MODEL	DEPLOYMENT CHECKLIST	ADDITIONAL INFORMATION
All	<ol style="list-style-type: none">1. Compare Microsoft 365 and Office 365 plan options and obtain a subscription and a tenant.2. Create a Microsoft 365 or Office 365 organization for your tenant.3. Purchase Microsoft 365 or Office 365 licenses for the tenant4. Configure domains and admin user accounts.	<ul style="list-style-type: none">• Office 365 plan options• Compare Microsoft 365 for business Plans• Buy or remove subscription licenses• Add licenses to a subscription• Set up Microsoft 365 for business• Add a domain with the setup wizard <p>Microsoft FastTrack is available to assist you.</p>
Cloud identity	<ul style="list-style-type: none">• Create user accounts with the Microsoft 365 admin center	<ul style="list-style-type: none">• Add users and assign licenses
Hybrid identity	<ol style="list-style-type: none">1. Install Azure AD Connect.2. Configure directory synchronization.3. Manage users and groups with AD DS tools.	<ul style="list-style-type: none">• Set up directory synchronization

IDENTITY MODEL	DEPLOYMENT CHECKLIST	ADDITIONAL INFORMATION
Hybrid identity with federated authentication	<ol style="list-style-type: none"> 1. Install and configure a federated identity provider such as AD FS. 2. Install Azure AD Connect and configure directory synchronization and federated authentication. 3. Manage users and groups with AD DS tools. 	<ul style="list-style-type: none"> • Plan your AD FS deployment • Checklist: Deploy your federation server farm • Configure extranet access for AD FS • Set up a trust between AD FS and Azure AD • Verify and manage single sign-on with ADFS • Set up directory synchronization

Multi-factor authentication

Passwords are the most common method of authentication for signing in to a computer or online service, but they are also the most vulnerable. People can choose easy passwords and use the same passwords for multiple sign-ins to different computers and services.

To provide an additional level of security for sign-ins, use multi-factor authentication (MFA), which requires both a password and an additional verification method such as:

- A text message sent to a phone that requires the user to type a verification code.
- A phone call.
- The Microsoft Authenticator smart phone app.
- Other methods available with hybrid identity and federated authentication.

MFA is supported with any Microsoft 365 or Office 365 plan that includes Microsoft Teams. It is highly recommended that at a minimum you require MFA for that accounts that are [assigned administrator roles](#), such as Teams service admin.

You should also roll out MFA to your users. Once your users are enrolled for MFA, the next time they sign in, they will see a message that asks them to set up their additional verification method.

For more information, see [Multi-factor authentication for Microsoft 365](#).

Sign in to Microsoft Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

Windows users

Microsoft recommends that organizations use recent versions of Windows 10 with either Hybrid Domain Join or Azure AD Join configuration. Using recent versions ensures that users' accounts are primed in Windows' Web Account Manager, which in turn enables single sign-on to Teams and other Microsoft applications. Single sign-on provides a better user experience (silent sign-in) and a better security posture.

Microsoft Teams uses modern authentication to keep the sign-in experience simple and secure. To see how users sign in to Teams, read [Sign in to Teams](#).

How modern authentication works

Modern authentication is a process that lets Teams know that users have already entered their credentials, such as their work email and password elsewhere, and they shouldn't be required to enter them again to start the app. The experience varies depending on a couple factors, like if users are working in Windows or on a Mac. It will also vary depending on whether your organization has enabled single-factor authentication or multifactor authentication. Multifactor authentication usually involves verifying credentials via a phone, providing a unique code, entering a PIN, or presenting a thumbprint. Here's a rundown of each modern authentication scenario.

Modern authentication is available for every organization that uses Teams. If users aren't able to complete the process, there might be an underlying issue with your organization's Azure AD configuration. For more information, see [Why am I having trouble signing in to Microsoft Teams?](#)

- If users have already signed in to Windows or to other Office apps with their work or school account, when they start Teams they're taken straight to the app. There's no need for them to enter their credentials.
- Microsoft recommends using Windows 10 version 1903 or later for the best Single Sign-On experience.
- If users are not signed in to their Microsoft work or school account anywhere else, when they start Teams, they're asked to provide either single-factor or multifactor authentication (SFA or MFA). This process depends on what your organization has decided they'd like the sign-in procedure to require.
- If users are signed in to a domain-joined computer, when they start Teams, they might be asked to go through one more authentication step, depending on whether your organization opted to require MFA or if their computer already requires MFA to sign in. If their computer already requires MFA to sign in, when they open up Teams, the app automatically starts.
- On Domain joined PCs, when SSO isn't possible Teams may pre-fill its login screen with the user principal name (UPN). There are cases where you may not want this, especially if your organization uses different UPNs on-premises and in Azure Active Directory. If that's the case, you can use the following Windows registry key to turn off pre-population of the UPN:

```
Computer\HKEY_CURRENT_USER\Software\Microsoft\Office\Teams  
SkipUpnPrefill(REG_DWORD)  
0x00000001 (1)
```

NOTE

Skipping or ignoring user name pre-fill for user names that end in ".local" or ".corp" is on by default, so you don't need to set a registry key to turn these off.

Signing in to another account on a Domain Joined computer

Users on domain-joined computer may not be able to sign in to Teams with another account in the same Active Directory domain.

macOS users

On macOS, Teams will prompt users to enter their username and credentials and may prompt for multifactor authentication depending on your organization's settings. Once users enter their credentials, they won't be required to provide them again. From that point on, Teams automatically starts whenever they're working on the same computer.

Teams on iOS and Android users

Upon sign in, mobile users will see a list of all the Microsoft 365 accounts that are either currently signed-in or were previously signed-in on their device. Users can tap on any of the accounts to sign in. There are two scenarios for mobile sign in:

1. If the selected account is currently signed in to other Office 365 or Microsoft 365 apps, then the user will be taken straight to Teams. There's no need for the user to enter their credentials.
2. If user isn't signed in to their Microsoft 365 account anywhere else, they will be asked to provide single-factor or multifactor authentication (SFA or MFA), depending on what your organization has configured for mobile sign-in policies.

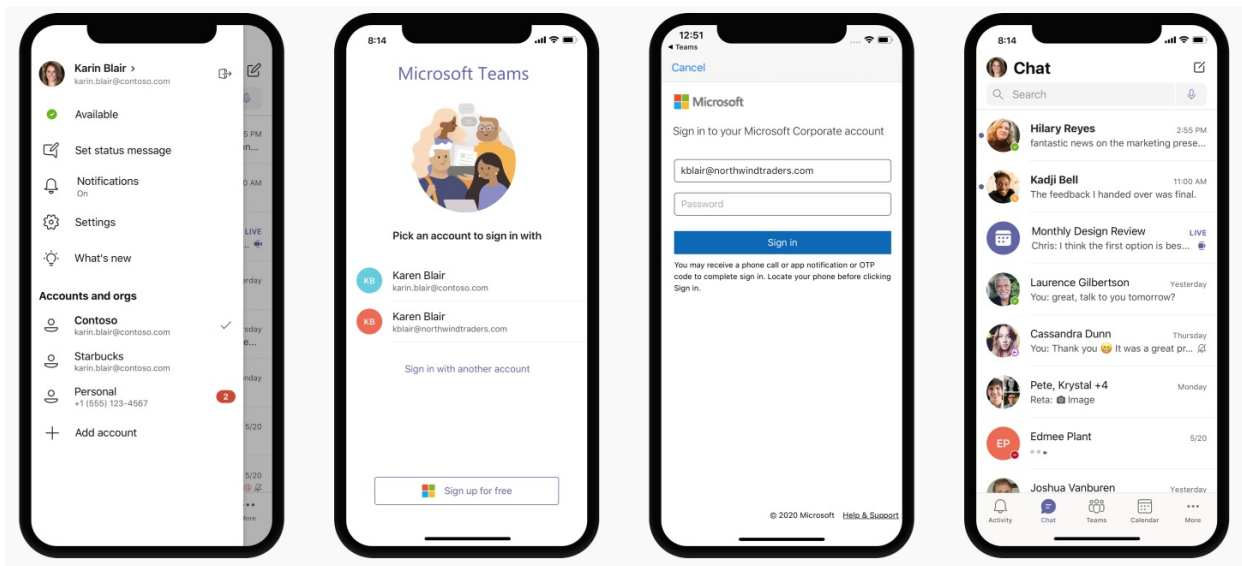

NOTE

For users to experience the sign on experience as described in this section, their devices must be running Teams for iOS version 2.0.13 (build 2020061704) or later, or Teams for Android version 1416/1.0.0.2020061702 or later.

Using Teams with multiple accounts

Teams for iOS and Android supports the use of multiple work or school and multiple personal accounts side by side. Teams desktop applications will support one work/school and one personal account side by side in December 2020, with support for multiple work/school accounts coming at a later date.

The following images show how users can add multiple accounts in Teams mobile applications.

Restrict sign in to Teams

Organization may want to restrict how corporate-approved apps are used on managed devices, for example to restrict students' or employees' ability to access data from other organizations or use corporate-approved apps for personal scenarios. These restrictions can be enforced by setting Devices Policies that Teams applications recognize.

How to restrict sign in on mobile devices

Teams for iOS and Android offers IT administrators the ability to push account configurations to Microsoft 365 accounts. This capability works with any Mobile Device Management (MDM) provider that uses the [Managed App Configuration](#) channel for iOS or the [Android Enterprise](#) channel for Android.

For users enrolled in Microsoft Intune, you can deploy the account configuration settings using Intune in the Azure portal.

Once account setup configuration has been configured in the MDM provider, and after the user enrolls their device, on the sign-in page, Teams for iOS and Android will only show the allowed account(s) on the Teams sign-in page. The user can tap on any of the allowed accounts on this page to sign in.

Set the following configuration parameters in the Azure Intune portal for managed devices.

PLATFORM	KEY	VALUE
iOS	IntuneMAMAllowedAccountsOnly	Enabled: The only account allowed is the managed user account defined by the IntuneMAMUPN key. Disabled (or any value that is not a case insensitive match to Enabled): Any account is allowed.
iOS	IntuneMAMUPN	UPN of the account allowed to sign in to Teams. For Intune enrolled devices, the {{userprincipalname}} token may be used to represent the enrolled user account.

PLATFORM	KEY	VALUE
Android	com.microsoft.intune.mam.Allowe dAccountUPNs	Only account(s) allowed are the managed user account(s) defined by this key. One or more semi-colons;- delimited UPNs. For Intune enrolled devices, the {{userprincipalname}} token may be used to represent the enrolled user account.

Once the account setup configuration has been set, Teams will restrict the ability to sign in, so that only allowed accounts on enrolled devices will be granted access.

To create an app configuration policy for managed iOS/iPadOS devices, see [Add app configuration policies for managed iOS/iPadOS devices](#).

To create an app configuration policy for managed Android devices, see [Add app configuration policies for managed Android devices](#).

How to restrict sign in on desktop devices

Teams apps on Windows and macOS are gaining support for device policies that restrict sign in to your organization. The policies can be set via usual Device Management solutions such as MDM (Mobile Device Management) or GPO (Group Policy Object).

When this policy is configured on a device, users can only sign in with accounts homed in an Azure AD tenant that is included in the "Tenant Allow List" defined in the policy. The policy applies to all sign-ins, including first and additional accounts. If your organization spans multiple Azure AD tenants, you can include multiple Tenant IDs in the Allow List. Links to add another account may continue to be visible in the Teams app, but they won't be operable.

NOTE

1. The policy only restricts sign-ins. It does not restrict the ability for users to be invited as a guest in other Azure AD tenants, or switch to those other tenants (where users have been invited as a guest).
2. The policy requires Teams for Windows version 1.3.00.30866 or higher, and Teams for macOS version 1.3.00.30882 (released mid-November 2020).

Policies for Windows Administrative Template files (ADMX/ADML) are available from the [Download center](#) (the policy setting descriptive name in the administrative template file is "Restrict sign in to Teams to accounts in specific tenants"). Additionally, you can manually set keys in Windows Registry:

- Value Name: RestrictTeamsSignInToAccountsFromTenantList
- Value Type: String
- Value Data: Tenant ID, or comma-separated list of Tenant IDs
- Path: use one of the following

Computer\HKEY_CURRENT_USER\SOFTWARE\Policies\Microsoft\Cloud\Office\16.0\Teams

Computer\HKEY_CURRENT_USER\SOFTWARE\Policies\Microsoft\Office\16.0\Teams

Computer\HKEY_CURRENT_USER\SOFTWARE\Microsoft\Office\16.0\Teams

Example: SOFTWARE\Policies\Microsoft\Office\16.0\Teams\RestrictTeamsSignInToAccountsFromTenantList = Tenant ID or SOFTWARE\Policies\Microsoft\Office\16.0\Teams\RestrictTeamsSignInToAccountsFromTenantList = Tenant ID 1,Tenant ID 2,Tenant ID 3

Policies for macOS For macOS managed devices, use .plist to deploy sign-in restrictions. The configuration profile is a .plist file that consists of entries identified by a key (which denotes the name of the preference), followed by a value, which depends on the nature of the preference. Values can either be simple (such as a numerical value) or complex, such as a nested list of preferences.

- Domain: com.microsoft.teams
- Key: RestrictTeamsSignInToAccountsFromTenantList
- Data Type: String
- Comments: Enter comma separate list of Azure AD tenant ID(s)

Global sign in

The Teams Android app now supports Global sign-in, to provide a hassle free sign-in experience for Frontline Workers. Employees can pick a device from the shared device pool and do a single sign in to "make it theirs" for the duration of their shift. At the end of their shift, they should be able to perform sign out to globally sign out on the device. See [Sign out of Teams](#) to learn more. This will remove all of their personal and company information from the device so they can return the device to the device pool. To get this capability, the device must be in shared mode. To learn how to set up a shared device, see [How to use a shared device mode in Android](#).

The sign-in experience looks similar to our standard Teams sign-in experience.

URLs and IP address ranges

Teams requires connectivity to the Internet. To understand endpoints that should be reachable for customers using Teams in Office 365 plans, Government, and other clouds, read [Office 365 URLs and IP address ranges](#).

[Teams Troubleshooting](#)

Sign out of Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

We recommend for users to remain signed in to the Microsoft Teams app to continue receiving chats, incoming calls, and other activities. We understand that, at times, users might want to sign out of the Teams application for several reasons:

- Because they're done using Teams for the day
- They want to use a different account
- Because they're on a device that they share with another person

For these reason and others, Teams allows you to sign out of the app and end your session.

Account sharing between apps

Modern operating systems allow sharing of accounts between different apps on a device. This single sign-on (SSO) design allows users to use multiple apps on their device without requiring them to sign in to every single app. Teams doesn't control this behavior, but it does take advantage of the convenience this design provides for the end-user experience.

SSO has an important impact on sign out. When users sign out of Teams, the data associated with their account is removed from the Teams app, but other apps on the device could continue to have access to their account. It also means that users might not be prompted to reenter their credentials if they choose to sign back in to Teams with the same account.

Sign out of Teams on desktop

To sign out of the Teams desktop client or from the browser, select your profile picture at the top of the app, and then select **Sign out**.

For the desktop app, you can also right-click the app icon in the taskbar, and then select **Sign out**.

If you have multiple accounts added, you'll need to sign out of each individual account. Once you've signed out of the accounts in Teams, you might need to enter your credentials again on the next launch of the app to access your account.

Sign out of Teams on mobile devices

On mobile, you can sign out of Teams by going to the menu, selecting the **More** menu, and then selecting **Sign out**. Once signed out, you'll need to reenter their credentials the next time you launch the app.

Global sign-in and sign-out for Frontline workers

The Teams Android app now supports Global sign-in and sign-out, to provide a hassle free sign-in and sign-out experience for Frontline Workers. Employees can pick a device from the shared device pool and do a single sign-in to "make it theirs" for the duration of their shift. At the end of their shift, they should be able to perform sign out to globally sign out on the device. This will remove all of their personal and company information from the device so they can return the device to the device pool. To get this capability, the device must be in shared mode. To learn how to set up a shared device, see [How to use a shared device mode in Android](#).

Manual Cleanup

While rare, it's possible that Teams might not be able to clean up after itself fully on sign-out. Based on user reports, the common causes include files being locked by a service running on the system but there could be other reasons dependent on an individual's device configurations or policies and user permissions applied to the device.

One common manifestation of this problem is that Teams will try to automatically select an existing account to sign the user in. In situations like this, the user might want to manually clean up Teams' local cache. Learn more at [Sign in or remove an account from Teams](#).

AppLocker application control policies in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article explains how to enable the Teams desktop client app with AppLocker application control policies. Use of AppLocker is designed to restrict program and script execution by non-administrative users. For more information and guidance on AppLocker, see [What is AppLocker?](#).

The process for enabling Teams with AppLocker requires the creation of AppLocker-based allow listing policies. Policies are created with Group Policy management software and/or the use of Windows PowerShell cmdlets for AppLocker (see the [AppLocker technical reference](#) for more information). The AppLocker policy is saved in XML format and can be edited with any text or XML editor.

Teams allow list with AppLocker

AppLocker rules are organized into collections of rules. AppLocker rules apply to the targeted app, and they are the components that make up the AppLocker policy.

To allow Teams, we recommend that you use the [publisher condition rules](#) since all Teams app files are digitally signed.

We don't recommend the use of path rules because the Teams installation directory is user-writable. We also don't recommend the use of hash rules because the rules would have to be updated each time the Teams client app is updated.

Since Teams desktop executable files are digitally signed, the publisher condition identifies an app file based on its digital signature and embedded version attributes. The digital signature contains information about the company that created the app file (the publisher). The version information, which is obtained from the binary resource, includes the name of the product that the file is part of and the version number of the application file.

Example of publisher condition rules

For the Teams client app (all files, all versions) add the following to the Executable Rules & DLL Rules:

```
Publisher: O=MICROSOFT CORPORATION, L=REDMOND, S=WASHINGTON, C=US
Product name: MICROSOFT TEAMS
Product name: MICROSOFT TEAMS UPDATE
```

Block access to SharePoint for specific users

12/7/2021 • 2 minutes to read • [Edit Online](#)

Applying any Conditional Access (CA) policy on SharePoint in Microsoft 365 is also applied to Teams. However, some organizations want to block access to SharePoint files (upload, download, view, edit, create) yet allow their employees to use Teams desktop, mobile, and web clients on unmanaged devices. Under the CA policy rules, blocking SharePoint would lead to blocking Teams as well. This article explains how you can work around this limitation and allow your employees to continue using Teams while completely blocking access to files stored in SharePoint.

NOTE

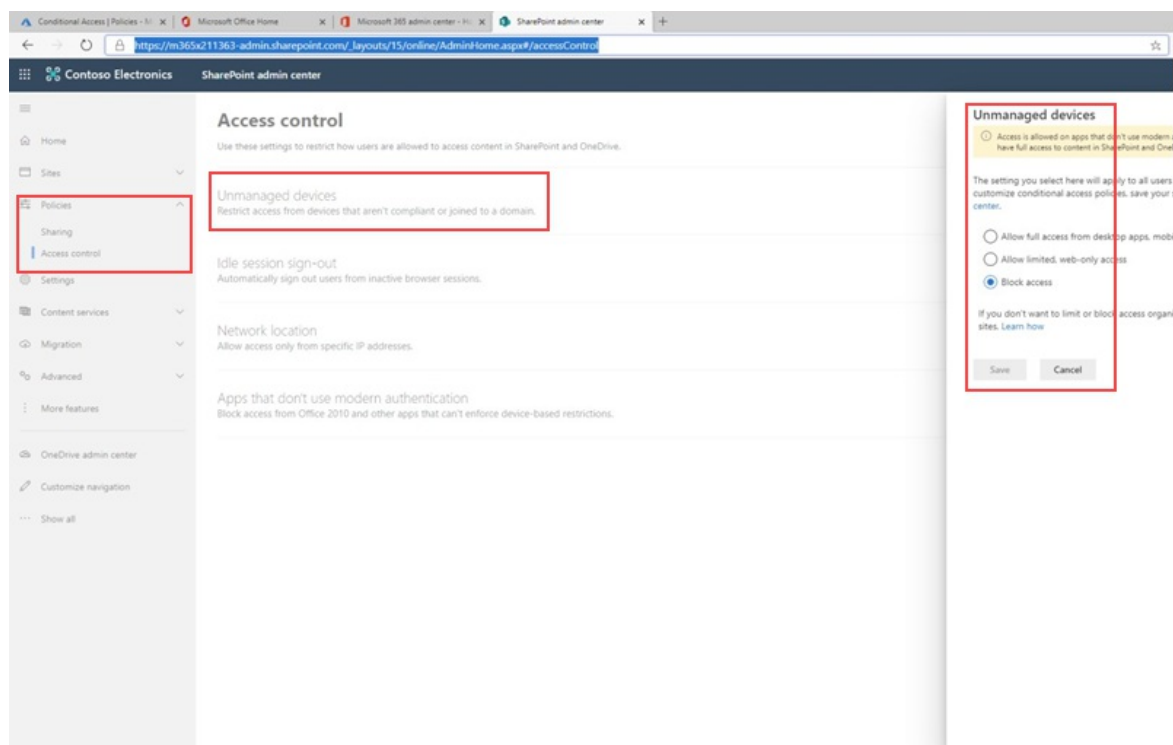

Blocking or limiting access on unmanaged devices relies on Azure AD conditional access policies. Learn about [Azure AD licensing](#). For an overview of conditional access in Azure AD, see [Conditional access in Azure Active Directory](#). For info about recommended SharePoint Online access policies, see [Policy recommendations for securing SharePoint sites and files](#). If you limit access on unmanaged devices, users on managed devices must use one of the [supported OS and browser combinations](#), or they will also have limited access.

You can block or limit access for:

- Users in the organization or only some users or security groups.
- All sites in the organization or only some sites.

When access is blocked, users will see an error message. Blocking access helps provide security and protects secure data. When access is blocked, users will see an error message.

1. Open the SharePoint Admin Center.
2. Expand **Policies** > **Access Policies**.
3. In the **Unmanaged Devices** section, select **Block Access** and select **Save**.

4. Open the [Azure Active Directory](#) portal and navigate to **Conditional Access Policies**.

You'll see a new policy has been created by SharePoint that's similar to this example:

Information barriers in Microsoft Teams

12/7/2021 • 11 minutes to read • [Edit Online](#)

Information barriers (IBs) are policies that an admin can configure to prevent individuals or groups from communicating with each other. IBs are useful if, for example, one department is handling information that shouldn't be shared with other departments. IBs are also useful when a group needs to be isolated or prevented from communicating with anyone outside of that group.

For Microsoft Teams, information barriers can determine and prevent the following kinds of unauthorized collaborations:

- Adding a user to a team or channel
- User access to team or channel content
- User access to 1:1 and group chats
- User access to meetings
- Prevents lookups and discovery, users will not be visible in the people picker.

NOTE

- Information barrier groups cannot be created across tenants.
- Using bots, Azure Active Directory (Azure AD) apps, APIs to send activity feed notifications, and some APIs to add users is not supported in version 1.
- Private channels are compliant to information barriers policies that you configure.
- For information about support for barriers for SharePoint sites that are connected to Teams, see [Segments associated with Microsoft Teams sites](#).

Background

The primary driver for IBs comes from the financial services industry. The Financial Industry Regulatory Authority ([FINRA](#)) reviews IBs and conflicts of interest within member firms and provides guidance about managing such conflicts (FINRA 2241, [Debt Research Regulatory Notice 15-31](#)).

However, since introducing IBs, many other areas have found them to be useful. Other common scenarios include:

- **Education:** Students in one school aren't able to look up contact details for students of other schools.
- **Legal:** Maintaining the confidentiality of data that is obtained by the lawyer of one client and preventing it from being accessed by a lawyer for the same firm who represents a different client.
- **Government:** Information access and control are limited across departments and groups.
- **Professional services:** A group of people in a company is only able to chat with a client or a specific customer via guest access during a customer engagement.

For example, Enrico belongs to the Banking segment and Pradeep belongs to the Financial advisor segment. Enrico and Pradeep can't communicate with each other because the organization's IB policy blocks communication and collaboration between these two segments. However, Enrico and Pradeep can communicate with Lee in HR.

When to use information barriers

You might want to use IBs in situations like these:

- A team must be prevented from communicating or sharing data with a specific other team.
- A team must not communicate or share data with anyone outside of the team.

The Information Barrier Policy Evaluation Service determines whether a communication complies with IB policies.

Managing information barrier policies

IB policies are managed in the Microsoft 365 Compliance Center (SCC) using PowerShell cmdlets. For more information, see [Define policies for information barriers](#).

IMPORTANT

Before you set up or define policies, you must enable scoped directory search in Microsoft Teams. Wait at least a few hours after enabling scoped directory search before you set up or define policies for information barriers. For more information, see [Define information barrier policies](#).

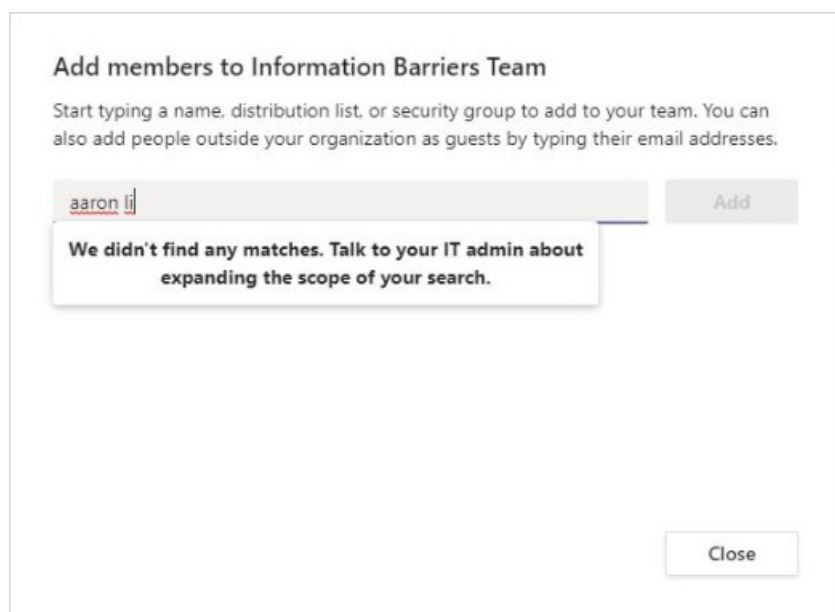

Information barriers administrator role

The IB Compliance Management role is responsible for managing IB policies. For more information about this role, see [Permissions in the Microsoft 365 Compliance Center](#).

Information barrier triggers

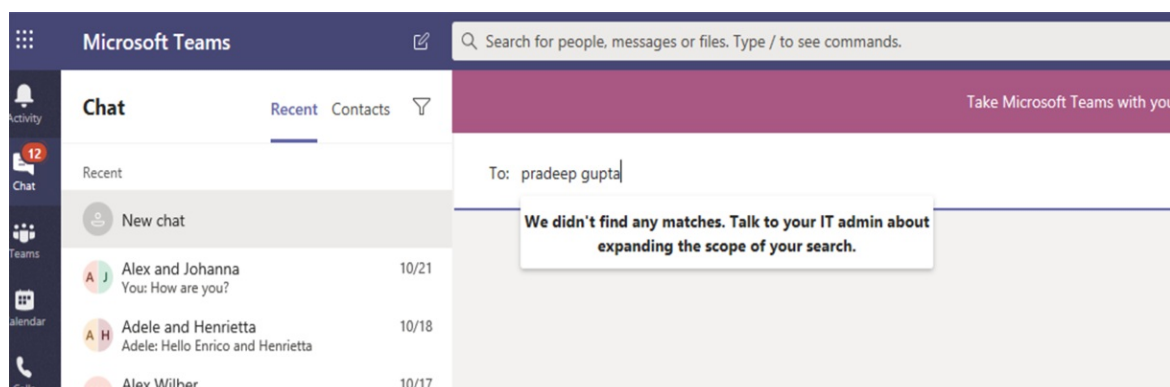

IB policies are activated when the following Teams events take place:

- **Members are added to a team:** Whenever you add a user to a team, the user's policy must be evaluated against the IB policies of other team members. After the user is successfully added, the user can perform all functions in the team without further checks. If the user's policy blocks them from being added to the team, the user won't show up in search.

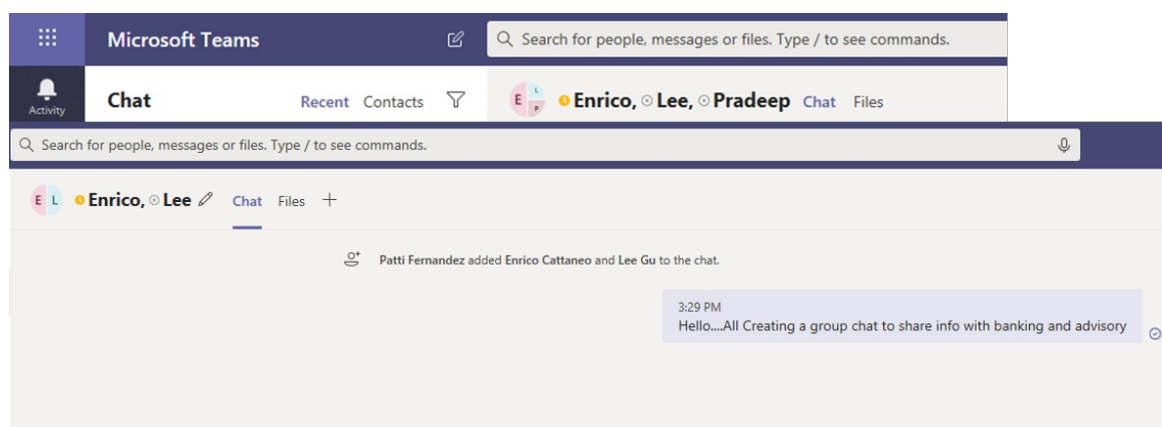

- **A new chat is requested:** Each time that a user requests a new chat with one or more other users, the chat is evaluated to make sure that it isn't violating any IB policies. If the conversation violates an IB policy, then the conversation isn't started.

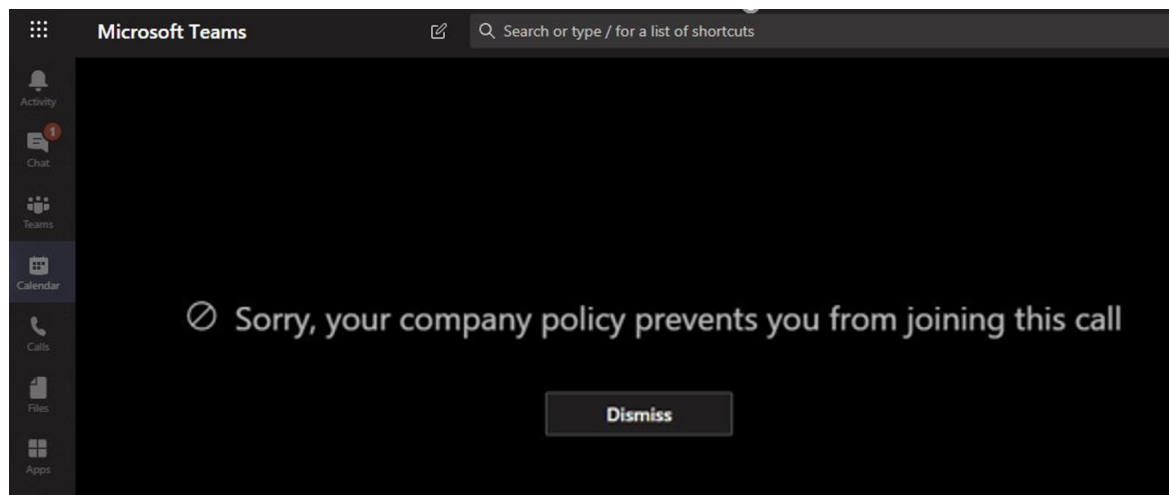

Here's an example of a 1:1 chat.

Here's an example of a group chat.

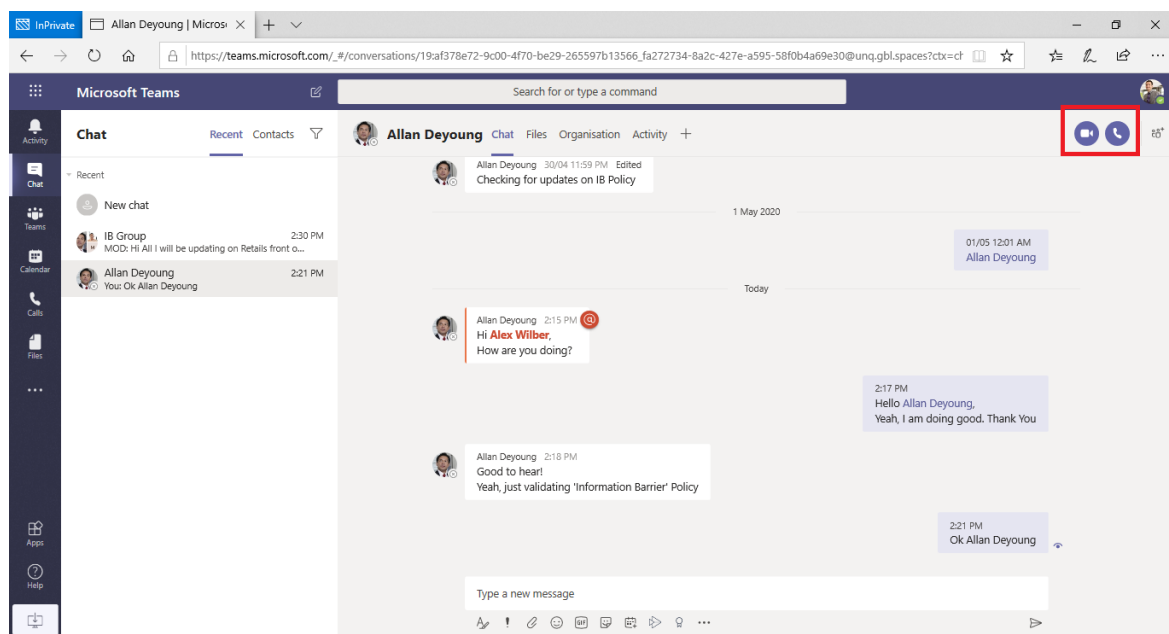

- **A user is invited to join a meeting:** When a user is invited to join a meeting, the IB policy that applies to the user is evaluated against the IB policies that apply to the other team members. If there's a violation, the user won't be allowed to join the meeting.

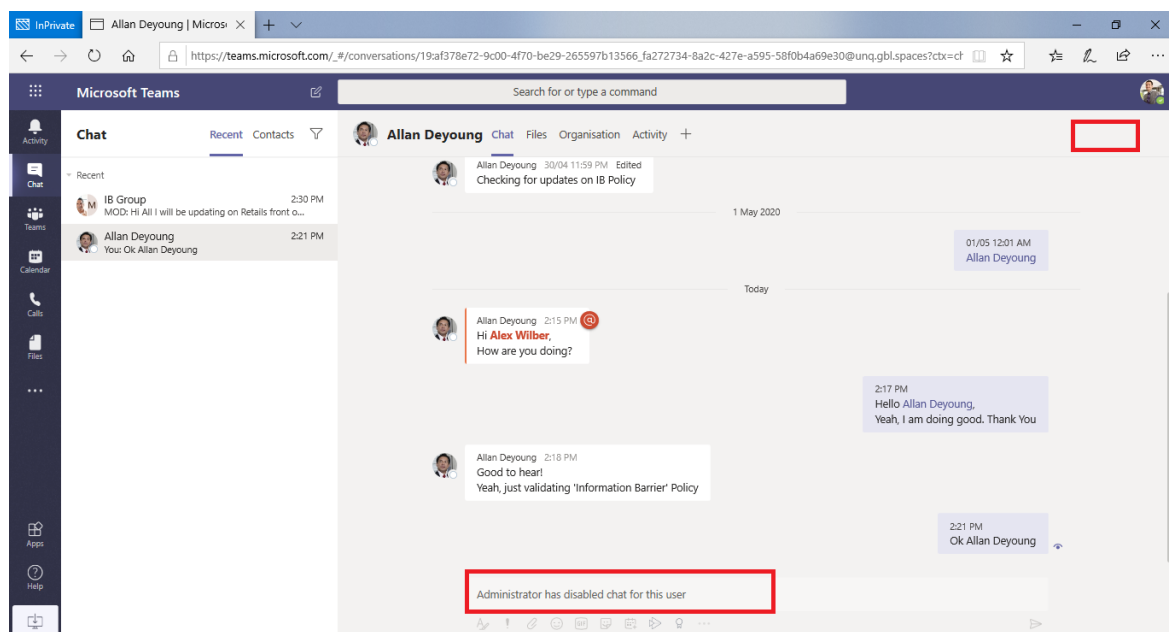

- **A screen is shared between two or more users:** When a user shares a screen with other users, the sharing must be evaluated to make sure that it doesn't violate the IB policies of other users. If an IB policy is violated, the screen share won't be allowed.

Here's an example of screen share before the policy is applied.

Here's an example of screen share after the policy is applied. The screen share and call icons aren't visible.

- **A user places a phone call in Teams:** Whenever a user initiates a voice call (via VOIP) to another user or group of users, the call is evaluated to make sure that it doesn't violate the IB policies of other team members. If there's any violation, the voice call is blocked.
- **Guests in Teams:** IB policies apply to guests in Teams, too. If guests need to be discoverable in your organization's global address list, see [Manage guest access in Microsoft 365 Groups](#). Once guests are discoverable, you can [define IB policies](#).

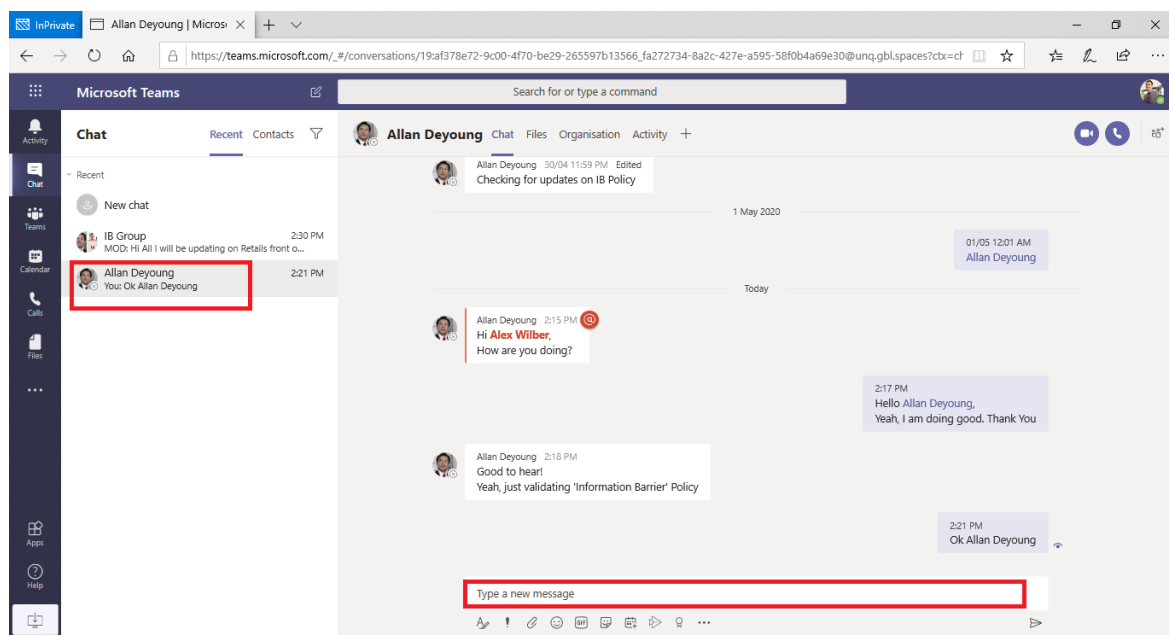

How policy changes impact existing chats

When the IB policy administrator makes changes to a policy, or when a policy change is activated because of a change to a user's profile (such as for a job change), the Information Barrier Policy Evaluation Service automatically searches the members to ensure that their membership in the team doesn't violate any policies.

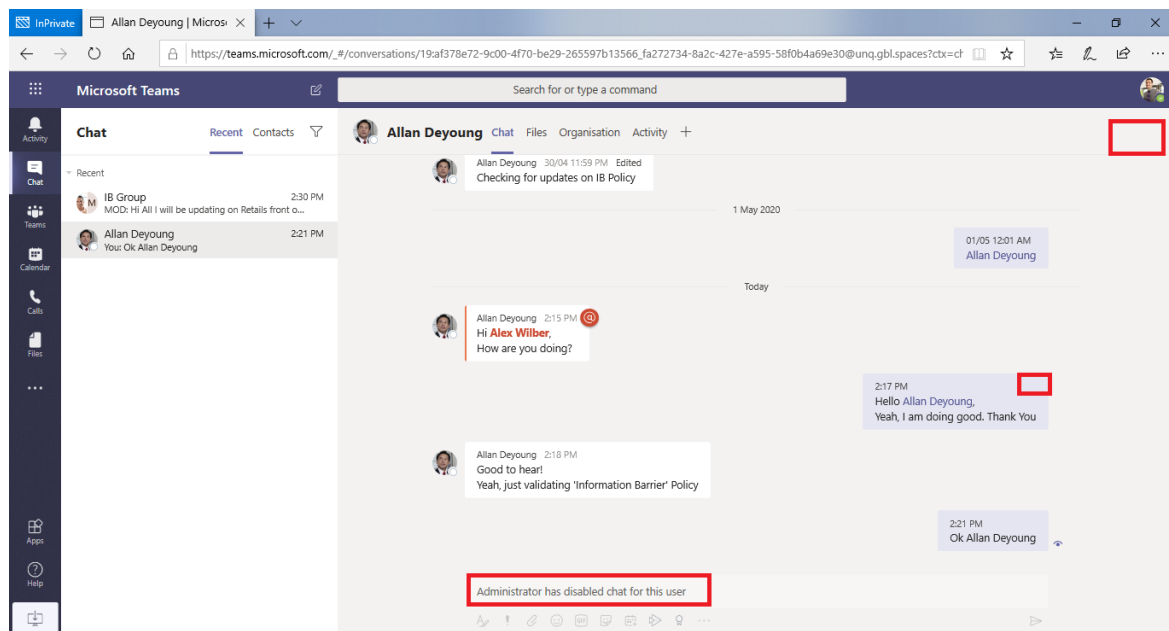

If there's an existing chat or other communication between users, and a new policy is set or an existing policy is changed, the service evaluates existing communications to make sure that the communications are still allowed to occur.

- **1:1 chat:** If communication between two users is no longer allowed (because of application to one or both users of a policy that blocks communication), further communication is blocked. Their existing chat conversations become read-only.

Here's an example that shows the chat is visible.

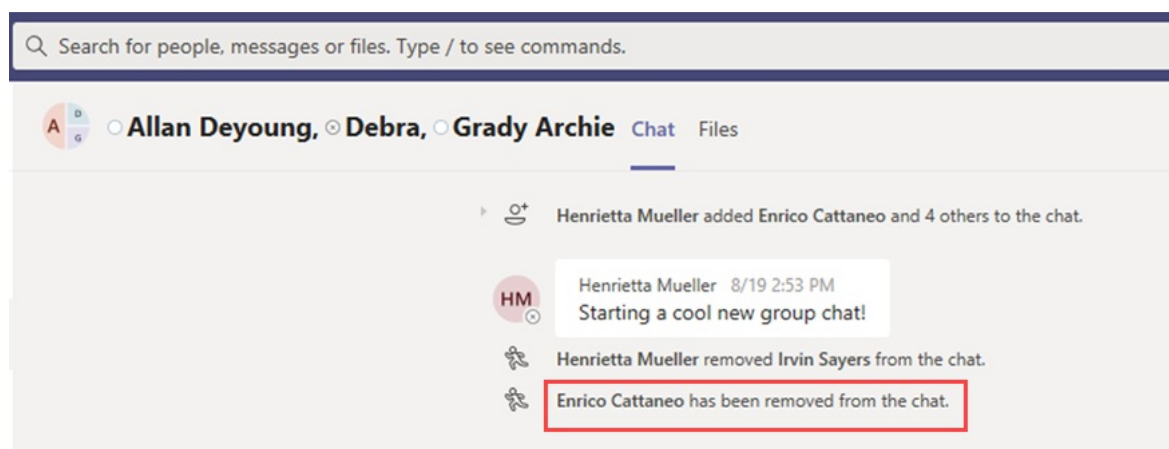

Here's an example that shows the chat is disabled.

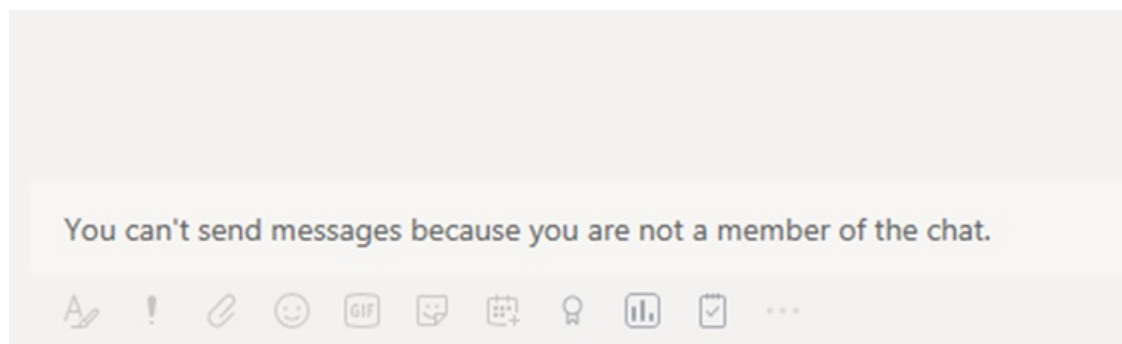

- **Group chat:** If communication from one user to a group is no longer allowed (for example, because a user changed jobs), the user—along with the other users whose participation violates the policy—may be removed from group chat, and further communication with the group won't be allowed. The user can still see old conversations, but won't be able to see or participate in any new conversations with the group. If the new or changed policy that prevents communication is applied to more than one user, the users who are affected by the policy may be removed from group chat. They can still see old conversations.

In this example, Enrico moved to a different department within the organization and is removed from the group chat.

Enrico can no longer send messages to the group chat.

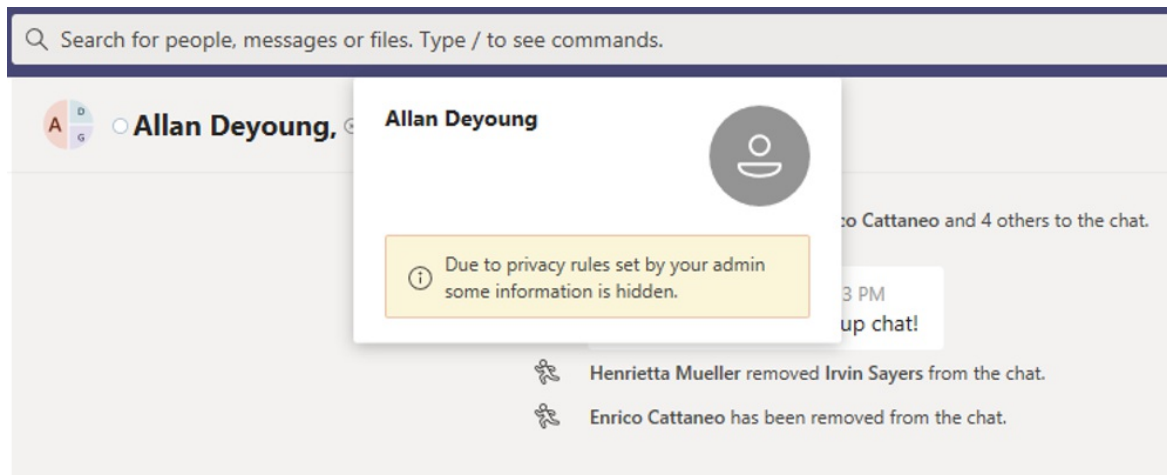

- **Team:** Any users who have been removed from the group are removed from the team and won't be able to see or participate in existing or new conversations.

Scenario: A user in an existing chat becomes blocked

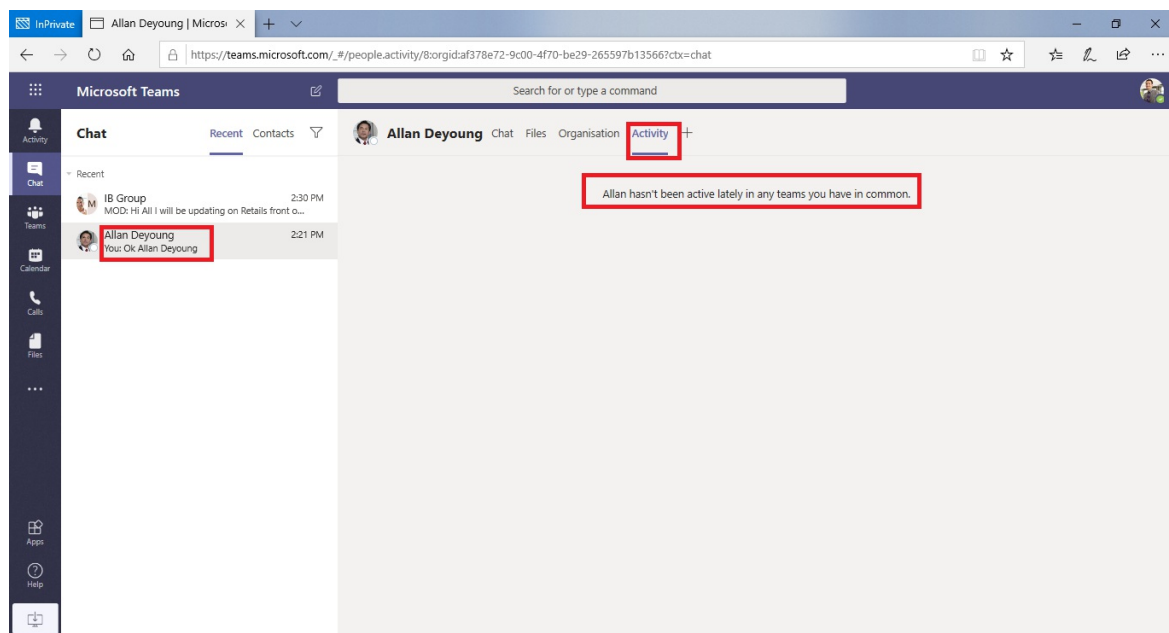

Currently, users experience the following scenarios if an IB policy blocks another user:

- **People tab:** A user can't see blocked users on the **People** tab.
- **People Picker:** Blocked users won't be visible in the people picker.

- **Activity tab:** If a user visits the **Activity** tab of a blocked user, no posts will appear. (The **Activity** tab displays channel posts only, and there would be no common channels between the two users.)

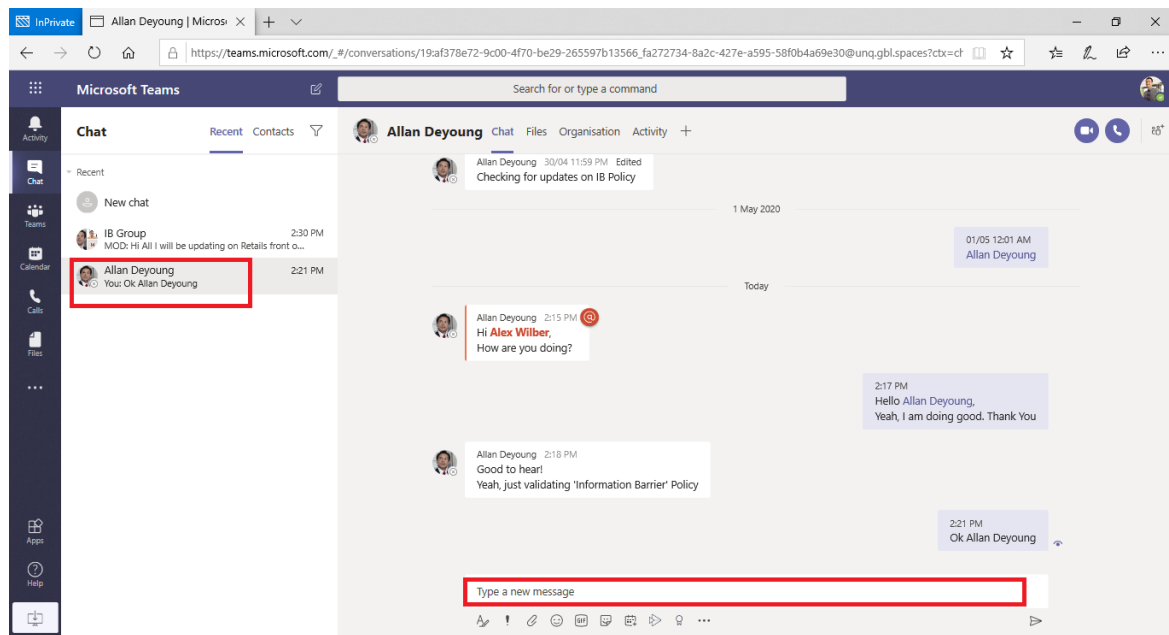

Here's an example of the activity tab view that is blocked.

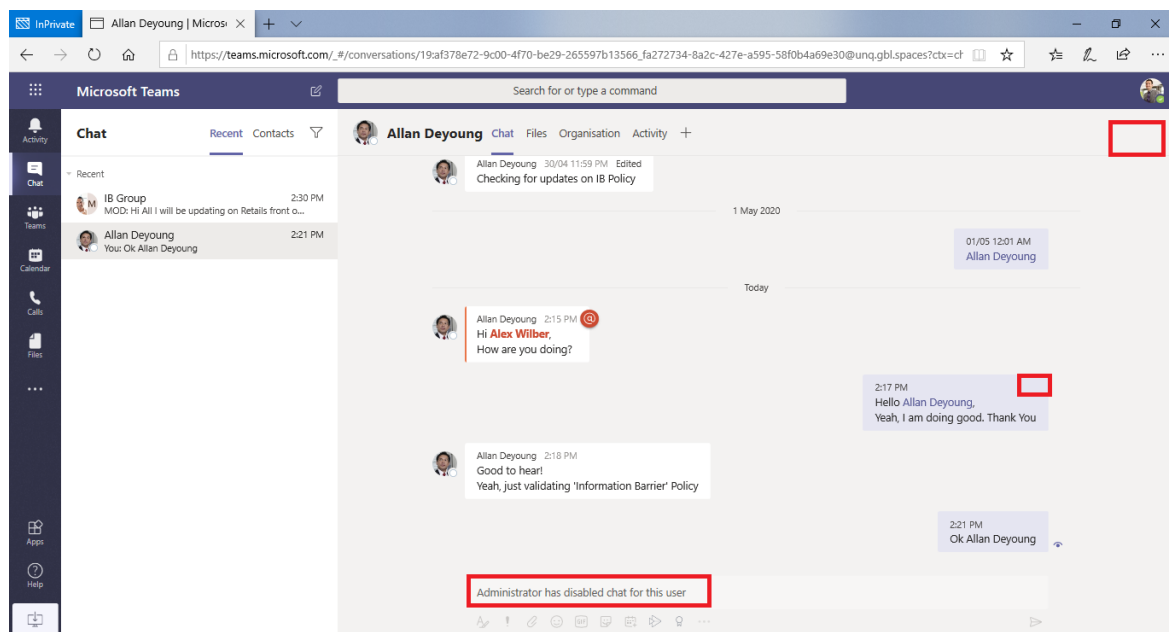

- **Org charts:** If a user accesses an org chart on which a blocked user appears, the blocked user won't appear on the org chart. Instead, an error message will appear.
- **People card:** If a user participates in a conversation and the user is later blocked, other users will see an error message instead of the people card when they hover over the blocked user's name. Actions listed on the card (such as calling and chat) will be unavailable.
- **Suggested contacts:** Blocked users don't appear on the suggested contacts list (the initial contact list that appears for new users).
- **Chat contacts:** A user can see blocked users on the chats contact list, but the blocked users will be identified. The only action that the user can perform on the blocked users is to delete them. The user can also select them to view their past conversation.

- **Calls contacts:** A user can see blocked users on the calls contact list, but the blocked users will be identified. The only action that the user can perform on the block users is to delete them.

Here's an example of a blocked user in the calls contact list.

Here's an example of the chat being disabled for a user on the calls content list.

- **Skype to Teams migration:** During a migration from Skype for Business to Teams, all users—even those users who are blocked by IB policies—will be migrated to Teams. Those users are then handled as described above.

Teams policies and SharePoint sites

When a team is created, a SharePoint site is provisioned and associated with Microsoft Teams for the files experience. Information barrier policies aren't honored on this SharePoint site and files by default. To enable information barriers in SharePoint and OneDrive, follow the guidance and steps in the [Use information barriers with SharePoint](#) article.

Information barrier modes and Teams

Information barriers mode help strengthen who can be added to or removed from a Team. When using

information barriers with Teams, the following IB modes are supported:

- **Open:** This configuration is the default IB mode for all existing groups that were provisioned before information barriers were enabled. In this mode, there are no IB policies applicable.
- **Implicit:** This configuration is the default IB mode when a Team is provisioned after enabling Information barriers. Implicit mode allows you to add all compatible users in the group.

Microsoft 365 Groups created before activating an information barrier policy are automatically set to *Open* mode by default. Once you activate IB policies on your tenant, you would be required to update mode that will reevaluate groups and sites and result in non-compliant users being automatically removed from these groups and sites. If you need to change the *Open* mode configuration on existing Teams-connected groups to meet compliance requirements for your organization, you'll need to [update the IB modes](#) for SharePoint sites connected to the Teams team.

Use the [Set-UnifiedGroup](#) cmdlet with the *InformationBarrierMode* parameter that corresponds to the mode you want to use for your segments. Allowed list of values for the *InformationBarrierMode* parameter are *Open* and *Implicit*.

For example, to configure the *Implicit* mode for a Microsoft 365 Group, you'll use the following PowerShell command:

```
Set-UnifiedGroup -InformationBarrierMode Implicit
```

For more information about how users may be automatically removed from groups, see the [Information barriers compliance assistant \(preview\)](#) article.

Required licenses and permissions

For more information on licenses and permissions, plans, and pricing, see [Microsoft 365 licensing guidance for security & compliance](#).

Known Issues

- **Users can't join ad-hoc meetings:** If IB policies are enabled, users aren't allowed to join meetings if the size of the meeting roster is greater than the [meeting attendance limits](#). The root cause is that IB checks rely on whether users can be added to a meeting chat roster, and only when they can be added to the roster are they allowed to join the meeting. A user joining a meeting once adds that user to the roster; hence for recurring meetings, the roster can fill up fast. Once the chat roster reaches the [meeting attendance limits](#), additional users cannot be added to the meeting. If IB is enabled for the organization and the chat roster is full for a meeting, new users (those users who aren't already on the roster) aren't allowed to join the meeting. But if IB isn't enabled for the organization and the meeting chat roster is full, new users (those users who aren't already on the roster) are allowed to join the meeting, though they won't see the chat option in the meeting. A short-term solution is to remove inactive members from the meeting chat roster to make space for new users. We will, however, be increasing the size of meeting chat rosters at a later date.
- **Users can't join channel meetings:** If IB policies are enabled, users aren't allowed to join channel meetings if they're not a member of the team. The root cause is that IB checks rely on whether users can be added to a meeting chat roster, and only when they can be added to the roster are they allowed to join the meeting. The chat thread in a channel meeting is available to Team/Channel members only, and non-members can't see or access the chat thread. If IB is enabled for the organization and a non-team member attempts to join a channel meeting, that user isn't allowed to join the meeting. However, if IB is *not* enabled for the organization and a non-team member attempts to join a channel meeting, the user is allowed to join the meeting—but they won't see the chat option in the meeting.
- **Maximum number of segments allowed in an organization:** Each organization can set up to 100

segments when configuring IB policies. There is no limit on the number of policies that can be configured.

- **IB policies don't work for federated users:** If you allow federation with external organizations, the users of those organizations won't be restricted by IB policies. If users of your organization join a chat or meeting organized by external federated users, then IB policies also won't restrict communication between users of your organization.

More information

- To learn more about IBs, see [Information barriers](#).
- To set up IB policies, see [Get started with information barriers](#).
- To edit or remove IB policies, see [Manage information barrier policies](#).

Availability

- The feature is available in our public cloud; in January 2021, we rolled out information barriers in the GCC cloud.
- The feature is not yet available in the GCC - High and DOD clouds.

Manage retention policies for Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

NOTE

If you are seeing a message in Teams that your chats or messages have been deleted by a retention policy, see [Teams messages about retention policies](#).

The information on this page is for IT administrators who manage these retention policies.

Retention policies and retention labels from Microsoft 365 help you to more effectively manage the information in your organization. You can configure retention settings to keep data that's needed to comply with your organization's internal policies, industry regulations, or legal requirements. You can also configure retention settings to delete data that's considered a liability, that you're no longer required to keep, or that has no legal or business value.

Teams supports retention policies for chat and channel messages so that as an admin, you can decide proactively whether to retain this data, delete it, or retain it for a specific period of time and then delete it. The start of the retention period for these actions is always based on when a message is created. You can apply a Teams retention policy to your entire organization or to specific users and teams. Retention labels aren't supported for Teams.

To learn more about retention solutions in Microsoft 365, see [Learn about retention policies and retention labels](#).

Users who are subject to a retention policy for Teams must have an appropriate license, such as Office 365 E3 or Office 365 A3. For other licensing options for these retention policies, see the [Information Governance](#) section from [Microsoft 365 licensing guidance for security & compliance](#). To learn more about licensing for Teams, see [Microsoft Teams service description](#).

How Teams retention policies support retain and delete actions

If you configure a Teams retention policy to retain chats or channel messages, users can still edit and delete their messages in their Teams app. Although users no longer see their pre-edited or deleted messages in Teams, data from these messages is stored in a secured location that's designed for eDiscovery searches by compliance administrators. Permanent deletion of this data doesn't happen before the end of the configured retention period, or if another retention policy is configured to retain this data, or it is subject to an [eDiscovery hold](#).

When a retention policy is configured to delete chats and channel messages, these messages become eligible for automatic deletion. If the messages are still displayed in the Teams app, they will disappear from there and [users are informed that a retention policy has deleted these messages](#). If the messages were previously subject to a retain action and have been edited or deleted by users, these messages will now be deleted from the secured location and no longer returned in eDiscovery searches.

For detailed information about how these policies work depending on your policy configuration and user actions, and what message data is included and excluded for Teams retention policies, see [Learn about retention for Microsoft Teams](#). That page also explains why you might sometimes experience delays when retention policies delete messages. For example, messages can be visible to users in the Teams app up to 7 days after the expiration period you've configured in the retention policy.

If you set up multiple Teams retention policies with different retention settings, the principles of retention resolve any conflicts. For example:

- If there is a conflict between retaining or deleting the same content, the content is always retained in the secured location so that it remains searchable with eDiscovery for compliance administrators.

This principle also applies to messages that are under eDiscovery holds for legal or investigative reasons.

- If there is a conflict in how long to retain the same content, it is retained in the secured location for the longest retention period.

These two principles of retention address most conflicts that might arise when you have multiple retention policies for Teams, but for more information, see [The principles of retention, or what takes precedence?](#)

When to use retention policies for Teams

In many cases, organizations consider private chat data as more of a liability than channel messages, which are typically more project-related conversations.

You can very efficiently configure a single retention policy for all Teams messages. Or, for more fine-grained control, you can:

- Have separate retention policies for private chats (1:1 or 1:many chats), messages from standard channels, or messages from private channels.
- Apply the policies only to specific users or teams in your organization. For Teams chats and private channels, you can select which users the policy applies to. For Teams channel messages, you can select which teams the policy applies to.

For example, for standard channel messages: Create a retention policy for specific teams in your organization and configure that policy with a delete action after 1 year. Then create another retention policy for standard channel messages for all other teams and configure that policy with a delete action after 3 years.

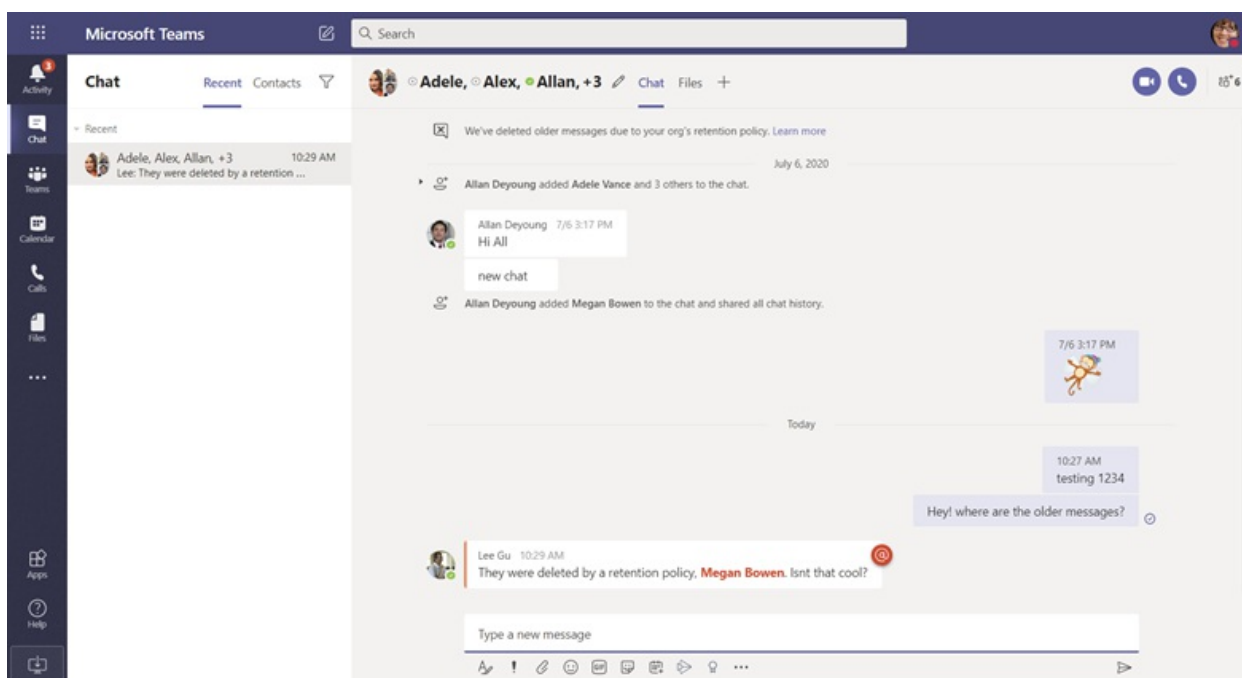

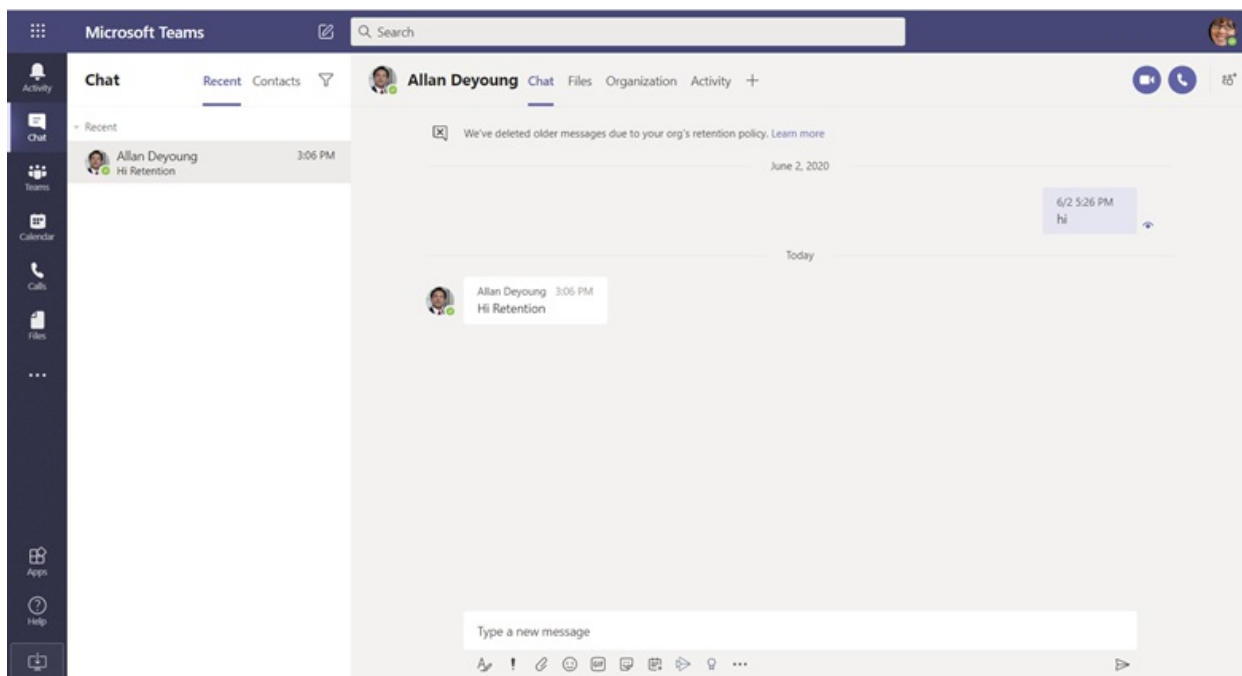

Create and manage retention policies for Teams

To create or edit a retention policy for Teams messages, use the instructions from [Retention policy for Teams locations](#).

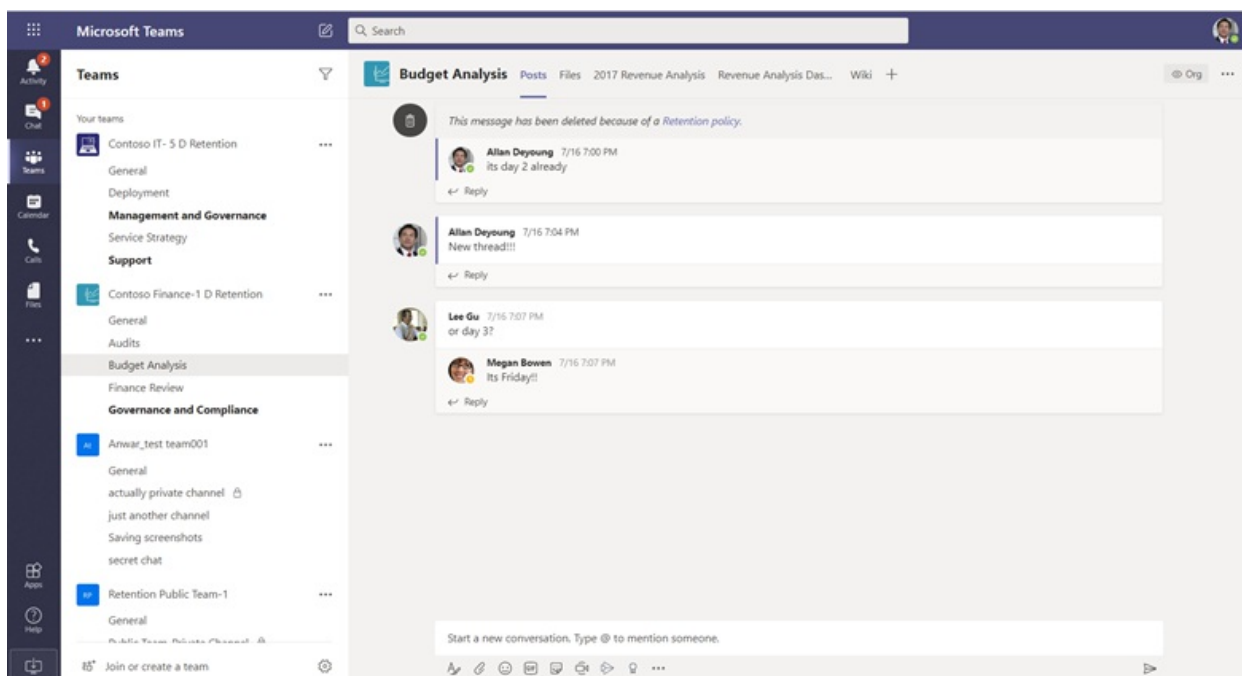

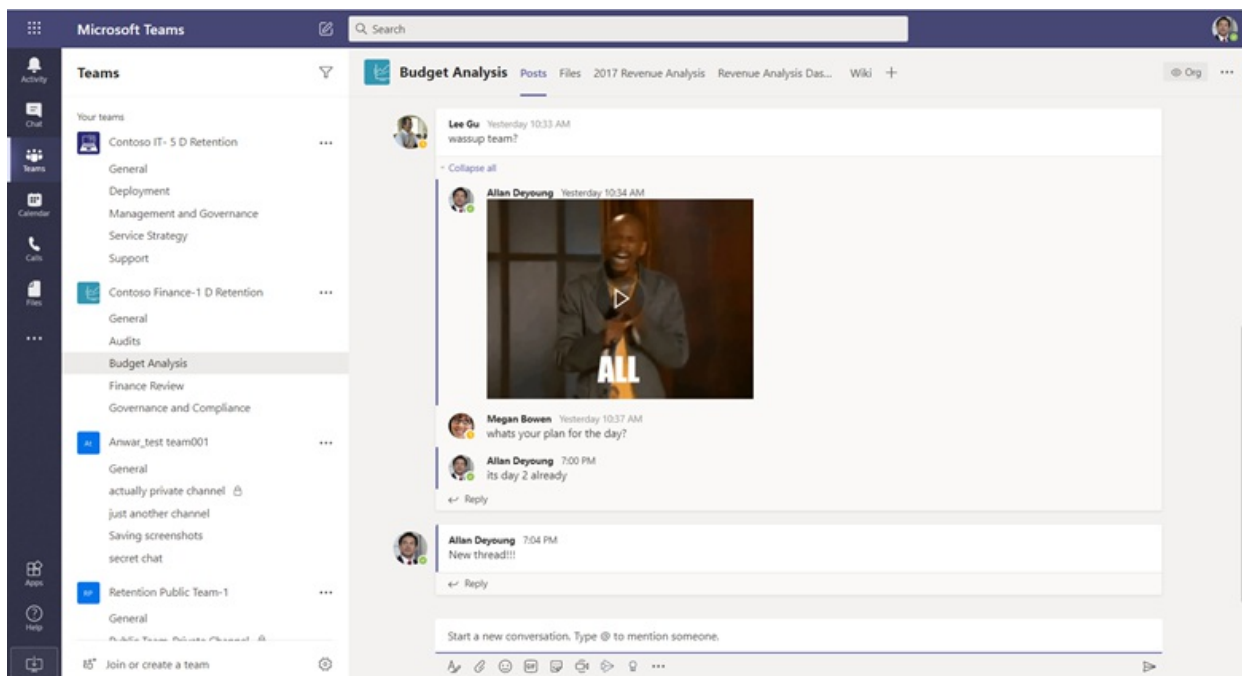

That page has additional information about creating and managing retention policies for other workloads in Microsoft 365. For example, you might want to also create a retention policy for Microsoft 365 Groups to retain and delete files that are accessed in Teams and stored in OneDrive or SharePoint.

End-user experience

For private chats (1:1 chats) or group chats, users will see that chats older than the retention policy configuration are deleted and an automatically generated message stating "We've deleted older messages due to your org's retention policy" is shown on top of yet undeleted messages. For example:

For Channel messages, users (channel members) will see the deleted messages disappear from view after messages expire. If the deleted message was a parent message of a threaded conversation, then, in place of parent message, a message stating "This message has been deleted because of a Retention Policy" will be displayed. For example:

NOTE

The displayed messages that users see as a result of deleted messages are not configurable at this time.

The links in these displayed messages go to [Teams messages about retention policies](#). This documentation for end users helps to answer basic questions about why their messages have been deleted. However, as part of your retention policy deployment, make sure that you communicate to users and your help desk the impact of your configured settings.

Communication compliance with Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Communication compliance is an insider risk solution in Microsoft 365 that helps minimize communication risks by helping you detect, capture, and act on inappropriate messages in your organization.

For Microsoft Teams, communication compliance helps identify the [following types](#) of inappropriate content in Teams channels, Private Teams channels, or in 1:1 and group chats:

- Offensive, profane, and harassing language
- Adult, racy, and gory images
- Sharing of sensitive information

For more information on communication compliance and how to configure policies for your organization, see [Communication compliance in Microsoft 365](#).

How to use communication compliance in Microsoft Teams

Communication compliance and Microsoft Teams are tightly integrated and can help minimize communication risks in your organization. After you've configured your first communication compliance policies, you can actively manage inappropriate Microsoft Teams messages and content that is automatically flagged in alerts.

Getting started

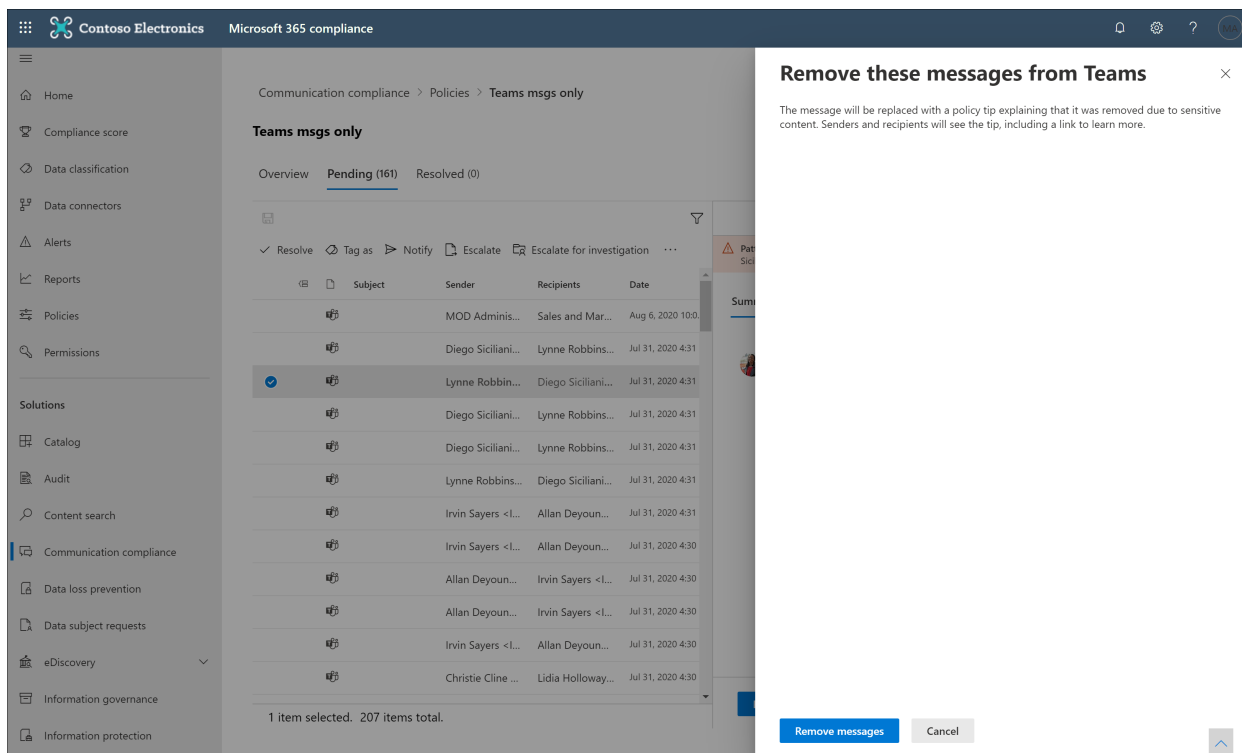

Getting started with communication compliance in Microsoft Teams begins with [planning](#) and creating pre-defined or custom policies to identify inappropriate user activities in Teams channels or in 1:1 and groups. Keep in mind that you'll need to [configure](#) some permissions and basic prerequisites as part of the configuration process.

Teams administrators can configure communication compliance policies at the following levels:

- **User level:** Policies at this level apply to an individual Teams user or may be applied to all Teams users in your organization. These policies cover messages that these users may send in 1:1 or group chats. Chat communications for the users are automatically monitored across all Microsoft Teams where the users are a member.
- **Teams level:** Policies at this level apply to a Microsoft Teams channel, including a Private channel. These policies cover messages sent in the Teams channel only.

Act on inappropriate messages in Microsoft Teams

After you have configured your policies and have received communication compliance alerts for Microsoft Teams messages, it's time for compliance reviewers in your organization to take action on these messages. Reviewers can help safeguard your organization by reviewing communication compliance alerts and removing flagged messages from view in Microsoft Teams.

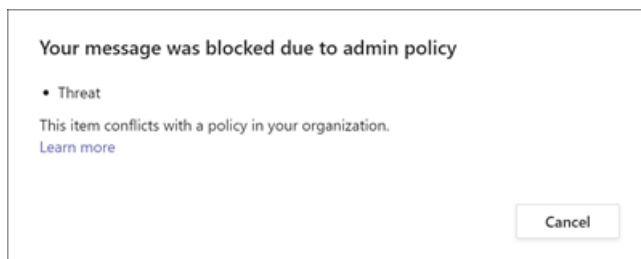

Removed messages and content are replaced with notifications for viewers explaining that the message or content has been removed and what policy is applicable to the removal. The sender of the removed message or content is also notified of the removal status and provided with original message content for context relating to its removal. The sender can also view the specific policy condition that applies to the message removal.

Example of policy tip seen by sender:

Example of policy condition notification seen by the sender:

Example of policy tip seen by recipient:

Introduction to Teams policy-based recording for callings & meetings

12/7/2021 • 6 minutes to read • [Edit Online](#)

Policy-based recording enables organizations that adopt Microsoft Teams for calling and meetings to stipulate, using an administrative policy, when calls and online meetings should be automatically recorded and captured for subsequent processing and retention as required by relevant corporate or regulatory policy.

Teams has been enhanced to support integration of third-party recording solutions, including the platform functionality, user experiences, and administrative interfaces needed to provide an end-to-end solution for configuring, managing, recording, storing, and analyzing Teams communications. Enhancements include communications platform APIs and events for recording, which provides:

- Seamless, high-quality media capture across devices and all supported endpoints for audio, video, screen share, and chat.
- Support for interaction capture between Teams users and supported calling endpoints (Teams, Teams Mobile, Skype for Business, PSTN)
- New administrative policies for compliance recording, including integration with existing Teams administrative calling and meeting tools and policies

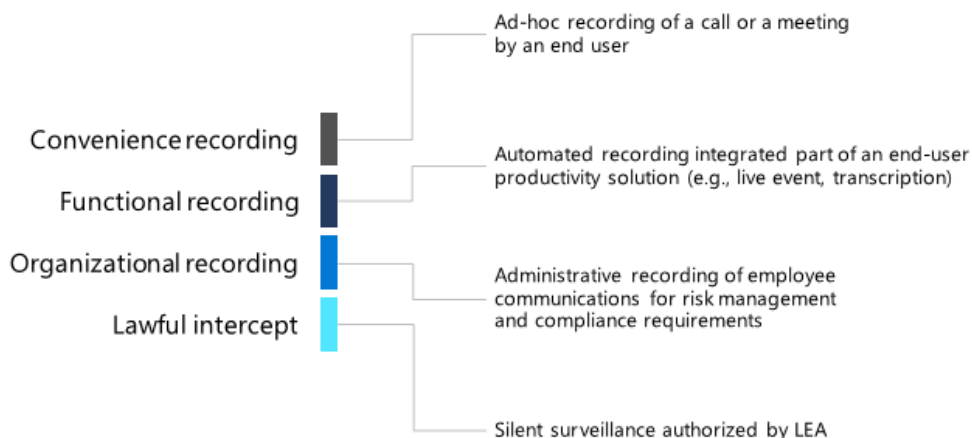

Compliance Recording can be enabled on Microsoft 365 A3/A5/E3/E5/Business Premium and Office 365 A3/A5/E3/E5 users.

The compliance recording solution integration capabilities were also reviewed at Ignite 2019 in the [Compliance Recording and Microsoft Teams session](#).

Teams interaction recording overview

Interaction recording use cases can effectively be separated into four primary categories of recording functionality – Convenience, Functional, Organizational, and Lawful Intercept, as shown in the image:

Interaction recording taxonomy

Each of the categories entails different requirements for how recordings are initiated, what is recorded, where recordings are stored, who is notified, who controls access, and how retention is handled.

TYPE	CONVENIENCE (REGULAR TEAMS RECORDING)	ORG - REGULATED (COMPLIANCE RECORDING)
Initiator	User	Admin (system)
Target	Per-call / meeting	Per-user
Storage owner	User	Compliance
Notification required?	Yes	Yes
Access Owner	User	Compliance
Retention Policy?	Optional	Yes

Teams provides various capabilities for [convenient](#) and functional recording of meetings and live events. Organizational recording means enabling organizations that adopt Teams for calling and meetings to stipulate, by way of an administrative policy, when calls and online meetings should be automatically recorded and captured for subsequent processing and retention as required by relevant corporate or regulatory policy. Users under this policy will be aware that their digital interactions with Teams are being recorded but will not be able to disable the recording and will not have access to the recording once the interaction is complete. The recording becomes part of the organizational archive available to compliance and legal personnel for eDiscovery, legal hold, and other corporate retention uses.

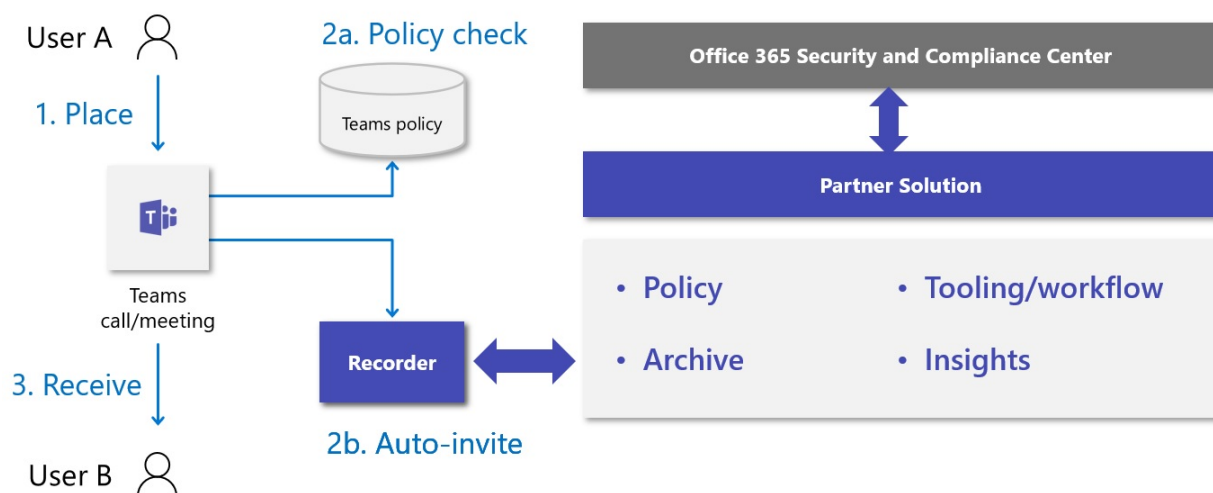

Example user needs

PERSONA	NEEDS
Recorded users	<ul style="list-style-type: none">• Be notified when recording is in progress.• Be informed when policy and/or recorder error is causing changes in calling behavior.
Communications admin	<ul style="list-style-type: none">• Understand why and how to apply / enforce recording policies to Teams users / endpoints.• Configure and maintain Teams recording policies for the organization.• Monitor and troubleshoot recording-related issues with Teams calls and meetings.• Support internal compliance officer with operational analytics on usage, quality, and reliability.

PERSONA	NEEDS
Compliance officer	<ul style="list-style-type: none"> Collect all Teams communications in the manner required to meet compliance obligations in appropriate regional boundaries. Search for interactions based on communication-related metadata or interaction content. Common examples include: <ul style="list-style-type: none"> Metadata – Participants, time, direction, dialed number, origin number, Custom business data Content – Transcription, sentiment, phonetics, related interactions Analyze and interact with collected communications, including the ability to monitor interactions as they are being collected. Ensure security of collected communications and prevent tampering at all stages.

Solution architecture overview

Compliance recording solutions are integrated with Teams as shown in the following diagram:

NOTE

This solution is designed specifically to enable policy-based compliance recording with Teams. Any other use of this solution will not be supported.

Recorder

The core component of the compliance recording solution is the recorder. Recorders are built as scalable Azure-based services (bots) that [use Microsoft's communications platform](#) and register as applications with Microsoft Graph. The recorder provides the direct interaction with the Teams calls and meetings [communications platform APIs](#) and provides the endpoint for media ingestion.

A [sample compliance recorder application is available](#) that shows how to configure the bot, create the app instance and assign the compliance policies. The sample also has examples on API usage for recording specific

interactions such as handling [incoming call](#) routing, [changing recording states](#), and [removing the user who is being recorded](#). Graph documentation on the specific APIs can be found here for [updateRecordingStatus](#) and [incomingContext](#).

The exact implementation of the recorder service will vary by partner but must be designed to support multiple recorders in order to achieve high availability and geographical distribution of deployment to reduce latency from Teams to the recorder. In addition, it is expected that Recorders themselves be designed with resiliency and redundancy in mind.

Partners must confirm the minimum required release version of the Microsoft Graph communications APIs and SDKs with Microsoft before submitting their solution for certification to ensure that all requirements of compliance recording integration are supported.

Two specific requirements that are fundamental for compliance recording scenario are:

- Recorder bot must be deployed in Azure
- Recorder bot must run on a Windows VM in Azure

The Azure and Windows VM requirements only apply to the Teams Bot component, which means that a partner may implement the rest of the platform of their choice provided they can meet the relevant performance and functional requirements for compliance recording.

Compliance recording policy assignment and provisioning

IT Administrators can determine which users are to be recorded and which recorder will be used for each user, by creating and assigning compliance recording policies. Recorders are automatically invited to participate in conversations based on the configuration of these policies when a communication interaction takes place. Compliance recording policies are managed using [Microsoft PowerShell](#) and can be applied at the tenant, per-user, and security group level for each organization. You can find more information on Microsoft Docs for [Meeting policies](#), [calling policies](#) and [group policies](#).

1. Create an application instance in your tenant.

```
PS C:\> New-CsOnlineApplicationInstance -UserPrincipalName cr.instance@contoso.onmicrosoft.com -
DisplayName ComplianceRecordingBotInstance -ApplicationId fcc88ff5-a42d-49cf-b3d8-f2e1f609d511
```

```
RunspaceId      : 4c13efa6-77bc-42db-b5bf-bdd62cdfc5df
ObjectId        : 5069aae5-c451-4983-9e57-9455ced220b7
TenantId       : 5b943d7c-5e14-474b-8237-5022eb8e0dc9
UserPrincipalName : cr.instance@contoso.onmicrosoft.com
ApplicationId   : fcc88ff5-a42d-49cf-b3d8-f2e1f609d511
DisplayName     : ComplianceRecordingBotInstance
PhoneNumber     :
```

```
PS C:\> Sync-CsOnlineApplicationInstance -ObjectId 5069aae5-c451-4983-9e57-9455ced220b7
```

2. Create a Compliance Recording policy.

```
PS C:\> New-CsTeamsComplianceRecordingPolicy -Identity TestComplianceRecordingPolicy -Enabled $true -
Description "Test policy created by tenant admin"
```

```
Identity          : Global
ComplianceRecordingApplications : {}
Enabled           : True
WarnUserOnRemoval : True
Description       : Test policy created by tenant admin
```

```
PS C:\> Set-CsTeamsComplianceRecordingPolicy -Identity TestComplianceRecordingPolicy `
-ComplianceRecordingApplications @(New-CsTeamsComplianceRecordingApplication -Id 5069aae5-c451-4983-
9e57-9455ced220b7 -Parent TestComplianceRecordingPolicy)
```

See [Set-CsTeamsComplianceRecordingPolicy](#).

3. Assign the Compliance Recording policy to a user.

```
PS C:\> Grant-CsTeamsComplianceRecordingPolicy -Identity testuser@contoso.onmicrosoft.com -PolicyName
TestComplianceRecordingPolicy
```

See [Grant-CsTeamsComplianceRecordingPolicy](#).

```
PS C:\> Get-CsOnlineUser testuser@contoso.onmicrosoft.com | select SipAddress, TenantId,
TeamsComplianceRecordingPolicy | fl

UserPrincipalName           : testuser@contoso.onmicrosoft.com
TenantId                    : 5b943d7c-5e14-474b-8237-5022eb8e0dc9
TeamsComplianceRecordingPolicy : TestComplianceRecordingPolicy
```

User experiences

Support for notifications is enabled using the Teams client experiences. The experiences can be either visual or audio.

Teams clients - visual notice

- Desktop/web
- Mobile (iOS/Android)
- Teams phones
- Teams rooms

Other endpoints - audio notice

- SIP phones
- Skype for Business
- Audio conferencing
- PSTN callers

NOTE

Compliance Recording is not supported with Conference mode call queues. Please use Transfer mode call queues.

Compliance recording for Teams certification programs

In addition to publishing publicly available APIs allowing partners to develop and integrate CCaaS solutions with Teams, we have developed the compliance recording for Microsoft Teams certification program to provide customers with the assurance that each participating partner's solution has been tested and verified to provide the quality, compatibility, and reliability they expect from Microsoft solutions.

The following partners have certified their solution for Microsoft Teams.

PARTNER	SOLUTION WEBSITE
ASC Technologies	https://www.asctechnologies.com/english/ASC_Recording_Insights_Compliance_Recording_for_Microsoft_Teams.html
AudioCodes	https://www.audiocodes.com/solutions-products/voiceai/meetings-and-recording/smarttap-360
CallCabinet	https://www.callcabinet.com/compliance-microsoft-teams-call-recording
Dubber	https://www.dubber.net/call-recording/
Insightful Technology	https://insightfultechnology.com/teams/
NICE	https://www.niceactimize.com/compliance/ms-teams-recording.html
Numonix	https://numonix.cloud
Red Box	https://www.redboxvoice.com/compliance-recording-for-microsoft-teams
Theta Lake	https://thetalake.com/integrations/microsoft/
Verint	https://www.verba.com/solutions/microsoft-teams-recording

The following partners are in the process of certifying their solution for Microsoft Teams.

PARTNER	SOLUTION WEBSITE
Landis Technologies	https://landistechnologies.com/
Luware	https://luware.com/en/solution/microsoft-teams-recording/
Oak Innovation	https://www.oakinnovate.com/call-recording

This list will be updated as more partners join and meet the certification criteria.

Next steps

If you are a vendor seeking to join the certification program, send mail to Teamscategorypartner@microsoft.com.

Sensitivity labels for Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

[Sensitivity labels](#) allow Teams admins to protect and regulate access to sensitive organizational content created during collaboration within teams. After you configure sensitivity labels with their associated policies in the [Microsoft compliance center](#), these labels can be applied to teams in your organization.

Sensitivity labels are currently unsupported in class teams for customers using Teams Education SKUs. To learn more about licensing, see [Microsoft Teams service description](#).

What's the difference between sensitivity labels and Teams classification?

Sensitivity labels are different from Teams classification, also known as Azure AD group classification. Classifications are text strings that can be associated with a Microsoft 365 group but don't have any actual policies associated with them. You use classification as metadata and then must use other methods such as internal tools and scripts, to enforce policies.

The benefit of using sensitivity labels is that their policies are automatically enforced end-to-end through a combination of the Microsoft 365 Groups platform, the compliance center, and Teams services. Sensitivity labels provide powerful infrastructure support for securing your organization's sensitive data and ensuring compliance with your internal policies or regulations.

If you currently use Teams classification, see the following documentation for more information and instructions how to convert these values to sensitivity labels: [Classic Azure AD group classification](#).

Example scenarios for sensitivity labels

Example scenarios for how you can use sensitivity labels with Teams in your organization:

- [Set the privacy level \(public or private\) for teams](#)
- [Control guest access to teams](#)

Set the privacy level for teams

You can create and configure a sensitivity label that, when applied during team creation, allows users to create teams with a specific privacy (public or private) setting.

For example, you create and publish a sensitivity label named "Confidential" that has the label privacy option configured as **Private**. As a result, any team that's created with this label must be a private team.

When a user creates a new team and selects the **Confidential** label, the only privacy option that's available to the user is **Private**. Other privacy options such as Public and Org-wide aren't available for the user to select:

What kind of team will this be?

Sensitivity

Confidential

Teams with this sensitivity must be private.

Privacy

Private
People need permission to join

Public
Anyone in your org can join

Org-wide
Everyone in your organization automatically joins

[Back](#)

Similarly, you create and publish a sensitivity label named "General" that has the label privacy option configured as **Public**. When a user creates a new team, they can only create public or org-wide teams when they select this label:

What kind of team will this be?

Sensitivity

General

Teams with this sensitivity must be public.

Privacy

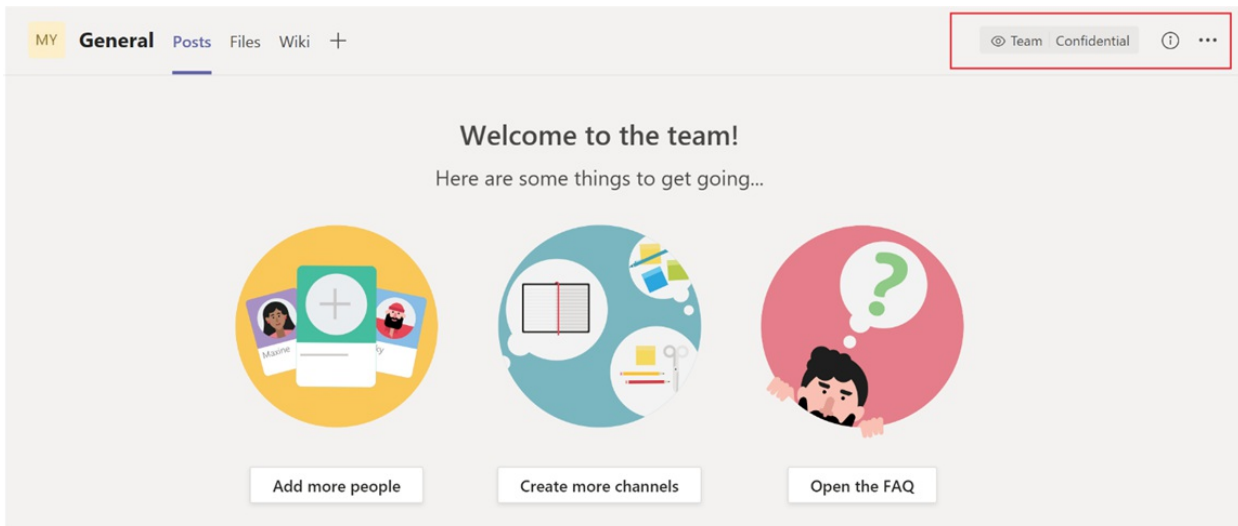

Private
People need permission to join

Public
Anyone in your org can join

Org-wide
Everyone in your organization automatically joins

[Back](#)

When the team is created, the sensitivity label is visible to users in the upper-right corner of channels in the team.

A team owner can change the sensitivity label and the privacy setting of the team at any time by going to the team, and then click **Edit team**.

Edit "MyTeam" team

Collaborate closely with a group of people inside your organization based on project, initiative, or common interest. [Watch a quick overview](#)

Team name

MyTeam

Description

Sensitivity

Confidential

Teams with this sensitivity must be private.

Privacy

Private - Only team owners can add members

This team is **searchable and discoverable**. [Change setting](#) ⓘ

Cancel Done

Control guest access to teams

You can use sensitivity labels to control guest access to your teams. Teams created with a label that doesn't allow guest access are only available to users in your organization. People outside your organization can't be added to the team.

Microsoft Teams admin center

You can apply sensitivity labels when you create or edit a team in the Microsoft Teams admin center.

Sensitivity labels are also visible in team properties and in the **Classification** column on the **Manage teams** page of the Microsoft Teams admin center.

Limitations

Before you use sensitivity labels for Teams, be aware of the following limitations:

- **Sensitivity labels aren't supported by Teams Graph APIs, PowerShell cmdlets, and templates**

Users won't be able to specify sensitivity labels while creating teams directly through Teams Graph APIs, Teams PowerShell cmdlets, and Teams templates. However Modern Groups Graph APIs and PowerShell cmdlets do allow creation of groups with labels. So users can first create Groups with labels using Groups Graph APIs or PowerShell cmdlets and then convert these Groups in to Teams.

- **Support for private channels**

Private channels that are created in a team inherit the sensitivity label that was applied on a team. The same label is automatically applied on the SharePoint site collection for the private channel.

However, if a user directly changes the sensitivity label on a SharePoint site for a private channel, that label change isn't reflected in the Teams client. In this scenario, users continue to see the original sensitivity label applied on the team in the private channel header.

How to create and configure sensitivity labels for Teams

Use the instructions from the Microsoft 365 documentation to create and configure sensitivity labels for Teams:

- [Use sensitivity labels to protect content in Microsoft Teams, Microsoft 365 groups, and SharePoint sites.](#)

Conduct an eDiscovery investigation of content in Microsoft Teams

12/7/2021 • 7 minutes to read • [Edit Online](#)

Large Enterprises are often exposed to high penalty legal proceedings that demand submission of all Electronically Stored Information (ESI). Microsoft Teams content can be searched and used during eDiscovery investigations.

Overview

All Microsoft Teams 1:1 or group chats are journaled through to the respective users' mailboxes. All standard channel messages are journaled through to the group mailbox representing the team. Files uploaded in standard channels are covered under the eDiscovery functionality for SharePoint Online and OneDrive for Business.

eDiscovery of messages and files in [private channels](#) works differently than in standard channels. To learn more, see [eDiscovery of private channels](#).

Not all Teams content is eDiscoverable. The following table shows the content types that you can search for using Microsoft eDiscovery tools:

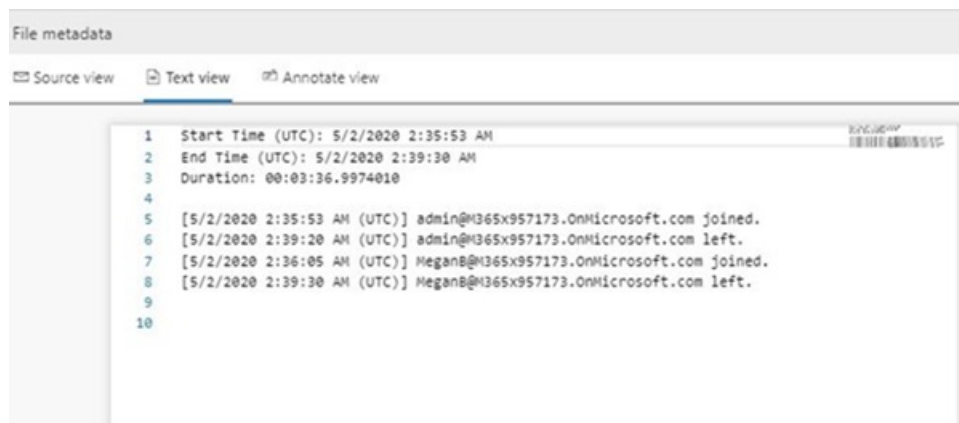

CONTENT TYPE	EDISCOVERABLE	NOTES
Audio recordings	No	
Card content	Yes	See Search for card content for more information.
Chat links	Yes	
Chat messages	Yes	This includes content in Teams channels, 1:1 chats, 1:N group chats, and chats with guest user participants.
Code snippets	No	
Edited messages	Yes	If the user is on hold, previous versions of edited messages are also preserved.
Emojis, GIFs, and stickers	Yes	
Inline images	Yes	
Meeting IM conversations	Yes	
Meeting metadata ¹	Yes	
Name of channel	No	
Private channel messages	Yes	

CONTENT TYPE	EDISCOVERABLE	NOTES
Quotes	Yes	Quoted content is searchable. However, search results don't indicate that the content was quoted.
Reactions (such as likes, hearts, and other reactions)	No	
Subject	Yes	
Tables	Yes	
Feed notifications	No	

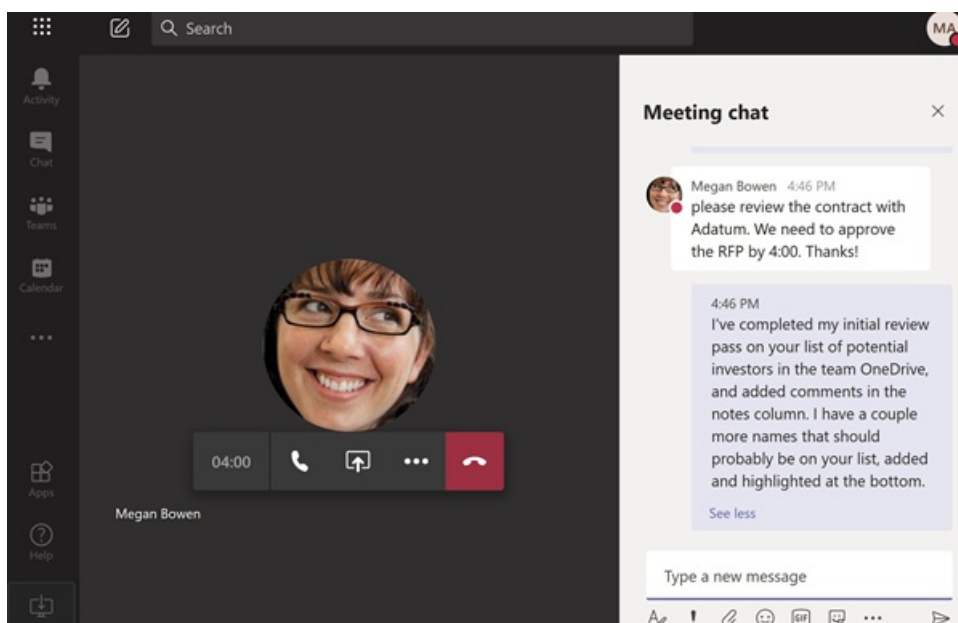

¹ Meeting (and call) metadata includes the following:

- Meeting start and end time, and duration
- Meeting join and leave events for each participant
- VOIP join/calls
- Anonymous join
- Federated user join
- Guest user join

The image shows an example of meeting metadata.

Here's an example of an IM conversation between participants during the meeting.

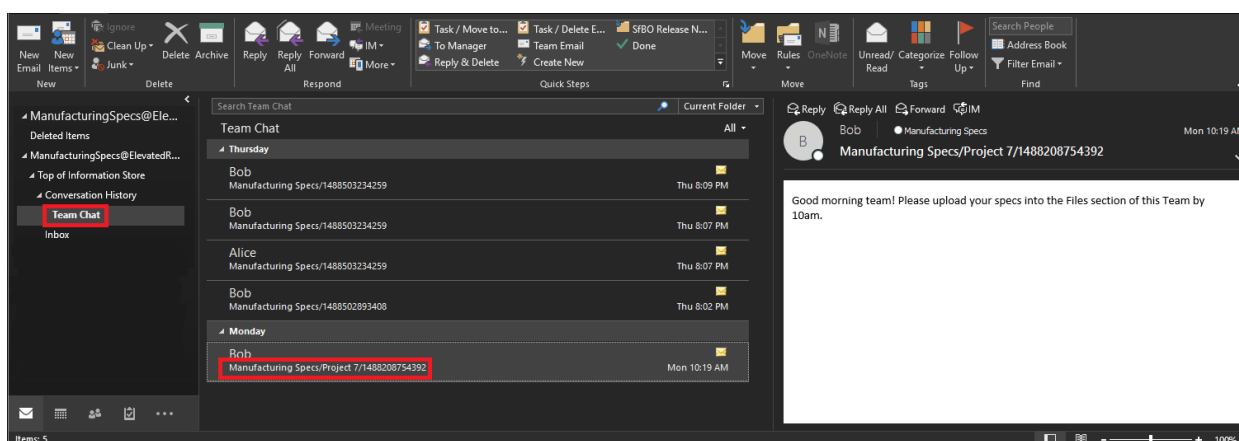

New query Action Manage review set Group by conversation Edit columns					
	Subject/Title	Status	Date	Sender/Author	
File metadata					Summary Text view Annotate view
		Ready	8/3/2020, 4:46:0...	Megan Bowen <...>	
		Ready	8/3/2020, 4:46:0...	Megan Bowen <...>	
		Ready	8/3/2020, 4:44:1...	Megan Bowen <...>	
		Ready	8/3/2020, 4:44:1...	Megan Bowen <...>	
		Ready	8/3/2020, 4:46:4...	MOD Administra...	
	Contoso Mark...	Ready	8/3/2020, 4:30:0...	Megan Bowen <...>	
	Contoso Mark...	Ready	8/3/2020, 4:30:0...	Megan Bowen <...>	

For more information about conducting an eDiscovery investigation, see [Get started with Core eDiscovery](#).

Microsoft Teams data will appear as IM or Conversations in the Excel eDiscovery export output. You can open the .pst file in Outlook to view those messages after you export them.

When viewing the .pst file for the team, all conversations are located in the Team Chat folder under Conversation History. The title of the message contains the team name and channel name. For example, the image below shows a message from Bob who messaged the Project 7 standard channel of the Manufacturing Specs team.

Private chats in a user's mailbox are stored in the Team Chat folder under Conversation History.

eDiscovery of private channels

Records for messages sent in a private channel are delivered to the mailbox of all private channel members, rather than to a group mailbox. The titles of the records are formatted to indicate which private channel they were sent from.

Because each private channel has its own SharePoint site that's separate from the parent team site, files in a private channel are managed independently of the parent team.

Teams doesn't support eDiscovery search of a single channel within a team, so the whole team must be searched. To perform an eDiscovery search of content in a private channel, search across the team, the site collection associated with the private channel (to include files), and mailboxes of private channel members (to include messages).

Use the following steps to identify files and messages in a private channel to include in your eDiscovery search.

Include private channel files in an eDiscovery search

Before you perform these steps, install the [SharePoint Online Management Shell and connect to SharePoint Online](#).

1. Run the following to get a list of all SharePoint site collections associated with private channels in the team.

```
Get-SPOSite
```

2. Run the following PowerShell script to get a list of all SharePoint site collection URLs associated with private channels in the team and the parent team group ID.

```
$sites = get-sposite -template "teamchannel#0"  
foreach ($site in $sites) {$x= get-sposite -identity $site.url -detail; $x.relatedgroupID; $x.url}
```

3. For each team or group ID, run the following PowerShell script to identify all relevant private channel sites, where `$groupID` is the group ID of the team.

```
$sites = get-sposite -template "teamchannel#0"  
$groupID = "e8195240-4a70-4830-9106-80193cf717cb"  
foreach ($site in $sites) {$x= Get-SpoSite -Identity $site.url -Detail; if ($x.RelatedGroupId -eq  
$groupID) {$x.RelatedGroupId;$x.url}}
```

NOTE

SharePoint sites for private channels created after June 28, 2021 use the value `teamchannel#1` for the custom template ID. So for private channels created after this date, use the value `teamchannel#1` when running the previous two scripts.

Include private channel messages in an eDiscovery search

Before you perform these steps, make sure you have the [latest version of the Teams PowerShell module](#) installed.

1. Run the following command to get a list of private channels in the team.

```
Get-TeamChannel -GroupId <GroupID> -MembershipType Private
```

2. Run the following command to get a list of private channel members.

```
Get-TeamChannelUser -GroupId <GroupID> -DisplayName "Engineering" -Role Member
```

3. Include the mailboxes of all members from each private channel in the team as part of your [eDiscovery search query](#).

Search for content for guest users

You can use eDiscovery tools to search for Teams content related to guest users in your organization. Teams chat content that's associated with a guest user is preserved in a cloud-based storage location and can be searched for using eDiscovery. This includes searching for content in 1:1 and 1:N chat conversations in which a guest user is a participant with other users in your organization. You can also search for private channel messages in which a guest user is a participant and search for content in *guest:guest* chat conversations where the only participants are guest users.

To search for content for guest users:

1. Connect to Azure AD PowerShell. For instructions, see the "Connect with the Azure Active Directory PowerShell" section in [Connect to Microsoft 365 with PowerShell](#). Be sure to complete Step 1 and Step 2 in the previous topic.
2. After you successfully connect to Azure AD PowerShell, run the following command to display the user principal name (UPN) for all guest users in your organization. You have to use the UPN of the guest user when you create the search in step 4.

```
Get-AzureADUser -Filter "userType eq 'Guest'" -All $true | FL UserPrincipalName
```

TIP

Instead of displaying a list of user principal names on the computer screen, you can redirect the output of the command to a text file. You can do this by appending `> filename.txt` to the previous command. The text file with the user principal names will be saved to the current folder.

3. In a different Windows PowerShell window, connect to Security & Compliance Center PowerShell. For instructions, see [Connect to Security & Compliance Center PowerShell](#). You can connect with or without using multi-factor authentication.
4. Create a content search that searches for all content (such as chat messages and email messages) in which the specified guest user was a participant by running the following command.

```
New-ComplianceSearch <search name> -ExchangeLocation <guest user UPN> -  
AllowNotFoundExchangeLocationsEnabled $true -IncludeUserAppContent $true
```

For example, to search for content associated with the guest user Sara Davis, you would run the following command.

```
New-ComplianceSearch "Sara Davis Guest User" -ExchangeLocation  
"sara.davis_hotmail.com#EXT#@contoso.onmicrosoft.com" -AllowNotFoundExchangeLocationsEnabled $true -  
IncludeUserAppContent $true
```

For more information about using PowerShell to create content searches, see [New-ComplianceSearch](#).

5. Run the following command to start the content search that you created in step 4:

```
Start-ComplianceSearch <search name>
```

6. Go to <https://compliance.microsoft.com> and then click **Show all > Content search**.
7. In the list of searches, select the search that you created in step 4 to display the flyout page.

8. On the flyout page, you can do the following things:

- Click **View results** to view the search results and preview the content.
- Next to the **Query** field, click **Edit** to edit and then rerun the search. For example, you can add a search query to narrow the results.
- Click **Export results** to export and download the search results.

Search for card content

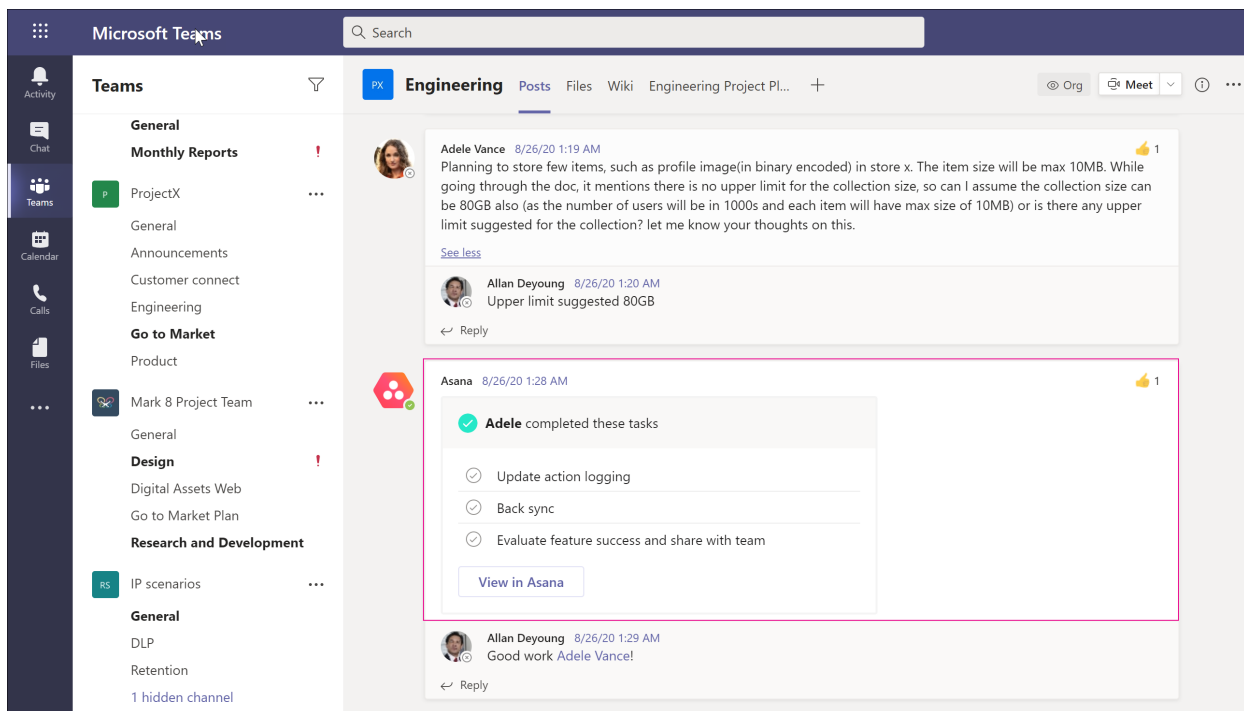

Card content generated by apps in Teams channels, 1:1 chats, and 1xN chats is stored in mailboxes and can be searched. A *card* is a UI container for short pieces of content. Cards can have multiple properties and attachments, and can include buttons that can trigger card actions. For more information, see [Cards](#)

Like other Teams content, where card content is stored is based on where the card was used. Content for cards used in a Teams channel is stored in the Teams group mailbox. Card content for 1:1 and 1xN chats are stored in the mailboxes of the chat participants.

To search for card content, you can use the `kind:microsoftteams` or `itemclass:IPM.SkypeTeams.Message` search conditions. When reviewing search results, card content generated by bots in a Teams channel has the **Sender/Author** email property as `<appname>@teams.microsoft.com`, where `appname` is the name of the app that generated the card content. If card content was generated by a user, the value of **Sender/Author** identifies the user.

When viewing card content in Content search results, the content appears as an attachment to the message. The attachment is named `appname.html`, where `appname` is the name of the app that generated the card content. The following screenshots show how card content (for an app named Asana) appears in Teams and in the results of a search.

Card content in Teams

Place a Microsoft Teams user or team on legal hold

12/7/2021 • 3 minutes to read • [Edit Online](#)

When a reasonable expectation of litigation exists, organizations are required to preserve electronically stored information (ESI), including Teams chat messages that are relevant to the case. Organizations may need to preserve all messages related to a specific topic or for certain individuals. This article will cover legal hold in Microsoft Teams. To hold content across Microsoft 365, see [Create an eDiscovery hold](#).

NOTE

In February 2020, we turned on legal hold for private channels. Private channel chats are stored in user mailboxes, while normal channel chats are stored in the Teams' group mailbox. If there is already a legal hold in place for a user mailbox, the hold policy will now automatically apply to private channel messages stored in that mailbox. There is no further action needed for an admin to turn this on. Legal hold of files shared in private channels is also supported.

Within Microsoft Teams, an entire team or select users can be put on legal hold. Doing that will make sure that all messages that were exchanged in those teams (including private channels) or messages exchanged by those individuals are discoverable by the organization's compliance managers or Teams Admins.

NOTE

Placing a user on hold does not automatically place a group on hold or vice-versa. Notifications sent in activity feed can't be placed on hold.

To put a user or a team on legal hold in a Core eDiscovery case:

1. Go to the [Microsoft 365 compliance center](#). When you create a new case, you are presented with the option to place mailboxes or sites on hold.
2. Go to **eDiscovery** > **Core** and create a case by clicking **Create a case**. After the case is created, open it.

Open	EXOCASE03	Active
Open	eDiscoverySearchForHold	Active
Open	EXOCASE06	Active
Open	EXOCASE05	Active
Open	EXOCASE04	Active
-	EXOCASE3	Active

NOTE

You can also place a user on a hold that's associated with an Advanced eDiscovery case. For more information, see [Manage holds in Advanced eDiscovery](#).

- Go to the **Holds** tab on the top menu and click **Create** to create a hold. Placing a user or a team on hold preserves all the messages exchanged by those users or messages. When you create a new case, you are presented with the option to place mailboxes or sites on hold.

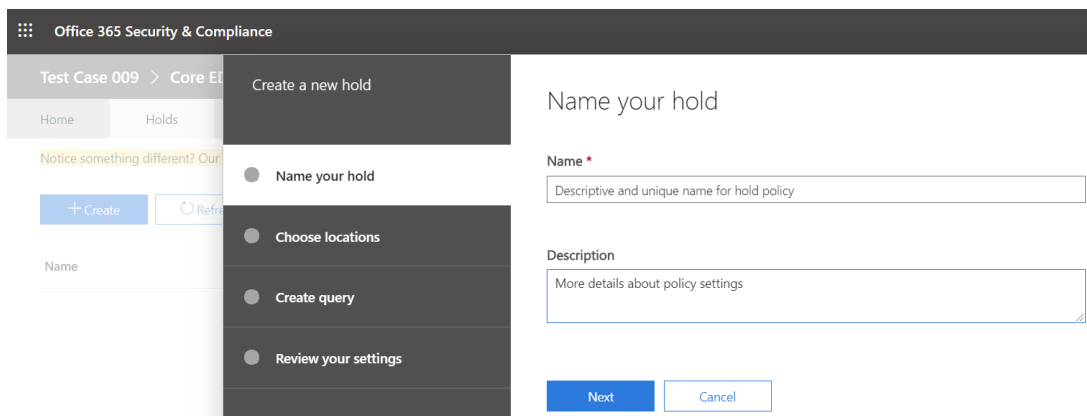

Notice something different? Our eDiscovery experience is new and improved. [Learn more about it](#)

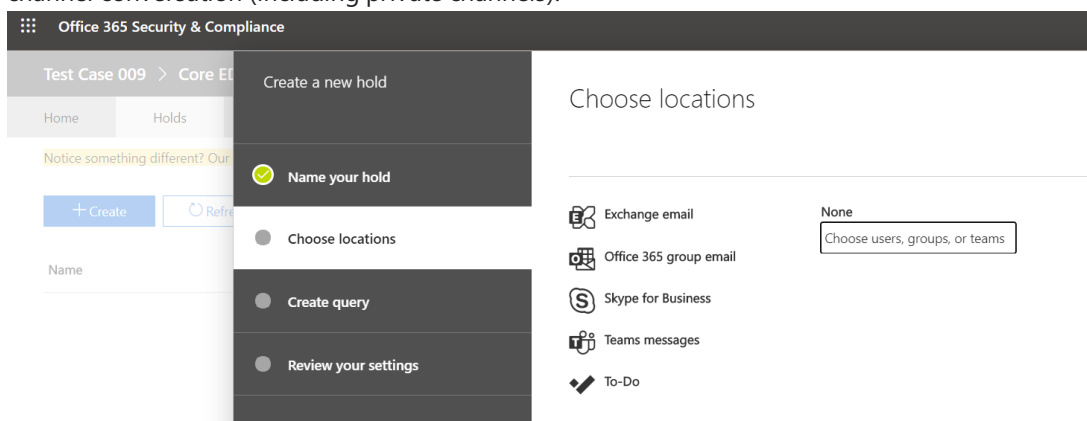

Name

- a. **Name your hold.** Select a descriptive and unique name for the hold you are going to create.

- b. **Choose location.** Choose whether you want the hold to be applied on a user or on an entire Team (hold cannot be applied on individual channels for now). Note: if a user is on hold, all their messages would be on hold, including whatever they sent in a 1:1 chat, 1:many or group chat, or a channel conversation (including private channels).

- c. **Create query.** You can customize the hold if you want more granularity in the hold policy. For example, you can specify keywords to look for, or you can add more conditions, that would need to be satisfied for the hold to take effect.

- d. **Review your settings** before creating the hold.

After the legal hold has been created, you can search the content retained by any hold policy. For more information, see [Conduct an eDiscovery investigation in Teams](#).

IMPORTANT

When a user or group is placed on hold, all message copies will be retained. For example, if a user posted a message in a channel and then modified the message, in a hold scenario, both copies of the message are retained. Without the legal hold in-place, only the latest message is retained.

Content locations to place on legal hold to preserve Teams content

As a helpful guide, you can use the following table to understand what content location (such as a mailbox or site) to place on legal hold to preserve different types of Teams content.

SCENARIO	CONTENT LOCATION
Teams chats for a user (for example, 1:1 chats, 1:N group chats, and private channel conversations)	User mailbox.
Teams channel chats (excluding private channels)	Group mailbox used for the team.
Teams file content (for example, Wiki content and files)	SharePoint site used by the team.
Teams private channel files	Dedicated SharePoint site for private channels.
User's private content	The user's OneDrive for Business account.
Card content in chats	User mailbox for 1:1 chats, 1:N group chats, and private channel conversations or group mailbox for card content in channel messages. For more information, see the "Preserve card content" section in Create an eDiscovery hold .

NOTE

To retain communication in private channels, you need to put the user mailboxes (Private channel users) on hold and when using eDiscovery tool to search, you should search in that user's mailbox. As was stated earlier, private channel chats are stored in user mailboxes, not in group mailbox of a Team.

If you want to read further on this topic for non-Teams areas in Microsoft 365, you should review [Manage eDiscovery cases: Place content locations on hold](#).

Use Content search in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

NOTE

Content search of messages and files in [private channels](#) work differently than in standard channels. To learn more, see [Content search of private channels](#).

Content search provides a way to query Microsoft Teams information spanning Exchange, SharePoint Online, and OneDrive for Business.

To learn more, see [Content search in Microsoft 365](#).

For example, using **Content search** against your Manufacturing Specs mailbox and Manufacturing Specs SharePoint site, you can search against Teams standard channel conversations from Exchange, file uploads and modifications from SharePoint Online, and OneNote changes.

You can also add query criteria to the **Content Search** to narrow the results returned. In the above example, you can look for content where the keywords "**New Factory Specs**" were used.

TIP

After adding search conditions, you can export a report or the actual content to your computer for analysis.

Content search of private channels

Records for messages sent in a private channel are delivered to the mailbox of all private channel members, rather than to a group mailbox. The titles of the records are formatted to indicate which private channel they were sent from.

Because each private channel has its own SharePoint site collection that's separate from the parent team site, files in a private channel are managed independently of the parent team.

Teams doesn't support content search of a single channel, so the whole team must be searched. To perform a content search of a private channel, search across the team, the site collection associated with the private channel (to include files), and mailboxes of private channel members (to include messages).

Use the following steps to identify files and messages in a private channel to include in your content search.

Include private channel files in a content search

Before you perform these steps, install the [SharePoint Online Management Shell and connect to SharePoint Online](#).

1. Run the following to get a list of all SharePoint site collections associated with private channels in the team.

```
Get-SPOSite
```

2. Run the following PowerShell script to get a list of all SharePoint site collection URLs associated with private channels in the team and the parent team group ID.

```
$sites = get-sposite -template "teamchannel#0"  
foreach ($site in $sites) {$x= get-sposite -identity $site.url -detail; $x.relatedgroupID; $x.url}
```

3. For each team or group ID, run the following PowerShell script to identify all relevant private channel sites.

```
$sites = get-sposite -template "teamchannel#0"  
$groupID = "e8195240-4a70-4830-9106-80193cf717cb"  
foreach ($site in $sites) {$x= Get-SpoSite -Identity $site.url -Detail; if ($x.RelatedGroupId -eq  
$groupID) {$x.RelatedGroupId;$x.url}}
```

Include private channel messages in a content search

Before you perform these steps, make sure you have the [latest version of the Teams PowerShell module](#) installed.

1. Run the following to get a list of private channels in the team.

```
Get-TeamChannel -GroupId <GroupID> -MembershipType Private
```

2. Run the following to get a list of private channel members.

```
Get-TeamChannelUser -GroupId <GroupID> -DisplayName "Engineering" -Role Member
```

3. Include the mailboxes of all members from each private channel in the team as part of your content search query.

Search the audit log for events in Microsoft Teams

12/7/2021 • 16 minutes to read • [Edit Online](#)

IMPORTANT

The Microsoft Teams admin center is gradually replacing the Skype for Business admin center, and we're migrating Teams settings to it from the Microsoft 365 admin center. If a setting has been migrated, you'll see a notification and then be directed to the setting's location in the Teams admin center. For more information, see [Manage Teams during the transition to the Teams admin center](#).

The audit log can help you investigate specific activities across Microsoft 365 services. For Microsoft Teams, here are some of the activities that are audited:

- Team creation
- Team deletion
- Added channel
- Deleted channel
- Changed channel setting

For a complete list of Teams activities that are audited, see [Teams activities](#) and [Shifts in Teams activities](#).

NOTE

Audit events from private channels are also logged as they are for teams and standard channels.

Turn on auditing in Teams

Before you can look at audit data, you have to first turn on auditing in the Microsoft 365 compliance center. For more information, see [Turn auditing on or off](#).

IMPORTANT

Audit data is only available from the point at which you turned on auditing.

Retrieve Teams data from the audit log

1. To retrieve audit logs for Teams activities, go to <https://compliance.microsoft.com> and select **Audit**.
2. On the **Search** page, filter the activities, dates, and users you want to audit.
3. Export your results to Excel for further analysis.

For step-by-step instructions, see [Search the audit log in the compliance center](#).

IMPORTANT

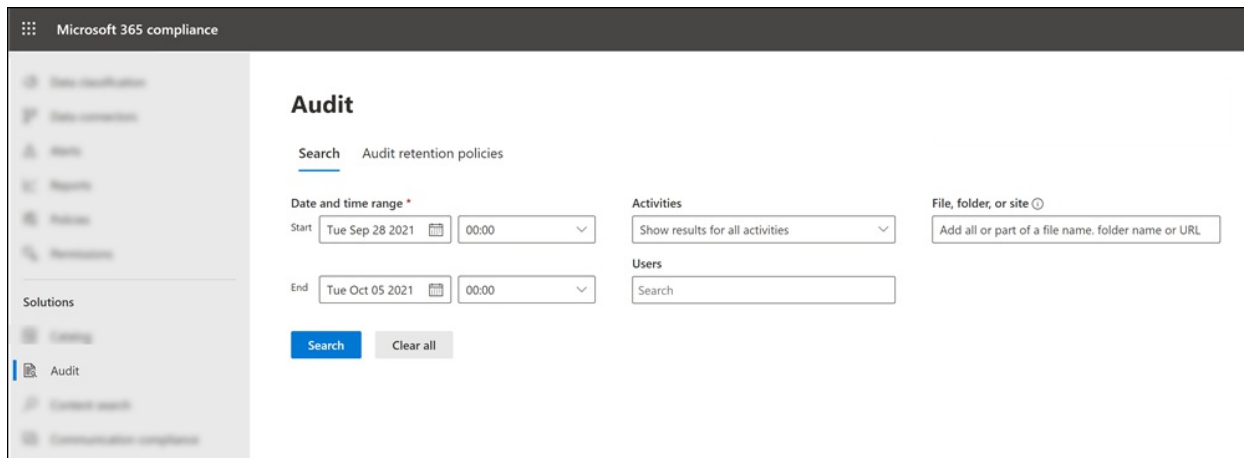

Audit data is only visible in the audit log if auditing is turned on.

The length of time that an audit record is retained and searchable in the audit log depends on your Microsoft

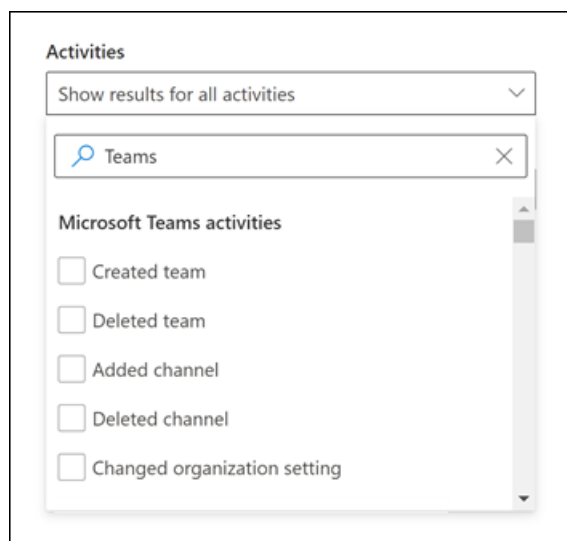

365 or Office 365 subscription, and specifically the type of license that's assigned to users. To learn more, see the [Security & Compliance Center service description](#).

Tips for searching the audit log

Here are tips for searching for Teams activities in the audit log.

- You can select specific activities to search for by clicking the checkbox next to one or more activities. If an activity is selected, you can click it to cancel the selection. You can also use the search box to display the activities that contain the keyword that you type.

- To display events for activities run using cmdlets, select **Show results for all activities** in the **Activities** list. If you know the name of the operation for these activities, type it in the search box to display the activity and then select it.
- To clear the current search criteria, click **Clear all**. The date range returns to the default of the last seven days.
- If 5,000 results are found, you can probably assume that there are more than 5,000 events that met the search criteria. You can refine the search criteria and rerun the search to return fewer results, or you can export all the search results by selecting **Export > Download all results**. For step-by-step instructions to export audit logs, see [Export the search results to a file](#).

Check out [this video](#) for using audio log search. Join Ansuman Acharya, a program manager for Teams, as he demonstrates how to do an audit log search for Teams.

Teams activities

Here's a list of all events that are logged for user and admin activities in Teams in the Microsoft 365 audit log. The table includes the friendly name that's displayed in the **Activities** column and the name of the corresponding operation that appears in the detailed information of an audit record and in the CSV file when you export the search results.

FRIENDLY NAME	OPERATION	DESCRIPTION
Added bot to team	BotAddedToTeam	A user adds a bot to a team.
Added channel	ChannelAdded	A user adds a channel to a team.
Added connector	ConnectorAdded	A user adds a connector to a channel.
Added details about Teams meeting ²	MeetingDetail	Teams added information about a meeting, including the start time, the end time, and the URL to join the meeting.
Added information about meeting participants ²	MeetingParticipantDetail	Teams added information about the participants of a meeting, including the user ID of each participant, the time a participant joined the meeting, and the time a participant left the meeting.
Added members	MemberAdded	A team owner adds members to a team, channel, or group chat.
Added tab	TabAdded	A user adds a tab to a channel.
Changed channel setting	ChannelSettingChanged	<p>The ChannelSettingChanged operation is logged when the following activities are performed by a team member. For each of these activities, a description of the setting that was changed (shown in parentheses is displayed in the Item column in the audit log search results.</p> <ul style="list-style-type: none"> Changes name of a team channel (Channel name) Changes description of a team channel (Channel description)
Changed organization setting	TeamsTenantSettingChanged	<p>The TeamsTenantSettingChanged operation is logged when the following activities are performed by a global admin in the Microsoft 365 admin center. Withdrawn schedule	ScheduleWithdrawn	A user successfully withdraws a published schedule.
Added shift	ShiftAdded	A user successfully adds a shift.
Edited shift	ShiftEdited	A user successfully edits a shift.
Deleted shift	ShiftDeleted	A user successfully deletes a shift.
Added time off	TimeOffAdded	A user successfully adds time off on the schedule.
Edited time off	TimeOffEdited	A user successfully edits time off.
Deleted time off	TimeOffDeleted	A user successfully deletes time off.
Added open shift	OpenShiftAdded	A user successfully adds an open shift to a scheduling group.
Edited open shift	OpenShiftEdited	A user successfully edits an open shift in a scheduling group.

FRIENDLY NAME	OPERATION	DESCRIPTION
Deleted open shift	OpenShiftDeleted	A user successfully deletes an open shift from a scheduling group.
Shared schedule	ScheduleShared	A user successfully shared a team schedule for a date range.
Clocked in using Time clock	ClockedIn	A user successfully clocks in using Time clock.
Clocked out using Time clock	ClockedOut	A user successfully clocks out using Time clock.
Started break using Time clock	BreakStarted	A user successfully starts a break during an active Time clock session.
Ended break using Time clock	BreakEnded	A user successfully ends a break during an active Time clock session.
Added Time clock entry	TimeClockEntryAdded	A user successfully adds a new manual Time clock entry on Time Sheet.
Edited Time clock entry	TimeClockEntryEdited	A user successfully edits a Time clock entry on Time Sheet.
Deleted Time clock entry	TimeClockEntryDeleted	A user successfully deletes a Time clock entry on Time Sheet.
Added shift request	RequestAdded	A user added a shift request.
Responded to shift request	RequestRespondedTo	A user responded to a shift request.
Canceled shift request	RequestCancelled	A user canceled a shift request.
Changed schedule setting	ScheduleSettingChanged	A user changes a setting in Shifts settings.
Added workforce integration	WorkforceIntegrationAdded	The Shifts app is integrated with a third-party system.
Accepted off shift message	OffShiftDialogAccepted	A user acknowledges the off-shift message to access Teams after shift hours.

Office 365 Management Activity API

You can use the Office 365 Management Activity API to retrieve information about Teams events. To learn more about the Management Activity API schema for Teams, see [Teams schema](#).

Attribution in Teams audit logs

Membership changes to Teams (such as users added or deleted) made through Azure Active Directory (Azure AD), Microsoft 365 admin portal, or Microsoft 365 Groups Graph API will appear in Teams audit messages and in the General channel with an attribution to an existing owner of the team, and not to the actual initiator of the

action. In these scenarios, consult Azure AD or [Microsoft 365 Group audit logs](#) to see the relevant information.

Use Cloud App Security to set activity policies

Using [Microsoft Cloud App Security](#) integration, you can set [activity policies](#) to enforce a wide range of automated processes using the app provider's APIs. These policies enable you to monitor specific activities carried out by various users, or follow unexpectedly high rates of one certain type of activity.

After you set an activity detection policy, it starts to generate alerts. Alerts are only generated on activities that occur after you create the policy. Here's some example scenarios for how you can use activity policies in Cloud App Security to monitor Teams activities.

External user scenario

One scenario you might want to keep an eye on, from a business perspective, is the addition of external users to your Teams environment. If external users are enabled, monitoring their presence is a good idea. You can use [Cloud App Security](#) to identify potential threats.

Cloud App Security

Edit activity policy [View policy matches \(0\)](#)

Policy template *
No template

Policy name *
Microsoft Teams - External user added to a team

Policy severity *
High

Category *
Threat detection

Description

Create filters for the policy

Act on:
☒ Single activity
Every activity that matches the filters
☐ Repeated activity:
Repeated activity by a single user

ACTIVITIES MATCHING ALL OF THE FOLLOWING [Edit and preview results](#)

User From group equals
External users as Activity object only

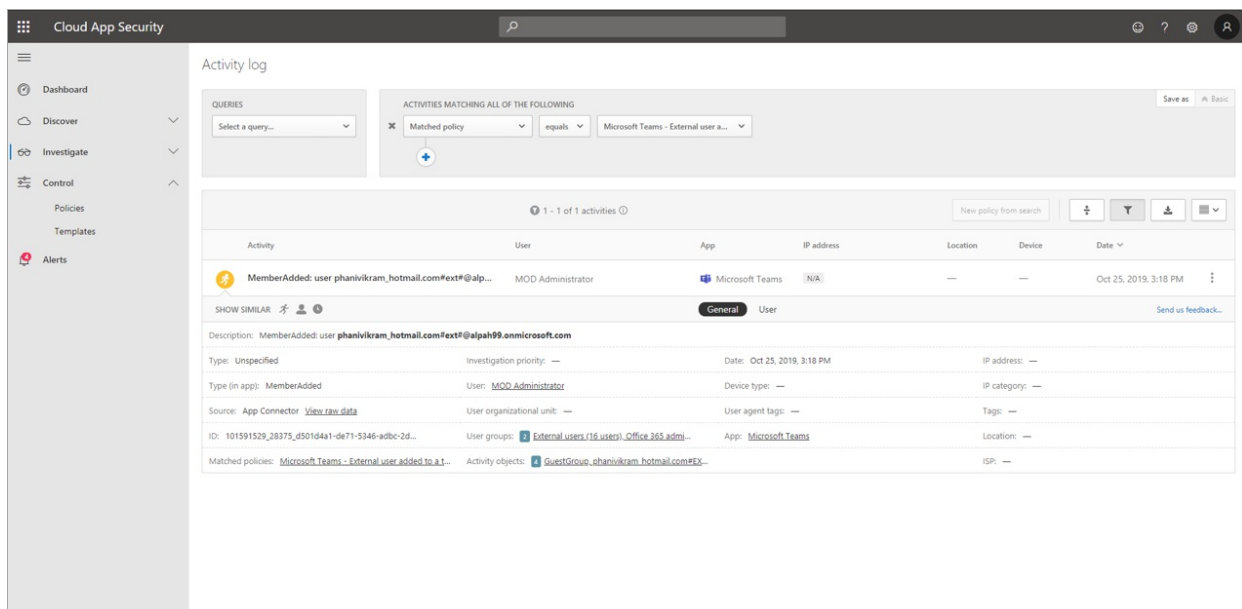

Activity type equals
MemberAdded

App equals
Microsoft Teams

+ Add filter

The screenshot of this policy to monitor adding external users allows you to name the policy, set the severity according to your business needs, set it as (in this case) a single activity, and then establish the parameters that will specifically monitor only the addition of non-internal users, and limit this activity to Teams.

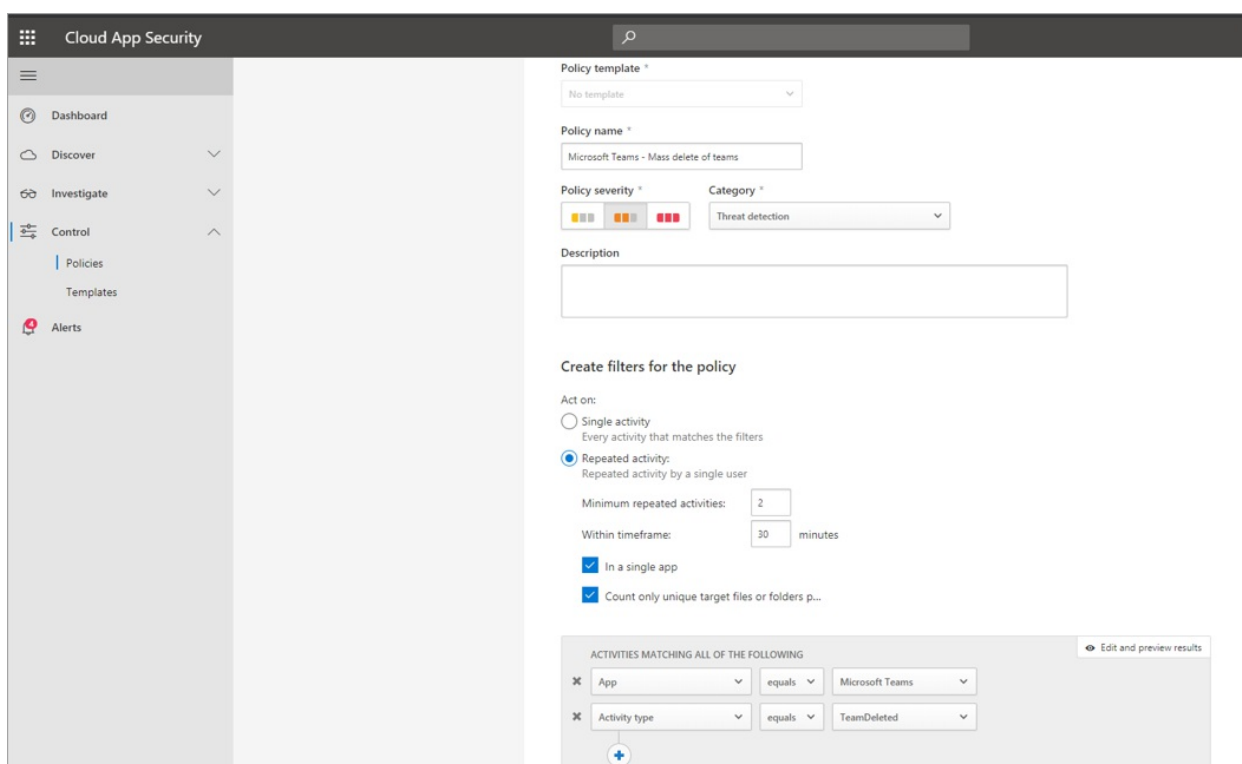

The results from this policy can be viewed in the activity log:

Here you can review matches to the policy you've set, and make any adjustments as needed, or export the results to use elsewhere.

Mass delete scenario

As mentioned earlier, you can monitor deletion scenarios. It's possible to create a policy that would monitor mass deletion of Teams sites. In this example, an alert-based policy is set up to detect mass deletion of teams in a span of 30 minutes.

As the screenshot shows, you can set many different parameters for this policy to monitor Teams deletions, including severity, single or repeated action, and parameters limiting this to Teams and site deletion. This can be done independently of a template, or you may have a template created to base this policy on, depending on your organizational needs.

After you establish a policy that works for your business, you can review the results in the activity log as events are triggered:

Activity	User	App	IP address	Location	Device	Date
Delete team: Microsoft Team Private2Testing	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 25, 2019, 3:21 PM
Delete team: Microsoft Team IB Test Team 1	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 25, 2019, 3:21 PM
Delete team: Microsoft Team VikramTestOWA	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 25, 2019, 3:17 PM
Delete team: Microsoft Team AuditTestTeamNRT	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 25, 2019, 3:13 PM
Delete team: Microsoft Team AuditNRTTeam	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 25, 2019, 3:13 PM
Delete team: Microsoft Team AuditTestTeam22	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 25, 2019, 3:07 PM
Delete team: Microsoft Team test	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 23, 2019, 7:40 AM
Delete team: Microsoft Team CAS team	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 23, 2019, 7:15 AM
Delete team: Microsoft Team Cas team - external user	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 23, 2019, 6:44 AM
Delete team: Microsoft Team CAS team 2	MOD Administrator	Microsoft Teams	N/A	—	—	Oct 23, 2019, 6:38 AM

You can filter down to the policy you've set to see the results of that policy. If the results you're getting in the activity log are not satisfactory (maybe you're seeing lots of results, or nothing at all), this may help you to fine-tune the query to make it more relevant to what you need it to do.

Alert and governance scenario

You can set alerts and send emails to admins and other users when an activity policy is triggered. You can set automated governance actions such as suspending a user or making a user to sign in again in an automated way. This example shows how a user account can be suspended when an activity policy is triggered and determines a user deleted two or more teams in 30 minutes.

Alerts

☒ Create an alert for each matching event with the policy's severity

☐ Send alert as email ⓘ

☐ Send alert as text message ⓘ

Daily alert limit:

☐ Send alerts to Power Automate
[Create a playbook in Power Automate](#)

Governance actions

☐ All apps

☒ Office 365 Suspend user ^

☒ Suspend user

☐ Require user to sign in again

☐ Confirm user compromised

Use Cloud App Security to set anomaly detection policies

[Anomaly detection policies](#) in Cloud App Security provide out-of-the-box user and entity behavioral analytics (UEBA) and machine learning (ML) so that you can immediately run advanced threat detection across your cloud environment. Because they're automatically enabled, the new anomaly detection policies provide immediate results by providing immediate detections, targeting numerous behavioral anomalies across your users and the machines and devices connected to your network. Additionally, the new policies expose more data from the

Cloud App Security detection engine, to help you speed up the investigation process and contain ongoing threats.

We're working to integrate Teams events into anomaly detection policies. For now, you can set up anomaly detection policies for other Office products and take action items on users who match those policies.

Export content with the Microsoft Teams Export APIs

12/7/2021 • 4 minutes to read • [Edit Online](#)

Teams Export APIs allow you to export 1:1, group chat, meeting chats, and channel messages from Microsoft Teams. If your organization needs to export Microsoft Teams messages, you are able to extract them using Teams Export APIs. *Chat Message* represents an individual chat message within a [channel](#) or [chat](#). The chat message can be a root chat message or part of a reply thread that is defined by the `replyToId` property in the chat message.

Here are some examples on how you can use these export APIs:

- **Example 1:** If you have enabled Microsoft Teams in your organization and want to export all the Microsoft Teams messages to date programmatically by passing the date range for a given user or team.
- **Example 2:** If you want to programmatically export all user or team messages daily by providing a date range. Export APIs can retrieve all the messages created or updated during the given date range.

What is supported by the Teams Export APIs?

- **Bulk Export of Teams Message:** Teams Export APIs support up to 200 RPS Per App Per tenant and 600 RPS for an Application, with these limits you should be able to bulk export of Teams messages.
- **Application Context:** To call Microsoft Graph, your app must acquire an access token from the Microsoft identity platform. The access token contains information about your app and the permissions it has for the resources and APIs available through Microsoft Graph. To get an access token, your app must be registered with the Microsoft identity platform and be authorized by either a user or an administrator for access to the Microsoft Graph resources it needs.

If you are already familiar with integrating an app with the Microsoft identity platform to get tokens, see the [Next Steps](#) section for information and samples specific to Microsoft Graph.

- **Hybrid Environment:** Export APIs support messages sent by users who are provisioned on Hybrid Environment (on-premises Exchange and Teams). Any messages that are sent by users who are configured for hybrid environment will be accessible using Export APIs.
- **User Deleted Messages:** Messages that are deleted by users from the Teams client can be accessed using export APIs up to 21 days from the time of deletion.
- **Message Attachments:** Export APIs include the links to the attachments that are sent as part of messages. Using Export APIs you can retrieve the files attached in the messages.
- **Chat Message Properties:** Refer to the complete list of properties that Teams Export APIs support [here](#).

NOTE

Export APIs do not support *reactions*.

How to access Teams Export APIs

- **Example 1** is a simple query to retrieve all the messages of a user or team without any filters:

```
GET https://graph.microsoft.com/v1.0/users/{id}/chats/getAllMessages
```

```
GET https://graph.microsoft.com/v1.0/teams/{id}/channels/getAllMessages
```

- **Example 2** is a sample query to retrieve all the messages of a user or team by specifying date time filters and top 50 messages:

```
GET https://graph.microsoft.com/v1.0/users/{id}/chats/getAllMessages?
$top=50&$filter=lastModifiedDateTime gt 2020-06-04T18:03:11.591Z and lastModifiedDateTime lt 2020-06-
05T21:00:09.413Z
```

```
GET https://graph.microsoft.com/v1.0/teams/{id}/channels/getAllMessages?
$top=50&$filter=lastModifiedDateTime gt 2020-06-04T18:03:11.591Z and lastModifiedDateTime lt 2020-06-
05T21:00:09.413Z
```

NOTE

The API returns response with next page link in case of multiple results. For getting next set of results, simply call GET on the url from @odata.nextlink. If @odata.nextlink is not present or null then all messages are retrieved.

Prerequisites to access Teams Export APIs

- Microsoft Teams APIs in Microsoft Graph that access sensitive data are considered protected APIs. Export APIs require that you have additional validation, beyond permissions and consent, before you can use them. To request access to these protected APIs, complete the [request form](#).
- Application permissions are used by apps that run without a signed-in user present; application permissions can only be consented by an administrator. The following permissions are needed:
 - *Chat.Read.All*: enables access to all 1:1, Group chat, and meeting chat messages
 - *ChannelMessage.Read.All*: enables access to all channel messages
 - *User.Read.All*: enables access to the list of users for a tenant

License requirements for Teams Export APIs

Export API supports Security and Compliance (S+C) and general usage scenarios through a model query parameter. S+C scenarios (Model A) include seeded capacity and require an E5 subscription and general usage scenarios (Model B) are available for all subscriptions and is consumption only. For more information about seeded capacity and consumption fees, see [Licensing and payment requirements for Microsoft Graph Teams APIs](#).

S+C/Model A scenarios

Restricted to applications performing security and/or compliance functions, users must have specific E5 licenses to use this functionality and receive seeded capacity. Seeded capacity is per user and is calculated per month and is aggregated at the tenant level. For usage beyond the seeded capacity, app owners are billed for API consumption. Model A can only access messages from users with an assigned E5 license.

General usage/Model B scenarios

Available for all non-S+C related scenarios, there are no license requirements or seeded capacity. When consumption meters become available, app owners will be charged for all monthly API calls.

Evaluation Mode (default)

No model declaration enables access to APIs with limited usage per each requesting application for evaluation purposes.

For more details on chatMessage resource, see the [chatMessage resource type](#) article.

Privacy and Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

When an organization is considering relying on Microsoft Teams for communication and collaboration, privacy is something that needs to be addressed at every level. The questions we have below should address the privacy concerns you may have when planning your Teams implementation, or at any point during Teams usage.

What personal data does Microsoft Teams collect and for what purposes does Microsoft Teams use this data?

Microsoft processes the personal data in Microsoft Teams to deliver the agreed-upon services defined in the [Online Services Terms](#) and ultimately for the purposes determined by the data controller obtaining the service. Microsoft Teams, as a cloud-based service, processes various types of personal data as part of delivering the service. This personal data includes:

- **Content** Your meetings and conversations chats, voicemail, shared files, recordings and transcriptions.
- **Profile Data** Data that is shared within your company about you. Examples include your E-mail address, profile picture, and phone number.
- **Call History** A detailed history of the phone calls you make, which allows you to go back and review your own call records.
- **Call Quality data** Details of meetings and call data are available to your system administrators. This allows your administrators to diagnose issues related to poor call quality and service usage.
- **Support/Feedback data** Information related to troubleshooting tickets or feedback submission to Microsoft.
- **Diagnostic and service data** Diagnostic data related to service usage. This personal data allows Microsoft to deliver the service (troubleshoot, secure and update the product and monitor performance) as well as perform some internal business operations, such as:
 - Determine revenue
 - Develop metrics
 - Determine service usage
 - Conduct product and capacity planning

To the extent Microsoft Teams processes personal data in connection with Microsoft's legitimate business operations, Microsoft will be an independent data controller for such use and will be responsible for complying with all applicable laws and controller obligations.

Legal Basis of Processing

Our customers are controllers for the data provided to Microsoft, as set forth in the [Online Services Terms](#), and they determine legal bases of processing. Microsoft, in turn, processes the data on the customers' instructions, as a processor.

To the extent Microsoft processes personal data in connection with its own legitimate business operations, as described in the [Online Services Terms](#), Microsoft will be an independent controller for such processing, the legal basis of which is legitimate interests. "Microsoft's legitimate business operations" consist of the following, each as incident to delivery of Microsoft Teams to the customer: (1) billing and account management; (2) compensation (e.g., calculating employee commissions and partner incentives); (3) internal reporting and modeling (e.g., forecasting, revenue, capacity planning, product strategy); (4) combatting fraud, cybercrime, or cyber-attacks that may affect Microsoft or Microsoft Products; (5) improving the core functionality of

accessibility, privacy or energy-efficiency; and (6) financial reporting and compliance with legal obligations.

What third parties have access to personal data?

Microsoft will not disclose personal data except:

1. as the customer directs (including as required to complete phone calls);
2. as described in the Online Service Terms (such as the use of authorized subcontractors to provide certain components of services);
3. as required by law.

If law enforcement contacts Microsoft with a demand, Microsoft will attempt to redirect the law enforcement agency to request that personal data directly from the customer. If compelled to disclose personal data to law enforcement, Microsoft will promptly notify the customer and provide a copy of the demand unless legally prohibited from doing so. For more information about data that we disclose in response to requests from law enforcement and other government agencies, please see our [Law Enforcement Requests Report](#).

The [Teams Security Guide](#) has more information about our compliance standards.

Where does Teams transfer and store personal data?

Personal data is transferred and stored as set forth in the [Online Service Terms](#).

For transfers of personal data from the EEA, EU, Switzerland, and the UK, Microsoft is certified to the EU-U.S. and Swiss-U.S. Privacy Shield Frameworks and the commitments they entail, although Microsoft does not rely on the EU-U.S. Privacy Shield Framework as a legal basis for transfers of Personal Data in light of the judgment of the Court of Justice of the EU in Case C-311/18.

We have information on the [Location of data in Microsoft Teams](#) if you need to learn more.

How long does Microsoft Teams retain personal data?

Microsoft Teams retains your data for the minimum amount of time necessary to deliver the service.

Because this data is required to provide the service, this typically means that we retain personal data until the user stops using Microsoft Teams, or until the user deletes personal data. If a user (or an administrator on the user's behalf) deletes the data, Microsoft will ensure that all copies of the personal data are deleted within 30 days.

If a company terminates service with Microsoft, corresponding personal data will all be deleted between 90 and 180 days of service termination.

In some circumstances, local laws require that Microsoft Teams retain telephone records (for billing purposes) for a specific period of time, in those circumstances Microsoft Teams follows the law for each region.

Additionally, if a company requests that Microsoft Teams hold a user's data to support a legal obligation, Microsoft will respect the company administrator's request.

Right to withdraw consent

If Microsoft Teams processes any personal data based on consent, you may have the right to withdraw your consent at any time. You should direct your request to withdraw consent to your administrator, where your administrator is the controller of the personal data at issue.

Contact Details of Microsoft's Data Protection Officer

If you have a privacy concern, complaint or question for the Microsoft Chief Privacy Officer and EU Data Protection Officer, please contact us by using [our web form](#). Our EU Data Protection Officer is located at

Microsoft Place, South County Business Park, Leopardstown, Dublin 18, Ireland. Telephone: +353 1 706 3117. You can also raise a concern or lodge a complaint with a data protection authority or other official with jurisdiction.

Location of data in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Data in Teams resides in the geographic region associated with your Microsoft 365 or Office 365 organization. Currently, Teams supports the Australia, Brazil, Canada, France, Germany, India, Japan, Norway, South Africa, South Korea, Switzerland (which includes Liechtenstein), the United Arab Emirates, United Kingdom, Americas, APAC, and EMEA regions.

IMPORTANT

Teams currently offers data residency in Australia, Brazil, Canada, France, Germany, India, Japan, Norway, the United Arab Emirates, United Kingdom, South Korea, South Africa, and Switzerland (which includes Liechtenstein) for new tenants only. A new tenant is defined as any tenant that hasn't had a single user from the tenant sign in to Teams or its admin user has never signed in to the Teams admin center. Existing tenants from Australia, India, Japan, and South Korea will continue to have their Teams data stored in the APAC region. Existing tenants in Brazil and Canada will continue to have their data stored in the Americas. Existing tenants in France, Germany, Liechtenstein, Norway, the United Arab Emirates, the United Kingdom, South Africa, and Switzerland will have their data stored in the EMEA region.

Where your Teams data is stored

To see which region houses data for your tenant, go to the [Microsoft 365 admin center](#) > **Settings** > **Organization profile**. Scroll down to **Data location**.

Data location

Office 365 has been built from the ground-up to provide enterprise-grade security, privacy and compliance capabilities. As part of our transparency principles we publish the location of your core customer data at rest here.

Service Name	Region
 Exchange	North America
 SharePoint	North America
 Skype for Business	North America
 Microsoft Teams	North America

For a detailed list of countries and data stored, see [Where your Microsoft 365 customer data is stored](#).

Data stored with a third-party storage provider

Organizations who allow users to store files with a third-party storage provider are dependent on the storage location of those services and should, therefore, review the location of data at rest for those services separately.

Microsoft Teams feedback privacy

12/7/2021 • 2 minutes to read • [Edit Online](#)

At Microsoft we take feedback from our customers very seriously. The feedback you provide will be used to troubleshoot, fix bugs, enhance existing features, and develop new ones. Your feedback may be reviewed by teams responsible for product quality and customer assurance.

You can request copies of your feedback or ask for the feedback you provided to be deleted. For more info, see the [Export or delete your Teams data](#) article.

When submitting feedback, we ask that you not include sensitive information, like phone numbers, addresses, or highly personal stories. Instead, please provide information on the specific issue you are experiencing with our app or your experience with the app. This will help us maintain your privacy as we review and take action based on your feedback.

As always, thank-you for taking the time to share your thoughts with us. Your perspectives help us improve our existing products and develop better ones.

Block access to SharePoint for specific users

12/7/2021 • 2 minutes to read • [Edit Online](#)

Applying any Conditional Access (CA) policy on SharePoint in Microsoft 365 is also applied to Teams. However, some organizations want to block access to SharePoint files (upload, download, view, edit, create) yet allow their employees to use Teams desktop, mobile, and web clients on unmanaged devices. Under the CA policy rules, blocking SharePoint would lead to blocking Teams as well. This article explains how you can work around this limitation and allow your employees to continue using Teams while completely blocking access to files stored in SharePoint.

NOTE

Blocking or limiting access on unmanaged devices relies on Azure AD conditional access policies. Learn about [Azure AD licensing](#). For an overview of conditional access in Azure AD, see [Conditional access in Azure Active Directory](#). For info about recommended SharePoint Online access policies, see [Policy recommendations for securing SharePoint sites and files](#). If you limit access on unmanaged devices, users on managed devices must use one of the [supported OS and browser combinations](#), or they will also have limited access.

You can block or limit access for:

- Users in the organization or only some users or security groups.
- All sites in the organization or only some sites.

When access is blocked, users will see an error message. Blocking access helps provide security and protects secure data. When access is blocked, users will see an error message.

1. Open the SharePoint Admin Center.
2. Expand **Policies > Access Policies**.
3. In the **Unmanaged Devices** section, select **Block Access** and select **Save**.

4. Open the [Azure Active Directory](#) portal and navigate to **Conditional Access Policies**.

You'll see a new policy has been created by SharePoint that's similar to this example:

[Home](#) > [Conditional Access | Policies](#) >

Policy control overview for Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Microsoft is committed to providing you with the information and controls you need to make choices about how your data is collected and used when you're using Microsoft Teams, a part of Microsoft 365.

This article is intended to provide you with information about privacy controls for the following areas:

- **Diagnostic data** that is collected and sent to Microsoft about Teams and Office software being used on computers running Windows in your organization.
- **Connected experiences** that use cloud-based functionality to provide enhanced Teams and Office features to you and your users.

As part of these changes, there are new and updated user interface (UI) elements and policy settings

IMPORTANT

For further reading, please review [Overview of privacy controls for Microsoft 365 Apps for enterprise](#).

Diagnostic data sent from Microsoft 365 Apps for enterprise to Microsoft

Diagnostic data is used to:

- Keep Teams secure and up-to-date.
- Detect, diagnose, and remediate problems.
- Make product improvements.

An example of some of the collected data includes:

- Application language
- User type
- Build version of the OS

Clients that adhere to diagnostic controls

The following clients adhere to diagnostic controls and will submit data:

- iOS
- Android
- Desktop (only the component that is using the win32 API)

To see a list of required diagnostic data events and their properties, see the following articles:

- [Required mobile diagnostic data for Microsoft Teams](#)
- [Required desktop diagnostic data for Microsoft Teams](#)

Diagnostic data sent from the Teams app to Microsoft

This diagnostic data is collected and sent to Microsoft about Teams software being used on computers running Windows in your organization.

There are three levels of diagnostic data for Teams software that you can choose from:

- **Required** The minimum data necessary to help keep Office secure, up-to-date, and performing as expected on the device it's installed on.
- **Optional** Additional data that helps us make product improvements and provides enhanced information to help us detect, diagnose, and remediate issues.
- **Neither** No diagnostic data about Teams software running on the user's device is collected and sent to us. This option, however, significantly limits our ability to detect, diagnose, and remediate problems your users may encounter using Teams.

Required diagnostic data could include, for example, information about the version of Teams client installed on the device, or include information that indicates that the Teams application is crashing when trying to join a meeting. Optional diagnostic data could include information about the time it takes to initiate a phone call, which could indicate an issue with connectivity or network performance.

If you choose to send us optional diagnostic data, required diagnostic data is also included.

As an admin for your organization, you'll be able to use a policy setting to choose which level of diagnostic data is sent to us. Optional diagnostic data will be sent to Microsoft unless you change the setting. Providing optional diagnostic data better enables the Office engineering team at Microsoft to detect, diagnose, and mitigate issues to reduce impacts to your organization.

To choose which level of diagnostic data is sent to us, use the [Office cloud policy service](#) and configure the *Configure the level of client software diagnostic data sent by Office to Microsoft* policy setting. This is the same policy setting that is used to configure which level of diagnostic data is sent by other Office apps (such as Word, Excel, and PowerPoint) that come with Microsoft 365 Apps for enterprise.

Your users won't be able to change the diagnostic data level for their devices if they are signed in to Teams with their organizational credentials, which is sometimes referred to as a work or school account.

This diagnostic data doesn't include names of users, their email addresses, or other user content, such as Office files shared in Teams, a chat message sent in Teams, or the text of a post published in a Teams channel. Our system creates a unique ID that it associates with your user's diagnostic data. When we receive diagnostic data showing that the Teams app crashed 100 times, this unique ID lets us determine if it was a single user who crashed 100 times or if it was 100 different users who each crashed once. We don't use this unique ID to identify a specific user.

To see what diagnostic data is being sent to Microsoft, you can use the Diagnostic Data Viewer, which you can download and install for free from the Microsoft Store. For more information, see [Using the Diagnostic Data Viewer with Office](#).

Required service data for connected experiences

Required service data is data that enables us to deliver these cloud-based connected experiences and help make these experiences secure and perform as expected. You can choose to not offer this functionality to your users, in which case this information will not be provided to Microsoft to support the functionality of connected experiences. You can learn more about [required service data](#).

Essential services for Microsoft Teams

There is also a set of services that are essential to how Microsoft 365 Apps for enterprise functions and cannot be disabled. For example, the licensing service that confirms that you are properly licensed to use Microsoft 365 Apps for enterprise. Required service data about these services is collected and sent to Microsoft, regardless of any other policy settings that you have configured.

For more information, see [Essential services for Office](#).

Required mobile diagnostic data for Microsoft Teams

12/7/2021 • 79 minutes to read • [Edit Online](#)

The following article contains a list of Microsoft Teams mobile events, and lists of properties each event collects.

For more information about diagnostic data, including how to control what diagnostic data is sent to Microsoft, see [Diagnostic data sent from the Teams app to Microsoft](#). To view the diagnostic data being sent to Microsoft, you can use the [Diagnostic Data Viewer](#).

Events

NOTE

There are common properties for all events listed below, to review them, see [Properties sent with all events](#).

PanelAction

NOTE

For information on the properties of PanelAction events, see [Properties sent with panelaction events](#).

- **acceptUser** - The user has accepted a 1:1 chat.
- **accessibilityUserConfiguration** - When a user toggles an accessibility feature.
- **acknowledgeSettingChange** - Acknowledge an update in the we updated a notification setting dialog. This is a feature success metrics used to acknowledge update notifications and to determine overall notification reliability.
- **actionComposeMenu**
 - Create message extension usage.
 - Action message extension usage.
- **active_session_banner_dismissed** - The location sharing active reminder banner was dismissed.
- **activityChatClicked** - Triggered when non-live chat is selected in the **Activity** tab or a split view is shown.
- **activityContextMenu** - Overflow actions in the activity feed.
- **activityFeedClick** - An activity feed item is tapped on and a bot chat is navigated to.
- **activityFeedLongPress** - Captures long press gestures on feed items.
- **activityFeedSwipe** - Captures swipe gestures on feed items.
- **activityFilterClick** - Captures activity filter usage.
- **activityFilterOptionsClick** - Captures activity filter usage.
- **activityFilterOptionsClicked** - Captures activity filter usage.

- **activityLiveChatClicked** - Triggered when chat is selected from a live meeting on the **Activity** tab.
- **activityLiveDetailsClicked** - Triggered when **Details** is selected from a live meeting on the **Activity** tab.
- **activityTabClicked** - Helps to determine if:
 - The **Activity** tab is shown.
 - Teams captures an **Activity** tab event.
- **activityTypeDropdown** - Captures activity filter usage to switch between **My Activity** and **Feeds**.
- **addChannel** - Adding a channel. This item provides success data around the successful creation of a channel.
- **addMember** - Triggered the **Invite people** button is selected in the **More** menu.
- **addMembers** - Add members to a team or private channel.
- **addToCalendar** - Select the **Add to calendar** button for calendar events missing in private calendar.
- **addToList** - A contact is added to a contact list.
- **addToMeeting** - Select the **Add to meeting** button in the participant list for a meeting (for participants who are a part of the chat).
- **addUserAsContact** - A contact can be added by selecting the **Add contact** icon from the profile card of the contact.
- **admitAll** - The number of times the **Admit all** button is selected from the lobby section.
- **admitParticipant** - The number of times someone is admitted into a meeting from the meeting roster.
- **alertsNavAlert** - Tapping on a feed item.
- **aliasDiscoverabilitySettingOpened** - Entry point to discoverability settings.
- **android: null** - Mute or unmute a bot chat. This is enhancing existing telemetry around chats only adds application information.
- **anonymousMeetingJoin** - **Join meeting** is selected on an anonymous join provide name page or **OK** is tapped in the name dialog.
- **anonymousMeetingJoinWelcome** - **Join as guest** is selected on an anonymous join meeting landing page.
- **anonymousMeetingPostMeetingChat** - The number of user views of chat from the call end screen.
- **anonymousMeetingPostMeetingRejoin** - The number of times an anonymous user tries to rejoin a meeting.
- **anonymousMeetingSignIn** - The number of times a user navigated to sign-in from the name input screen.
- **anonymousMeetingSignInWelcome** - The **Sign in and join** is selected on an anonymous join meeting landing page.
- **anonymousMeetingToggleMuted** - The number of times the mute toggle button was selected.
- **anonymousMeetingToggleVideo** - The number of times the video toggle button was selected.
- **appKilled** - The application is terminated.
- **approveTimeOffRequest** - When a Frontline Worker (FLW) Manager approves a Frontline Worker

request to take time off.

- **assigneeChange** - Triggers when a new assignee is added to a task item.
- **assignmentPickerClicked** - The **Assign To** button is selected, opening an assignee picker page.
- **assignmentRemoved** - Triggers when an assignee is removed from a task item by selecting the **x** (which is the only way to remove an assignee).
- **attachmentAdded** - Confirms that an attachment in a task was successfully added.
- **attachmentDeleted** - Confirms that an attachment in a task was successfully deleted.
- **attachmentUpdated** - Confirms that an attachment in a task was successfully updated.
- **audioOnlyLowBatteryBanner** - The **Audio only** option is selected due to a low battery banner.
- **audioOnlyPoorNetworkBanner** - The **Video off** option is selected due to a poor connection banner.
- **audioUserDoubleTap** - Double tap on an audio participant.
- **autoReconnectCallmebackCallDrop** - The number of times the **Callmeback** button was selected at a call end screen.
- **autoReconnectDialIn**
 - The **Dial in** button is selected on the reconnect UFD.
 - The number of times the **Dial In** button was selected while a reconnect is happening.
- **autoReconnectDialInonCallDrop** - The **Dial in** button is selected on the call disconnected UFD.
- **autoReconnectDialOut** - The **Call me back** button is selected on the reconnect UFD.
- **autoReconnectRejoinonCallDrop** - The number of times the **Rejoin** or the **Redial** button was selected at the call end screen.
- **backFromCallMePSTN** - Call Me back PSTN number flow is not completed.
- **backToPhotoShare** - Returning to a camera.
- **backToStageFromWhiteboard** - Returning to a call screen from a whiteboard.
- **backToWhiteboardFromStage** - Going to a whiteboard from a call screen.
- **blockAnonymous** - When:
 - Enables calling setting to block calls without caller id from settings.
 - Disables calling setting to block calls without caller id from settings.
 - Enables calling setting to block calls without caller id from action sheet.
 - Disables calling setting to block calls without caller id from action sheet.
- **blockCaller** - Blocking:
 - A number and contact from the new iOS calls action sheet.
 - A contact and number from the contact card.
 - Numbers from settings.
- **blockChat** - Blocking a bot chat. This enhances existing telemetry around chats and is only adding application information.
- **botClickCardAction** - Connector card usage.
- **brbFormOpened** - The user requested to send feedback.

- **brbFormSubmit** - The user submitted feedback.
- **breakStartEndClicked** - On the clock in screen, the **Start** or the **End break** button is selected.
- **breakStartEndTriggered** - Register a user chooses to use break start or end.
- **bucketSelected** - Confirms that a bucket has been successfully selected.
- **bucketUnselected** - Confirms that a bucket has been successfully unselected.
- **bucketPickerClicked** - Confirms that the bucket picker successfully launched.
- **BYOELiveEventJoin** - BYOE (broadcast your own event) live event is joined by a user.
- **calendarLiveChatClicked** - Chat from live meeting on the **Schedule** tab.
- **calendarMeetingJoin** - **Meeting Join** button selected from a calendar.
- **calendarTab** - Select the **Meetings** tab in the bottom rail. Useful in understanding the calendar usage and comparing with other apps on the bottom rail, or determining if there was a failure in rendering the calendar post after selecting from the bottom bar.
- **calendarTabClicked** - In the circumstances listed below, this will show calendar usage and allow you to compare with other navbar apps on the bottom rail. This can be used to determine if there was a failure when:
 - The **Schedule** tab is shown.
 - The **Meetings** tab is selected in the bottom rail.
- **calendarUpcomingChatClicked** - Chat from an upcoming meeting on the **Schedule** tab.
- **callAccepted** - Call accepted.
- **callAcceptedSFB** - Call accepted.
- **callAppPreference** - A preferred calling App is selected.
- **callControlsManualDismiss** - Call controls are dismissed manually.
- **callControlsManualInvoke** - Call controls are invoked manually.
- **callHistoryItemExpand** - Call History item expanded.
- **callHistoryTab** - **CallHistory** tab is selected in Calls.
- **callInProgressShown** - A ***Call in progress** banner is shown.
- **callMePSTNConnected** - **Call me** is successful.
- **callOrMeetUpAddParticipants** - Triggered when:
 - Add participant button is tapped on a 1:1 call screen.
 - Select Person (VoIP) in Add participants.
 - Select PSTN in Add participants.
 - Add people in a live private meeting.
 - Select PSTN in a live private meeting.
 - Select Company contact in a live Private meeting.
 - Select Device contact in a live private meeting.
 - Add Participants Done in a live private meeting.
 - Add people in a live channel meeting.
 - Select PSTN in a live channel meeting.

- Select Team Member in a live channel meeting.
 - Select Device contact in a live channel meeting.
 - Add Participants Done in a live channel Meeting.
- **callOrMeetUpAddParticipantsDone** - A user finalizes their participant addition.
- **callOrMeetUpAddRoom** - Triggered when:
 - **Add room** is selected in roster.
 - A search result is selected in add room.
 - **Dismiss** is selected for Nearby.
 - **Enable BT** or **Location** is selected for Nearby.
 - A nearby room result is selected in add room.
 - A suggested room result is selected in add room.
 - **Done** is selected in add room.
- **callOrMeetUpAudioOffSwitch** - Flip **Audio off** button while in companion join mode in a live call or meetup.
- **callOrMeetUpAutoReconnect** - Poor network performance causes a user's device to go into Autoreconnect mode.
- **callOrMeetUpCallAccepted** - Triggered when:
 - A call is accepted.
 - A PSTN Call is accepted.
- **callOrMeetUpCallEnded** - Triggered when:
 - An **End call** button is tapped.
 - A **Call ended** button is tapped while in callOrMeetupLive.
 - A **Call ended** button is tapped while in lockScreen.
 - A **Call ended** button tapped while in notification.
 - A **Call ended** button tapped while in inApp.
 - A **Call ended** button tapped while in callKit.
 - A **Call Ended** button for PSTN tapped.
- **callOrMeetUpChatWithParticipants** - Chat toggle while in live meeting or call.
- **callOrMeetUpDeviceAudioSwitch** - Triggered when:
 - Switch audio source to speaker.
 - Switch audio source to device.
 - Switch audio source to Bluetooth.
 - Switch audio source to audio off.
 - Switch speaker while in live meeting or a call.
 - Switch speaker to Audio off while in live meeting or a call.
 - Flip **Audio off** button while in companion join mode in live call or meetup.
 - Device Audio Switch while in PSTN.
- **callOrMeetUpEnterDriveMode** - Switches manually to drive mode from the ... menu.
- **callOrMeetupExitDriveMode** - Exit drive mode button tapped.
- **callOrMeetUpHold** - Triggered when:
 - The **Hold** button is tapped while in live meeting or a call.
 - Call Hold in PSTN.

- **callOrMeetUpIncomingVideoSwitch** - Turn off IncomingVideo while in live meeting or a call.
- **callOrMeetUpInvitedParticipants** - Triggered when:
 - Clicked **See all** at the bottom of an **Others invited** participant group during private live meeting.
 - Clicked **See all** at the bottom of an **Others invited** participant group during live channel meeting.
- **callOrMeetUpJoinedParticipants** - Triggered when:
 - Clicked **See all** at the bottom of an **In the meeting** participant group during private live meeting.
 - Clicked **See all** at the bottom of an **In the meeting** participant group during live channel meeting.
- **callOrMeetUpLobbyParticipants** - Triggered when:
 - Clicked **See all** at the bottom of a **Lobby** participant group during private live meeting.
 - Clicked **See all** at the bottom of a **Lobby** participant group during live channel meeting.
- **callOrMeetUpMicrophoneSwitch** - Triggered when:
 - Switch Microphone on.
 - Switch Microphone off.
 - **Microphone** button is selected while in a live meeting or a call.
 - Microphone switch while in PSTN.
- **callOrMeetUpMuteParticipant** - A remote participant is muted.
- **callOrMeetUpMuteParticipants** - Mute all participants while in live meeting or a call.
- **callOrMeetUpParticipants** - Participants toggle while in live meeting or a call.
- **callOrMeetUpRemoteMuteUFD** - You have been muted UFD.
- **callOrMeetUpResume** Triggered when:
 - **Resume** button is selected while in a live meeting or a call.
 - Call Resume in PSTN.
- **callOrMeetUpSearchParticipants** - Triggered when:
 - Clicked **Search** in meeting participants during private live meeting.
 - Clicked **Search** after viewing the **Lobby** participant group during private meeting.
 - Clicked **Search** after viewing the **In the meeting** participant group during private meeting.
 - Clicked **Search** after viewing the **Others invited** participant group during private meeting.
 - Clicked **Search** in meeting participants during a live channel meeting.
 - Clicked **Search** after viewing the **Lobby** participant group during a live channel meeting.
 - Clicked **Search** after viewing the **In the meeting** participant group during a live channel meeting.
 - Clicked **Search** after viewing the **Others invited** participant group during a live channel meeting.
- **callOrMeetUpVideoSwitch** - Triggered when:
 - Switch Video on.
 - Switch Video off.
 - Video button selected while in live meeting or call.
- **callPark** - Triggered when:
 - **Park Call** is selected in the ... menu.
 - **Retrieve** button is selected.
 - **Pickup** is selected in the retrieve dialog.
 - **Cancel** is selected in the retrieve dialog.
- **callPreferenceSetting** - Call preference app setting.

- **callsTabNewCall** - **New Call** is selected in the **Calls** tab.
- **callTransfer** - A call transfer is started.
- **callVoicemailTab** - **Voicemail** tab selected in **Calls**.
- **cameraPermissionCancel** - **Cancel** is selected the camera permission dialog.
- **cameraPermissionGoToSettings** - **Settings** is navigated to from the camera permissions dialog.
- **cancelEditMeeting** - Select the **Close** button while on the meeting scheduler page, after selecting **Edit meeting**. This logs when a user abandons the edit meeting selection.
- **cancelFileShare** - **Cancel** is selected on the confirmation dialog.
- **cancelFileUpload** - **x** is selected on the upload dialog.
- **cancelMeeting** - Select **Cancel event** from the meeting details page. Used to get aggregated data on the number of cancelled meetings.
- **cancelNavigationToLink** - Cancel navigation was chosen.
- **cancelRequestToJoinTeam** - Cancel request to join a team.
- **cancelRequestToJoinTeamError** - Error with a cancel join request.
- **cancelNewMeeting** - To log abandoned Create meeting selections and verify what caused them when:
 - The **Close** button is selected while on meeting scheduler page.
 - The **Close** button is selected while on meeting scheduler page after selecting **Edit meeting**.
- **cardView** - **No AS assigned** - Card view and card rendering. Cards are key platform constructs and measuring their usage and pattern is necessary to understand platform usage and keep a look out for potential issues on the client side. This item is required to measure any error with joining a team.
- **castPpt** - Event is triggered when:
 - A PowerPoint option is selected.
 - A particular PowerPoint is selected.
 - The Teams and Channels folder is selected in the file picker page.
 - Selects a OneDrive folder in the file picker page.
 - Stops the casting session.
 - Taps on multitasking PiP.
 - Selects a display option from file view.
- **castScreen** - Refers to:
 - Tapping on share screen option.
 - Stopping the screen sharing session.
 - Selecting display option from file view.
- **center_on_team_clicked** - A user successfully centers map on groups.
- **channelFollow** - Turn on notifications for a channel.
- **channelUnfollow** - Turn off notifications for a channel.
- **channelsActiveSetting** - The **notify me when I'm active on desktop** notification setting is changed.
- **chatCreation** - Successful chat creation.
- **changelActiveSetting** - Change desktop activity based notification.

- **channel** - New message button or textbox in chat.
- **channelDetails** - Channel navigation information for when:
 - A channel header is selected.
 - The channel details page is navigated to.
- **channelFollow/channelUnfollow** - Follow or unfollow a channel.
- **channelNav** - Navigating to a channel from anywhere.
- **channelNavTab** - Provides success and discoverability data for files in Teams when:
 - The **Files** tab is selected in channel.
 - There is a connector card reply.
- **channelNotificationSettings** - Triggered when:
 - The **New Notification settings** dialog is selected.
 - The channel notification settings button is selected in channel view.
 - A channel notification setting is selected.
- **channelSelected** - Confirms that a channel was successfully selected for a new plan.
- **channelSendMessage** - Triggered when:
 - A channel message is sent.
 - A bot is @mentioned in a compose box.
- **channelTabOverflow** - Selects the **More** tab in a channel.
- **chat** - Refers to:
 - A new message button or textbox in chat.
 - 1:1 chat selected on a callHistory item.
 - A 1:1 chat selection from call list.
- **chat - No AS Assigned** - Viewing unread chat or editing the chat roster, specifically:
 - Selecting the **Done** button when adding a user to a chat.
 - A chat list filter is selected, to filter by unread.
- **chatAddChat** - Add a member to chat button tapped (this will be same for 1:1 chat and group chat).
- **chatAllowJoinViaLink** - Turns the Join Link capabilities in the Chat Details page on or off.
- **chatAvatarEdit** - Tracks how many groups change their avatar from the Chat Details page.
- **chatAvatarEditCamera** - Triggered when a user edits the avatar from a live camera feed.
- **chatAvatarEditGallery** - Triggered when a user edits the avatar from the phone's gallery.
- **chatAvatarEditView** - Triggered when a user views the existing avatar image.
- **chatListNavConversations** - When a user taps into a chat list item.
- **chatCancelAudioCall** - Cancel a group audio call - Confirm dialog.
- **chatCancelVideoCall** - Cancel a group video call - Confirm dialog.
- **chatCM_CopyText** - Tap **Copy text** on a chat context menu.
- **chatCM_DeleteMessage** - Tap **Delete message** on a chat context menu.
- **chatCM_edit** - Tap **Edit** on a chat context menu.

- **chatCM_Forward** - Tap **Forward** on a chat context menu.
- **chatCM_markUnread** - Tap **Mark as unread** on a chat context menu.
- **chatCM_save** - Tap **Save** on a chat context menu.
- **chatCM_SeenBy** - Tap on **Seen** on a context menu option. Read Receipts, such as read by (readby).
- **chatContactsEnter** - The **Chat Contacts** tab is entered.
- **chatDetails** - Provides success and discoverability data for a chat details page when:
 - A chat header is selected.
 - A chat detail page is navigated to.
- **chatRecentEnter** - The **Chat Recent** tab is entered.
- **chatSendMessage** - Send a chat message.
- **chatShareLink** Tracks how many users send a group invite link.
- **chatStartAudioCall** - Triggered when:
 - 1:1 audio call button tapped.
 - Taps the **Audio** button on a search result.
 - Taps the **Start Call** button on the right.
 - 1:1 audio call tapped from a callHistory item.
 - 1:1 audio call tapped from a voicemail item.
 - Place a group audio call - Confirm dialog.
- **chatStartAudioCallOnBehalfOf** - Delegate starts a call from the action sheet as Boss.
- **chatStartAudioCallOnBehalfOfMyself** - Delegate starts a call from the action sheet as Myself.
- **chatStartAudioCallISFB** - 1:1 audio call button tapped.
- **chatStartVideoCall** - Triggered when:
 - 1:1 video call button tapped.
 - Taps video button on search result.
 - 1:1 video call tapped from callHistory item.
 - Place a group video call - Confirm dialog.
- **chatStartVideoCallISFB** - 1:1 video call button tapped.
- **chatWithMeetingParticipants** - Selects the **Chat** tab from Meeting Details page.
- **checkListAddClicked** - **Add an item** is selected inside the task details view for checklist section.
- **checkListItemAdded** - A checklist item is created for a task.
- **checkListItemDeleted** - A checklist item is deleted from a task.
- **checkListItemUpdated** - A checklist item is updated for a task.
- **channelPickerClicked** - Confirms that the channel picker successfully launched.
- **checklistSeeAllClicked** When the **See All** button is selected inside task details to view all checklist items.
- **chicletExpand** - Understand how cards are previewed on mobile and the preview closure behavior.
- **clearFilter** - When all filters are cleared while viewing a tasklist.

- **clickPhotoOfficeLens** - Select **Take photo** - Launch camera (Android only).
- **clockInEntryTeamSelectionShown** - A user selects a team for time clock while not clocked in.
- **clockInOutClicked** - On the clock in screen, the **Clock In** or **Clock Out** button are selected.
- **clockInOutTriggered** - Register a user's clock in or out. This will not trigger until you have checked the location, assuming location is required.
- **closedBannerMessage** - Triggered when the banner message of a notification is closed.
- **closeLobbyBanner** - Number of times the lobby toast is closed using its **Close** button.
- **commentAdded** - Confirms that a comment was added to a task.
- **commentsClicked** - Confirms that the comments view was successfully launched.
- **commentUpdated** - Confirms that a comment was successfully updated on a task.
- **companionBannerJoin** - Select **Join** on the top-level banner.
- **companionDismiss** - Dismiss the companion banner.
- **companionDismissProximity** - Dismiss the companion banner.
- **companionJoin** - Join as companion option is selected on the sheet.
- **companionJoinProximity** - Joined through the companion banner.
- **completeVaultFRE** - User completes process of generating a master key which is used to encrypt their Safe data.
- **completionStateChange** - Triggers when a completed or uncompleted filter toggle is selected in filter view from task list.
- **composeExpandComposer** - **Format** button tapped.
- **composeFilePick** - Native file picker launched.
- **composeImagePicker** - **Image** button tapped.
- **composeLocation** - **Location** button tapped in compose.
- **composeMention** - **@mention**.
- **composeOpenEmoticonPicker** - Emoticon picker tapped.
- **composeOpenFunPicker** - Fun picker tapped.
- **composeParticipantAdded** - When a participant is added to the Shifts app.
- **composeSearchResult** - Message extension result selection, which is helpful to understand the app search result relevance. Also enhances message send telemetry with app data.
- **composeSelectExtension** - Tap on a ME app.
- **composeSendSmartReply** - A smart reply item is clicked.
- **composeSendMessage** - Enhances message send telemetry with app data.
- **confirmAudioOn** - A user confirms that they want audio on.
- **confirmFileShare** - **Share** is selected on the confirmation dialog.
- **consultTransfer** - Triggered when:

- Selects **Transfer > Consult first**
- Transfer target set to Person
- Transfer target set to Phone Number.
- **consultTransferCall** - Triggered when:
 - A consult call is initiated.
 - Confirm is selected on a confirms transfer dialog.
 - Cancel is selected on a confirms transfer dialog.
 - The **Banner transfer** button is selected.
 - The **Banner resume** button is selected.
- **consultTransferChat** Triggered when:
 - A consult chat is initiated.
 - Confirm is selected on a confirms transfer dialog.
 - Confirms is selected on a confirms transfer dialog.
 - A **Banner transfer** button or **Banner resume** button is selected.
- **consumeVoiceMessage** - Voice message played.
- **ContactCard_SeeMoreOOF** - See more of a long OOF message.
- **contactOrganizer** - Selected **Contact organizer**.
- **conversation, tabs** - Tab selected.
- **copyLink** - Copy a link to a channel post.
- **contactActivity** - When the button to view a user's activity from the contact card is selected.
- **conversation** - When a user navigates to the **Chat** or **Posts** tab.
- **cortanaClose** - When a user manually dismisses Cortana canvas.
- **cortanaEduCategorySelect** - When a user clicks on an education tips category item.
- **cortanaEduOpen** - When education page shows on Cortana canvas.
- **cortanaInvoke** - When Cortana starts listening.
- **cortanaKWSSwitchToggle** - When a user tap on KWS switch in Cortana settings page.
- **cortanaMicPermissionDialogButtonClick** - When a user grants or declines mic permission on Cortana canvas.
- **cortanaOpen** - When a user opens Cortana canvas.
- **cortanaOptionsOpen** - When the user taps options button on Cortana canvas.
- **cortanaSafetyFirstActions** - When the user accepts safety first declaration.
- **cortanaSafetyFirstLaunch** - When the user opens Cortana for the first time after FRE is finished.
- **cortanaSettingsOpen** - When a user opens Cortana settings page via clicking Cortana settings button on Cortana canvas.
- **cortanaStopResponding** - When a user clicks cancel button on Cortana canvas.
- **cortanaUserSettingsLaunch** - When the user opens Cortana settings in Teams settings.
- **cortanaVoiceSelect** - When a user selects Cortana voice font in Cortana settings page.

- **createChannel** - Provides success data around the successful creation or discard action for new channel creation, when:
 - The **Done** button is selected on the **Create Channel** Page.
 - The **Cancel** button is selected on the **Create Channel** Page.
- **createComposeExtension** - Create message extension usage, or action ME usage.
- **createConversationClicked** - When a conversation is created with other workers.
- **createDefaultPlannerPlan** - A shared list is created automatically when the Tasks app is opened for the first time by anyone in that group, checks auto list created with Planner service. Confirms the default shared task list is successfully created in Planner the first time a user attempts to create a shared task list.
- **createOrJoinTeam** - The **+** button is selected to create or join a team.
- **createPersonalPlan** - A personal list is created, checks list created with ToDo service. Confirms a new personal task list is created in ToDo.
- **createPersonalSubtask** - Confirms a personal sub-task has been successfully created.
- **createPersonalTask** - Confirms a personal task has been successfully created.
- **createPlan** - Confirms that a shared task list has been successfully created. Confirms that a shared plan has been successfully created through middle tier.
- **createPlannerPlan** - A shared list is created, checks list created with Planner service. Confirms a new shared task list is created in Planner.
- **createPlannerTask** - Checks a call to the Planner service. Confirms that a task has successfully been created in a shared tasks list.
- **createShiftClicked** - When a manager selects **Create a shift**.
- **createShiftOrTimeOffClicked** - Triggered if you select **Create a shift** or **Time off**.
- **createTask** - Used for when create action fails, checks call to Planner service. Confirms a task create operation failed.
- **createTaskList** - When a user navigates to the create plan view from home view.
- **createTeam** - Provides success data around the successful creation or discard action for new team creation, when:
 - The **Done** button is selected on the **Create Team** Page.
 - The **Cancel** button is selected on the **Create Team** Page.
- **createTeam, createChannel** - This provides success data around the successful addition of members in a team and the successful creation of a new team when:
 - The **Skip** button is selected in the **Add Members** page (check existing first).
 - The **Done** button is selected in the **Add Members** page (check existing first).
 - Shows team or channel creation acknowledgement.
- **crossCloudDialogCancel** - **Cancel** is selected for a cross-cloud dialog.
- **crossCloudDialogJoin** - **Join as guest** is selected for a cross-cloud dialog.
- **dashboardNav** - A user navigates to a tile on the chat dashboard.
- **dateChanged** - A user modified a shift date.
- **datePickerLaunch** - Confirms that date picker was successfully launched.

- **dayClicked** - Selecting the day view when user is seeing their shifts.
- **daySaved** - A user saves the day availability, saves a day of shifts.
- **declineTimeOffRequest** - When a user declines the request for time off of work. It's a key functionality for time off, for manager to reject time off request.
- **deleteClicked** - When **Delete** is selected within task details, which brings up the confirmation dialog.
- **deleteContact** - A user deletes an existing private contact.
- **deleteMeeting** - Select the **Delete** button from the Meeting Details page.
- **deletePersonalTask** - Confirms a personal task has been successfully deleted.
- **deletePersonalSubtask** - Confirms a personal sub-task has been successfully deleted.
- **deletePersonalVaultItem** - User requests to delete their personal Safe.
- **deletePlannerTask** - Confirms that a shared task delete operation completed successfully.
- **deleteShift** - Shift deletion.
- **duration_picker_dismissed** - When the duration picker is dismissed.
- **deleteTask** - Verifies with the Planner service as to whether a delete action was successful or unsuccessful. Confirms that a task delete failed, that is, the deletion of a task was unsuccessful.
- **deleteVoicemail** - Delete voicemail item tapped.
- **demotedToAttendee** - A user demotes a presenter - **Change** button in the dialog box.
- **denyParticipant** - Number of times a user denies someone entry from the roster.
- **descriptionChanged** - Confirms a shared task description has changed successfully.
- **descriptionClicked** - When a user selects **View description** from task details.
- **detailsTabClicked** - The **Details** tab is selected on the meeting.
- **deviceAddressBookSync** - Fired when address book sync is turned on from the settings page.
- **deviceAddressBookUnsync** - Fired when address book sync is turned off from the settings page.
- **deviceSyncEnabled** - Device sync enabled.
- **deviceSyncDisabled** - Device sync disabled.
- **dialIn** - A user chooses to Dial in into a meeting (various locations).
- **dialInBadNetworkBanner** - **Dial in** is selected for a poor connection banner.
- **dialInBadNetworkBannerCancel** - The **Dial in** is cancelled on the native dialog.
- **dialInBadNetworkBannerConfirm** - The **Dial in** is confirmed on the native dialog.
- **dialInCall** - **Call** is selected on the **Dial in** pop-up.
- **dialInCancel** - **Cancel** is selected on the **Dial in** pop-up.
- **dialOutCall** - Triggered when a user:
 - Joins in Drive mode.
 - Selects **Call** on the **Call me back** pop-up.
- **dialOutCallAAD** - When any number is selected from **My numbers** in the action sheet

- **dialOutCallRecent** - When any number is selected from previous recent numbers in the action sheet.
- **dialOutCancel** - Cancel is selected on the **Call me back** pop-up.
- **dialOutDialog** - **New number** is selected in the action sheet.
- **dialOutFailRetry** - **Retry** is selected from a failure banner.
- **DialPad** - The **DialPad** button is selected from the call list.
- **directShare** - Shared an invite link to a Sms/Email native app.
- **disableCategory** - Disable a type of notification or disable incoming call notifications.
- **disabled** - **Skip notifications** is selected in the First-run experience (FRE). This provides key success data for skipping the notification in the FRE flow.
- **disableQuietDays** - Quiet Days disabled. Feature success telemetry for quiet days.
- **disableQuietHours** - Quiet Hours disabled.
- **discoverTeams** - Navigate to Browse and Join Teams page.
- **Dismiss_earlycancelledCQF** - The CQF early cancelled call form is dismissed.
- **Dismiss_ratemycallCQF** - The CQF rate my call form is dismissed.
- **Dismiss_ratemyliveeventCQF** - The CQF rate my live event form is dismissed.
- **dismissBadNetworkBanner** - **Dismiss** is selected for a poor connection banner.
- **dismissFlyout** - **Dismiss** button is selected.
- **dismissModality** - The modality picker is exited without sharing.
- **dismissModalityPicker** - The **Modality picker** button is selected.
- **dismissReadReceiptsNotice** - **Got it** is selected from a feature notice.
- **dismissStartRecording** - Dismiss error when starting recording.
- **dismissStopRecording** - Dismiss error when stopping recording.
- **dismissUseWifiForVideoBanner** - Triggered when a user dismisses a banner:
 - That tells the user that remote participant video is blocked, and users have to switch to WiFi to see it.
 - That tells the user that users have to switch to WiFi to share video.
- **DLPDelete** - A user deleted a blocked message.
- **DLPEdit** - A user edited a blocked message.
- **DLPOverride** - A user overrode blocked message.
- **DLPOverrideReport** - A user reported a false positive and overrode the message.
- **DLPReport** - A user reported a false positive.
- **DLPResolve** - A user attempted to resolve a DLP message.
- **DLPSeeOriginal** - A user tapped to see an original message.
- **downloadFile** - Helps to:
 - Determine if a download operation was initiated.
 - Determine if a file was downloaded successfully.

- **dragDatePickerHandle**
- **dtmfPSTNCall** - DTMF button on DialPad is tapped.
- **dueDateChanged** - Triggers when a user assigns a due date to a task.
- **dueDatePickerClicked** - Triggers when the **Due Date** button is selected in task details, opening the due date picker page.
- **dueDateSelected** - Triggers when a user applies a filter by due date while viewing a tasklist.
- **dueDateUnselected** - Triggers when a user unapplies a filter by due date while viewing a tasklist.
- **edit** - Edit button in a chat message.
- **editChannel** - A user selects a button to edit a channel that they own or administer.
- **editContact** - A user edits an existing private contact, this can be done by navigating to the contact card.
- **editMeetingResponse** - Edit meeting response from the meeting detail page.
- **editNavigation** - **Reorder** is selected in the **More** menu to edit the order of bottom bar apps.
- **editRsvpMeetingOptions** - Select **RSVP** to change from the previous selection.
- **editShiftClicked** - Edit a shift.
- **editSmartReply** - A smart reply item is edited.
- **editTeam** - A user taps on a button to edit a team that they own or administer.
- **editTeam, editChannel** - Relating to the successful addition of members in a team and successful creation of an existing team when:
 - The **Cancel** button is selected in the **Add Members** page (existing team or channel).
 - The **Done** button is selected in the **Add Members** page (existing team or channel).
- **emergencyCall** - Emergency Call placed calling plan.
- **emergencyCallDirectRouting** - Emergency Call placed direct routing.
- **emergencyCallLocationPolicyBased** - DialEmergency using DialPad.
- **emergencyCallSecurityDeskNotify** - Emergency Call placed, security desk informed.
- **enableCategory** - Relating to notification settings when enabling:
 - A type of notification.
 - Incoming call notifications.
- **enabled** - Relating to enabling the notification in the First-run experience (FRE) flow:
 - **Enable notifications** is selected in the First-run experience (FRE).
 - **Enable** is selected in a reminder.
- **enabled/disabled** - Calling permissions or contact permissions (Android only).
- **enabled, notNow** - Notification permission prompt **Accept** button, First-run experience (FRE) Notifications Permission (iOS). This captures how many people have enabled the notification feature and provides information.
- **enablediOSPrompt** - A user actually enables notifications in the iOS notifications permissions prompt. This gives information about users who actually enable notifications in iOS from notifications permissions prompt.

- **enabledQuietDays** - Quiet Days enabled.
- **enableLocationPermission** - When a user enables location permissions for the share location feature.
- **enableQuietDays** - A user enables quiet days.
- **enableQuietHours** - Quiet Hours enabled.
- **endEditing** - **Save** button pressed.
- **endFileShare** - **Go back** is selected on a file sharing dialog.
- **endMyShift** - Number of devices in shared mode or number of times signed out.
- **endPhotoShare** - x out from photo share.
- **entryPointClicked** - Selecting **Requests** in the **Schedule** tab. Requests are for when a Frontline Worker (FLW) is requesting a shift time, etc..
- **endPSTNCallSelected** - A user ends a PSTN and a Content call.
- **endPSTNCallShown** - A user is prompted to end a PSTN or a Content call.
- **endVideoShare** - x out from Video share.
- **errorShown** - An error is shown.
- **expand/collapse** - Device contacts or company contacts section.
- **expandCollapseSection** - Tap a section header to expand or collapse a section.
- **Expected: atMention** - **Android: chatSendMessage** - **iOS: sendMsg** - @mention a bot in a compose box.
- **Expected: botClickCardAction** - **Android: showCard** - **iOS: missing** - Tap on card buttons. Cards are key platform constructs and measuring their usage and pattern is necessary to understand platform usage and keep a look out for potential issues on the client side.
- **Expected: chatSendMessage** - **iOS: composeSendMessage** - Tap on **Reply** and reply to a bot chat in a channel.
- **Expected: composeSendMessage** - **Android: replyChannel** - **iOS: missing** - Tap on **Reply** and reply to a bot chat in a channel.
- **Expected: messageLike** - **Android: reactLike_CM** - Like a bot message.
- **Expected: messageUnread** - **Android: markAsLastUnread** - Message context menu options for a bot message.
- **federatedUpgradeNewChat** - Legacy chat is upgraded to native.
- **files** - Tracks if the file listing is done successfully in the chat and channel files tab.
- **fileSelected** - A PowerPoint presentation is selected.
- **fileThumbnailPreviewDownloaded** - Helps to identify if a thumbnail was rendered successfully for a file.
- **fileThumbnailPreviewFromCache** - Captures if thumbnail shows from cache successfully and helps to identify if thumbnail was rendered successfully for a file.
- **fileThumbnailPreviewNotAvailable** - Helps to identify if thumbnail was rendered successfully for a file.

- **fillFrameVideo** - Fill frame from action sheet.
- **firstTimeSignedIn** Sign in or sign up event triggered by:
 - Sign-in success.
 - First sign-in succeeded.
 - Sign-in Errors are seen by a user.
 - Record telemetry about MAM/MDM policies implemented on first time login.
 - Record app install referrer parameters after first time successful login.
- **fitToFrameVideo** - Fit to frame from action sheet.
- **flipCamera** - Flip camera.
- **forcedUpdateAccept** - A user accepts to update the app version in the force update dialog.
- **forcedUpdateExit** - A user closes the app instead of updating the app version in the force update dialog.
- **forcedUpdatePrompt** - Used in situations where users on older versions, that may not have the latest security and privacy fixes, need to be reached.
- **formattingBold** - A user selects bold formatting.
- **formattingHighlight** - A user selects highlight formatting.
- **formattingImportant** - A user selects importance.
- **formattingItalics** - A user selects italics.
- **formattingTextColor** - A user selects text color formatting.
- **formattingUnderline** - A user selects underline.
- **FRE - No AS Assigned** - Record telemetry about MAM/MDM policies on app launch. Telemetry for Intune integration for MAM and MDM. Provides success data about failure during First-run experience (FRE).
- **freActionClicked** - **Get started**, **Try Later**, or **Close** (GPS) is selected in the First-run experience (FRE).
- **freDone** - First-run experience (FRE) has been done.
- **freTriggered** - A user views the time clock on the First-run experience (FRE).
- **funSearchQueryEntered** - Giphy query entered. Success data for the giphy attachment feature in Teams.
- **funSelectItem** - Giphy image chosen. Success data for the giphy attachment feature in Teams.
- **galleryImage** - Image uploaded - gallery.
- **get_directions_clicked** - The **Get directions** button is selected.
- **giphyUserDisabled** - User selects to decline Giphy terms/conditions.
- **giphyUserEnabled** - User selects to accept Giphy terms/conditions.
- **goToNotificationSettings** - Go to the notification settings page from **we updated notification settings** dialog.
- **GPSPromptClicked** - The **Allow** or **Don't Allow** is selected in an OS prompt. either allowing GPS or not.
- **group_map_closed** - A user opens the map view from chat.

- **group_map_open** - User closes the map view.
- **groupCallJoin** - A user joins a Group call.
- **groupClicked** - Tracks when a user selects the shift group.
- **guideMe** - Users selects a banner that informs them about a 3P app blocking notifications and offers troubleshooting guidance.
- **hamburgerMenu** - Navigate to the hamburger menu. The hamburger menu contains important actions, such as account switch, notification settings, data setting, and profile settings.
- **handoffComplete** - A meeting or call was handed off on this device.
- **handoffJoin** A meeting hand-off option is selected on the action sheet.
- **hardwareAudioOff** - Turn audio off through the hardware buttons.
- **hardwareAudioOn** - Turn audio on through the hardware buttons.
- **hide** - Hide chat.
- **hideChannel** - Hide a channel from the teams and channel list.
- **image** - Image.
- **inAppNotification**- Triggered when a notification is tapped while the user is active in the app.
- **immediateCallForward** - Immediate call forward target is set, or enabling immediate call forwarding (Calls ring me is disabled).
- **importanceToggleClicked** - Triggers when the ! field is toggled inside task item details.
- **importantMessage_select** - A user selects an important message from the priority context menu.
- **importantMessageSend** - A user sends an important message.
- **inCallDialOut** - A user selects the **Call me back** button from in-call more options.
- **initiatePhotoShare** - Initiate photo share.
- **initiateVideoShare** - Initiate video share.
- **install** - Install or Install Event.
- **installReferrer** - Record app install referrer parameters after first time install.
- **invisionWhiteboardClicked** - Invision whiteboard is selected:
 - The **Channel Files** tab.
 - The meeting **Chat Files** tab.
- **inviteFreemium** - Tapping the + button in the Invite screen.
- **inviteGuest** - Tapping the + button in the Invite screen.
- **joinFromDeeplinkInTeams** - A user joined through a deeplink from within the Teams app.
- **joinFromDeeplinkOutsideTeams** - A user joined through a deeplink from outside the Teams app.
- **joinFromJoinLauncher** - A user joined from a Join Launcher.
- **joinFromNudge** - A user joined from nudge.
- **joinFromStore** - A user joined after downloading the app from the app store.

- **joinMeeting** - detects the success or failure of joining meetings from calendar in the following circumstances:
 - Join the meeting through Dial in.
 - Join the meeting through Call me back.
 - Join the meeting content only.
 - Select the **Meeting join** button from agenda view.
- **joinOptionsEdu** - An EDU user selects options to join a scheduled meeting and is shown the proper options.
- **joinTeam** - The Join button is pressed.
- **joinViaCode** - A user joins a meeting via a code.
- **labelPickerClicked** - Confirms that the label picker successfully launched.
- **labelSelected** - Confirms that a label has been successfully selected.
- **labelUnselected** - Confirms that a label has been successfully unselected.
- **launchLinksGallery** - When a user enters the links gallery from the dashboard.
- **launchSlideshow** - User Launches Slideshow full screen image viewer from one of three possible app feature locations.
- **Launch source such as direct, link, appShortcut** - Launches directly or via link (recording Mobile Application Management (MAM) or Mobile Device Management (MDM) telemetry on app launch to collect data for active users).
- **lastSearchableAliasTurnedOff** - The user has disabled all searchable aliases for account.
- **leaveChat** - Confirm leaving chat.
- **legacyChatLink** - A link is selected to a legacy chat.
- **link** - User initiated redeem of invite link by entering Teams application.
- **likeAppDismiss** - When the prompt that asks whether a user likes the app or not is dismissed without a response.
- **likeAppNo** - When the prompt that asks whether user likes the app receives a response of no.
- **likeAppYes** - When the prompt that asks whether user likes the app receives a response of yes.
- **likeMsg** - Select Like.
- **linkPreviewCancel** - Understand the preview closure behavior.
- **listUserClicked** - When a user selects a user in Working Now.
- **liveCaptions** - Live captions are turned on or off.
- **liveEventAdditonalLink** - An additional link is selected.
- **liveEventInfo** - The Info button is selected.
- **liveEventJoin** - A user joins a live event.
- **liveEventLeave** - The Leave button is pressed.
- **liveEventPresenterJoin** - A live event is joined by a presenter.
- **liveEventPresenterJoinAsAttendee** - A live event presenter joined as an attendee.

- **liveEventQnA** - The Q&A icon is selected.
- **liveEventYammer** - The Yammer icon is selected.
- **liveMeetingPushNotificationClicked** - Push notification is selected.
- **liveMeetingToastClicked** - In-app toast is selected.
- **live_location_in_chats_from_profile_clicked** - Live locations is selected in profile view.
- **lobbyPickAudio** - Number of times a user switches audio output from lobby.
- **lobbyToggleMuted** - Number of times a user turned the mic on or off from lobby.
- **lobbyToggleVideo** - Number of times a user turned video on or off from lobby.
- **logoutClicked** - When a user logs out.
- **location_active_tracking** - A user's device is switched to active tracking.
- **locationCard** - Select a location card.
- **location_family_sync** - Showing members of a Family group that were created in MSA family app. Confirms that all family members that can be granted consent are displayed.
- **location_data_use_privacy_denied** - The user denied acceptance of privacy terms.
- **location_group_map_sync** - Map view is opened.
- **location_map_load** - Map view load.
- **location_map_markers_load** - Map view load. Confirms that location markers for all users actively sharing are displayed properly on the map view.
- **location_message_send** - A user initiates a location sharing session.
- **location_data_use_privacy_denied** - A user dismisses or selects **Not now** on a popup explaining use of location data by TFL.
- **location_data_use_privacy_granted** - A user selects **Allow** on a popup explaining the use of location data by TFL.
- **location_settings_open** - A user opens location settings.
- **location_sharing_start** - A user shares their live location in a chat.
- **location_sharing_stop** - A user stops sharing their live location in a chat.
- **loginFailed** - User was unable to login.
- **loginSuccess** - User was able to login.
- **logoutVault** - User logs out of the app and in turn logs out of Safe.
- **manageBlockedNumbers** - Access blocked numbers through Settings.
- **manageVaultKey** - User changes their Safe key management choice (MSA vs self tracked).
- **manualSendMessage** - A message is sent out manually.
- **mapAppPicker** - When a user selects which mapping app to use when they tap on a location card.
- **markAsRead** - Mark as read.
- **markAsUnread** - Mark as unread.

- **markChannelRead** - A user marks a channel read.
- **messageBookmarkMessage** - Connector card save. Uses existing telemetry with app specific data. Or save a bot message.
- **markAsLastUnread** - Connector card context menu.
- **maskCallerId** - A user enables or disables calling setting to mask caller id.
- **meetingAttachmentFileClick** - A meeting attachment item is clicked.
- **meetingAttachmentFileOptions** - A meeting attachment item options is clicked.
- **meetingAttachmentSeeMoreClick** - A meeting attachment see more button is clicked.
- **meetingDetailCalendarList** - Meeting Details page selected from calendarList, or select the **Details** tab on the Meeting Details page.
- **meetingDetailChatWithParticipants** - Chat with participants from the Meeting detail page.
- **meetingDetailDeleteMeetingforSelf** - Delete a Meeting from Meeting Detail page for oneself.
- **meetingDetailJoin** - The **Meeting Join** button is selected from Meeting Detail page.
- **meetingDetailParticipants** - See all participants from the Meeting Detail page.
- **meetingDetailScheduledMeeting** - Meeting details page selected from scheduled meeting object (...), or select the **Details** tab of a scheduled meeting.
- **meetingDetailSearchParticipants** - Selected **Search** in meeting participants on the meeting schedule.
- **meetingInsightFileClick** - A meeting related file item is clicked.
- **meetingInsightFileLocatorClick** - A meeting related content locator tip button is clicked.
- **meetingInsightFileOptions** - A meeting related file item options is clicked.
- **meetingInsightSeeMoreClick** - A meeting related content see more button is clicked.
- **meetingJoinLeave** - Leave tapped -> x is tapped after the **Join** button is tapped.
- **meetingJoinNow** - Join now for VOIP selected.
- **meetingJoinNowWithCallMe** - A user joins a meeting with **Call me**.
- **meetingJoinNowWithPSTN** - A user joins a meeting with Dial in.
- **meetingLeaveChat** - Leave chat.
- **meetingMuteChat** - Mute chat.
- **meetingNotesCreatedInChatLink** - The **Meeting notes created** chicklet is selected in private meeting chat or in channel meeting chat.
- **meetingNotesMentionCharLink** - The @mention link is selected in private meeting chat.
- **meetingNotesMentionChatLink** - The @mention link is selected in channel meeting chat.
- **meetingNotesTabEntryPoint** - The **Meeting Notes** tab is selected in private meeting or in a channel.
- **meetingNotificationSettingsAccepted** - Notification settings option was changed to Accepted only.
- **meetingNotificationSettingsAll** - Notification settings option was changed to All.
- **meetingNotificationSettingsNone** - Notification settings option was changed to None.

- **messagePriority_select** - A Message priority entry point is selected.
- **messageSeeOriginal** - A user reverts translated message back to original.
- **meetingSeeParticipantsChatDetails** - See all participants.
- **memberListLoadMore** - Scroll down to load more.
- **messagedEditMessage** - A user edits a message.
- **messageShareMessage** - Share a message.
- **messageTranslate** - A user translates a message.
- **messageUnabletoEdit** - A user is unable to edit a message.
- **meetingUserAnonB2B** - Anonymous B2B joined the meeting.
- **meetingUserAnonB2C** - Anonymous B2C joined the meeting.
- **meetingUserDialIn** - PSTN (Dial in) user joined the meeting.
- **meetingUserDialOut** - PSTN Call me back user joined the meeting.
- **meetingUserFederated** - A federated user joined the meeting.
- **meetingUserFreemium** - A freemium user joined the meeting.
- **meetingUserGuest** - A guest user joined the meeting.
- **meetingUserTenant** - An in-tenant user joined the meeting.
- **memeGenerated** - When a meme is generated given a user input of image and text data.
- **meProfileFetch** - Indicates a successful profile fetch and creation.
- **messageCopyMessage** - Copy Message.
- **messageDelete** - Message delete.
- **messageEditMessage** - Edit message.
- **messageForwardMessage** - A user selects a Forward entry point from message context menu.
- **messageLike/messageUnlike** - Message like or unlike.
- **messageMuteSender** - Mute or unmute sender.
- **messageLike** - Connector card like. Uses existing telemetry with app specific data.
- **messageScheduledMeeting** - Meeting object in channel selected (Not only scheduled ones).
- **messageTriggered** - This is when a notification is triggered for a message.
- **micPermissionCancel** - Cancel is selected on the mic permission dialog.
- **micPermissionGoToSettings** - A user navigates to settings from the mic permissions dialog.
- **MicrosoftWhiteboardClicked** - Microsoft whiteboard is selected on the **Channel Files** tab or the **Meeting Chat Files** tab.
- **moreOptionsClicked** - Triggers when ... menu on the top-right is selected on the task item editor screen.
- **moveTaskClicked** - Option inside task item more options list.

- **msaAddDeleteAliasLinkClicked** - Link to setup an alias on MSA Profile page.
- **multiCallEndFromUFD** - Number of times a user ends the call on hold in a multi-call scenario.
- **multiCallResumeFromUFD** - Number of times a user selects to resume a call from hold.
- **multiCallSwitch** - Number of times a user selects an option to switch the call and list of calls on hold shows up.
- **multipleAccounts** - Number of accounts for a user.
- **multipleTenants** - Number of tenants per account.
- **mute** - Mute chat.
- **muteOnWhiteboard** - A user mutes or unmutes on the whiteboard screen.
- **muteParticipant** - Mute participant (move to the action sheet).
- **my_location_button_clicked** - User centers the map on their location by selecting the **My location** button.
- **my_location_clicked** - A user centers the map on their location by selecting the **blue dot** on the map.
- **myShiftPickerClicked** - Only logged if the request being sent is a swap or offer. **My Shift** picker is selected.
- **nameGroupChat** - Name group chat.
- **nativeTimeClockBreak** - A break on the time clock.
- **nativeChatLink** - A link to native chat is selected.
- **navActivity** - Navigate to the activity feeds page.
- **navBookmark** - A user navigates to the **Saved** tab or app on the bottom bar or app tray.
- **navCalendar** - Measures if a user navigates to a calendar.
- **navCallingSettings** - A user navigates to the calling settings.
- **navCalls** - Calls tab tapped.
- **navCamera** - A user navigates to the **Camera** tab or app on the bottom bar or app tray.
- **navChat** - A user navigates to the **Chat** tab or app on the bottom bar or app tray.
- **navContacts** - A user navigates to the **Contacts** or **People** tab or app on the bottom bar or app tray.
- **navDashboardTab** - A user navigates to the **Dashboard** tab within a conversation.
- **navDynamics365** - Triggered when the Dynamics365 app is opened.
- **navFiles** - Files app is selected, tracks if a user can launch the files app in the app tray (iOS).
- **navFilesTab** - Files app is selected, tracks if a user can launch the files app in the bottom nav bar (iOS).
- **navMeetings** - **Calendar** tab tapped.
- **navNotes** - Triggered when the Notes app is opened.
- **navOrganization** - Triggered when the Organization app is opened.
- **navOrgChart** - Triggered when the Orgchart app is opened.
- **navPeople** - Event is triggered when the People app is opened.

- **navPeopleSettings** - Triggered when you navigate to the **People** category in the Settings menu.
- **navPersonalFiles** - Files app is selected, tracks if a user can launch the files app in the bottom nav bar (Android).
- **navPhotoTab** - Photo tab.
- **navSaved** - A user navigates to the **Saved** tab or app on the bottom bar or app tray.
- **navSelectPlan** - When a user selects a shared plan to navigate to from home view.
- **navSelectPersonalList** - When a user selects a personal plan to navigate to from home view.
- **navSelectSmartList** - When a user selects a smart plan to navigate to from home view.
- **navTasks** - Triggered when the Tasks app is opened.
- **navTeams** - Tap **See all**.
- **navVideocamera** - A user navigates to the **Camera** tab or app on the bottom bar or app tray.
- **navVideoTab** - Video tab.
- **navVoicemail** - A user navigates to the voicemail page.
- **navWalkieTalkie** - A user has opened the walkie talkie app.
- **navWiki** - Triggered when the Wiki app is opened.
- **newChat** - A user creates a chat.
- **newCall** - Taps **New call** button.
- **newCallDialPad** - Taps the **Dialpad** button on tab.
- **newCallPeople** - Taps the **People** button on tab.
- **noBGActivityDetected** - Exceeds the threshold for background activity failures.
- **notBlockedDevice** - A user doesn't reach the threshold for background activity failures in 30 days.
- **notNow** - **Not now** is selected in reminder.
- **notNowUpdate** - UpdateDefer.
- **notification/ notification_clicked** - Triggered when a notification is tapped.
- **notificationNavChannelConversation** - Launch the app using a notification for a channel conversation.
- **notificationNavChannelThreadConversation** - Launch the app using a notification for a specific message in a channel conversation.
- **notificationSettingTurnedOff** - Turn off push notifications for the Teams Android app.
- **notificationNavPreCall** - A user gets a notification of a meeting starts that navigates them to the precall screen on selection.
- **ocvFeedback** - Relating to the performance of the OCV feedback form.
- **ocvFormCancelled** - An event sent when the OCV feedback form is cancelled and the user returns to the app.
- **ocvFormOpened** - An event sent when the OCV form is opened.

- **ocvFormSubmit** - An event sent when the user clicks submit on the OCV feedback form.
- **offerRecipientClicked** - Only logged if the request being sent is an offer. The user enters the team member picker to offer a shift. Offering means offering a shift time off.
- **offerSwapShiftFromL1** - The type of shift a user tries to offer or swap from a shifts list. iOS action is a **SwipedRight** and Android action is **LongPressed**.
- **offerSwapShiftFromL1Triggered** - A user offers to swap a shift with another user.

 - A user tries to attach a photo to their message
 - A user tries to take a photo and upload directly to the gallery.
- **officeLens or cameraImage** - Camera picture selected - standard camera or office lens.
- **onBackClicked** - Whenever the back arrow is selected to navigate back a page.
- **oneNote** - When a user opens the OneNote app.
- **open** - Notification Settings tap.
- **open edit** - Wiki usage telemetry - User selects to edit the wiki.
- **openApp** - Opening a personal app.
- **openAppDrawer** - **More** is selected at the bottom bar to open the app drawer.
- **openEditMeetingForm** - The **Edit** button is selected from the Meeting Details page.
- **openFile** - Helps:
 - To identify a file was able to be opened in the chat successfully.
 - To identify a file was able to be opened from a files listing.
 - To check if files can be opened from a OneDrive list.
 - To identify open files can be opened from a channel list.
 - Determining if files can be opened from group chats.
 - Determining if a file can be successfully opened from files app.
 - Determining if a message file can be opened from the chicklet successfully.
 - Determining if files from recent list can be opened successfully.
 - Determining if a file from file list can be opened successfully.
 - Determining if a file can be opened from a messages file chicklet.
 - Determining if files can be opened successfully from a file list.
- **openInAppClicked** - Option inside task item more options list, only available for personal tasks.
- **opensCalendarView** - Tapping on **Open shifts** from the **Schedule** tab.
- **openContactCard** - A user taps on a **Contact** icon or a contact in the people app to launch the profile card of that contact.
- **openContactCard_ReactionSummary** - Navigate to contact card from the reaction summary page.
- **openFileInApp** - Helps to identify if user opted to open files outside of Teams versus inside of Teams.
- **openHamburgerMenu** - The **Hamburger** icon (top-left) is selected to open the side menu for access to settings, presence, and tenant switcher.
- **openInStream** - Open a video in Stream.
- **openMeetingDetails** - Open the meeting details or the Open Meeting details page of a particular

meeting.

- **openModalityPicker** - X = ChatsAndChannels for chats and channels.
- **openNewMeetingForm** - Confirms a personal sub-task has been successfully updated.
- **openNewMeetingForm** - Open the scheduler while setting up a new meeting.
- **openPhotoLibrary** - Select a photo library.
- **openQuietDays** - Navigate to Quiet Days page.
- **openQuietHours** - Navigate to Quiet Hours Page.
- **openReactionHoverBubble** - Press the **Add reaction** button on the reaction summary page.
- **openReactionSummary** - Invoke reaction summary drawer.
- **openSettingsSetUpInstructions** - Open **Settings** from instructions.
- **openSharedLink** - When a user opens a link from the dashboard links tile or the links gallery.
- **openShiftsClicked** - How many people tap the **Calendar** icon.
- **orgChart** - **No AS assigned** - Basic usage telemetry for org chart.
- **pageEntered** - A user entered a page.
- **parental_consent_grant** - A user grants permission for a minor in their MSFamily to use the Live Location feature in TFL.
- **parental_consent_remove** - A user revokes permission for a minor in their MSFamily to use the Live Location feature in TFL.

- **personalAppNavTab** - Navigate to tabs within personal app.
- **photoLibraryPicker** - **Open photo library** tapped inside image picker.
- **pickGalleryPhoto** - Pick a photo from the gallery.
- **pickParticipantChatDetails** - Pick a user from the list.
- **pickRecentPhoto** - Chooses a recent image to share.
- **pinChannel** - Pin a channel to show it above the teams and channels list.
- **pinSelf** - Pin myself from the action sheet.
- **pinUser** - Pin a user from the action sheet.
- **place_created** - The user created a shared place.

- **place_deleted** - The user deleted a shared place.
- **place_edited** - The user edited a shared place.
- **play** - Play the recording.
- **playVoicemail** - **Play** tapped on voicemail item.
- **plusButtonClicked** - Selecting the **plus button (+)**.
- **pptNextSlide** - Next slide as a presenter or in private viewing.
- **pptPreviousSlide** - Previous slide as a presenter or in private viewing.
- **pptReturnToPresenter** - Go to the **Live** slide (the one that the presenter and everyone else is on).
- **pptStopPresenting** - Stop presenting.
- **pptTakeControl** - Take control.
- **preJoinAddRoom** - The **Add a room** button is selected in pre-join dropdown, **Join** is selected in the **Add a room** scenario.
- **preJoinAudioOff** - The **Audio off** button is selected in pre-join dropdown.
- **preJoinAutoAddRoom** - **Join now** is selected when a room is nearby.
- **preJoinBack** - **Back** or **Close** button selected.
- **preJoinDenied** - A user is unable to join a meeting.
- **preJoinDeviceAudio** - **Join with device audio** is selected from dropdown.
- **preJoinDialIn** - The **Dial in** button is selected in the pre-join dropdown.
- **preJoinDialInCall** - A user confirms the **Dial in** request on prejoin.
- **preJoinDialInCancel** - A user cancels the **Dial in** request on prejoin.
- **preJoinDialOut** - The **Call me back** button is selected the in pre-join dropdown.
- **preJoinDialOutCall** - A user confirms the **Call me back** request on prejoin.
- **preJoinDialOutCancel** - A user cancels the **Call me back** request on prejoin.
- **preJoinPSTNOptions** - A user selects a dropdown for other join options.
- **priorityChange** - Triggers when priority filter is applied while viewing a tasklist.
- **priorityPickerClicked** - Triggers when a user navigates to a priority filter picker from the task list filter screen.
- **privateMeetingJoin** - **Meeting Join** button tapped from Private meeting chat.
- **processInBG** - Process incoming notification in the background (Android).
- **processInFG** - Process incoming notification in the foreground (Android).
- **profileNameSaved** - Profile name was updated.
- **progressItemClicked** - Confirms a user has successfully opened the progress picker for a task.
- **promotedToPresenter** - User promotes an attendee - **Change** button in the dialog box.
- **provideFeedbackDismiss** - Dismiss the prompt that asks whether the user would like to send feedback about why they didn't like the app.

- **provideFeedbackNo** - Respond no to prompt that asks whether the user would like to send feedback about why they didn't like the app.
- **provideFeedbackYes** - Respond yes to prompt that asks whether the user would like to send feedback about why they didn't like the app.
- **provideRatingDismiss** - Dismiss the prompt that asks whether the user would like to rate us on the app store after saying they liked the app.
- **provideRatingNo** - Respond no to the prompt that asks whether the user would like to rate us on app store after saying they liked the app.
- **provideRatingYes** - Respond yes to the prompt that asks whether the user would like to rate us on app store after saying they liked the app.
- **proximityPermissionDismissed** - Permission banner is dismissed.
- **proximityPermissionGranted** - Permission is given on the pop-up.
- **proximityPermissionViewed** - Permission banner is tapped.
- **pushNotification** - Triggering events are:
 - Launch via notification.
 - Push notification selected.
 - Reconnecting push notification is tapped.
 - **Reconnect failed** push notification is tapped.
- **quickNotificationAction** - When a user interacts with one of the quick action responses on a notification (such as the ability to like a message directly from the push notification).
- **quickSelectImagePicker** - Quick select.
- **quickStartLiveEventJoin** - Quick start live event is joined by a user.
- **quietHoursValues** - Capture Quiet Hours State on back button navigation.
- **quotedReplySent** - A user sent a reply message with context type.
- **reactAngry_CM** - React with angry from the context menu.
- **reactAngry_HB** - React with angry from the hover bubble.
- **reactHeart_CM** - React with heart from the context menu.
- **reactHeart_HB** - React with heart from the hover bubble.
- **reactLaugh_CM** - React with laugh from the context menu.
- **reactLaugh_HB** - React with laugh from the hover bubble.
- **reactLike_CM** - React with like from context menu or like a bot message.
- **reactLike_doubleTap** - React with like from the double tap.
- **reactLike_HB** - React with like from the hover bubble.
- **reactSad_CM** - React with sad from the context menu.
- **reactSad_HB** - React with sad from the hover bubble.
- **reactSurprised_CM** - React with surprise from the context menu.

- **reactSurprised_HB** - React with surprise from the hover bubble.
- **reactRemoved_HB** - When a user removes a reaction through the reaction summary page experience.
- **readReceipts** - User enabled feature.
- **redeemInvite** - In app redemption.
- **redeemLinkInAppStart** - User initiated redeem of invite link from within Teams application.
- **refreshCalendarList** - Pull down to refresh agenda view.
- **refreshLinksGallery** - When a user swipes down to refresh the links gallery.
- **removeAssignee** - Confirms that an assignee is removed from the assignment picker view (as opposed to *assignmentRemoved* which triggers when selecting **x** outside of assignment picker view).
- **removeMeeting** - Select **Remove from Calendar** from the Meeting Details page of a cancelled meeting.
- **removeParticipantFromEditMeeting** - Remove a participant after selecting **Edit meeting** from the Meeting Details page.
- **removeParticipantFromNewMeeting** - Remove a participant from the scheduler page while setting up a new meeting.
- **removeReplyObject** - A user removed reply object from compose.
- **removeUser** - Confirms that an assignee is removed from within the assignment picker view (as opposed to *assignmentRemoved* which triggers when selecting **x** outside of assignment picker view).
- **removeUser_CM** - When a user removes someone via the chat participant list.
- **removeUserConfirm** - A user confirmed a remove user dialog.
- **removeUserContextMenu** - A user removed a participant via context menu.
- **removeUserSwipe** - A user removed a participant via swipe.
- **reorderChannelItem** - A user reorders pinned channels.
- **reportAbuseConfirmation** - When a user selects the **Done** button on the confirmation screen.
- **reportAbuseOpen** The number of times the **Report a concern** button is selected in the context menu.
- **reportAbuseSend** - When a user selects the **Report** button, the telemetry should store the type of report selected.
- **replyChain** - Selected **New message** button or textbox in reply chain (thread).
- **replyChannel** - Selected **Reply** button in channels.
- **replyNavigation** - Reply object was selected to navigate to referenced post.
- **replySendMessage** - Send channel reply.
- **replyViaMsgOptions** - User started reply via context menu.
- **replyViaSwipe** - User started reply via swipe.
- **requestActedOn** - Triggered when a manager acts on open shift requests.
- **requestActionClicked** - When a user requests an action, such as when the request for a shift is selected (either a Frontline Worker (FLW) manager viewing or a Frontline Worker.

- **requestDetailsClicked** - When the request for a shift is selected (either a Frontline Worker (FLW) manager viewing or Frontline Worker).
- **requestJoinTeam** - Request button pressed.
- **requestSent** - Logs if there was a request sent.
- **requestToJoinTeam** - Request to join team (public or private).
- **requestToJoinTeamError** - Error with join request.
- **requestTypeClicked** - Determining the type of request people select from the requests picker.
- **resetLocalVault** - User resets and clears all Safe data from their device.
- **resolveIssue** - **Resolve** is selected in the notification troubleshooter flyout to navigate to the blocker app.
- **responseClicked** - A user selects a response page.
- **retryButtonClicked** - The **Retry** button is selected.
- **returnToMessage** - The **Return** button is selected to navigate back to the message.
- **runningLate** - The user is running late.
- **safeLink** - Link verified as safe.
- **saveEditMeeting** - Select the **Save** button while on the meeting scheduler page after updating a meeting.
- **saveNewMeeting** - Select the **Save** button while on the meeting scheduler page. To log successfully saved meetings and the percentage of meetings that failed to create due to a client side or service error.
- **savePlanClicked** - Triggers **Create** is selected in the new plan creator from the default opening of the app.
- **scenarioChannelDashboard** - The user navigates to a tile on the dashboard.
- **scenarioDashboardNav** - The user navigates to the dashboard tab within a conversation (sibling of the chat tab).
- **scheduledMeetingJoin** - The **Meeting Join** button is selected from the scheduled meeting object.
- **scrollCalendarList** - Measures scrolls in calendar.
- **scrollDatePicker** - Scroll through the calendar date picker control.
- **searchAbandoned** - Determines if search was abandoned.
- **searchCancelled** - Determine if:
 - Search was successful or if the user abandoned search.
 - A search query was successful.
- **searchContacts** - Search from the Call List.
- **searchInitiated** - Determines if search can be triggered, and the source of search trigger.
- **searchMeetingParticipants** - Search for participants to add within the scheduler form. To distinguish between the number of appointments created versus the number of meetings created.
- **searchResultsClicked** - Determines:
 - If relevant results can be found successfully.

- If search results were from the All tab versus an individual domain.
- **searchTabClicked** - Determines:
 - Domain information of the search result - for people, chat, messages, and files.
 - If the relevant results are found successfully.
- **seeAllMeetingParticipants** - Select **See All** from the meeting details page, or view all participants. Logs user data across the calendar funnel, where calendar meeting details play an important role, this helps validate selections for Dial ins, Teams meetings, RSVPs, etc..

Data is logged across the calendar funnel, where calendar meeting details play an important role, this helps validate selections for Dial ins, Teams meetings, RSVPs, etc..
- **seeRsvpMeetingOptions** - Select **Notify Organizer** from the RSVP pop up, or select **Rsvp** options from the Meeting Details page.
- **selectActivityType** - Captures select gestures on feed item.
- **selectCalendarDate** - Select a specific date on the calendar date picker control.
- **selectDevice** - Selecting a particular device in the displays app.
- **selectGeneralSetting** - Go to general settings.
- **selection** - Device contact selected, or company contact selected.
- **selectMeetingChicklet** | Meeting.
- **selectMeetingRsvpOption** - Select the **RSVP** button to choose an option.
- **selectMeetingRsvpOptions** - Select the **RSVP** button to choose an option.
- **selectPersonalList** - Confirms that the user successfully navigated to a personal task list by tapping it.
- **selectPlannerList** - Confirms that the user successfully navigated to a shared task list by tapping it.
- **selectSettingOption** - Go to the **Settings** tab from the hamburger menu.
- **selectTheme** - Enable dark theme.
- **selectUser** - Confirms that an assignee was successfully selected for a task.
- **selfLongPress** - Long press on myself.
- **Send_earlycancelledCQF** - A user submits feedback on CQF early cancelled call form.
- **send_map_pin_clicked** - A user sends a static location.
- **Send_ratemycallCQF** - A user submits feedback on CQF rate my call form.
- **Send_ratemyliveeventCQF** - A user submits feedback on CQF rate my live event form.
- **sendForward** - A user confirms to send a forward message from the forward picker.
- **sendImage** - Send image.
- **sendLocation** - Send location.
- **sendMsg** - Select **Send** in reply.
- **sendRequestBulkClicked** - This is logged once for each bulk request send.

- **sendRequestClicked** - **Shift request sent** is selected.
- **sendVoiceMessage** - **Record** button is released.
- **Setting/Dismiss** - Device contacts setting.
- **settingsNavReadReceiptNotice** - User went to settings from the feature notice.
- **settingsOpened** - This is triggered when the user's device time zone doesn't match the team time zone, and the user goes to Settings.
- **setupPinVault** - User saves a Safe pin for their account.
- **shareCharmCompleted** - User completed sharing of an invite link via application share charm.
- **shareCharmOpened** - User initiated sharing of an invite link via application share charm.
- **shareFile** - Triggered when **Share file** is selected. Also helps to check if:
 - The user was able to initiate share file operation.
 - The user can share a file successfully.
- **shareHistory** - Share history picker selected.
- **shareInto** -- A user shares something from another app into Teams.
- **sharePlanToChat** - A shared list is manually shared from the tasks app to the group chat as a chicklet, check chicklet sent via the backend messaging service.
- **sharePPTFromChannels** - **Teams and Channels** is selected.
- **sharePPTFromOneDrive** - **OneDrive** is selected.
- **shareRecording** - Share a recording.
- **shareScreen** - Start or stop a screen share.
- **shareShift** - The information that is given when a shift is shared.
- **shareShiftsClicked** - The details of an open shift.
- **shareTray** - **Share...** is selected in the action sheet.
- **shiftAssigneeClicked** - The Shifts Calendar view showing the particular shifts details.
- **shiftDetails** - This allows you to see the details of a shift.
- **shiftDetailsCalendar** - User goes to shift details.
- **shiftDetailsMyShifts** - Tapping on **Calendar** from the **Schedules** tab.
- **shiftDetailsTodaysCoworkers** - On the clock in screen, the **Start** or **End break** button is selected.
- **shortCircuitContactCount** - The number of address book matched short circuited contacts received from a contacts fetch.
- **showBanner** - Number of times the **WiFi Connected, No Internet** banner appears.
- **showCard** - Tap on card buttons. Cards are key platform constructs and measuring their usage and pattern is necessary to understand platform usage and keep a look out for potential issues on the client side.
- **shownReadReceiptNotice** - The user shown feature notice with settings options.
- **signIn** - **Sign in** is selected on welcome page, or the **Sign In** button is tapped.

- **SignInWithOTP** - User selects the option to sign in as a guest with one time passcode (OTP).
- **signUp** - Create a free account or **Sign up for free** is selected.
- **SignUpFromSignIn** - User taps on **Create a new account** option from sign-in.
- **simultaneousCallForward** - Triggered when:
 - Simultaneous call forward target is set.
 - Simultaneous call forwarding is enabled (Calls ring me is enabled & Also ring is set).
- **skipVerificationForLink** - The user chose to skip verification.
- **smartReply** - Smart reply toggle button is clicked.
- **SMSSendMessage** - The user sends a SMS message.
- **sortChanged** - Triggers when user changes sort order while viewing a tasklist.
- **SSOAccountListItem**: Triggered when the user taps on an SSO account to sign in.
- **startEditing** - Edit button selected.
- **startPresentPhoto** - Start presenting photo.
- **startPresentVideo** - Start presenting video.
- **startPSTNCall** - Triggered due to:
 - PSTN Result in Global Search (People).
 - PSTN call placed from Device contactCard.
 - PSTN Call placed from callList.
 - DialPSTN Number using DialPad.
- **startRecording** - Start recording.
- **startVoicemailCall** - **Change voicemail greeting** selected.
- **static_place_selected** - A user drags map to select a static place.
- **statusCheckBoxClicked** - Triggers when task item is either completed or uncompleted.
- **statusMsgCancel** - A user cancels change to status message.
- **statusMsgExpiry** - A user sets the expiry time.
- **statusMsgSet** - A user sets a new status message.
- **statusPageViaContactCard** - A user enters the status compose experience via a contact card.
- **statusPageViaHamburger** - A user enters the status compose experience via the hamburger.
- **stop_location_sharing_logout** - A user logs out of the app.
- **stopMeetingButton** - The number of times a user leaves the lobby without being admitted into the meeting.
- **stopPresentPhoto** - Stop presenting photo.
- **stopPresentVideo** - Stop presenting video.
- **stopRecording** - Stop recording.
- **structuredMeetingsBannerDismiss** - a user dismisses the banner that informs them about their meeting role.

- **stuckOnConnectingDialInSelected** - **Dial in** is selected on the drawer.
- **stuckOnConnectingRetrySelected** - **Retry** is selected on the drawer.
- **stuckOnConnectingShownDismissed** - A user dismissed the drawer.
- **suggested_place_selected** - A user shares a static location by selecting a suggested place.
- **Switching**- Tenant or account is switched from the app. This is required to measure account/tenant switch issues proactively and provides a smooth account/tenant switch experience.
- **switchTeamAction** - A user switches teams within the time clock. This should fire after the user selects which team they want to switch to.
- **switchTeamsDialogTriggered** - A user views the **Shifts** tab.
- **tabActionCopyLink** - How users discover and use the tab copy link on mobile.
- **tabActionMoreOptions** - Understand ellipsis (...) usage from within a tab.
- **tabActionOpenInBrowser** - Open in browser usage. This is necessary to understand if users prefer opening a tab outside Teams.
- **tabActionOpenInBrowserFromTab** - Understand open in browser usage from within a Tab for more option - discoverability and usage.
- **tabActionOpenInTeams** - Open in usage. This is key in understanding if the tab can be by default set to open in Teams.
- **tabActionRemove** - Understand how discoverable the delete option is and the usage of the feature.
- **tabActionRename** - Understand how discoverable rename is and the usage of the feature.
- **tabActionSetting, Android - fix** - How users discover and use tab config on mobile.
- **table** - Select a table.
- **tabListMoreOptions** - Understand the usage of the more options for a tab.
- **tabOpen** - Notes success in opening tabs, or if there are issues in the way tabs open.
- **tabViewed** - Only logged if the request being sent is a swap, for entries into the **Team Shift** picker.
- **takePhoto** - Take a photo.
- **takePhotoPicker** - **Take photo** selected inside the image picker.
- **tapChicletExpand** - How users preview cards on mobile.
- **tapDatePickerHandle** - Expand the calendar date picker control.
- **tapSettings** - The number of users re-configuring apps on mobile.
- **tasksAppLaunchAdaptiveCard** - The Tasks app is opened from an adaptivecard in a group chat, check the app launch via the URL of the IC3 service.
- **tasksAppLaunchComposeExtension** - The Tasks app is opened from the compose extension in a group chat, check the app launch via the MT service.
- **tasksAppLaunchDashboard** - The Tasks app is opened from the dashboard tile or specific plan, check the app launch via the MT service.
- **tasksAppLaunchDashboardSeeAll** - The Tasks app is opened from the dashboard **See all** button on the dashboard, check the app launch via the MT service.

- **tasksAppLaunchDefault** - The Tasks app is opened from the bottom drawer, check the app launch via the MT service.
- **tabCalendarClicked** - A user has chosen a team from the team picker.
- **teamChannelChanged** - Triggered when a user selects and navigates to a plan from plan list. Only sent to applnsights, not Aria.
- **teamCreate** - A user selects the option to create a new team.
- **teamEdit** - A user edits some aspect of a team that they own or administer.
- **teamNav** - View menu options for a team.
- **teamsDeviceCallResumed** - A user with a bluetooth connected peripheral (mobile phone dock) reactivates a call from hold.
- **teamSelectedClicked** - When a user selects **Team selected** for a timesheet.
- **teamShiftPickerClicked** - When a user adds a new break entry. The event is logged once the user saves the changes.
- **tenantSwitch** - On Switch Tenant. Feature success metrics for MTMA (multiple tenant and multiple account) feature, this helps identify and fix issues proactively and provide a smooth switching experience.
- **tenantSwitchUnsupportedError** - Tenant Unsupported Error (when a user sees the error). Feature success metrics for MTMA (multiple tenant and multiple account), provides telemetry around account or tenant switch errors, so we can identify and fix issues proactively and provide a smooth switching experience.
- **timeClockClicked** - A user selects the **Time clock** button on the My Shifts tab.
- **timeOffReasonClicked** - Determining if a reason for time off is cited.
- **timesheetAddClicked** - When a user adds a note to their break edits. The event is logged once the user saves the changes. **timesheetBreakAdded** - Adding a new clock entry. The event is logged once the changes are saved.
- **timesheetBreakEdited** - When a user confirms their timesheet. The event is logged when the user hits confirm in the modal.
- **timesheetBreakNoteAdded** - When a user deletes their timesheet. The event is logged when the user confirms the delete in the modal.
- **timesheetClockAdded** - When a user selects Edit for a timesheet.
- **timesheetClockEdited** - When a user selects Save on an edited timesheet.
- **timesheetConfirmed** - When a user adds a note to their timesheet edits. The event is logged once the user saves the changes.
- **timesheetDeleted** - If a user does or does not have a shift reminder set, and the amount of minutes before a shift a user wants to be alerted.
- **timesheetEditClicked** - User Configuration telemetry.
- **timesheetEditSaved** - A user taps on a time sheet from a user's profile to open that user's time sheet.
- **timesheetNoteAdded** - To view an approved time off request.
- **titleChanged** - Triggers when a task item title changes, triggers on every character change.

- **toast** - In-app toast is selected.
- **toggleChannelsInChat** - Turn feature on or off. Feature success metrics for unified chats and channel experience.
- **toggleClicked** - A toggle is selected.
- **transferNow** - Triggered when:
 - A user selects **Transfer** > **Transfer now**.
 - Transfer target is set to a Person.
 - Transfer target is set to a Phone Number.
- **translateFailed** - Translation failed (excluding offline). Feature success metrics for message translation feature.
- **trigger_created** - The user created a geofence.
- **trigger_deleted** - The user deleted a geofence.
- **unansweredCallForward** - An unanswered call forward target is set. Also enables unanswered call forwarding (Calls ring me is enabled and If unanswered is enabled).
- **unblockCaller** - Unblock:
 - Contact or number from the action sheet.
 - Contact or number from a contact card.
 - Number from settings.
- **unblockChat** - Unblock a bot chat.
- **unpinChannel** - Unpin a channel.
- **unpinSelf** - Unpin yourself from the action sheet.
- **unpinUser** - Unpin a user from the action sheet.
- **unsafeLink** - A link was determined to be unsafe.
- **updatePersonalTask** - Confirms a personal task has been successfully updated.
- **updatePlaybackSpeedVoicemail** - Voicemail playback speed value is changed.
- **updateTask** - Confirms update tasks action failed.
- **updateTaskState** - Confirms that the task state has been updated. action.
- **upgrade** - Selecting the **Upgrade** button in the **More** menu.
- **uploadFile** - A user selects **Upload from device**.
- **uploadSelectedFile** - Triggered under these circumstances:
 - Upload files in channel successfully.
 - Upload files in chat successfully.
 - Upload files in the reply window.
 - Upload files successfully in group chat.
 - Usage of core scenario.
 - The start of upload scenario in channel.
 - The start of upload scenario in chat.
 - The start of end of upload scenario in channel.

- Upload a file into the **Files** tab successfully.
- If a prompt is acted on during file upload.
- If a selected file is uploaded successfully.
- **uploadSelectFile** - Select a file successfully; Select the **Upload file** button successfully.
- **urgentMessageSelect** - Selects an urgent message from the priority context menu.
- **urgentMessageSend** - Sends an urgent message.
- **url** - URL.
- **urlPreview** - URL preview.
- **urlPreviewAdd** - URL preview add.
- **urlPreviewOpen** - URL preview open.
- **urlPreviewRemove** - URL preview removed.
- **userConfiguration** - To view a pending time off request.
- **userJoinedViaShareLink** - A user joined a meeting from a link.
- **userLongPress** - Long press on a participant.
- **userProfileOpened** - A user selects a **User** icon to open a user profile.
- **userTimesheetOpened**** - A user selects a timesheet from a user's profile to open that person's timesheet.
- **useWifiForAudioDialog** - A user selects **OK** while the system prompts, while an Admin has blocked audio and video calls on cellular.
- **useWifiForVideoDialog** - Triggered when:
 - **OK** is selected while the system prompts, while an Admin has blocked video calls on cellular.
 - Trying to enable video in meeting, while an Admin has blocked it on cellular.
 - **OK** is selected while the system prompts, while an Admin has blocked video in meetings on cellular.
- **videoUserDoubleTap** - Double tap on a video participant.
- **viewChannelMembers** - View a channel members list.
- **viewContactCard** - ContactCard selected from:
 - A callHistory item.
 - A voicemail item.
 - A call list.
- **viewed** - A user viewed a page.
- **viewFullAllDayMeetingList** - Agenda view on Mobile.
- **viewLobbyFromBanner** - The number of times a user selects **View lobby** from a notification banner.
- **viewMeetingDetails** - Select the ... menu on the Meeting Details page. Pertaining to the usage of the **More** menu on mobile calendars.
- **viewMeetingOccurrence** - Open up the meeting details of an instance of a recurring meeting.
Telemetry to log user data across the calendar funnel, where calendar meeting details play an important role, that helps validate Selects Dial ins, Teams meetings, RSVPs, and so on.
- **viewMeetingSeries** - To log the successful rendering of a meeting series in the following circumstances:

- When switching from an instance to the series meeting detail page.
- When selecting **View series** from the meeting details page.
- **viewOrgChart** - Basic usage telemetry for an org chart.
- **viewRequests** - The **View requests** button is pressed.
- **voiceDataCollectionOptOut** - A user opts-out of the recording from mobile by clicking the banner.
- **voicemail - No AS Assigned** - A speaker taps on a voicemail item.
- **whiteboardUsed** - A user annotates on a whiteboard (any action on the webview).
- **wiki - No AS assigned** - Wiki usage telemetry.
- **poorNetworkBanner** - Poor network banner shown.
- **badNetworkBanner** - Bad network banner shown.

PanelView

NOTE

For information on the properties of PanelView events, see [Properties sent with panelview events](#).

- **appInstall**: Triggered when a user opens the app for the first time after installation.
- **fileDeleteFailed** - Triggered when a file delete operation fails.
- **fileDeleteSuccess** - Triggered when a file delete operation succeeds.
- **filePreview** - Triggered in following scenarios:
 - When share option is tapped in file preview screen.
 - When copy option is tapped in file preview screen.
 - When download option is tapped in file preview screen.
 - When a file preview is successfully loaded.
- **files** - Triggered in following scenarios:
 - When a file is previewed within Teams app.
 - When file upload option is tapped in OneDrive files screen.
 - When "Copy Link" option is tapped in file preview screen.
 - When the file sharing screen is dismissed.
 - When files options menu is opened or when one of the options in that menu is tapped.
 - When "in-call" files screen is opened.
 - When a file is tapped to open.
- **filesChannel** - Triggered when channel files screen is opened.
- **fileSources** - Triggered when files options menu is opened or when one of the options in that menu is tapped.
- **filesPersonal** - Triggered when a batch of files is loaded in OneDrive or recent files screen.
- **fileUploadDeleteTriggered** - Triggered when a file attachment is deleted or detached from message area.
- **fileUploadFailed** - Triggered when a file upload operation fails.
- **fileUploadIndividualNotification** - Triggered when the contents of file upload notification change or when the notification is interacted with. The interactions may include gestures like swiping to dismiss the notification or tapping the notification etc.
- **fileUploadSuccess** - Triggered when a file upload operation succeeds.
- **fileUploadSummaryNotification** - Triggered when the contents of file upload summary notification change or when the notification is interacted with. The interactions may include gestures like swiping to dismiss the notification or tapping the notification etc.

- **meetingFiles** - Triggered when meeting files screen is opened.
- **meetNowActionSheet** - Triggered when user creates a Meet Now meeting.
- **navPersonalFiles** - Triggered when navigation to files screen is performed.
- **signInSSOPage**: Triggered when the user views a single sign-on page while signed in. -- **signInError**: Triggered when the user hits any error while signed in. This is needed to proactively identify and fix issues that users face during sign-in. -- **TfLSignInSuccessful**: Triggered when the user successfully signs in to a personal Microsoft account. This is needed to understand sign-in and sign-up reliability and proactively identify and fix issues. -- **TfWFreemiumSignInSuccessful**: Triggered when the user successfully signs in to a freemium account. This is needed to understand sign-in and sign-up reliability and proactively identify and fix issues. -- **TfWSignInSuccessful**: Triggered when the user successfully signs in to a work or school account. This is needed to understand sign-in and sign-up reliability and proactively identify and fix issues.
- **appDrawer** - Triggered when app drawer is opened successfully.
- **appPolicyChange** - Triggered when a user resets and save new tabs order locally.
- **app_stageview** - Triggered when a stage view is successfully rendered.

Scenario

NOTE

For information on the properties of PanelAction events, see [Properties sent with scenario events](#).

- **acquire_resource_token_interactive**- Required service call which is triggered when an authentication token is acquired by interactive sign-in.
- **acquire_resource_token_silent**- Required service call which is triggered when an authentication token is acquired by silent sign-in.
- **add_buddy** - Captures status of adding a contact.
- **app_crash2** – Triggered when the app is crashed unexpectedly. Provides information on how frequently the Teams app is crashing.
- **app_incremental_sync_launch** - Confirms that the pill count gets updated successfully for cold launch.
- **app_incremental_sync_resume** - Confirms that the pill count gets updated successfully for warm/hot launch.
- **app_start_cold** - To monitor cold app launch (Android only).
- **app_start_hot** - To monitor hot app launch (Android only).
- **app_start_warm** - To monitor warm app launch (Android only).
- **auth_adal_tokens**- Required service call to do silent authentication. Triggered when a user starts the app, or the token is refreshed on expiry.
- **chat_add_giphy** - Confirms that the Giphy GIF rendering action succeeded or failed.
- **chat_send_message_sfc**- Triggered when a chat message is sent in SfC interop chat.
- **cortanaError** - To monitor Cortana error happens.
- **cortanaView** - To monitor Cortana canvas appear.
- **cortanaRestart** - To monitor Cortana restart.
- **cortanaSetNewConversation** To monitor Cortana sets new conversation.
- **cortanaSpeechRecognition** To monitor Cortana speech recognition latency.
- **cortanaStart** To monitor Cortana backend start.
- **cortanaStartListening** To monitor Cortana start listening.
- **cortanaStopListening** To monitor Cortana stop listening.
- **cortanaThinking** To monitor Cortana state change to thinking(waiting for service's response).
- **cortanaTokenRefresh** To monitor Cortana token refresh in foreground.
- **cortanaWarmingUp** To monitor Cortana warming up start(Cortana is open but token is still fetching).

- **cortana_admin_policy_refresh** - To monitor Cortana admin policy refresh.
- **cortana_background_token_refresh** - To monitor Cortana token refresh.
- **cortana_initialization** - To monitor Cortana initialization steps.
- **cortana_sdk_events** - To monitor Cortana turn related events.
- **cortana_skill_action_execution** - To monitor Cortana action execution.
- **cortana_skill_action_delay** - Confirms the start of delay action.
- **cortana_watchdog** - To monitor Cortana watchdog recovery process.
- **create_default_plan_and_nav_to_view** - Confirms successful creation of a default shared task list and how long it took for a user to land on the resulting view after action.
- **create_new_chat_thread_sfc** - Triggered when a new chat thread is created for an SfC interop chat.
- **create_personal_plan_and_nav_to_view** - Confirms successful creation of a personal task list and how long it took for a user to land on the resulting view after action.
- **create_personal_task** - Confirms successful creation of a personal task item.
- **create_planner_plan_and_nav_to_view** - Confirms successful creation of shared task list and how long it took for a user to land on resulting view after action.
- **create_planner_task** - Confirms successful creation of shared task item.
- **forwardExistingAmsObject** Confirms that the media forward action succeeded or failed.
- **delete_personal_plan** - Confirms the successful deletion of a personal task list.
- **delete_personal_task** - Confirms the successful deletion of a personal task item.
- **delete_planner_plan** - Confirms the successful deletion of a shared task list.
- **delete_planner_task** - Confirms the successful deletion of a shared task item.
- **json_parse_failure** - Provides information on the frequency of JSON parsing issues.
- **fetch_me_profile** - The users profile creation status.
- **getProfilePicture** - Necessary service call to get user profile picture.
- **get_resource_token_async**: Required service call to acquire tokens for Azure Active Directory resources asynchronously.
- **get_resource_token_sync**: Required service call to acquires tokens for Azure Active Directory resources synchronously.
- **get_sender_sub_scenario** - Get sender sub scenario in activity.
- **interactiveAuthNopa2** - Triggered when no password user is interrupted to do interactive authentication.
- **load_chat_plans_list** - Confirms the successful fetching of planner plans for a chat's plan view.
- **load_home_page** - Confirms the successful fetching of both personal and shared tasklists for the main home view.
- **load_personal_task_list** - Confirms the successful fetching of a personal tasklist's tasks for the tasklist view.
- **load_shared_task_list** - Confirms the successful fetching of a shared tasklist's tasks for the tasklist view.
- **load_smart_task_list** - Confirms the successful fetching of a smart tasklist's tasks for the tasklist view.
- **meetingAttachmentRender** - Confirms the render of meeting attachments.
- **meetingInsightFetch** - Confirms the fetch of meeting related content.
- **meetingInsightLocatorRender** - Confirms the render of meeting related content locator tip.
- **meetingInsightRender** - Confirms the render of meeting related content.
- **meetingInsightVisible** - Confirms the visibility of meeting related content.
- **open_image** Confirms that the full screen image rendering succeeded or failed.
- **rename_personal_plan** - Confirms the successful renaming of a personal task list.
- **rename_planner_plan** - Confirms the successful renaming of a shared task list.
- **save_image** Confirms that the image save action succeeded or failed.
- **saveMeProfile** - Required service call that gets triggered when user saves the profile

- **share_image** - Confirms that the image share action succeeded or failed.
- **smart_reply_enabled** - Confirms that smart reply is enabled for current user.
- **smart_reply_received** - Confirms that a smart reply suggestion is received.
- **smart_reply_banned** - Confirms that smart reply cannot be displayed for current user.
- **park_call_for_hold_v2** - Confirms that putting call on hold succeeded or failed using call park.
- **unpark_call_for_hold_v2** - Confirms that resuming call succeeded or failed using call un-park.
- **update_planner_task_and_nav_to_view** - Confirms the successful updating of a shared task item and how long it took for a user to land on resulting view after action.
- **update_personal_task_and_nav_to_view** - Confirms the successful updating of a personal task item and how long it took for a user to land on resulting view after
- **updatePlannerTask** - Confirms that a user has successfully updated a task in a shared task list.
- **upload_images** Confirms that the image upload action succeeded or failed.
- **upload_voice_messages** Confirms that the voice message upload action succeeded or failed.
- **voiceMessageUpload** Confirms that the voice message upload action succeeded or failed.
- **cancel_channel_meeting** Confirms that the cancellation of a channel meeting has succeeded or failed.
- **cancel_meeting** Confirms that the cancellation of a meeting has succeeded or failed.
- **cancel_private_meeting** Confirms that the cancellation of a private meeting has succeeded or failed.
- **edit_channel_meeting** Confirms that the edit operation of a channel meeting has succeeded or failed.
- **edit_meeting** Confirms that the edit operation of a meeting has succeeded or failed.
- **server_fetch_agenda_view** Confirms that the calendar event sync using the Middle Tier API has succeeded or failed.
- **server_fetch_date_picker_view** Confirms that the calendar event sync using the Outlook REST API has succeeded or failed.
- **server_fetch_agenda_view_group** Confirms that the calendar event sync using the Middle Tier API for the TFL group has succeeded or failed.
- **server_fetch_date_picker_view_incremental** Confirms that the calendar event incremental sync using the Outlook REST API has succeeded or failed.
- **meeting_details** - Confirms that the meeting details sync has succeeded or failed.
- **show_meeting_participants** - Confirms that showing the meeting participant list has succeeded or failed.
- **search** - Confirms that the whole search session has succeeded or failed.
- **time_based_retention_shared_channel** - Captures performance data for pruning the database.
- **toggle_searchability** - Captures status of network call for stamping/unstamping an alias.
- **sync_user_entitlements_and_app_definitions** - Required service call to fetch aggregatedEntitlements.
- **bots_load_mediacards** - Captures instanced when Connector cards are configured in chat and channel.
- **bots_load_one_card** - Captures if at least one card is present and loaded when chatting with a bot.
- **load_assignments** - Captures exceptional handling for loading assignment app.
- **load_channel_tab** - Captures loading of channel tab. (Android only)
- **load_messaging_extension_results** - Captures loading of messaging extension search/query result. (Android only)
- **load_static_tab** - Captures loading of static tab. (Android only)
- **app_authenticated** - Confirms that the authentication is successful and a token is fetched. (Android only)
- **blocked_by_conditional_access** - When receive conditional access blocked error code in authentication. (we try to force refresh the primary token in that case). (Android only)
- **get_resource_token_sync** - Triggered when we attempt to fetch token for app resources synchronously. (Android only)
- **get_resource_token_async** - Triggered when we attempt to fetch token for app resources asynchronously. (Android only)

OnePlayer events

NOTE

For OnePlayer events, only properties listed in [Property lists for OnePlayer events](#) apply.

OnePlayer user action events

- **PlayerPlay** - Confirms if the user taps on the play button in the OnePlayer view.
- **PlayerPause** - Confirms if the user taps on the pause button in the OnePlayer view.
- **PlayerSeek** - Confirms if the user seeks the video either using the seek bar or forward/backward buttons in the OnePlayer view (iOS only).
- **VideoPlayerSeekForward** - Confirms if the user seeks the video either using the seek bar or forward buttons in the OnePlayer view (Android only).
- **VideoPlayerSeekBackward** - Confirms if the user seeks the video either using the seek bar or backward buttons in the OnePlayer view (Android only).
- **ChangePlaybackSpeed** - Confirms if the user has selected a new playback speed.
- **changePlaybackQuality** - Confirms if the user has selected a new video quality for playback.
- **ShareVideo** - Confirms if the user has tapped on the share icon.
- **PlayerClose** - Confirms if the user has tapped on the close icon.
- **VideoCaptionsOn** - Confirms if the user has switched on the captions.
- **VideoCaptionsOff** - Confirms if the user has switched off the captions.
- **ChangePlayerOrientation** - Confirms if the user has changed the orientation of the device.
- **OpenPlayerSettingsMenu** - Confirms if the user has opened the settings menu.
- **OpenPlaybackSpeedMenu** - Confirms if the user has opened the playback speed menu.
- **PlayerAction** - Custom action provided by the host app.

OnePlayer playback events

- **PlayerHeartbeat** - This is a recurring event that sends the current status of the player and playback to a log.

Property lists

Properties sent with all events

PROPERTY NAME	DESCRIPTION
EventInfo_Time	Event generation time
EventInfo_Name	Event name - Used to differentiate between event types
EventInfo_BaseType/name	Event type - Used to differentiate between event types in an event
EventInfo_Source	Source of the event generation
AppInfo_Language	App language
AppInfo_ETag	Experiment ID assigned to a user
DeviceInfo_OsBuild	Build version of the OS

PROPERTY NAME	DESCRIPTION
UserInfo_Mri	Type a user ID
Session_RunId	Type of a session ID
DeviceInfo_DetailModel	Model of the device
UserInfo_TimeZone	Time zone of the user
DeviceInfo_OsName	Device OS name
DeviceInfo_NetworkProvider	Device network provider
DeviceInfo_Model	Device Model
DeviceInfo_NetworkType	Device network type
UserInfo_Language	User language - similar to app language
client_ring/UserInfo_Ring	User ring that helps to release features to early adopters
UserInfo_Id	User ID
UserInfo_TenantId	Tenant ID
EventInfo_SdkVersion	SDK version used to generate the event
DeviceInfo_Id	Device ID provided by device OS
eventpriority	Priority of an event
DeviceInfo_Make	Device manufacturer
AppInfo_Version	Version of the app
DeviceInfo_OsVersion	Device OS version
Session_Id/SessionId	Session ID of the request
Session_Environment	Session Environment
isNetworkIssue	Captures info if there was a network issue while serving the request
UserRole	User role in a tenant
Tenant_Model	Captures if the account is a freemium or enterprise account
licenseType/UserInfo_LicenseType	Licence type assigned to the user
UserLocale	Locale in which app is being accessed

PROPERTY NAME	DESCRIPTION
Intune_sdkVersion	Version of the Intune SDK
Intune_sdkBundleVersion	Detailed version of the Intune SDK
ApplInfo_Environment	Environment in which the app is being access

Properties sent with panelaction events

PROPERTY NAME	DESCRIPTION
Action_DestinationUri	Uri of the resource being accessed by user action
Panel_Uri	Uri of the panel delivered to the user
Action_Gesture	Type of gesture performed by user on the app
Action_ScenarioType	Feature grouping that relates to business metric for feature
Panel_Type	Panel type accessed by the user
Action_Outcome	Outcome of the action performed by user
Team_Id	ID of the team in which action was performed by the user
Module_Type	Type of the module which hosted user action
Module_Name	Name of the module which hosted user action
Module_Summary	Summary of the module that hosted user action
Thread_Id	ID of the thread that was accessed by user
Panel_PreviousUri	URI of the previous panel
Panel_Region	Region where the panel was hosted in the app
Panel_LaunchMethod	Method through which the panel was launched
Panel_PreviousType	Type of the previous panel
Thread_Type	Type of thread accessed by user
Module_State	State of the module accessed by user
Action_Scenario	Feature inside a group of features that relates to business metric
Panel_LaunchSource	Source information of the panel that was launched
Tab_Type	Type of the tab accessed by user

PROPERTY NAME	DESCRIPTION
Team_Type	Type of team accessed by user

Properties sent with panelview events

PANEL_URI	URI OF THE PANEL DELIVERED TO THE USER
Panel_Type	Panel type accessed by the user
Team_Id	ID of the team in which action was performed by the user
Thread_Id	ID of the thread that was accessed by user
Panel_PreviousUri	URI of the previous panel
Panel_Region	Region where the panel was hosted in the app
Panel_LaunchMethod	Method through which the panel was launched
Panel_PreviousType	Type of the previous panel
Thread_Type	Type of thread accessed by user
Panel_LaunchSource	Source information of the panel that was launched
Tab_Type	Type of the tab accessed by user
Team_Type	Type of team accessed by user

Properties sent with scenario events

PROPERTY NAME	DESCRIPTION
Scenario_Status	Status of a scenario - Abandon/OK/ERROR
Scenario_Step	When a scenario contains multiple steps with different failure points, this property captures details about the step
Scenario_StatusCode	Property records status code of the scenario based on scenario success or failure

Properties sent with trace events

PROPERTY NAME	DESCRIPTION
Trace_message	Contains error string and details about the reasons due to which a failure might have happened

Property lists for OnePlayer events

1. Properties sent with all OnePlayer events

1.1 Standard properties

PROPERTY NAME	DESCRIPTION
eventType	Type of event (AppLogic, ErrorAlert, Performance, UserAction)
accountType	Type of user account (for example, business)
component	OnePlayer
language	Locale/language of the app
platform	Platform of OnePlayer (iOS/Android)
tenantId	Tenant ID
version	Version of the OnePlayer being used
aadUserId	User ID

1.2 Player properties

PROPERTY NAME	DESCRIPTION
engineName	Underlying player name (AVFoundation for iOS/ExoPlayer for Android)
engineVersion	Operating System version
loadMode	Load mode of the player
playbackSessionId	Session ID for playback

1.3 Host properties

PROPERTY NAME	DESCRIPTION
hostIntegrationType	Host integration type (for example, Package, OneUp)
hostPlatform	Platform for host app
hostProperties	Host properties, if any (iOS only)
hostApp	Name of the host app
hostVersion	Version of the host app

1.4 Experimentation properties

PROPERTY NAME	DESCRIPTION
ring	Ring to which the user belongs
hostSettings	Attributes set by the host app (moreOptionsEnabled, shareFeatureEnabled, playbackQualityFeatureEnabled, playbackSpeedFeatureEnabled)

PROPERTY NAME	DESCRIPTION
flightFilters	Description
flightsOverridden	Bool for flights overridden or not

1.5 Service properties

PROPERTY NAME	DESCRIPTION
contentType	Type of content being served
environment	Environment name
mediaService	Which media service is being used (SPO, ODB, ODC, IC3-AMS, Unknown)
mediaType	Type of the media being played
playbackTech	Playback tech of the media
correlationId	Correlation ID for the media, if any

2. Properties sent with all OnePlayer User Action Events

PROPERTY NAME	DESCRIPTION
actionType	Type of action being performed, such as tap, drag, and flick(iOS only)
isIntentional	Boolean value if the action is intentional or not (iOS only)

2.1 Properties sent with changePlaybackQuality Event

PROPERTY NAME	DESCRIPTION
currentPlaybackQuality	current playback quality

2.2 Properties sent with ChangePlaybackSpeed Event

PROPERTY NAME	DESCRIPTION
previousPlaybackRate	Previous playback rate of the video (iOS only)
currentPlaybackRate	Current playback rate of the video

2.3 Properties sent with PlayerSeek Event (iOS only)

PROPERTY NAME	DESCRIPTION
seekSource	Source of seek (seekbar, forwardButton, backwardButton)
seekValue	Seek position

3. Properties sent with OnePlayer Heartbeat Event

PROPERTY NAME	DESCRIPTION
mediaCurrentTime	Current playback time of the media (iOS only)
isLoaded	Is media loaded
loadTimeMs	Load time taken in milliseconds
numberOfStalls	Number of stalls during playback (iOS only)
bufferingCount	Number of stalls during playback (Android only)
observedBitrate	Observed bit rate during playback (iOS only)
avgBitrateBitsPerSecond	Observed bit rate during playback (Android only)
playedSeconds	Played seconds till the event
rebufferingSeconds	Rebuffering seconds during playback
timeSinceSourceSetMs	Time since source was set (ms)
triggerType	Trigger type (buffering, error, errorLog, canPlayThrough, intervalHeartbeat, sourceset, unload)
errorId	Error ID for the error, if any
errorCorrelationId	Error correlation ID for the error, if any
errorLog	Error log for the error, if any
errorType	Error type for the error, if any
errorMessage	Error message for the error, if any
errorStack	Extended error info for the error, if any
metaUrl	Meta URL for media
odspDocId	ODSP doc ID for media
siteId	Site ID for media
teamsCallId	Teams call ID for media, if any

Required desktop diagnostic data for Microsoft Teams

12/7/2021 • 15 minutes to read • [Edit Online](#)

The following article contains a list of Microsoft Teams desktop events, and lists of properties each event collects.

For more information about diagnostic data, including how to control what diagnostic data is sent to Microsoft, see [Diagnostic data sent from the Teams app to Microsoft](#). To view the diagnostic data being sent to Microsoft, you can use the [Diagnostic Data Viewer](#).

Events

NOTE

There are common properties for all events listed below, to review them, see [Properties sent with all events](#).

Logging

NOTE

For information on the properties of Logging events, see [Properties sent with logging events](#).

- **adal-anonymous-mac.ts:this.logger.logError** - Records that a generic sso error occurred when logging in anonymously on a Mac device.
- **adalAnonymousUtil.ts:loggingService.getInstance** - Records error statement logging that the app could not launch anonymous user authentication.
- **adal-anonymous-windows.ts:this.logger.logError** - Records that a generic sso error occurred when logging in anonymously on a windows device.
- **adalBase.ts:this.loggingService.logError** - Records information needed to determine that the user profile is null or empty.
- **adal-impl-mac.ts:this.loggingService.logError** - Records the occurrence of an issue when parsing telemetry received during authentication or generic sso error occurred when logging in on a Mac device.
- **adal-rigel-windows.ts:this.logger.logError** - General logging statement indicating a generic sso error occurred when logging in on our Meeting room device.
- **adal-sso-windows.ts:this.loggingService.logError** - Records that a generic sso error occurred when logging in on a Windows device, errors in initiating the chat service or log in failure information.
- **appOnlineService.ts:loggingService.getInstance** - Records the occurrence of an error due to settings that could not be parsed during startup or with downloading pre-user authentication, pre-authorized settings.
- **appStart.ts:loggingService.logError** - Records the occurrence of an error when the application could not launch, disk space error, valid certificate error or failed to find the correct certificate, and restarting the app.
- **browserWindowHttp.ts:this.loggingService.logError** - Records information to indicate that the application could not be updated due to issues with the file system.
- **contextInstallService.ts:loggingService.getInstance** - Records the occurrence of an error when:
 - attempting to parse or read a file or resolve a URL critical to the contextual install feature.

- the URL shortener attempts to run the contextual install feature.
- **crashManager.ts:loggingService.logError** - Records information to determine the cause of an error when the application crashes.
- **localStorageService.ts:loggingService.getInstance** - Records the occurrence of an error when essential boot data does not load properly to run the application.
- **logProviders\pageDumpProvider.ts:loggingService.getInstance** - Records error information when the application crashes.
- **multiWindowManager.ts:this.logError** - Records the occurrence of an error when essential boot data does not load properly to run the application.
- **nativeElectronNotifications\osNotificationService.ts:this.loggingService.logError** - This event records the occurrence of an error when attempting to launch a notification about a failure.
- **OutlookMeetingAddinHelper.ts:loggingService.getInstance** - Records the occurrence of an error when attempting to connect to a meeting using the Outlook meeting addin.
- **recoveryManager.ts:loggingService.getInstance** - Records the occurrence of an error during update rollbacks.
- **renderer\startPage\startPage.ts:this.logger.logError** - Records the occurrence of an error with the application start page.
- **settingsService.ts:loggingService.getInstance** - Records the occurrence of an error with the application settings.
- **updateInfo.ts:loggingService.getInstance** - Records the occurrence of an error with transmitting updates.
- **updatenotification.js:this._loggingService.logError** - Records the occurrence of disk space issues.
- **utility.ts:loggingService.logError** - Records an error accessing a local file (a file in the application).
- **utility.ts:loggingService.getInstance** - Records an error in available disk space, display issues, url issues, cookie issues, protocols, or regkey issues on machine to load the application.
- **windowmanager.js:this._loggingService.logError** - Records the occurrence of cookie issues, whitescreen issues, issues between desktop and shell communication, url issues, errors with loading page messages, errors with process rendering, and network connectivity issues.
- **windowmanager.js:loggingService.getInstance** - Records information to indicate when the recovery window cannot be shown.

Outlook addin

NOTE

For information on the properties of Outlook addin events, see [Properties sent with Outlook addin events](#).

- **joinmeetingoperation** - Records information needed to join a user to a meeting.
- **meetingaddinapplifecycle** - Records information regarding app state such as Launch or Exit.
- **meetingaddinloadtime** - Records the time it takes to load meeting information from Outlook.
- **openmeetingoperation** - Records information needed to open a scheduled meeting.
- **savemeetingoperation** - Records information needed to save the meeting while scheduling it.

Scenario

NOTE

For information on the properties of Scenario events, see [Properties sent with scenario events](#).

- **desktop_app_load** - Records information needed to determine that the desktop application has launched, that the service should be initialized, and that it is able to be initialized.

- **desktop_app_not_ready** - Records information needed to determine that the desktop application is not ready to function.
- **desktop_install** - Records information needed to determine that the desktop application has been installed successfully, or that it failed to install.
- **desktop_previous_lifecycle_invalid** - Records information needed to determine that the desktop application restarted after it had been previously been running and then crashed.

Tracking

NOTE

For information on the properties of Tracking events, see [Properties sent with tracking events](#).

- **deeplink_scenario_missing** - Teams was launched from a deeplink, but the telemetry/diagnostic is not present.
- **desktop_app_initialized** - Records information needed to determine if the application has successfully started when the desktop application is initialized.
- **desktop_app_quit_exception** - The application crashed while attempting to close.
- **desktop_blankScreenDetected** - Records information needed to determine errors when the desktop application renders a blank screen.
- **desktop_blankScreenDetectedAfterRepaint** - Detected that page was blank upon detecting rendering attempt.
- **desktop_blankScreenRecoveredAfterRepaint** - Recovered from a rendering issue where the screen was not rendered earlier.
- **desktop_configuration_failed_to_save** - Collects information needed to determine configuration errors when desktop settings have failed to save.
- **desktop_navigation_error_recovery** - Collects information needed to determine desktop navigation errors when a page fails to load after five attempts.
- **desktop_previous_gpu_crashed** - Records information needed to determine graphics processing unit errors when the desktop crashes.
- **desktop_previous_plugin_host_crashed** - Collects information need to determine media stack issues associated with desktop application crashes.
- **desktop_recovery_cleared_user_data** - Records application crashed multiple times, and app had to clear local cache to recover.
- **desktop_settings_blank_on_load** - This is an error that the applications settings are not present.
- **desktop_settings_failed_to_load** - Collects information needed to determine cause when desktop settings fail to load.
- **desktop_silent_restart** - Client update is staged and client is updated without user disruption.
- **desktop_terminated** - Records information needed to determine whether the inter-process communication has been disconnected when the user closes the desktop application.
- **desktop_uncaught_exception** Function call on an undefined object, this will result in a crash/app restart.
- **desktop_write_storage_failed** - Records information needed to determine disk errors when the desktop application fails to write to storage.
- **registration_failed** - Records information needed to resolve add-in registration failures.
- **registration_success** - Records information needed to determine whether add-in registrations were successful.
- **security_unsupported_ipc_channel** - Interprocess message that was not permitted was inbound.
- **sfb_running_not_connected** - Detected that the Skype for Business app is not running.
- **sfb_not_running** - Records that the 'wait for response' from call to Skype of Business timed out.
- **sfb_never_replied** - Tracks no API response when communicating with Skype for Business.

- **server_error_hit** - Tracks that an error from the ipc pipes communicating with Skype for Business.
- **unexpected_sfb_ipc_disconnection** - Records information needed to determine a failure to connect to the service.
- **unregister_failed** - Records information needed to determine errors in de-registering the Outlook meeting add-in.

UserBI panelaction

NOTE

For information on the properties of UserBI panelaction events, see [Properties sent with UserBI panelaction events](#).

- **inlinereply** - Records information whether a user has replied from the notification.
- **toastclick** - Records a user's click to navigate to the message entry to toast notifications to monitor service SLA and to load the appropriate response to toast notification.
- **toastdismiss** - Records information needed to determine errors and delays when the user dismisses the rendering of a toast notification.
- **toast_skip** - Records information needed to avoid transmitting a delayed toast notification.
- **toasttimeout** - Records information needed to determine errors and delays when the rendering of a toast notification has timed out.

UserBI panelview

NOTE

For information on the properties of UserBI panelview events, see [Properties sent with UserBI panelview events](#).

- **toastshow** - Records information needed to determine that a toast was rendered.

Property lists

Properties sent with all events

PROPERTY NAME	DESCRIPTION
EventInfo_Time	Event generation time
EventInfo_Name	Event name - Used to differentiate between event types
EventInfo_BaseType/name	Event type - Used to differentiate between event types in an event
EventInfo_Sequence	Sequence of the event
userAgent	Browser agent string
userpdcllevel	Privacy data control setting of the user
eventpdcllevel	Privacy data control categorization level of the event

PROPERTY NAME	DESCRIPTION
AppInfo_Language	App language
clientType/AppInfo_ClientType	Client type where the app is running
environment/AppInfo_Environment	Engineering environment that served the user request
clientVersion/appversion/AppInfo_Version/desktopBuildVersion	Version of the app
buildtime	timestamp that the app was built in engineering systems
osversion/DeviceInfo_OsVersion	OS version
AppInfo_ProcessArchitecture	System architecture (32bit/64bit)
preferredLocales	preferred locale for the user
locale/AppInfo_Locale	App locale
os/DeviceInfo_OsName	OS Name
UserInfo_Language	Selected user language
UserInfo_Id	User ID
UserInfo_TenantId/TenantId	Tenant ID
ring/UserInfo_Ring	Concept that helps deliver application in a phased manner
region	Datacenter region that served user's request
UserInfo_ConfigIds/UserInfo_Etag	ID that helps identify users in different experiments/rollouts
DeviceInfo_BrowserName	Browser name
DeviceInfo_BrowserVersion	Browser version
DeviceInfo_Id/machineId/DeviceInfo_IdV2	ID that helps identify the device
totalMemory	Hardware memory of the device
cores	Hardware cores of the device
cpuspeed	Hardware cpu speed of the device
DeviceInfo_CpuArchitecture/cpuarchitecture	CPU architecture of the device
UserRole	Helps identify user role in a tenant
DeviceInfo_WindowsMode	Helps identify Windows security mode

PROPERTY NAME	DESCRIPTION
desktopSession/Session_Id	Helps identify a session
dbOpen	Captures state of the local database
UserInfo_Upn	One sided hash of user identifier

Properties sent with logging events

PROPERTY NAME	DESCRIPTION
message	Captures a detailed message about the log

Properties sent with scenario events

PROPERTY NAME	DESCRIPTION
Scenario_Status	Status of a scenario
Scenario_Step	Step in a scenario
sequence	Sequence number of the scenario
delta	Time taken to complete different steps in a scenario
elapsed	Time since the scenario started
scenario	Uniquely identify a scenario
Scenario_Name	Name of the scenario
errorInfo	Info of the error that might have occurred during a scenario
session	Unique session ID
freeMemory	Captures free memory available
processMemory	Captures process memory
scenarioDelta	Captures time different between 2 scenario steps
Session_DesktopId	Unique session ID
machineLocked	Captures if the machine was locked or not
windowsIsVisible	Captures if the app window was visible to use
appStates/webAppStates	records a list of app states that the app went through. This helps with crash investigation because we can see what state the app was in
crashDesktopSession	Captures ID of the crashed session

PROPERTY NAME	DESCRIPTION
appRuntime	Captures runtime of the app
diagnosticEvents	Last 50 web app diagnostic events before app crash
activities	Last 50 user scenario names which happened before crash
crashSession	Captures ID of the crashed session
crashId	Captures ID of the crashed session
isPreviousLifecycleValid	Whether previous app was fully initialized and terminated successfully
isSettingValid	Whether preauth settings are valid
rollbackReason	Reason due to which app was rolled back
deeplinkType	Type of the deeplink
watchdogCrash	Whether app crashed due to hang
protocols	Protocol used to launch the app
electronBuild	Build version of electron app
distribution	whether Teams was installed via exe or msi or dmg or pkg, etc.
updateTimeOfDay	Time the app was updated
launchPath	whether Teams is installed in %LOCALAPPDATA%, %PROGRAMFILES%, or other locations
loggedIn	If the user was logged in
envType/complianceEnvironmentType	Commercial cloud or private (e.g. DoD, GCC-High, etc.)
cpuusage	CPU usage
installationSource	Type of installation user has
adalVersion	Version of the auth library
asyncStart	Is the app using synchronous or asynchronous start
attempts	Number of online check attempts made for the user before showing a blocking screen

Properties sent with tracking events

PROPERTY NAME	DESCRIPTION
name2	Captures name of the tracking event
numVisibleNotifications	Number of visible application notifications
giphyEnabled	Whether giphy service was enabled
error	Captures error details related to the tracking event
method	Protocol method GET or POST
channel	Captures inter-process communication channel within the app
windowTitle	Type of display window associated with event
message	The type of error message
crashSession/crashDesktopSession/crashId/Session_DesktopId/Session_DesktopBackgroundId	Captures unique ID for session debug purposes
responseCode	Captures response code for the service call
errorUrl	The URL that failed to load
errorCode	Captures error code
ssoEventData	Authentication state and status
correlationId	ID to correlate events with service side for debug purposes
errorDescription	Captures description of the errorcode
source	Method to get the Teams app and what package type Teams was installed from
windowsDestroyed	True/False state of Application Windows during event
windowsFocused	True/False state of Application Windows during event
windowsVisible	Was the application visible when event happened
windowsMinimized	True/False state of Application Windows during event
windowsMaximized	True/False state of Application Windows during event
windowsFullscreen	True/False state of Application Windows during event
distSrc	Captures the distribution source of user landing into the app
retries	Retry count when attempting to connect to an endpoint

PROPERTY NAME	DESCRIPTION
uses_slimcore	True or false if web call is using slimcore
persistCookieExpiresIn	Time remaining in validity of web application cookie
tenantName	Name of tenant for user of the application
appStartReason	How the application session started such as user initiated, after updating, etc.
machineLocked	Whether machine was locked or not locked during the event
data	Captures technical data for scenario investigation
appRuntime	Captures runtime of the app
activities	Last 50 user scenario names which happened before crash
timeSinceActivity	Time since last user activity
appStates	Records a list of app states that the desktop app went through, which helps with crash investigations because it shows what state the desktop app was in
timeSinceAppState	Time since the app state changed
webAppStates	Records a list of app states that the web client went through, which helps with crash investigations because it shows what state the web client app was in
timeSinceWebAppState	Time since the web app state changed
diagnosticEvents	Last 50 web app diagnostic events before app crash
timeSinceLastDiagnosticEvent	Time since last diagnostic event sent
timeSinceSecondLastDiagnosticEvent	Time since second-last diagnostic event sent
appInitialized	Whether webapplication has started
targetVersion	Version application is going to be updated to
port	Internet message port number
originalUrl	Original location of page being rendered
deeplinkId	GUID for destination type of Teams link
appSessionEnd	Whether event occurred at end of application session
eventData	Captures machine state and app config to help debugging in case of issues

PROPERTY NAME	DESCRIPTION
deeplinkType	Type of the deeplink (chat, meeting, channel)
previousUpdateUrl	Location where application last retrieved its update from
previousUpdateVersion	Last version application was updated to
previousUpdateTime	When application binaries were last updated
protocol	Handler type for link, such as file or image
files	Type of file associated with an event, such as Application cache or GPU cache
Perf_WorkingSetSizeKB	Size of memory cache
isTimeboxingWebAppInitialize	Whether app initialized before time box counter ran out
isExp	Whether the app version in use is part of an experiment
deviceType	Captures type of the device
sanitizedErr	Captures sanitized version of the error information
rigelVersion	Captures version of rigel device
DeviceInfo_OsSku	Captures OS SKU information
isLoggedOut	Captures if the user is logged out
complianceEnvironmentType	Commercial cloud or private (e.g. DoD, GCC-High, etc.)
restartTimes	Exact times of previous restarts
Skype_ResultCode	Captures result of interop communication between Skype and Teams
cpumodel	Captures model of CPU
isSlimCoreRunningOutproc	Whether Slimcore component is running in its own process
isSlimCoreStartedAsync	Type of launch of internal audio/video (A/V) stack
networkState	Captures state of the network
desktopBuildAge	How old the application build is at event time
vdiMode	Captures if the app is running in VDI mode

Properties sent with UserBI panelview events

PROPERTY	DESCRIPTION
Panel_Uri	Uri of the panel delivered to the user
Panel_Type	Panel type accessed by the user
Team_Id	ID of the team in which action was performed by the user
Thread_Id	ID of the thread that was accessed by user
Panel_PreviousUri	URI of the previous panel
Panel_Region	Region where the panel was hosted in the app
Panel_LaunchMethod	Method through which the panel was launched
Panel_PreviousType	Type of the previous panel
Thread_Type	Type of thread accessed by user
Panel_LaunchSource	Source information of the panel that was launched
Tab_Type	Type of the tab accessed by user
Team_Type	Type of team accessed by user

Properties sent with UserBI panelaction events

PROPERTY NAME	DESCRIPTION
Action_DestinationUri	Uri of the resource being accessed by user action
Panel_Uri	Uri of the panel delivered to the user
Action_Gesture	Type of gesture performed by user on the app
Action_ScenarioType	Feature grouping that relates to business metric for feature
Panel_Type	Panel type accessed by the user
Action_Outcome	Outcome of the action performed by user
Team_Id	ID of the team in which action was performed by the user
Module_Type	Type of the module which hosted user action
Module_Name	Name of the module which hosted user action
Module_Summary	Summary of the module that hosed user action
Thread_Id	ID of the thread that was accessed by user

PROPERTY NAME	DESCRIPTION
Panel_PreviousUri	URI of the previous panel
Panel_Region	Region where the panel was hosted in the app
Panel_LaunchMethod	Method through which the panel was launched
Panel_PreviousType	Type of the previous panel
Thread_Type	Type of thread accessed by user
Module_State	State of the module accessed by user
Action_Scenario	Feature inside a group of features that relates to business metric
Panel_LaunchSource	Source information of the panel that was launched
Tab_Type	Type of the tab accessed by user
Team_Type	Type of team accessed by user

Properties sent with Outlook addin events

PROPERTY NAME	DESCRIPTION
AccountComparisonFailedReason	Addin compares the account with Teams account to see if creation is allowed, this event is sent if the comparison fails
AccountComparisonSuccessful	Addin compares the account with Teams account to see if creation is allowed, this event is sent if the comparison is successful
AdalVersion	Version of the authentication library used
AddinBitness	Version of addin
AddinLanguage	Language of addin strings being used
AggregatorSetupCompletedTime	Setup time for addin loader
AppDomainCreatedTime	Time when addin loader initializes app domain
AppointmentDisplayTime	Time at which the appointment item was displayed during meeting creation
AuthenticationCompletedTime	Time at which authentication was provided for a given request
ConnectionMode	Indicates the connection mode of the user's primary Exchange account
ConnectionStartedTime	Time when Outlook calls OnConnection

PROPERTY NAME	DESCRIPTION
ErrorDetails	Captures details of the error
ErrorMessage	Captures name of the error
ExchangeVersion	Captures version of Exchange
IsSmtFormatError	Error in SMTP address
IsTeamsRunning	Captures if there is a Teams process running
IsTeamsUserLoggedOut	Captures if the user is logged out of Teams
LanguageSetupCompletedTime	Time at which language setup got completed
ManagedConnectTime	Time when the managed add-in received the connect callback
ManagedOnStartupTime	Time when managed started the startup
MTFetchCompleted	Time when MT meeting options request is completed
NetFrameworkVersion	.NET framework used
NetworkAvailable	Is network available
OperationStartTime	Time when different operations started
OsBitness	Bitness of OS
OutlookLanguage	Captures language of the Outlook app
OutlookVersion	Captures version of Outlook app
OwnerResolutionTime	Time to resolve the meeting owner
ParseResponseCompletedTime	Time when parsing of response completed
RecipientResolutionError	Error details when resolving a recipient
RecipientsResolutionTime	Total time to resolve all recipients
RehydrateCompletedTime	Time when properties are read from Outlook
SaveToOutlookCompletedTime	Time when properties are saved to Outlook
ServiceRequestStartTime	Start time of the service request
ServiceResponseReceiveTime	Time of response from the service
SettingsInitializeCompletedTime	Time when settings initialized

PROPERTY NAME	DESCRIPTION
SetupLoggingCompletedTime	Time when logging was set up
ShutdownBeginTime	Time when shutdown of addin begins
ShutdownCompletedTime	Time when shutdown completed
StartupBeginTime	Time when startup of addin begins
StartupCompletedTime	Time when startup completed
TeamsDeployment	Deployment of Teams client (Dev, Prod)
TeamsRing	Ring of current user logged into Teams client
TeamsVersion	Captures version of Teams app
TelemetrySetupCompletedTime	Time when telemetry setup is completed
UpnMismatch	Whether there is a upn mismatch between outlook and teams
UserDomain	Domain of the user
ViewUpdatedTime	Time when the view got updated

Overview of optional connected experiences in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

If you have a work or school account, your organization's admin may have provided you with the ability to use one or more cloud-backed services (also referred to as **optional connected experiences**) while using Microsoft Teams, like GIPHY and/or URL Preview service. These cloud-backed services are optional. Whether you use them is up to you. They're offered to you under terms that differ from the [Microsoft Online Service Terms](#), as described separately for each optional service. This article lists our Teams cloud-backed services.

If your admin has given you the ability to use optional connected experiences in Teams, you can go to **Settings** > **Privacy** in Teams and choose whether you want to use optional connected experiences.

NOTE

If you're an admin, you can give or restrict your users' ability to use optional connected experiences. You can do this by using the [Office cloud policy service](#) and configuring the *Allow the use of additional optional connected experiences in Office* policy setting. This is the same policy setting that controls whether optional connected experiences are available to your users in the Office apps (such as Word, Excel, and PowerPoint) that come with Microsoft 365 Apps for enterprise.

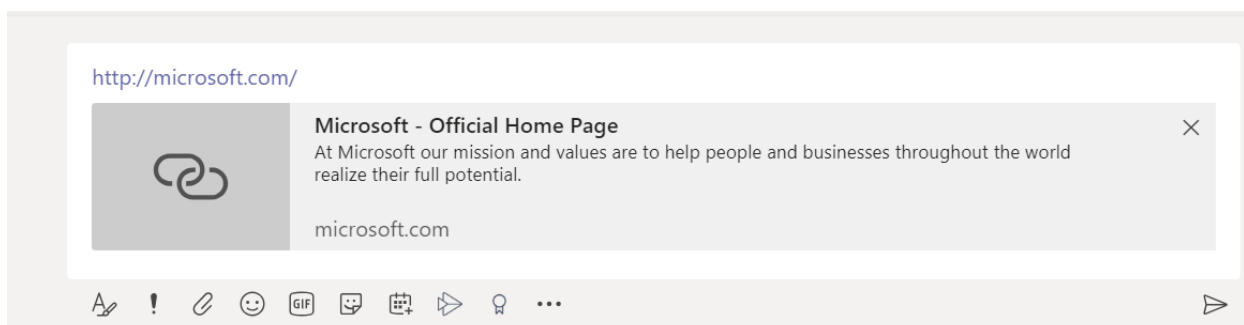

GIPHY

GIPHY is a cloud-backed service that lets you use GIFs in your Teams chats. If you're in **Teams** > **GIF** > **Search**, the search terms are sent to GIPHY. These experiences, if allowed by your admin and after you choose to use them, are subject to the [GIPHY Privacy Policy](#) and [Terms of Service](#).

URL Preview service

The URL Preview service automatically generates a preview snippet and attaches under the snippet the URL when a user sends a URL string. This service will make a request to the service URL as the user is typing the message.

Data transfers between carriers and Microsoft for Operator Connect

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft is the controller of Personal Data it processes in connection with Operator Connect. Customer must notify its end users of the following information:

- Microsoft's Operator Connect functionality for Microsoft Teams enables Teams end users to communicate with others through calling networks via Microsoft Teams.
- When this feature is enabled by your organization, Microsoft shares information with your organization's communication services carrier/s (each, an Operator) to ensure proper functioning of the service and for troubleshooting purposes.

Information Microsoft shares with the Operator when you use Operator Connect includes:

- your phone number and, if applicable, the Microsoft-assigned SIP URI (Session Initiation Protocol Uniform Resource Identifiers) assigned to your phone number;
- call details and call quality data, such as caller and call recipient phone numbers; call invite and end times; certain caller identifiers; call duration; and information about service connections (e.g., IP addresses and operating systems of the caller and call recipient); and
- emergency calling location information.

Operators will be able to export and download the information listed above.

This information will be handled by your Operator in accordance with your Operator's privacy practices. For more information, refer to your Operator's privacy policy and terms of use. For information about Microsoft's privacy practices, please refer to the Microsoft privacy notice applicable to Teams at [this link](#).

Manage and monitor Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams provides several tools for managing and monitoring the Teams service, and for managing the users in your organization.

This article provides a roadmap to the content you'll need to successfully manage and monitor your Teams deployment.

- [Administrator roles](#). Read this article to understand Teams administrator roles and capabilities, and how to assign roles to users.
- [The Teams admin center](#). Read this article to understand how to use the Teams admin center for managing Teams.
- [Manage Teams during the transition to the new admin center](#). Read this article to understand how to transition from the Skype for Business admin center to the new Teams admin center.
- [Manage Teams setting for your organization](#). Read this article to understand how to manage Teams settings for guest and external access, notifications, email integration, and devices.
- [Communicate with users from other organizations](#). Read this article to understand the differences between guest and external access and what functionality is available with both. Additional articles in this section describe how to manage guest and external access.
- [Manage policies](#). Read this article to understand how to define and assign policies to manage users, permissions, and Teams functionality.
- [Monitor and manage call quality](#). Read this article to understand how to use the tools available for monitoring and improving call quality for your organization.
- [Reports in the Teams admin center](#) and [Reports in the Microsoft 365 admin center](#). Read these articles to understand what reports are available, and how to use these reports to monitor Teams usage and service health.
- [Operate your service](#) and [Enhance your service](#). Read these articles for guidelines and roadmaps for how to operate and enhance your Teams service.

Some manage topics remain under the relevant workload sections. For more information, see the overview articles for the following:

- [Chat, teams, channels](#)
- [Meetings and Audio Conferencing](#)
- [Voice](#)
- [Apps, bots, and connectors](#)

Use Microsoft Teams administrator roles to manage Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Using Azure Active Directory (Azure AD), you can designate administrators who need different levels of access for managing Microsoft Teams. Administrators can manage the entire Teams workload, or they can have delegated permissions for troubleshooting call quality problems or managing your organization's telephony needs.

Teams roles and capabilities

There are several Teams admin roles available: Teams administrator, Teams communications administrator, Teams communications support specialist, Teams communications support engineer, and Teams Device Administrator. Review the following table to understand what each role can do and which tools the admin can use in the Microsoft Teams admin center and PowerShell.

To follow along, you must be an admin. The instructions for getting the permissions are in this article.

ROLE	CAN DO THESE TASKS	CAN ACCESS THE FOLLOWING TOOLS
------	--------------------	--------------------------------

ROLE	CAN DO THESE TASKS	CAN ACCESS THE FOLLOWING TOOLS
Teams Administrator	Manage the Teams service, and manage and create Microsoft 365 Groups.	<p>Everything in the Microsoft Teams admin center and associated PowerShell controls, including:</p> <ul style="list-style-type: none"> • Manage meetings, including meeting policies, configurations, and conference bridges.^{1,2} • Manage voice, including calling policies and phone number inventory and assignment.^{1,3} • Manage messaging, including messaging policies.^{1,2} • Manage all org-wide settings, including federation, teams upgrade, and teams client settings.^{1,2} • Manage the teams in the organization and their associated settings, including membership (group management supported via PowerShell, team management in the Teams admin center).^{1,2} • Manage Teams-certified devices and set up and assign configuration policies.¹ • View user profile page and troubleshoot user call quality problems using advanced troubleshooting toolset.² • Access all reports in the Microsoft Teams admin center • Access, monitor and troubleshoot tenant's call quality and reliability using data exposed in Call Quality Dashboard (CQD) down to the users impacted by poor call quality. Create new call quality reports, update and remove call quality reports as needed. Upload and update CQD building data. • Publish apps to the tenant app catalog in the Microsoft Teams admin center

ROLE	CAN DO THESE TASKS	CAN ACCESS THE FOLLOWING TOOLS
Teams Communications Administrator	Manage calling and meetings features within the Teams service.	<p>Manage meetings, including meeting policies, configurations, and conference bridges.^{1,2}</p> <p>Manage voice, including calling policies and phone number inventory and assignment.^{1,3}</p> <p>View user profile page and troubleshoot user call quality problems using the advanced troubleshooting toolset.²</p> <p>Access, monitor, and troubleshoot tenant's call quality and reliability using data exposed in Call Quality Dashboard (CQD) down to the users who are impacted by poor call quality. Create new call quality reports, update and remove call quality reports as needed. Upload and update CQD building data.</p>
Teams Communications Support Engineer	Troubleshoot communications issues within Teams by using advanced tools.	<p>View user profile page and troubleshoot user call quality problems using advanced troubleshooting toolset.²</p> <p>Access, monitor, and troubleshoot tenant's call quality and reliability using data exposed in Call Quality Dashboard (CQD) down to the users who are impacted by poor call quality.</p>
Teams Communications Support Specialist	Troubleshoot communications issues within Teams by using basic tools.	<p>Access user profile page for troubleshooting calls in Call Analytics. Can only view user information for the specific user being searched for.²</p> <p>Access, monitor, and troubleshoot tenant's call quality and reliability using data exposed in Call Quality Dashboard (CQD).</p>
Teams Device Administrator	Manage devices configured for use with the Teams service.	<p>Manage device configuration and updates, review device health and status of connected peripherals, set up and apply configuration profiles, and restart devices.</p> <p>The Teams Device Administrator role doesn't provide access to call quality data or call analytics. To view call quality data or call analytics, you need to be assigned the Teams Communications Administrator role.</p>

¹ [PowerShell - Microsoft Teams module](#) (The public release 1.1.6 or later is integrated with Skype for Business Online Connector.)

² [Microsoft Teams admin center](#) ³ Teams administrator account must have a valid Teams license.

For more information about the admin tools available for managing Microsoft Teams, see [Managing Microsoft Teams](#).

For more information about limits, specifications, and other requirements that apply to Teams, see [Limits and specifications for Microsoft Teams](#).

Assign users to each role

You can assign users to these roles in Azure AD. To learn how to assign administrative roles to a user in Azure AD, see [Assign a user to administrator roles in Azure Active Directory](#).

Cmdlets available for each role

Most of the PowerShell tools for these admin roles live in the Teams PowerShell module, and it's important to note that some of the cmdlets that these admin roles have access to control shared settings that are also used for Skype for Business Online.

To view the full list of cmdlets:

```
Get-Command -Module MicrosoftTeams
```

Manage teams in the Microsoft Teams admin center

12/7/2021 • 4 minutes to read • [Edit Online](#)

Overview

This article provides an overview of the management tools for Teams in the Microsoft Teams admin center.

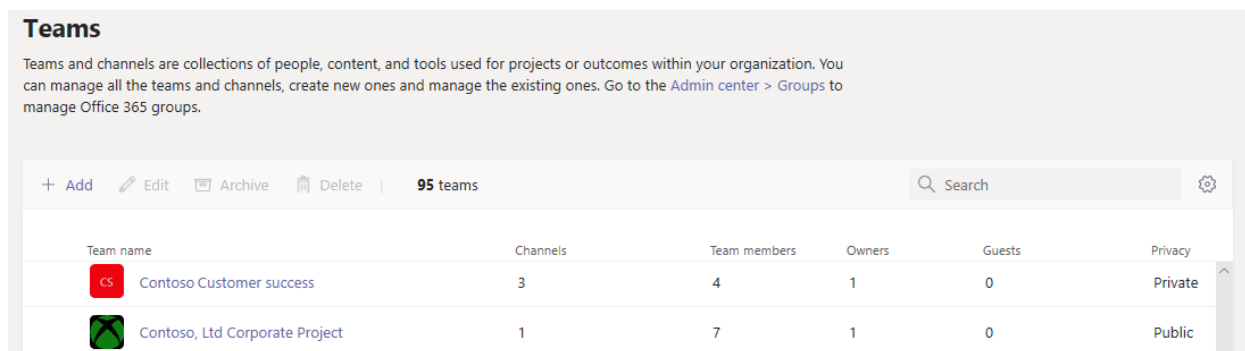

As an admin, you may need to view or update the teams that your organization set up for collaboration, or you might need to perform remediation actions such as assigning owners for ownerless teams. You can manage the teams used in your organization through both the Microsoft Teams PowerShell module and the Microsoft Teams admin center. You can access the admin center at <https://admin.microsoft.com>. For full administration capabilities using these two toolsets, you should make sure that you are assigned one of the following roles:

- Global Administrator
- Teams Administrator

You can learn more about admin roles in Teams in [Use Microsoft Teams admin roles to manage Teams](#), and you can read more about how to use the PowerShell cmdlets for managing teams in the [Microsoft Teams cmdlet reference](#).

Teams overview grid

Management tools for teams are under the **Teams** node in the Microsoft Teams admin center. (In the admin center, select **Teams** > **Manage teams**.) Each team is backed by a Microsoft 365 Group, and this node provides a view of groups that have been Microsoft Teams-enabled in your organization.

Team name	Channels	Team members	Owners	Guests	Privacy
 Contoso Customer success	3	4	1	0	Private
 Contoso, Ltd Corporate Project	1	7	1	0	Public

The grid displays the following properties:

- **Team name**
- **Channels** - a count of all channels in the team, including the default General channel.
- **Team members** - a count of total users, including owners, guests, and members from your tenant.
- **Owners** - a count of owners for this team.
- **Guests** - a count of Azure Active Directory B2B guest users who are members of this team.
- **Privacy** - the Visibility/AccessType of the backing Microsoft 365 group.
- **Status** - the Archived or Active status for this team. Learn more about archiving teams in [Archive or restore a team](#).
- **Description** - the description of the backing Microsoft 365 group.
- **Classification** - the classification (if used in your organization) assigned to the backing Microsoft 365 group. Learn more about classifications at [Create classifications for Office groups in your organization](#).
- **GroupID** - the unique GroupID of the backing Microsoft 365 group.

NOTE

If you don't see all these properties in the grid, click the **Edit columns** icon. In the **Edit columns** pane, you can use the toggles to turn on or turn off columns in the grid. When you're finished, click **Apply**.

Add

To add a new team, click **Add**. In the **Add a new team** pane, give the team a name and description, set whether you want to make it a private or public team, and set the classification.

NOTE

Newly created teams can be managed right away in the Teams Admin Center, unlike the experience in other clients like, Outlook.

Edit

To edit group and team-specific settings, select the team by clicking to the left of the team name, and then select **Edit**.

Archive

You can archive a team. Archiving a team puts the team into read-only mode within Teams. As an admin, you can archive and un-archive teams on behalf of your organization in the admin center.

Delete

Deleting a team is a soft-delete of the team and corresponding Microsoft 365 group. To restore a mistakenly deleted team, follow the instructions in [Restore a deleted Group](#).

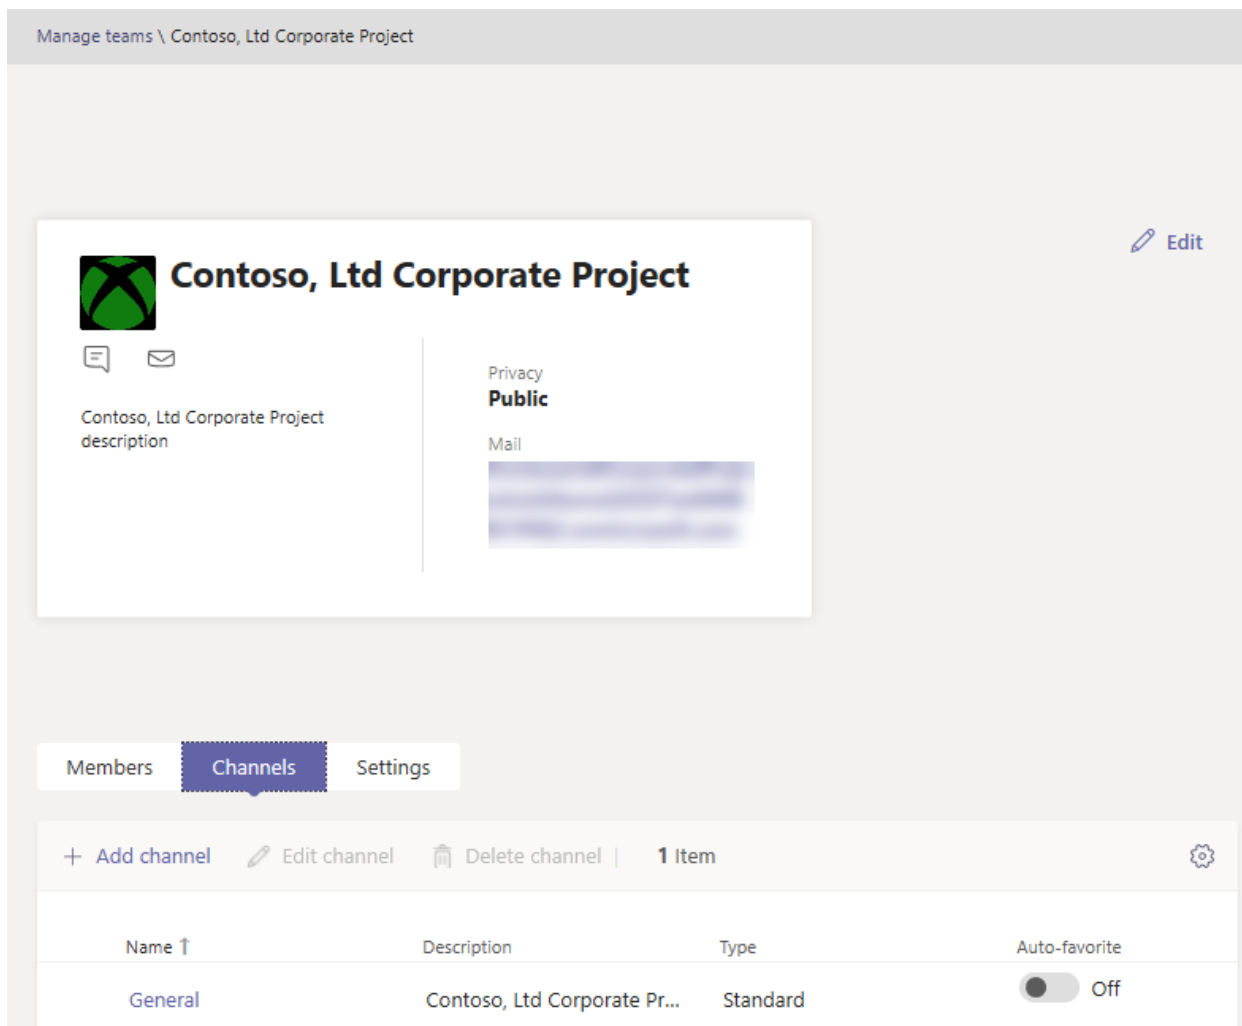

Search

Search currently supports the string "Begins with" and searches the **Team name** field.

Team profile

You can navigate to the team profile page of any team from the main teams overview grid by clicking the team name. The team profile page shows the members, owners, and guests that belong to the team (and its backing Microsoft 365 group), as well as the team's channels and settings. From the team profile page, you can:

- Add or remove members and owners.
- Add or remove channels (note that you can't remove the General channel).
- Change team and group settings.

Making changes to teams

On the team's profile page, you can change the following elements of a team:

- **Members** - add or remove members and promote or demote owners.
- **Channels** - add new channels, and edit or remove existing channels. Remember that you can't delete the default General channel.
- **Team name**
- **Description**
- **Privacy** - set whether the team is public or private.
- **Classification** - this is backed by your Microsoft 365 group classifications. Choose **Confidential**, **Highly Confidential**, or **General**.
- **Conversations settings** - set whether members can edit and delete sent messages.
- **Channels settings** - set whether members can create new channels and edit existing ones, and add, edit, and remove tabs, connectors, and apps.

The changes that you make to a team are logged. If you're modifying group settings (changing the name, description, photo, privacy, classification, or team members), the changes are attributed to you through the audit pipeline. If you're performing actions against Teams-specific settings, your changes are tracked and attributed to you in the General channel of the team.

Troubleshooting

Issue: Teams missing from the Team overview grid

Some of your teams are missing from the list of teams in the Teams overview grid.

Cause: This issue occurs when the team was incorrectly (or not yet) profiled by the system, which can lead to a missing property for it to be recognized.

Resolution: Manually set the property to the correct value via MS Graph

Replace {groupid} in the Query for the actual GroupId in question, which you can get via the Exchange Online PowerShell, with the "**Get-UnifiedGroup**" cmdlet, as the "ExternalDirectoryObjectId" attribute.

1. Access [Graph Explorer](#).
2. Sign in to Graph Explorer on the left menu.
3. Change the query line to: PATCH > v1.0 > <https://graph.microsoft.com/v1.0/groups/{groupid}>.
4. Add the following value on the request body: {"resourceProvisioningOptions": ["Team"]}.
5. Run the query on the top-right.
6. Confirm the team appears correctly in the Microsoft Teams admin center - Team Overview.

Manage Microsoft Teams settings for your organization

12/7/2021 • 6 minutes to read • [Edit Online](#)

Teams apps settings in the Microsoft Teams admin center

You manage apps for your organization in **Teams apps** in the [Microsoft Teams admin center](#). For example, you can set policies to control what apps are available org-wide or to specific Teams users and you can customize Teams by pinning the apps that are most important for your users.

To learn more, see [Admin settings for apps in Teams](#).

Teams external access and guest access settings in the Microsoft Teams admin center

You can control external and guest access settings in the Microsoft Teams admin center. To edit these settings, go to the Microsoft Teams admin center, and then select **Users**. You can configure the following settings.

External access

External access lets your Teams and Skype for Business users communicate with users who are outside of your organization or domain. To configure external access, go to [Let your Teams users chat and communicate with users in another Teams organization](#).

To add or block a domain:

1. Select **Add a domain**.
2. In the Add a domain pane, enter the domain name, and select the space bar to save the name.
3. Select **Allowed** or **Blocked**.
4. Select **Done** to save your changes.

Guest access

Guest access in Microsoft Teams allows teams in your organization to collaborate with people outside your organization by granting them access to teams and channels. Anyone with a business or consumer email account, such as Outlook, Gmail, or others, can participate as a guest in Teams with full access to team chats, meetings, and files. For more information, see [Guest access in Microsoft Teams](#).

Teams settings and Teams upgrade settings in the Microsoft Teams admin center

You can control Teams settings and Teams upgrade settings in the Microsoft Teams admin center. To edit these settings, go to the Microsoft Teams admin center, and then select **Teams**. You can configure the following settings.

Teams settings

In **Teams settings**, you can set up features for teams including notifications and feeds, email integration, cloud storage options, and devices.

Notifications and feeds

Here you can control whether suggested feeds appear in users' activity feed in Teams. To learn more about the activity feed, see [Explore the Activity feed in Teams](#).

Tagging

Tags let users communicate with a subset of people on a team. Tags can be added to one or more team members. After a tag is added, it can be used in @mentions by anyone on the team in a channel post to communicate with only those people who are assigned that tag. Use these settings to control who can add tags and how tags are used across your organization. To learn more, see [Manage tags in Teams](#).

Email integration

Turn on this feature so users can send email to a channel in Teams, using the channel email address. Users can do this for any channel belonging to a team they own. Users can also send emails to any channel in a team that has adding connectors turned on for team members. To turn on email integration, make sure that **Allow users to send emails to a channel email address** is **On**. Next, check to make sure that the domain for the sender's email address isn't blocked in Teams Admin Center > Org-Wide settings > Teams Settings > Email integration > **Accept channel email from these SMTP domains**. It should be either blank or includes all the domains that you expect to receive emails from. Next, you need to make sure you have the necessary rules in place to ensure [the email to the Teams channel email address isn't blocked](#).

Files

Here you can turn on or turn off file sharing and cloud file storage options.

Users can upload and share files from cloud storage services in Teams channels and chats. Cloud storage options in Teams currently include Dropbox, Box, ShareFile, Google Drive, and Egnyte. Turn on the switch for the cloud storage providers that your organization wants to use.

Organization

Here you can turn on the **Organization** tab, which shows the detailed organizational chart for the user's organization. For more information, see [Use the organization tab in Teams](#).

Devices

These settings control resource account behavior for Surface Hub devices attending Microsoft Teams meetings. Use these settings to configure authentication requirements, require a content PIN, and turn on Surface Hub resource accounts to send messages.

- **Require a secondary form of authentication to access meeting content** – Select the level of access that users have when they enter the content PIN.
- **Set content PIN** – Require users to enter this PIN to prevent unauthorized access to documents. This prevents an unauthorized user from joining upcoming meetings and browsing attachments.
- **Resource accounts can send messages** – Turn this setting **On** to allow messages to be sent from the Surface Hub resource account.

Search by name

Microsoft Teams scoped directory search uses Exchange address book policy (APB) to allow organizations to create virtual boundaries that control how users can find and communicate with other users in their organization. You might want to use a scoped directory search in situations like these:

- Your organization has multiple companies within its tenant that you want to keep separate.
- Your school wants to limit chats between faculty and students.

Switch this setting **On** to turn on scoped directory searches.

Safety and communications

Supervised chat allows organizations and schools to limit chat capabilities using role-based permissions. These permissions control the amount of supervision a user requires while chatting with others. Learn more about [supervised chat](#).

Teams upgrade settings

You can use these settings to configure how your users will be upgraded from Skype for Business to Microsoft Teams.

Coexistence mode

You can specify a coexistence mode:

- **Teams only**
- **Islands** (Teams and Skype for Business will coexist)
- **Skype for Business only**
- **Skype for Business with Teams collaboration** (Users receive chats and calls and schedule meetings in Skype for Business but use Teams for group collaboration)
- **Skype for Business with Teams collaboration and meetings** (Users receive chats and calls in Skype for Business but use Teams for group collaboration and to schedule meetings)

The coexistence mode you choose determines the routing of incoming calls and chats and the app that is used by the user to initiate chats and calls or to schedule meetings. For more information about coexistence modes, go to [Understand Microsoft Teams and Skype for Business coexistence and interoperability](#).

App preferences

Here you can choose the app that users will use to join Skype for Business meetings (Skype for Business or the [Skype Meetings App](#)). This setting isn't dependent on the coexistence mode setting.

Planning settings in the Microsoft Teams admin center

Network Planner

Network Planner helps you determine and organize network requirements for connecting Teams users across your organization. Learn how to [Use the Network Planner for Microsoft Teams](#).

You can also select the "Download the Teams app in the background for Skype for Business users" option as well. By default this setting is set to On. With this setting enabled it will download the Teams app in the background for users running the Skype for Business app on Windows PCs. This happens if the Coexistence mode for the user is Teams Only, or if a pending upgrade notification is enabled in the Skype for Business app.

Other settings in the Microsoft Teams admin center

Skype for Business

Use this page to manage Skype for Business features for Skype for Business users in your organization. To learn more, see [Manage Skype for Business settings in the Microsoft Teams admin center](#).

How can I tell which features are available?

See the [Microsoft 365 Roadmap](#) for information about new Teams features. For more information about new and upcoming features, see the Teams [What's New](#) page and the [Tech Community Microsoft Teams blog](#) for Teams.

More information

For information about which roles can perform admin functions, see [Use Microsoft Teams admin roles to manage Teams](#).

Manage Teams with policies

12/7/2021 • 2 minutes to read • [Edit Online](#)

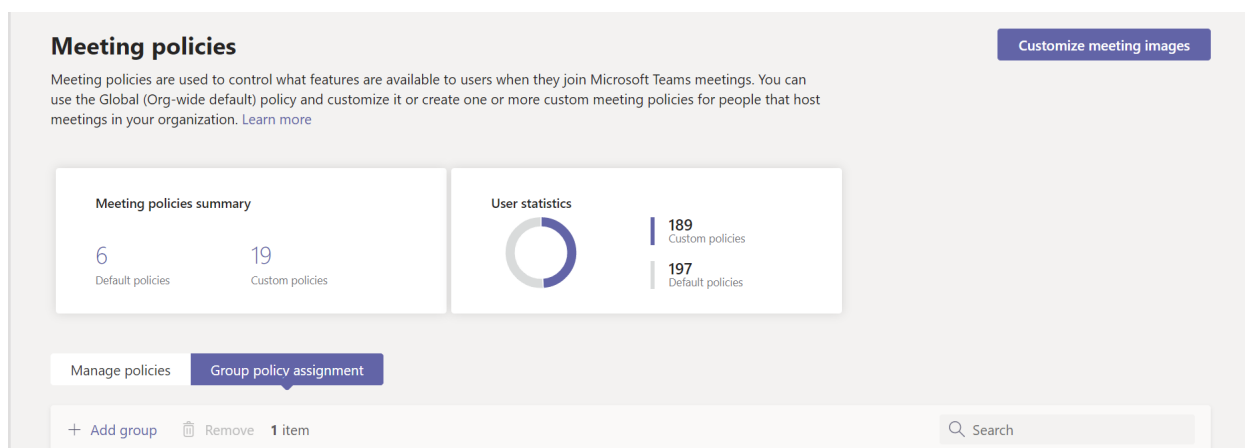

Policies are an important part of managing Teams. Use this article to navigate how to use policies to benefit your organization.

What you use policies for

Policies are used to accomplish many tasks in your organization across different areas such as messaging, meetings, and applications. Some of the things you can do include allowing users to schedule meetings in a teams channel, enabling users to edit sent messages, and controlling whether users can pin apps to the Teams app bar.

How to assign policies

Policies can be assigned in several different ways depending on what your organization is trying to accomplish. You can make and view assignments in the Teams admin center.

Learn more about assigning policies [here](#).

How to manage policies

Policies are managed with the Microsoft Teams admin center or [using PowerShell](#).

For example, an app setup policy can allow you to enable users to upload custom apps, install apps on behalf of your users, and pin apps to the Teams app bar. These policies are configured in the Teams admin center.

App setup policies \ Add

Add app setup policy

Description

Upload custom apps [?](#) ☐ Off

Allow user pinning ☒ On

Installed apps

Choose which apps you want installed for your users. They can still install other apps that they want by setting up those apps in permission policies.

Add apps that you want to install.

[Add apps](#)

Pinned apps

Choose the order that apps are pinned in the Teams app navigation bar.

[+ Add apps](#) [↑ Move up](#) [↓ Move down](#) [✕ Remove](#) | 6 items

✓	Name	App ID	Publisher
	Activity	14d6962d-6eeb-4f48-8890-de55454bb136	Microsoft Corporation
	Chat	86fcd49b-61a2-4701-b771-54728cd291fb	Microsoft Corporation

Additionally, a meeting policy can be used to control audio and video settings in Teams meetings such as transcriptions, cloud recordings, and IP audio/video.

Teams for Education

You can also use the [Teams for Education policy wizard](#) to easily set up and manage policies for your learning environment.

Types of policies

The following policies can be managed with Microsoft Teams.

POLICY TYPE	DESCRIPTION
Policy packages	A policy package in Microsoft Teams is a collection of predefined policies and settings you can assign to users who have similar roles in your organization.
Meeting policies	A meeting policy is used to control the features that are available to meeting participants for meetings scheduled by users in your organization. Meeting policies include the following topics. <ul style="list-style-type: none"> - Audio and video policies - Content and screen sharing policies - Participants, guests, and access policies - General policies
Voice and calling policies	Voice and calling policies manage these settings through teams such as emergency calling, call routing, and caller ID.
App policies	App policies are used to control applications in Microsoft Teams. Admins can allow or block which apps users can install, pin applications to a user's Teams app bar, and install application on behalf of your users.
Messaging policies	Messaging policies control chat and channel feature availability.

Assign policies in Teams – getting started

12/7/2021 • 7 minutes to read • [Edit Online](#)

As an admin, you use policies to control the Teams features that are available to users in your organization. For example, there are calling policies, meeting policies, and messaging policies, to name just a few.

Organizations have different types of users with unique needs. Custom policies that you create and assign let you tailor policy settings to different sets of users based on those needs.

To easily manage policies in your organization, Teams offers several ways to assign policies to users. Assign a policy directly to users, either individually or at scale through a batch assignment, or to a group that the users are members of. You can also use policy packages to assign a preset collection of policies to users in your organization who have similar roles. The option that you choose depends on the number of policies that you're managing and the number of users you're assigning policies to. Global (Org-wide default) policies apply to the largest number of users in your organization. You only have to assign policies to those users that require specialized policies.

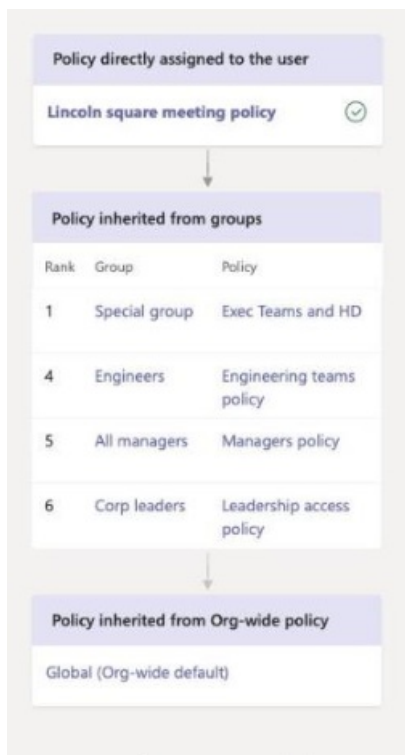

This article describes the different ways that you can assign policies to users and the recommended scenarios for when to use what.

For details on how to **assign policies to users and groups**, see [assigning policies to users and groups](#). For details on how to **assign policy packages**, see [assign policy packages](#).

Which policy takes precedence?

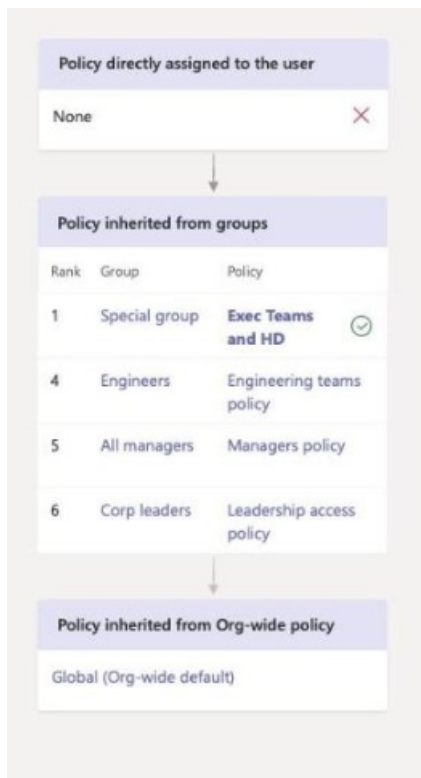

A user has one effective policy for each policy type. It's possible, or even likely, that a user is directly assigned a policy and is also a member of one or more groups that's assigned a policy of the same type. In these kinds of scenarios, which policy takes precedence? A user's effective policy is determined according to rules of precedence, as follows.

If a user is directly assigned a policy (either individually or through a batch assignment), that policy takes precedence. In the following visual example, the user's effective policy is the Lincoln Square meeting policy, which is directly assigned to the user.

If a user isn't directly assigned a policy of a given type, the policy assigned to a group that the user is a member of takes precedence. If a user is a member of multiple groups, the policy that has the highest ([group assignment ranking](#)) for the given policy type takes precedence.

In this visual example, the user's effective policy is the Exec Teams and HD policy, which has the highest assignment ranking relative to other groups that the user is a member of and that are also assigned a policy of the same policy type.

If a user isn't directly assigned a policy or isn't a member of any groups that are assigned a policy, the user gets the global (Org-wide default) policy for that policy type. Here's a visual example.

To learn more, see ([Precedence rules](#)).

Ways to assign policies

Here's an overview of the ways that you can assign policies to users and the recommended scenarios for each. Select the links to learn more.

Before assigning policies to individual users or groups, start by [setting the global \(Org-wide default\) policies](#) so that they apply to the largest number of users in your organization. Once the global policies are set, you'll only need to assign policies to those users that require specialized policies.

DO THIS	IF...	USING...
Assign a policy to individual users	You're new to Teams and just getting started or you only need to assign one or a couple of policies to a small number of users.	The Microsoft Teams admin center or PowerShell cmdlets in the Teams PowerShell module
Assign a policy to a group	Assign policies based on a user's group membership. For example, assign a policy to all users in a security group or distribution list.	The Microsoft Teams admin center or PowerShell cmdlets in the Teams PowerShell module
Assign a policy to a batch of users	Assign policies to large sets of users. For example, assign a policy to hundreds or thousands of users in your organization at a time.	The Microsoft Teams admin center or PowerShell cmdlets in the Teams PowerShell module
Assign a policy package to users	Assign multiple policies to specific sets of users in your organization who have the same or similar roles. For example, assign the Education (Teacher) policy package to teachers in your school to give them full access to chats, calling, and meetings. Assign the Education (Secondary school student) policy package to secondary students to limit certain capabilities such as private calling.	The Microsoft Teams admin center or PowerShell cmdlets in the Teams PowerShell module

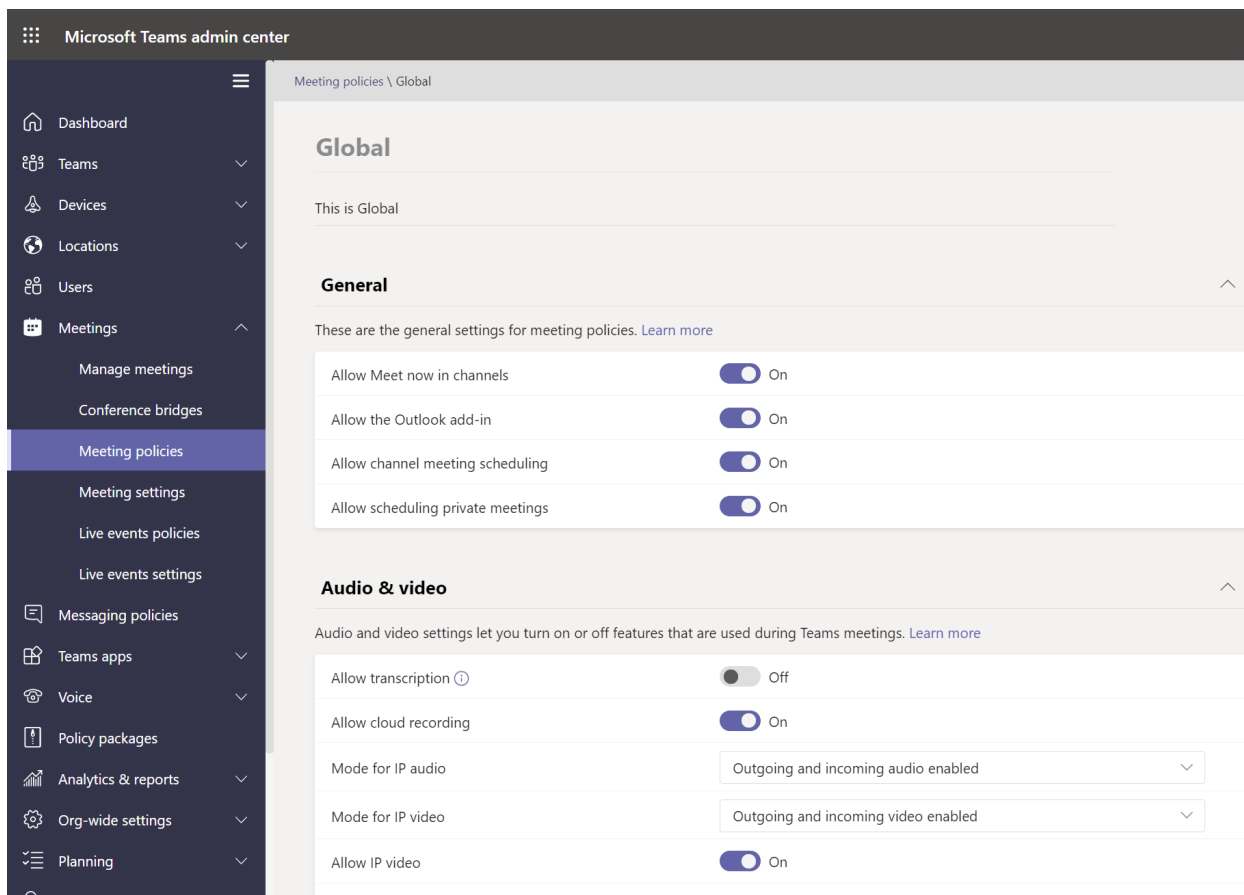

DO THIS	IF...	USING...
Assign a policy package to a group (in private preview)	Assign multiple policies to a group of users in your organization who have the same or similar roles. For example, assign a policy package to all users in a security group or distribution list.	The Microsoft Teams admin center (coming soon) or PowerShell cmdlets in the Teams PowerShell module
Assign a policy package to a batch of users	Assign multiple policies to a batch of users in your organization who have the same or similar roles. For example, assign the Education (Teacher) policy package to all teachers in your school using batch assignment to give them full access to chats, calling, and meetings. Assign the Education (Secondary school student) policy package to a batch of secondary students to limit certain capabilities such as private calling.	PowerShell cmdlets in the Teams PowerShell module

Set the global policies

Follow these steps to set the global (Org-wide default) policies for each policy type.

Using the Microsoft Teams admin center

1. In the left navigation of the Microsoft Teams admin center, go to the policy page for the policy type you want to update. For example, **Teams > Teams policies**, **Meetings > Meetings policies**, **Messaging policies**, or **Voice > Calling policies**.
2. Select the **Global (Org-wide default)** policy to view the current settings.
3. Update the policy as needed, and then select **Apply**.

Using PowerShell

To set the global policies using PowerShell, use the Global identifier. Start by reviewing the current Global policy to determine which setting you want to change.

```
Get-CsTeamsMessagingPolicy -Identity Global

Identity           : Global
Description        :
AllowUrlPreviews   : True
AllowOwnerDeleteMessage : False
AllowUserEditMessage : True
AllowUserDeleteMessage : True
AllowUserChat      : True
AllowRemoveUser    : True
AllowGiphy         : True
GiphyRatingType    : Moderate
AllowMemes         : True
AllowImmersiveReader : True
AllowStickers      : True
AllowUserTranslation : False
ReadReceiptsEnabledType : UserPreference
AllowPriorityMessages : True
ChannelsInChatListEnabledType : DisabledUserOverride
AudioMessageEnabledType : ChatsAndChannels
Expand (20 lines) Collapse
```

Next, update the Global policy as needed. You only need to specify values for the settings that you want to change.

```
Set-CsTeamsMessagingPolicy -Identity Global -AllowUserEditMessage $false
```

View your policy assignments in the Activity log

When you assign policies to users in the Microsoft Teams admin center, you can view the status of those policy assignments in the Activity log. The Activity log shows policy assignments to batches of more than 20 users through the Microsoft Teams admin center from the last 30 days. Keep in mind that the Activity log doesn't show policy package assignments, policy assignments to batches of less than 20 users through the Microsoft Teams admin center, or policy assignments through PowerShell.

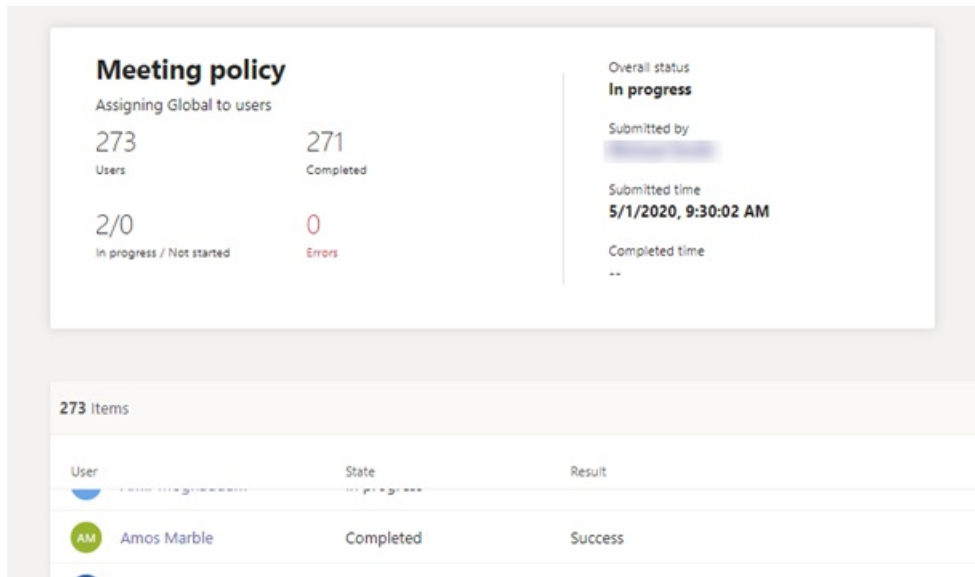

The screenshot shows the 'Activity log' section in the Microsoft Teams admin center. At the top, there's a title 'Activity log' and a descriptive paragraph: 'Activity log shows the last 30 days of policy assignment activities of more than 20 users in Teams admin center. Policy package assignments, assignments to fewer than 20 users and assignment through PowerShell are not displayed.' Below this, there's a filter section with 'Overall status' set to 'All' and a 'Show results' button. The main area displays a table of activities. The table has columns for 'Name', 'Submitted', 'Completion time', 'Impact on', and 'Overall status'. The first row shows 'Assigning to Messaging policy' submitted on 4/30/2020 at 5:06:44 PM, completed at 5:14:09 PM, impacting 273 users, with a status of 'Completed'. A second row is partially visible below it.

Name	Submitted	Completion time	Impact on	Overall status
Assigning to Messaging policy	4/30/2020, 5:06:44 PM	4/30/2020, 5:14:09 PM	273 users	Completed
Assigning to App settings policy	4/30/2020, 5:06:44 PM	4/30/2020, 5:14:09 PM	273 users	Completed

View your policy assignment activities in the Activity log

To view your policy assignments in the Activity log:

1. In the left navigation of the Microsoft Teams admin center, go to **Dashboard**, and then under **Activity Log**, select **View details**.
2. You can view all policy assignments or filter the list by status to show only assignments that are **Not started**, **In progress**, or **Completed**. You'll see the following information about each assignment:
 - **Name:** The name of the policy assignment. Click the link to view more details. This includes the number of users the policy was assigned to and the number of assignments completed, in progress, and not started. You'll also see the list of users in the batch, and the status and result for each user. Here's an example:

- **Submitted:** Date and time the policy assignment was submitted.
- **Completion time:** Date and time the policy assignment was completed.
- **Impact on:** Number of users in the batch.
- **Overall status:** Status of the policy assignment.

NOTE

You can also get to the Activity log from the **Users** page. After you click **Apply** to submit a bulk policy assignment, you'll see a banner at the top of the page. Click the **Activity log** link in the banner.

Assign policies to users and groups

12/7/2021 • 12 minutes to read • [Edit Online](#)

This article reviews the different ways to assign policies to users and groups in Microsoft Teams. Before reading, be sure you've read [Assign policies in Teams - getting started](#).

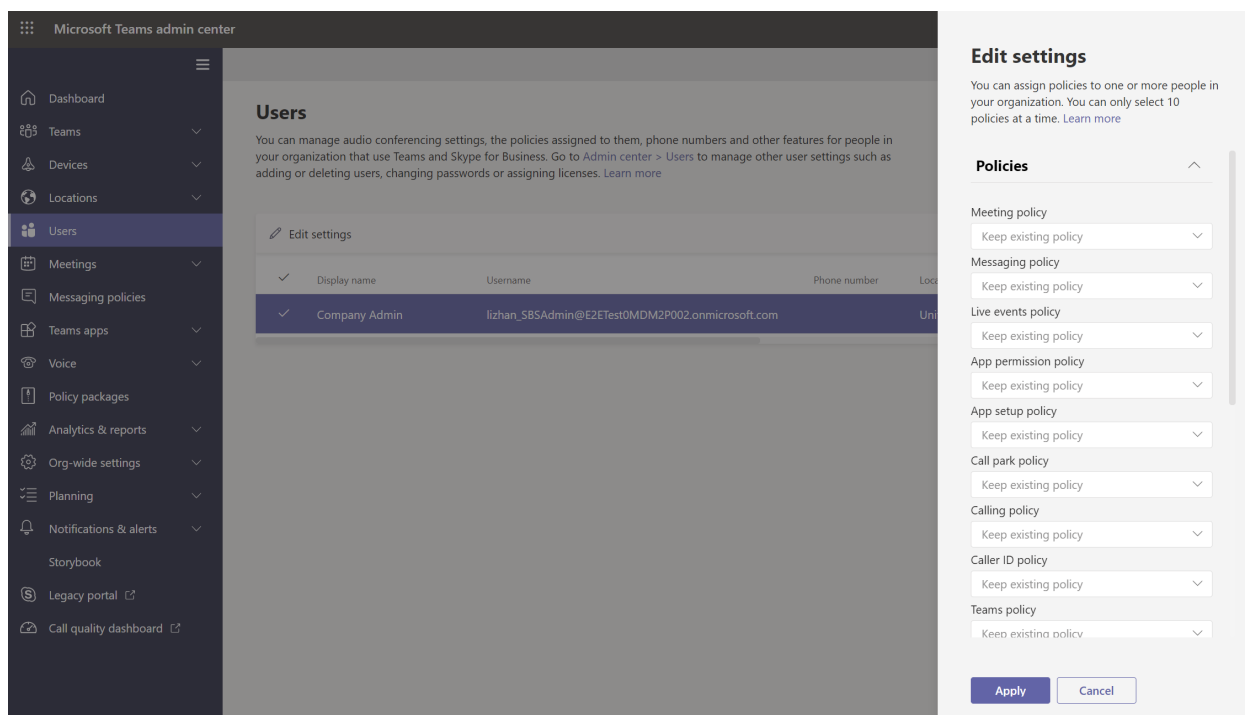

Assign a policy to individual users

Follow these steps to assign a policy to an individual user or to a small number of users at a time.

Use the Microsoft Teams admin center

To assign a policy to a user:

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then select the user.
2. Select the user by clicking to the left of the user name, and then select **Edit settings**.
3. Select the policy you want to assign, and then select **Apply**.

Or, you can also do the following:

1. In the left navigation of the Microsoft Teams admin center, go to the policy page.
2. Select the policy you want to assign by clicking to the left of the policy name.
3. Select **Manage users**.
4. In the **Manage users** pane, search for the user by display name or by user name, select the name, and then select **Add**. Repeat this step for each user that you want to add.
5. When you're finished adding users, select **Apply**.

The screenshot shows the Microsoft Teams admin center interface. On the left is a navigation pane with options like Dashboard, Teams, Devices, Locations, Users, Meetings, Messaging policies (selected), Teams apps, Voice, Policy packages, Analytics & reports, Org-wide settings, Planning, Notifications & alerts, Storybook, Legacy portal, and Call quality dashboard. The main area displays 'Messaging policies' with a summary showing 1 Default policy and 175 Custom policies. Below this is a table of policies with columns for Name, Description, and Custom policy. A 'Manage users' dialog is open on the right, showing a search for 'Company' and a list of users to add, including 'Company Admin'.

Use PowerShell

Each policy type has its own set of cmdlets for managing it. Use the `Grant-` cmdlet for a given policy type to assign the policy. For example, use the `Grant-CsTeamsMeetingPolicy` cmdlet to assign a Teams meeting policy to users. These cmdlets are included in the Teams PowerShell module and are documented in the [Skype for Business cmdlet reference](#).

Download and install the [Teams PowerShell public release](#) (if you haven't already), and then run the following to connect.

NOTE

Skype for Business Online Connector is currently part of the latest Teams PowerShell module.

If you're using the latest [Teams PowerShell public release](#), you don't need to install the Skype for Business Online Connector.

```
# When using Teams PowerShell Module

Import-Module MicrosoftTeams
$credential = Get-Credential
Connect-MicrosoftTeams -Credential $credential
```

In this example, we assign a Teams meeting policy named Student Meeting Policy to a user named Reda.

```
Grant-CsTeamsMeetingPolicy -Identity reda@contoso.com -PolicyName "Student Meeting Policy"
```

To learn more, read [Manage policies via PowerShell](#).

Assign a policy to a group

Policy assignment to groups lets you assign a policy to a group of users, such as a security group or distribution list. The policy assignment is propagated to members of the group according to precedence rules. As members are added to or removed from a group, their inherited policy assignments are updated accordingly.

Policy assignment to groups is recommended for groups of up to 50,000 users but it will also work with larger groups.

When you assign the policy, it's immediately assigned to the group. However, the propagation of the policy assignment to members of the group is performed as a background operation and might take some time, depending on the size of the group. The same is true when a policy is unassigned from a group, or when members are added to or removed from a group.

Group policy assignments are only propagated to users who are direct members of the group. The assignments aren't propagated to members of nested groups.

What you need to know about policy assignment to groups

Before you get started, it's important to understand precedence rules and group assignment ranking.

Precedence rules

For a given policy type, a user's effective policy is determined according to the following:

- A policy that's directly assigned to a user takes precedence over any other policy of the same type that's assigned to a group. In other words, if a user is directly assigned a policy of a given type, that user won't inherit a policy of the same type from a group. This also means that if a user has a policy of a given type that was directly assigned to them, you have to remove that policy from the user before they can inherit a policy of the same type from a group.
- If a user doesn't have a policy directly assigned to them and is a member of two or more groups and each group has a policy of the same type assigned to it, the user inherits the policy of the group assignment that has the highest ranking.
- If a user isn't a member of any groups that are assigned a policy, the global (Org-wide default) policy for that policy type applies to the user.

A user's effective policy is updated according to these rules:

- when a user is added to or removed from a group that's assigned a policy.
- a policy is unassigned from a group.
- a policy that's directly assigned to the user is removed.

Group assignment ranking

When you assign a policy to a group, you specify a ranking for the group assignment. This is used to determine which policy a user should inherit as their effective policy if the user is a member of two or more groups and each group is assigned a policy of the same type.

The group assignment ranking is relative to other group assignments of the same type. For example, if you're assigning a calling policy to two groups, set the ranking of one assignment to 1 and the other to 2, with 1 being the highest ranking. The group assignment ranking indicates which group membership is more important or more relevant than other group memberships with regards to inheritance.

Say, for example, you have two groups, Store Employees and Store Managers. Both groups are assigned a Teams calling policy, Store Employees Calling Policy and Store Managers Calling Policy, respectively. For a store manager who is in both groups, their role as a manager is more relevant than their role as an employee, so the calling policy that's assigned to the Store Managers group should have a higher ranking.

GROUP	TEAMS CALLING POLICY NAME	RANK
Store Managers	Store Managers Calling Policy	1
Store Employees	Store Employees Calling Policy	2

If you don't specify a ranking, the policy assignment is given the lowest ranking.

In the Teams admin center

NOTE

Currently, policy assignment to groups using the Microsoft Teams admin center is only available for Teams calling policy, Teams call park policy, Teams policy, Teams live events policy, Teams meeting policy, and Teams messaging policy. For other policy types, use PowerShell.

1. In the left navigation of the Microsoft Teams admin center, go to the policy type page. For example, go to **Meetings > Meeting policies**.
2. Select the **Group policy assignment** tab.
3. Select **Add group**, and then in the **Assign policy to group** pane, do the following:
 - a. Search for and add the group you want to assign the policy to.
 - b. Set the ranking for the group assignment.
 - c. Select the policy that you want to assign.
 - d. Select **Apply**.

The screenshot displays the Microsoft Teams admin center interface. On the left, the navigation pane is open, highlighting 'Messaging policies'. The main area shows the 'Messaging policies' page, which includes a summary of policies (1 default, 175 custom) and a 'Group policy assignment' tab. Below this, a table lists the assigned group: 'Fabrikam Residences Engineer' with a rank of 1. To the right, a modal window titled 'Assign policy to group' is open, showing a search for 'Lamna Healthcare Co...', a selected rank of 2, and a selected policy 'Healthcare_ClinicalWorker'. At the bottom of the modal are 'Apply' and 'Cancel' buttons.

To remove a group policy assignment, on the **Group policy assignment** tab of the policy page, select the group assignment, and then select **Remove**.

To change the ranking of a group assignment, you have to first remove the group policy assignment. Then, follow the steps above to assign the policy to a group.

Use the PowerShell option

NOTE

Currently, policy assignment to groups using PowerShell isn't available for all Teams policy types. See [New-CsGroupPolicyAssignment](#) for the list of supported policy types.

Install and connect to the Microsoft Teams PowerShell module

For step-by-step guidance, see [Install Teams PowerShell](#).

Assign a policy to a group of users

Use the [New-CsGroupPolicyAssignment](#) cmdlet to assign a policy to a group. You can specify a group by using

the object ID, SIP address, or email address.

In this example, we assign a Teams meeting policy named Retail Managers Meeting Policy to a group with an assignment ranking of 1.

```
New-CsGroupPolicyAssignment -GroupId d8ebfa45-0f28-4d2d-9bcc-b158a49e2d17 -PolicyType TeamsMeetingPolicy -PolicyName "Retail Managers Meeting Policy" -Rank 1
```

Get policy assignments for a group

Use the [Get-CsGroupPolicyAssignment](#) cmdlet to get all policies assigned to a group. Note that groups are always listed by their group ID even if its SIP address or email address was used to assign the policy.

In this example, we retrieve all policies assigned to a specific group.

```
Get-CsGroupPolicyAssignment -GroupId e050ce51-54bc-45b7-b3e6-c00343d31274
```

In this example, we return all groups that are assigned a Teams meeting policy.

```
Get-CsGroupPolicyAssignment -PolicyType TeamsMeetingPolicy
```

Remove a policy from a group

Use the [Remove-CsGroupPolicyAssignment](#) cmdlet to remove a policy from a group. When you remove a policy from a group, the priorities of other policies of the same type assigned to that group, and that have a lower ranking, are updated. For example, if you remove a policy that has a ranking of 2, policies that have a ranking of 3 and 4 are updated to reflect their new ranking. The following two tables show this example.

Here's a list of the policy assignments and priorities for a Teams meeting policy.

GROUP NAME	POLICY NAME	RANK
Sales	Sales policy	1
West Region	West Region policy	2
Division	Division policy	3
Subsidiary	Subsidiary policy	4

If we remove the West Region policy from the West Region group, the policy assignments and priorities are updated as follows.

GROUP NAME	POLICY NAME	RANK
Sales	Sales policy	1
Division	Division policy	2
Subsidiary	Subsidiary policy	3

In this example, we remove the Teams meeting policy from a group.

```
Remove-CsGroupPolicyAssignment -PolicyType TeamsMeetingPolicy -GroupId f985e013-0826-40bb-8c94-e5f367076044
```

Change a policy assignment for a group

NOTE

The [Set-CsGroupPolicyAssignment](#) cmdlet will be available soon. In the meantime, to change a group policy assignment, you can remove the current policy assignment from the group, and then add a new policy assignment.

After you assign a policy to a group, you can use the [Set-CsGroupPolicyAssignment](#) cmdlet to change that group's policy assignment as follows:

- Change the ranking
- Change the policy of a given policy type
- Change the policy of a given policy type and the ranking

In this example, we change a group's Teams call park policy to a policy named SupportCallPark and the assignment ranking to 3.

```
Set-CsGroupPolicyAssignment -GroupId 566b8d39-5c5c-4aaa-bc07-4f36278a1b38 -PolicyType TeamsMeetingPolicy -PolicyName SupportCallPark -Rank 3
```

Change the effective policy for a user

Here's an example of how to change the effective policy for a user who is directly assigned a policy.

First, we use the [Get-CsUserPolicyAssignment](#) cmdlet together with the `PolicySource` parameter to get details of the Teams meeting broadcast policies associated with the user.

```
Get-CsUserPolicyAssignment -Identity daniel@contoso.com -PolicyType TeamsMeetingBroadcastPolicy | select -ExpandProperty PolicySource
```

The output shows that the user was directly assigned a Teams meeting broadcast policy named Employee Events, which takes precedence over the policy named Vendor Live Events that's assigned to a group the user belongs to.

AssignmentType	PolicyName	Reference
Direct	Employee Events	
Group	Vendor Live Events	566b8d39-5c5c-4aaa-bc07-4f36278a1b38

Now, we remove the Employee Events policy from the user. This means that the user no longer has a Teams meeting broadcast policy directly assigned to them and will inherit the Vendor Live Events policy that's assigned to the group the user belongs to.

Use the following cmdlet in the Skype for Business PowerShell module to do this.

```
Grant-CsTeamsMeetingBroadcastPolicy -Identity daniel@contoso.com -PolicyName $null
```

Use following cmdlet in the Teams PowerShell module to do this at scale through a batch policy assignment, where \$users is a list of users that you specify.

```
New-CsBatchPolicyAssignmentOperation -OperationName "Assigning null at bulk" -PolicyType TeamsMeetingBroadcastPolicy -PolicyName $null -Identity $users
```

Assign a policy to a batch of users

Use the admin center

To assign a policy to users in bulk:

1. In the left navigation of the Microsoft Teams admin center, select **Users**.
2. Search for the users you want to assign the policy to or filter the view to show the users you want.
3. In the ✓ (check mark) column, select the users. To select all users, click the ✓ (check mark) at the top of the table.
4. Select **Edit settings**, make the changes that you want, and then select **Apply**.

To view the status of your policy assignment, in the banner that appears at the top of the **Users** page after you select **Apply** to submit your policy assignment, select **Activity log**. Or, in the left navigation of the Microsoft Teams admin center, go to **Dashboard**, and then under **Activity log**, select **View details**. The Activity log shows policy assignments to batches of more than 20 users through the Microsoft Teams admin center from the last 30 days. To learn more, see [View your policy assignments in the Activity log](#).

Use PowerShell method

NOTE

Currently, batch policy assignment using PowerShell isn't available for all Teams policy types. See [New-CsBatchPolicyAssignmentOperation](#) for the list of supported policy types.

With batch policy assignment, you can assign a policy to large sets of users at a time without having to use a script. You use the [New-CsBatchPolicyAssignmentOperation](#) cmdlet to submit a batch of users and the policy that you want to assign. The assignments are processed as a background operation and an operation ID is generated for each batch. You can then use the [Get-CsBatchPolicyAssignmentOperation](#) cmdlet to track the progress and status of the assignments in a batch.

Specify users by their object ID or Session Initiation Protocol (SIP) address. A user's SIP address often has the same value as the User Principal Name (UPN) or email address, but this is not required. If a user is specified using their UPN or email, but it has a different value than their SIP address, then policy assignment will fail for the user. If a batch includes duplicate users, the duplicates will be removed from the batch before processing and status will only be provided for the unique users remaining in the batch.

A batch can contain up to 5,000 users. For best results, don't submit more than a few batches at a time. Allow batches to complete processing before submitting more batches.

Install and connect to the Teams PowerShell module

Run the following to install the [Microsoft Teams PowerShell module](#). Make sure you install version 1.0.5 or later.

```
Install-Module -Name MicrosoftTeams
```

Run the following to connect to Teams and start a session.

```
Connect-MicrosoftTeams
```

When you're prompted, sign in using your admin credentials.

Install and connect to the Azure AD PowerShell for Graph module (optional)

You might also want to [download and install the Azure AD PowerShell for Graph module](#) (if you haven't already) and connect to Azure AD so that you can retrieve a list of users in your organization.

Run the following to connect to Azure AD.

```
Connect-AzureAD
```

When you're prompted, sign in using the same admin credentials that you used to connect to Teams.

Assign a setup policy to a batch of users

In this example, we use the [New-CsBatchPolicyAssignmentOperation](#) cmdlet to assign an app setup policy named HR App Setup Policy to a batch of users listed in the Users_ids.text file.

```
$user_ids = Get-Content .\users_ids.txt
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsAppSetupPolicy -PolicyName "HR App Setup Policy" -
Identity $users_ids -OperationName "Example 1 batch"
```

In this example, we connect to Azure AD to retrieve a collection of users and then assign a messaging policy named New Hire Messaging Policy to a batch of users specified by using their SIP address.

```
Connect-AzureAD
$users = Get-AzureADUser
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsMessagingPolicy -PolicyName "New Hire Messaging
Policy" -Identity $users.SipProxyAddress -OperationName "Example 2 batch"
```

Get the status of a batch assignment

Run the following to get the status of a batch assignment, where OperationId is the operation ID that's returned by the `New-CsBatchPolicyAssignmentOperation` cmdlet for a given batch.

```
$Get-CsBatchPolicyAssignmentOperation -OperationId f985e013-0826-40bb-8c94-e5f367076044 | fl
```

If the output shows that an error occurred, run the following to get more information about errors, which are in the `UserState` property.

```
Get-CsBatchPolicyAssignmentOperation -OperationId f985e013-0826-40bb-8c94-e5f367076044 | Select -
ExpandProperty UserState
```

To learn more, see [Get-CsBatchPolicyAssignmentOperation](#).

Assign policy packages to users and groups

12/7/2021 • 5 minutes to read • [Edit Online](#)

This article reviews the different ways to assign policy packages to users and groups in Microsoft Teams. Before reading, be sure you've read [Assign policies in Teams - getting started](#).

NOTE

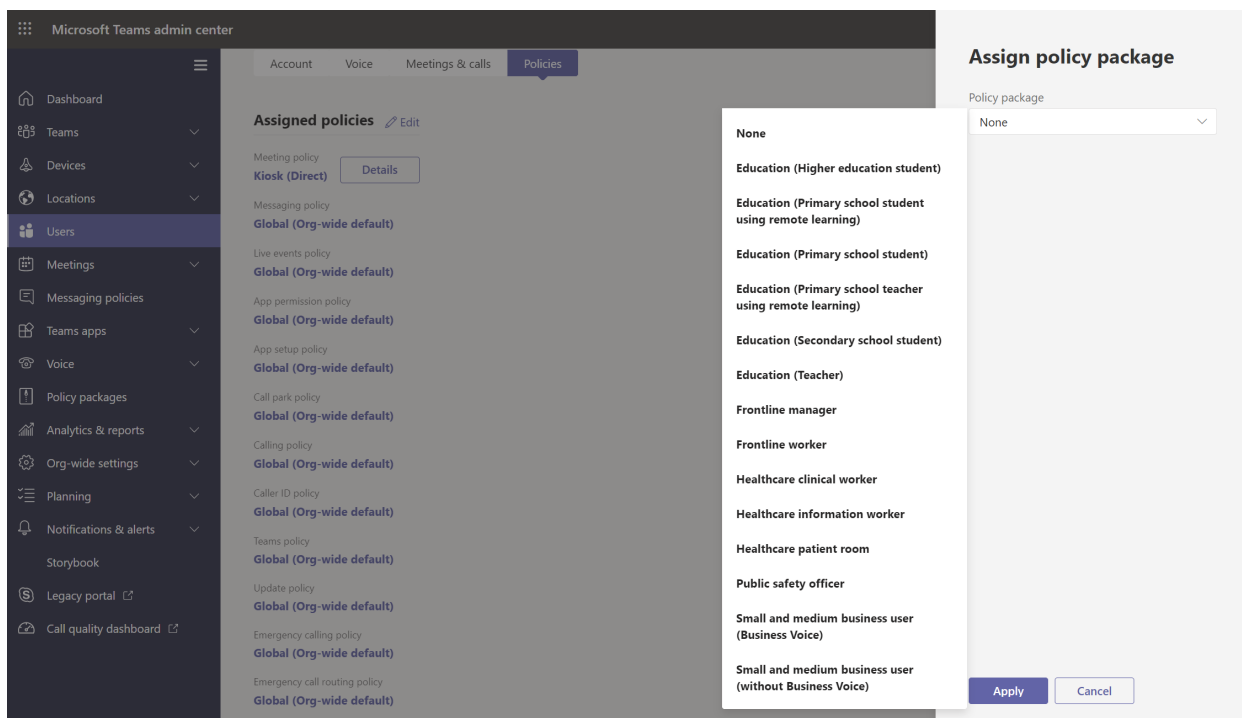

Each user will require the Advanced Communications add-on in order to receive a custom policy package assignment. For more information, see [Advanced Communications add-on for Microsoft Teams](#).

Assign a policy package to users

A policy package in Teams is a collection of predefined policies and policy settings that you can assign to users who have the same or similar roles in your organization. Each policy package is designed around a user role and includes predefined policies and policy settings that support activities typical for that role. Some examples of policy packages are the Education (Teacher) package and Healthcare (Clinical worker) package. To learn more, see [Manage policy packages in Teams](#).

Assign a policy package to one user

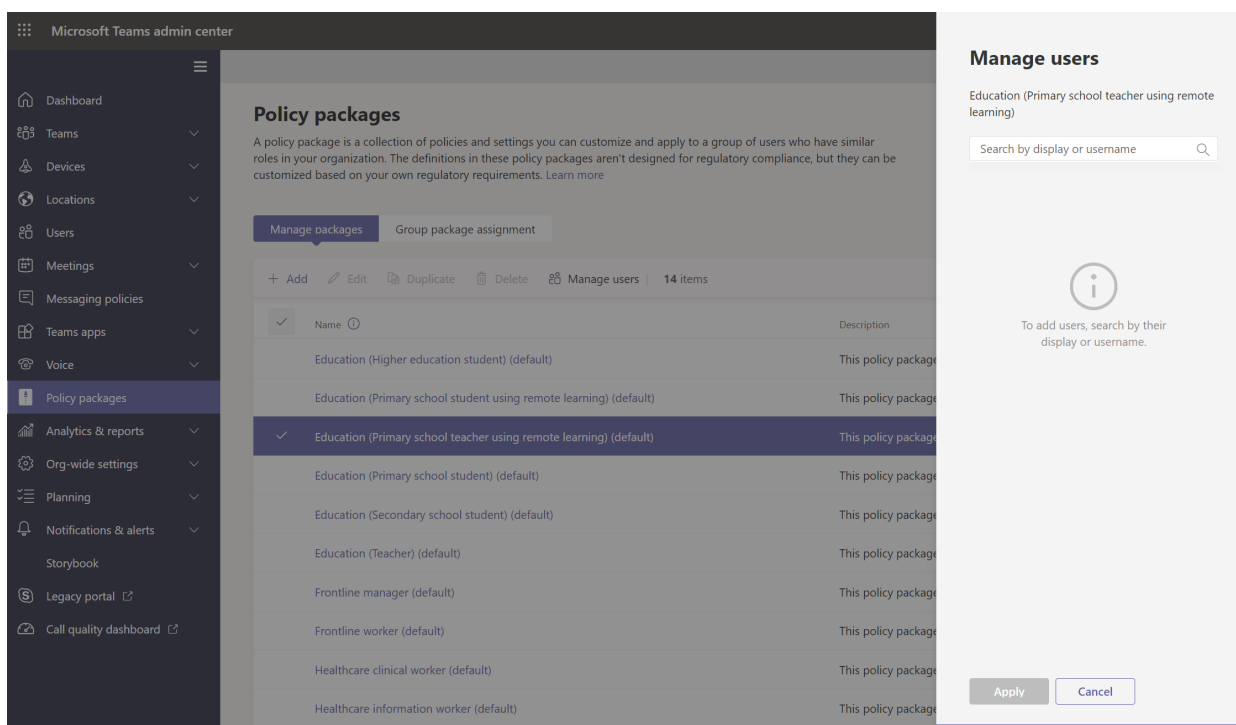

1. In the left navigation of the Microsoft Teams admin center, go to **Users**, and then select the user.
2. On the user's page, select **Policies**, and then next to **Policy package**, select **Edit**.
3. In the **Assign policy package** pane, select the package you want to assign, and then select **Save**.

Assign a policy package to multiple users

1. In the left navigation of the Microsoft Teams admin center, go to **Policy packages**, and then select the policy package you want to assign by clicking to the left of the package name.
2. Select **Manage users**.

3. In the **Manage users** pane, search for the user by display name or by user name, select the name, and then select **Add**. Repeat this step for each user that you want to add.
4. When you're finished adding users, select **Save**.

Assign a policy package to a group

Policy package assignment to groups let you assign multiple policies to a group of users, such as a security group or distribution list. The policy assignment is propagated to members of the group according to precedence rules. As members are added to or removed from a group, their inherited policy assignments are updated accordingly.

Policy package assignment to groups is recommended for groups of up to 50,000 users, but it will also work with larger groups.

When you assign the policy package, it's immediately assigned to the group. However, the propagation of the policy assignment to members of the group is performed as a background operation and might take some time, depending on the size of the group. The same is true when a policy is unassigned from a group, or when members are added to or removed from a group.

IMPORTANT

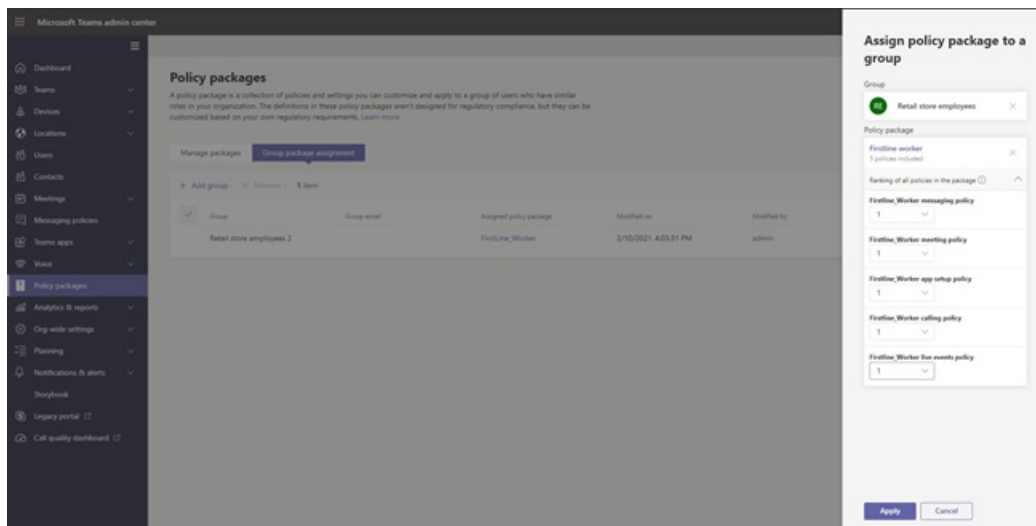

Before you get started, it's important to understand ([precedence rules](#)) and ([group assignment ranking](#)). Make sure you read and understand the concepts in ([What you need to know about policy assignment to groups](#)) earlier in this article.

Assign a policy package to a group of users in the admin center

1. Sign in to the Teams admin center.
2. In the left navigation, go to the policy package page.
3. Select the Group policy assignment tab.
4. Select **Add group**, and then in the Assign a policy package to group pane, do the following:
 - a. Search for and add the group you want to assign the policy package to.
 - b. Select a policy package.

c. Set the ranking for each policy type.

d. Select **Apply**.

5. To manage ranking for a specific policy type, navigate to the specific policy page.

6. To reassign a policy package to a group, first remove the group policy assignment. Then, follow the steps above to assign the policy package to a group.

Work with PowerShell

Get the Teams PowerShell module

For step-by-step guidance, see [Install Teams PowerShell](#).

Assign a policy package to a group of users

Use the [Grant-CsGroupPolicyPackageAssignment](#) cmdlet to assign a policy package to a group. You can specify a group by using the object ID, SIP address, or email address. When you assign the policy package, specify a ([group assignment ranking](#)) for each policy type in the policy package.

In this example, we assign the Education_Teacher policy package to a group with an assignment ranking of 1 for TeamsAppSetupPolicy and TeamsMeetingBroadcastPolicy and a ranking of 2 for TeamsMeetingPolicy.

```
Grant-CsGroupPolicyPackageAssignment -GroupId "dae90bb4-120f-4a3e-a15d-30f142e79f69" -PackageName "Education_Teacher" -PolicyRankings "TeamsAppSetupPolicy, 1", "TeamsMeetingBroadcastPolicy, 1", "TeamsMeetingPolicy, 2"
```

Assign a policy package to a batch of users

With batch policy package assignment, you can assign a policy package to large sets of users at a time without having to use a script. You use the [New-CsBatchPolicyAssignmentOperation](#) cmdlet to submit a batch of users and the policy package that you want to assign. The assignments are processed as a background operation and an operation ID is generated for each batch. You can then use the [Get-CsBatchPolicyAssignmentOperation](#) cmdlet to track the progress and status of the assignments in a batch.

Specify users by their object ID or Session Initiation Protocol (SIP) address. A user's SIP address often has the same value as the User Principal Name (UPN) or email address, but this isn't required. If a user is specified using their UPN or email, but it has a different value than their SIP address, then policy assignment will fail for the user. If a batch includes duplicate users, the duplicates will be removed from the batch before processing and status will only be provided for the unique users remaining in the batch.

A batch contains up to 5,000 users. For best results, don't submit more than a few batches at a time. Allow batches to complete processing before submitting more batches.

Use the Teams PowerShell module

Run the following to install the [Microsoft Teams PowerShell module](#) (if you haven't already). Make sure you install version 1.0.5 or later.

```
Install-Module -Name MicrosoftTeams
```

Run the following to connect to Teams and start a session.

```
Connect-MicrosoftTeams
```

When you're prompted, sign in using your admin credentials.

Assign policy packages to a batch of users

In this example, we use the [New-CsBatchPolicyAssignmentOperation](#) cmdlet to assign the Education_PrimaryStudent policy package to a batch of users.

```
New-CsBatchPolicyPackageAssignmentOperation -Identity 1bc0b35f-095a-4a37-a24c-c4b6049816ab,user1@econtoso.com,user2@contoso.com -PackageName Education_PrimaryStudent
```

See the status of a batch assignment

Run the following to get the status of a batch assignment, where OperationId is the operation ID that's returned by the `New-CsBatchPolicyAssignmentOperation` cmdlet for a given batch.

```
$Get-CsBatchPolicyAssignmentOperation -OperationId f985e013-0826-40bb-8c94-e5f367076044 | fl
```

If the output shows that an error occurred, run the following to get more information about errors, which are in the `UserState` property.

```
Get-CsBatchPolicyAssignmentOperation -OperationId f985e013-0826-40bb-8c94-e5f367076044 | Select -ExpandProperty UserState
```

To learn more, see [Get-CsBatchPolicyAssignmentOperation](#).

Manage feedback policies in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

This is a preview or early release feature.

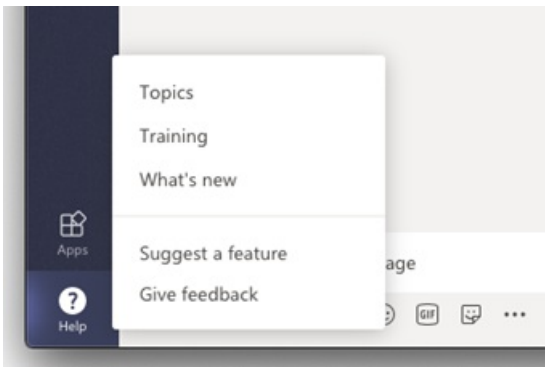

Users in your organization can send feedback about Microsoft Teams to let us know how we're doing directly from within the Teams desktop, web clients, and mobile. We're continually improving the Teams experience and we use this feedback to make Teams better.

NOTE

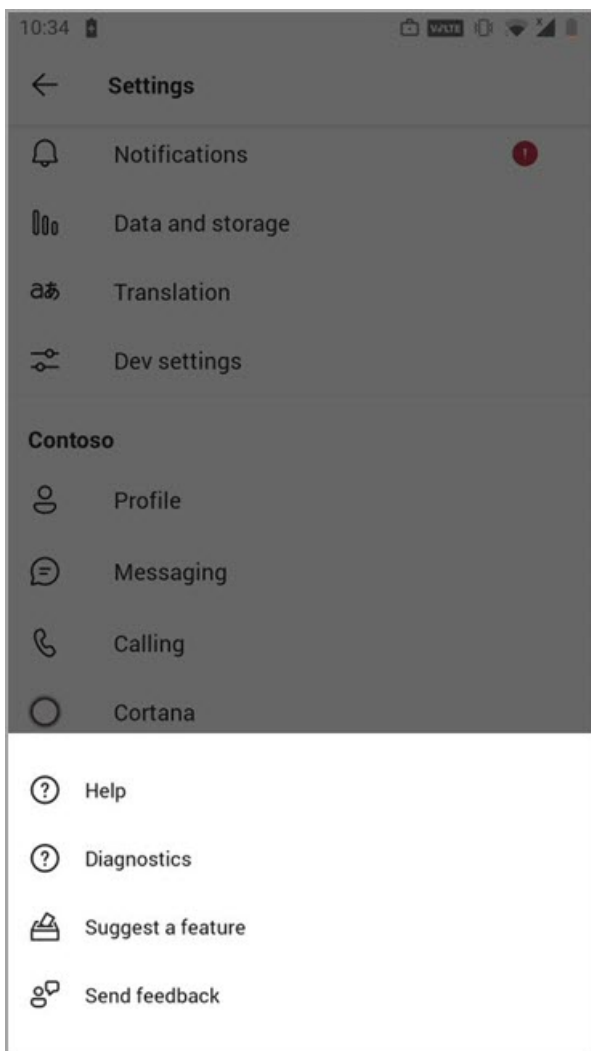

Feedback policies aren't available in GCC, GCC High, or DOD deployments.

The Give feedback feature

Users can send comments and suggestions about Teams to us by going to **Help > Give feedback** in Teams desktop and web.

Access feedback on mobile using **Settings > Help & feedback > Send feedback**.

Data sent through **Give feedback** and **Send feedback** is considered as "Support Data" under your Microsoft 365 or Office 365 agreement, including information that would otherwise be considered "Customer Data" or "Personal Data".

Surveys

Users can also rate their experience with Teams and send us details about the rating they give. This pop-up survey is displayed to users from time-to-time in Teams. When a user selects **Provide feedback** in the notification, the survey is displayed for them to complete.

A screenshot of a Microsoft Teams feedback survey. The survey title is "How likely are you to recommend Microsoft Teams to others, if asked?". Below the title is a rating scale from 0 to 10, with "Not at all likely" on the left and "Extremely likely" on the right. The scale shows a rating of 5. Below the scale is a text box for "Please explain why you gave this score." At the bottom are "Cancel" and "Send to Microsoft" buttons. A small pop-up window titled "How are we doing?" is also visible, asking for feedback and showing a "Provide feedback" button.

Set whether users can send feedback about Teams to Microsoft

As an admin, you can control whether users in your organization can send feedback about Teams to Microsoft and whether they receive the survey. By default, all users in your organization are automatically assigned the global (Org-wide default) policy, and the feedback feature and survey are enabled in the policy. The exception is Teams for Education, where the features are enabled for teachers and disabled for students.

You can edit the global policy or create and assign a custom policy. After you edit the global policy or assign a custom policy, it can take a few hours for changes to take effect.

Say, for example, you want to allow all users in your organization to send feedback and receive surveys except for new hires in training. In this scenario, you create a custom policy to turn off both features and assign it to new hires. All other users in your organization get the global policy with the features turned on.

You manage feedback policies by using PowerShell. Use the [New-CsTeamsFeedbackPolicy cmdlet](#) to create a custom policy. Use the [Grant-CsTeamsFeedbackPolicy](#) cmdlet to assign it to one or more users or groups of users, such as a security group or distribution group. Use [Set-CsTeamsFeedbackPolicy](#) to set specific flags.

To turn off and turn on the features, set the following parameters:

- **Give feedback:** Set the **userInitiatedMode** parameter to **enabled** to allow users who are assigned the policy to give feedback. Setting the parameter to **disabled** turns off the feature and users who are assigned the policy don't have the option to give feedback.
- **Surveys:** Set the **receiveSurveysMode** parameter to **enabled** to allow users who are assigned the policy to receive the survey. To have users receive the survey and allow them to opt out, set the parameter to **enabledUserOverride**. In Teams, users can then go to **Settings > Privacy** and choose whether they want to participate in surveys. Setting the parameter to **disabled** turns off the feature and users who are assigned the policy won't receive the survey.
- **Email:** Use the **AllowEmailCollection** flag to add an email field.
- **Log collection:** Use the **AllowLogCollection** flag to add log collection opt-in for users. Log collection is currently enabled only on mobile. For more details on what data is shared via logs, [learn more](#).

Create a custom feedback policy

In this example, we create a feedback policy called New Hire Feedback Policy and we turn off the ability to give feedback through **Give feedback** and the survey.

```
New-CsTeamsFeedbackPolicy -identity "New Hire Feedback Policy" -userInitiatedMode disabled -
receiveSurveysMode disabled
```

Assign a custom feedback policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

In this example, we assign a custom policy named New Hire Feedback Policy to a user named user1.

```
Grant-CsTeamsFeedbackPolicy -Identity user1@contoso.com -PolicyName "New Hire Feedback Policy"
```

Manage policy packages in Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

A policy package in Microsoft Teams is a collection of predefined policies and policy settings that you can assign to users who have similar roles in your organization. We built policy packages to simplify, streamline, and help provide consistency when managing policies for groups of users across your organization.

You can use the [policy packages included in Teams](#) or [create your own custom policy packages](#).

You can customize the settings of the policies in a policy package to suit the needs of your users. When you change the settings of policies in a package, all users who are assigned to that package get the updated settings. You manage policy packages by using the Microsoft Teams admin center or PowerShell.

NOTE

Each user will require the Advanced Communications add-on in order to receive a custom policy package assignment. For more information, see [Advanced Communications add-on for Microsoft Teams](#).

What is a policy package?

Policy packages let you control Teams features that you want to allow or restrict for specific sets of people across your organization. Each policy package in Teams is designed around a user role and includes predefined policies and policy settings that support the collaboration and communication activities that are typical for that role.

Policy packages support the following Teams policy types:

- Messaging policy
- Meeting policy
- App setup policy
- Calling policy
- Live events policy

Policy packages included in Teams

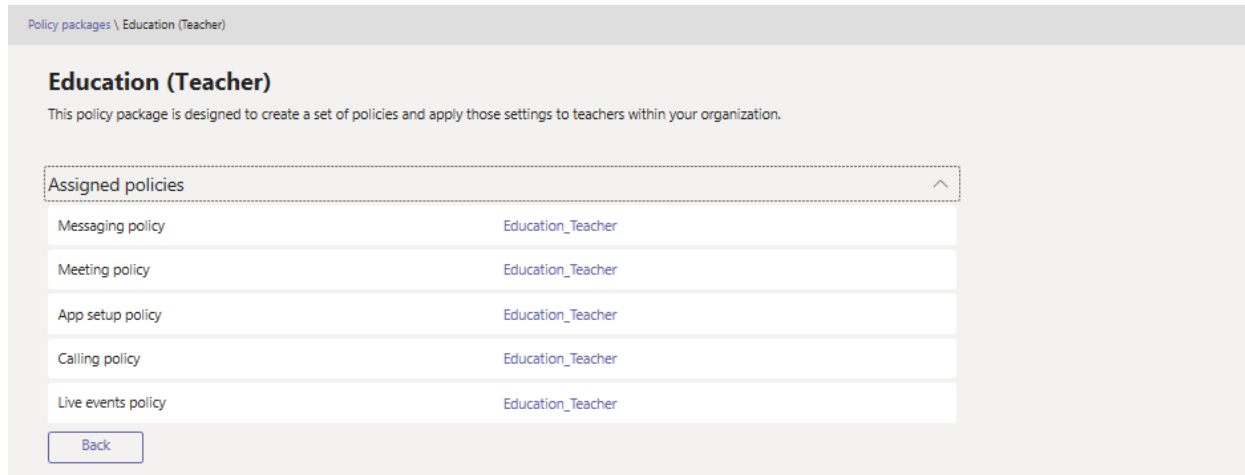

Teams currently includes the following policy packages.

PACKAGE NAME	DESCRIPTION
Education (Higher education student)	Creates a set of policies and policy settings that apply to higher education students.
Education (Primary school student)	Creates a set of policies and policy settings that apply to primary students.
Education (Secondary school student)	Creates a set of policies and policy settings that apply to secondary students.
Education (Teacher)	Creates a set of policies and policy settings that apply to teachers.
Education (Primary school teacher using remote learning)	Creates a set of policies that apply to primary teachers to maximize student safety and collaboration when using remote learning.
Education (Primary school student using remote learning)	Creates a set of policies that apply to primary students to maximize student safety and collaboration when using remote learning.
Frontline manager	Creates a set of policies and applies those settings to Frontline managers in your organization.
Frontline worker	Creates a set of policies and applies those settings to Frontline workers in your organization.
Healthcare clinical worker	Creates a set of policies and policy settings that give clinical workers such as registered nurses, charge nurses, physicians, and social workers full access to chat, calling, shift management, and meetings.
Healthcare information worker	Creates a set of policies and policy settings that give information workers such as IT personnel, informatics staff, finance personnel, and compliance officers, full access to chat, calling, and meetings.
Healthcare patient room	Creates a set of policies and policy settings that apply to patient rooms in your healthcare organization.
Small and medium business user (Business Voice)	Creates an app setup policy that includes the apps for a business voice experience.
Small and medium business user (without Business Voice)	Creates an app setup policy relevant for a small and medium sized business Teams users (non-Business Voice experience).
Public safety officer	Creates a set of policies and policy settings that apply to public safety officers in your organization.

NOTE

We'll be adding more policy packages in future releases of Teams, so check back for the most up-to-date information.

Each individual policy is given the name of the policy package so you can easily identify the policies that are linked to a policy package. For example, when you assign the Education (Teacher) policy package to teachers in your school, a policy that's named Education_Teacher is created for each policy in the package.

Custom policy packages

Custom policy packages let you bundle your own set of policies for users with similar roles in your organization. Create your own policy packages by adding the policy types and policies that you need.

To create a new custom policy package:

1. In the left navigation of the Microsoft Teams admin center, select **Policy packages**, and then click **Add**.

2. Enter a name and description for your package.

3. Select the policy types and policy names to include in the package.
4. Click **Save**.

How to use policy packages

The following outlines how to use policy packages in your organization.

- **View:** View the policies in a policy package. Then, view the settings of each policy in a package before you assign the package. Make sure that you understand each setting. Decide whether the predefined values are appropriate for your organization or whether you need to change them to be more restrictive or lenient based on your organization's needs.

If a policy is deleted, you can still view the settings but you won't be able to change any settings. A deleted policy is re-created with the predefined settings when you assign the policy package.

- **Customize:** Customize the settings of policies in the policy package to fit the needs of your organization.
- **Assign:** Assign the policy package to users.

NOTE

You can also change the settings of policies in a policy package after you assign a package. Any changes you make to policy settings are automatically applied to users who are assigned the package.

Here are the steps for how to view, assign, and customize policy packages in the Microsoft Teams admin center.

View the settings of a policy in a policy package

1. In the left navigation of the Microsoft Teams admin center, select **Policy packages**, and then select a policy package by clicking to the left of the package name.
2. Click the policy you want to view.

Customize policies in a policy package

You can edit the settings of a policy through the **Policy packages** page or by going directly to the policy page

in the Microsoft Teams admin center.

1. In the left navigation of the Microsoft Teams admin center, do one of the following:
 - Click **Policy packages**, and then select the policy package by clicking to the left of the package name.
 - Click the policy type. For example, click **Messaging policies**.
2. Select the policy you want to edit. Policies that are linked to a policy package have the same name as the policy package.
3. Make the changes that you want, and then click **Save**.

Assign a policy package

You can assign a policy package to an individual user, a group, or a batch of users. For more information on how to assign policy packages, see [Assign policy packages to users and groups](#).

Use guest access and external access to collaborate with people outside your organization

12/7/2021 • 3 minutes to read • [Edit Online](#)

When you need to communicate and collaborate with people outside your organization, Microsoft Teams has two options:

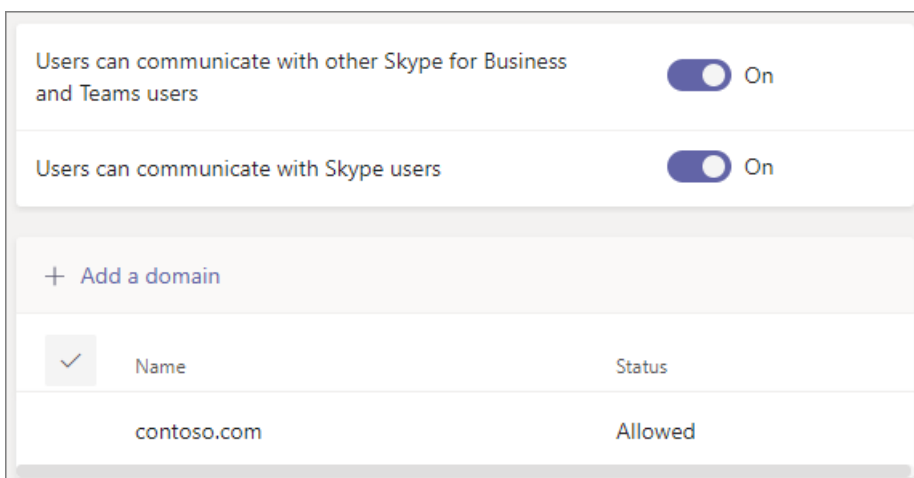

- **External access** - A type of federation that allows users to find, call, and chat with people in other organizations. These people cannot be added to teams unless they are invited as guests.
- **Guest access** - Guest access allows you to invite people from outside your organization to join a team. Invited people get a guest account in Azure Active Directory.

Note that Teams allows you to invite people outside your organization to meetings. This does not require external or guest access to be configured.

External access (federation)

Set up external access if you need to find, call, chat, and set up meetings with people outside your organization who use Teams, Skype for Business (online or on premises) or Skype.

By default, external access is enabled for all domains. You can restrict external access by allowing or blocking specific domains or by turning it off.

The screenshot shows the 'External access' settings in Microsoft Teams. At the top, there are two toggle switches, both set to 'On': 'Users can communicate with other Skype for Business and Teams users' and 'Users can communicate with Skype users'. Below these is a section titled '+ Add a domain' which contains a table. The table has two columns: 'Name' and 'Status'. One row is visible with 'contoso.com' in the 'Name' column and 'Allowed' in the 'Status' column.

✓	Name	Status
	contoso.com	Allowed

To configure external access, see [Manage external access](#).

NOTE

Microsoft Teams free licenses do not support external access.

Guest access

Use guest access to add a person from outside your organization to a team, where they can chat, call, meet, and collaborate on files. A guest can be given nearly all the same Teams capabilities as a native team member. For more information, see [Guest experience in Teams](#).

Guests are added to your organization's Azure Active Directory as B2B users and must sign in to Teams using their guest account. This means that they may have to sign out of their own organization to sign in to your

organization.

To configure guest access for Teams, see [Collaborate with guests in a team](#).

Compare external and guest access

The following tables show the differences between using external access (federation) and guests. In both cases, people outside your organization are identified to your users as being external.

Things your users can do

USERS CAN	EXTERNAL ACCESS USERS	GUESTS
Chat with someone in another organization	Yes	Yes
Call someone in another organization	Yes	Yes
See if someone from another organization is available for call or chat	Yes	Yes ¹
Search for people in other organizations	Yes ²	No
Share files	No	Yes
See the out-of-office message of someone in another organization	No	Yes
Block someone in another organization	No	Yes
Use @mentions	Yes ³	Yes

Things people outside your organization can do

PEOPLE OUTSIDE YOUR ORGANIZATION CAN	EXTERNAL ACCESS USERS	GUESTS
Access Teams resources	No	Yes
Be added to a group chat	Yes	Yes
Be invited to a meeting	Yes	Yes
Make private calls	Yes	Yes ⁵
View the phone number for dial-in meeting participants	No ⁴	Yes
Use IP video	Yes	Yes ⁵
Use screen sharing	Yes ³	Yes ⁵
Use meet now	No	Yes ⁵

PEOPLE OUTSIDE YOUR ORGANIZATION CAN	EXTERNAL ACCESS USERS	GUESTS
Edit sent messages	Yes ³	Yes ⁵
Delete sent messages	Yes ³	Yes ⁵
Use Giphy in conversation	Yes ³	Yes ⁵
Use memes in conversation	Yes ³	Yes ⁵
Use stickers in conversation	Yes ³	Yes ⁵
Presence is displayed	Yes	Yes
Use @mentions	Yes ³	Yes

¹ Provided that the user has been added as a guest and is signed in with the guest account.

² Only by email or Session Initiation Protocol (SIP) address.

³ Supported for 1:1 chat for Teams Only to Teams Only users from two different organizations.

⁴ By default, external participants can't see the phone numbers of dialed-in participants. If you want to maintain the privacy of these phone numbers, select **Tones** for **Entry/exit announcement type** (this prevents the numbers from being read out by Teams). To learn more, read [Turn on or off entry and exit announcements for meetings in Microsoft Teams](#).

⁵ Allowed by default, but can be turned off by the Teams admin

[External access in Teams](#)

[Guest access in Teams](#)

Manage external access in Microsoft Teams

12/7/2021 • 9 minutes to read • [Edit Online](#)

External access is a way for Teams users from outside your organization to find, call, chat, and set up meetings with you in Teams. You can also use external access to communicate with people from other organizations who are still using Skype for Business (online and on-premises) and Skype (in preview).

If you want people from other organizations to have access to your teams and channels, use guest access instead. For more information about the differences between external access and guest access, see [Compare external and guest access](#).

Use external access when:

- You have users in external domains who need to collaborate. For example, Rob@contoso.com and Ann@northwindtraders.com are working on a project together along with some others in the contoso.com and northwindtraders.com domains.
- You want the people in your organization to use Teams to contact people in specific businesses outside of your organization.
- You want anyone else in the world who uses Teams to be able to find and contact you, using your email address.

Plan for external access

By default, external access is turned on in Teams, which means that your organization can communicate with all external domains. If you add blocked domains, all other domains will be allowed; and if you add allowed domains, all other domains will be blocked. The exception to this rule is if anonymous participants are allowed in meetings. There are three scenarios for setting up external access in the Teams admin center (**Users > External access**):

NOTE

Teams users can add apps when they host meetings or chats with people from other organizations. They can also use apps shared by people in other organizations when they join meetings or chats hosted by those organizations. The data policies of the hosting user's organization, as well as the data sharing practices of any third-party apps shared by that user's organization, are applied.

NOTE

If you turn off external access in your organization, external users can still join meetings through anonymous join. To learn more, see [Manage meeting settings in Teams](#).

- **Allow all external domains:** This is the default setting in Teams, and it lets people in your organization find, call, chat, and set up meetings with people external to your organization in any domain.

In this scenario, your users can communicate with all external domains that are running Teams or Skype for Business or are allowing all external domains or have added your domain to their allow list.

- **Allow only specific external domains:** By adding domains to an **Allow** list, you limit external access to only the allowed domains. Once you set up a list of allowed domains, all other domains will be

blocked. To allow specific domains, click **Add a domain**, add the domain name, click **Action to take on this domain**, and then select **Allowed**.

- **Block specific domains** - By adding domains to a **Block** list, you can communicate with all external domains *except* the ones you've blocked. To block specific domains, click **Add a domain**, add the domain name, click **Action to take on this domain**, and then select **Blocked**. Once you set up a list of blocked domains, all other domains will be allowed.
- **Block all external domains** - Prevents people in your organization from finding, calling, chatting, and setting up meetings with people external to your organization in any domain.

NOTE

The allowed or blocked domains only apply to meetings if anonymous access to meetings is "off".

Allow or block domains

Using the Microsoft Teams admin center

To allow specific domains

1. In the Teams admin center, go to **Users > External access**.
2. Under **Choose which domains your users have access to**, choose **Allow only specific external domains**.
3. Select **Allow domains**.
4. In the **Domain** box, type the domain that you want to allow and then click **Done**.
5. If you want to allow another domain, click **Add a domain**.
6. Click **Save**.

To block specific domains

1. In the Teams admin center, go to **Users > External access**.
2. Under **Choose which domains your users have access to**, choose **Block only specific external domains**.
3. Select **Block domains**.
4. In the **Domain** box, type the domain that you want to allow and then click **Done**.
5. If you want to block another domain, click **Add a domain**.
6. Click **Save**.

Make sure the admin in the other Teams organization completes these same steps. For example, in their **allowed domains** list, their admin needs to enter the domain for your business if they limit the organizations that can communicate with their users.

Communicate with Skype users (preview)

Follow these steps to let Teams users in your organization chat with and call Skype users. Teams users can then search for and start a one-on-one text-only conversation or an audio/video call with Skype users and vice versa.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Users > External access**.
2. Turn on the **Allow users in my organization to communicate with Skype users** setting.

To learn more about the ways that Teams users and Skype users can communicate, including limitations that apply, see [Teams and Skype interoperability](#).

Block unsolicited contact with external unmanaged Teams users

Follow these steps to keep Teams users in your organization from unsolicited contact with external Teams users whose accounts are not managed by an organization.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Users > External access**.
2. Follow one of these steps:
 - To block Teams users in your organization from communicating with external Teams users whose accounts are not managed by an organization, turn off the **People in my organization can communicate with Teams users whose accounts aren't managed by an organization** setting and clear the **External users with Teams accounts not managed by an organization can contact users in my organization** checkbox.
 - To let Teams users in your organization communicate with external Teams users whose accounts are not managed by an organization if your Teams users have initiated the contact, turn on the **People in my organization can communicate with Teams users whose accounts aren't managed by an organization** setting and clear the **External users with Teams accounts not managed by an organization can contact users in my organization** checkbox.
 - To let Teams users in your organization communicate with external Teams users whose accounts are not managed by an organization and receive requests to communicate with those external Teams users, turn on the **People in my organization can communicate with Teams users whose accounts aren't managed by an organization** setting and select the **External users with Teams accounts not managed by an organization can contact users in my organization** checkbox.

Test access

To test your setup, you need a Teams user who's not behind your firewall.

1. After you and the admin from the organization have changed the **External access** settings, you should be good to go.
2. In the Teams app, search for the person by email address, and send a request to chat.
3. Ask your Teams contact to send you a request to chat. If you don't receive their request, the problem is your firewall settings (assuming they've already confirmed their firewall settings are correct).
4. Another way to test whether the problem is your firewall is to go to a WiFi location not behind your firewall. such as a coffee shop, and use Teams to send a request to your contact to chat. If the message goes through at the WiFi location, but does not when you're at work, then you know the problem is your firewall.

NOTE

If you and another user both turn on external access and allow one another's domains, this will work. If it doesn't work, the other user should make sure their configuration isn't blocking your domain.

Common external access scenarios

The following sections describe how to enable federation for common external access scenarios, and how the TeamsUpgradePolicy determines delivery of incoming chats and calls.

Enable federation

To enable users in your organization to communicate with users in another organization, both organizations must enable federation. The steps to enable federation for a given organization depend on whether the organization is purely online, hybrid, or purely on-premises.

IF YOUR ORGANIZATION IS	ENABLE FEDERATION AS FOLLOWS
Online with no Skype for Business on-premises. This includes organizations that have TeamsOnly users and/or Skype for Business Online users.	<p>If using Teams Admin Center:</p> <ul style="list-style-type: none">- Make sure the domains that you want to communicate with are allowed in External Access. <p>If using PowerShell:</p> <ul style="list-style-type: none">- Ensure the tenant is enabled for federation: <code>Get-CsTenantFederationConfiguration</code> must show <code>AllowFederatedUsers=true</code>.- Ensure the user's effective value of <code>CsExternalAccessPolicy</code> has <code>EnableFederationAccess=true</code>.- If you are not using open federation, ensure the target domain is listed in <code>AllowedDomains</code> of <code>CsTenantFederationConfiguration</code>.
Pure on-premises	<p>In on-premises tools:</p> <ul style="list-style-type: none">- Ensure federation is enabled in <code>CsAccessEdgeConfiguration</code>.- Ensure federation for the user is enabled through <code>ExternalAccessPolicy</code> (either through the global policy, site policy, or user assigned policy).- If you are not using open federation, ensure the target domain is listed in <code>AllowedDomains</code>.
Hybrid with some users online (in either Skype for Business or Teams) and some users on-premises.	Follow above steps for both online and on-premises organizations.

Delivery of incoming chats and calls

Incoming chats and calls from a federation organization will land in the user's Teams or Skype for Business client depending on the recipient user's mode in TeamsUpgradePolicy.

IF YOU WANT TO	DO THIS:
Ensure incoming federated chats and calls arrive in the user's Teams client:	Configure your users to be TeamsOnly.
Ensure incoming federated chats and calls arrive in the user's Skype for Business client	Configure your users to be in any mode other than TeamsOnly.

Enable federation between users in your organization and consumer users of Skype

To enable federation between users in your organization and consumer users of Skype:

IF YOUR ORGANIZATION IS	ENABLE CONSUMER FEDERATION AS FOLLOWS
Pure online with no Skype for Business on-premises. This includes organizations that have TeamsOnly users and/or Skype for Business Online users.	<p>If using Teams Admin Center:</p> <ul style="list-style-type: none">- Make sure Allow users in my organization to communicate with Skype users is enabled in External Access. <p>If using PowerShell:</p> <ul style="list-style-type: none">- Ensure the tenant is enabled for federation: <code>Get-CsTenantFederationConfiguration</code> must show <code>AllowPublicUsers=true</code>.- Ensure the user's effective value of <code>CsExternalAccessPolicy</code> has <code>EnablePublicCloudAccess=true</code>.
Pure on-premises	<p>In on-premises tools:</p> <ul style="list-style-type: none">- Ensure Skype is enabled as a federated partner.- Ensure <code>EnablePublicCloudAccess=true</code> for the user through <code>ExternalAccessPolicy</code> (either via global policy, site policy, or user assigned policy).
Hybrid with some users online (in either Skype for Business or Teams) and some users on-premises.	Follow above steps for both online and on-premises organizations.

IMPORTANT

You don't have to add any **Skype domains** as allowed domains in order to enable Teams or Skype for Business Online users to communicate with Skype users inside or outside your organization. All **Skype domains** are allowed.

Federation Diagnostic Tool

If you're an administrator, you can use the following diagnostic tool to validate a Teams user can communicate with a federated Teams user:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.
[Run Tests: Teams Federation](#)
2. In the Run diagnostic pane, enter the **Session Initiation Protocol (SIP) Address** and the **Federated tenant's domain name**, and then select **Run Tests**.
3. The tests will return the best next steps to address any tenant or policy configurations that are preventing communication with the federated user.

Related topics

- [Native chat experience for external \(federated\) users](#)

Native chat experience for external (federated) users in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When a Microsoft Teams user is chatting with an external (federated) user, the chat experience is limited to text. However, if both your Teams user and the person in another organization are in the TeamsOnly upgrade mode, you can have a "native-Teams chat experience," which includes rich formatting, @mentions, and other chat features.

The native chat experience for people in other organizations is turned on for all Teams tenants, but not all people are eligible. To be offered a native chat experience, both the sender and receiver need to be configured for TeamsOnly upgrade mode. To learn more about upgrade policies, read [Setting your coexistence and upgrade settings](#).

To see a list of capabilities for external access users in Teams, see [Compare external and guest access](#).

How do I know if I'm in a native chat?

If you can only exchange text in your chat with people in other organizations, then you're in a standard external-access (federated) chat. If you've got other chat functionality, including formatting, @mentions, emojis, etc., then you're in a native Teams chat.

Teams periodically checks the upgrade mode for people in other organizations and, when it finds an them running Teams in the TeamsOnly upgrade mode, it'll prompt you to switch to a native Teams chat and lock the original chat.

When you switch to a native Teams chat, Teams doesn't merge the two conversations. Instead, you'll see both of the chats in your chat feed. The new, native-Teams chat is active, but the old, text-only chat is locked.

What happens if a user isn't in Teams Only mode anymore?

If you were having a native Teams chat with people in other organizations and then one of you gets switched out of the TeamsOnly upgrade mode, Teams locks the native Teams chat and gives you a link for a limited, text-only chat. You won't be able to continue in the native Teams chat. You can still read the native Teams chat, but you can't continue the conversation there.

If Teams finds an old text-only chat with this person, it'll revive that chat. Otherwise, Teams creates a new text-only chat.

Teams and Skype interoperability

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article gives you an overview of the interoperability capabilities between Microsoft Teams and Skype (Consumer). Learn how Teams users and Skype users can communicate through chats and calls and the admin controls that apply.

Teams users in your organization can chat with and call Skype users by using their email address and vice versa.

- Teams users can search for and start a one-on-one text-only conversation or an audio/video call with a Skype user.
- Skype users can search for and start a one-on-one text-only conversation or an audio/video call with a Teams user.

These capabilities are available on the desktop, web, and mobile (Android and iOS) clients for both Teams and Skype. For an optimal experience, we recommend Skype version 8.58 and later.

NOTE

The Teams and Skype interop capabilities discussed in this article aren't available in GCC, GCC High, or DOD deployments, or in private cloud environments.

Chat and calling experience

Here's an overview of the chat and calling experience.

Teams user starts a chat or call with a Skype user

Teams users can search for a Skype user by typing their email address in a new chat or in the search bar. The Teams user can then select the Skype user in the search results to start a chat or call with them.

A Skype user may choose not to appear in search results. In this case, they won't show up in the search results in Teams and Teams users won't be able to find them.

Skype user starts a chat or call with a Teams user

Skype users can search for and start a chat with a Teams user by using their email address. The Teams user is notified that they have a new message from a Skype user, and has to first accept the message before they can reply to it.

- If the Teams user selects **Accept**, the conversation is accepted, and both users can chat and call each other.
- If the Teams user selects **Block**, the conversation is blocked, and subsequent messages and calls from that Skype user are blocked.
- If the Teams user selects **View messages**, the message is displayed in Teams, which helps the user decide whether to accept or block the conversation.

NOTE

If you upgraded from Skype for Business to Teams and your users are in Teams Only mode, chats and calls from Skype users to Teams users are delivered to Teams. If your users are in Islands mode, chats and calls from Skype users to Teams users are delivered to Skype for Business.

Teams user blocks or unblocks a Skype user

After a Teams user accepts or blocks the initial conversation request from a Skype user, they can choose to block or unblock that person at any time. They can do this either in the conversation or in their privacy settings in Teams. Skype users won't know that they've been blocked.

Blocked Skype users, along with other people and public switched telephone network (PSTN) phone numbers that a Teams user has blocked, are listed on the user's blocked contact list in Teams.

Limitations

- Conversations are text-only. This means that there's no rich formatting, @mentions, emojis, or other any of the other chat features that are available in a [native Teams chat experience](#).
- Conversations are one-on-one only. Group chats aren't supported.
- Teams users and Skype users can't see each other's presence.
- Searching for Skype users by using their Skype ID or phone number isn't supported.
- Skype users can't call Teams users who set up call forwarding to another user's number, a delegate's number, or a Public Switched Telephone Network (PSTN) number. Only voicemail is supported.
- Interop escalation, group calls, and meetings aren't supported.
- The ability for a delegate to call a Skype user on behalf of a Teams user isn't supported.
- Screen sharing with chat isn't supported.

Set whether Teams users can communicate with Skype users

As an admin, you use the Microsoft Teams admin center or PowerShell to set external access settings to control whether Teams users in your organization can communicate with Skype users. By default, this capability is turned on for new tenants. However, there's a prerequisite that the following DNS SRV record needs to be configured by the IT Admin if not already available for your domain, for example `_sipfederationtls.contoso.com`.

Service: sipfederationtls

Protocol: TCP

Priority: 100

Weight: 1

Port: 5061

Target: sipfed.online.lync.com

If you upgraded from Skype for Business to Teams, the external communications settings that you configured in the Skype for Business admin center are migrated to Teams.

In the Microsoft Teams admin center

In the Microsoft Teams admin center, go to **Org-wide settings** > **External access**, and then turn on **Users can communicate with Skype users**. For step-by-step guidance on how to configure this and other external access settings, see [Manage external access in Teams](#).

Using PowerShell

Do the following:

1. Use the [Set-CsExternalAccessPolicy](#) cmdlet together with the `EnablePublicCloudAccess` parameter to control whether Teams users can communicate with Skype users. Setting the parameter to `true` allows Teams users to communicate with Skype users. You can use the `EnablePublicCloudAudioVideoAccess` parameter to enable/disable audio/video calls.
2. Use the [Set-CsTenantPublicProvider](#) cmdlet together with the `Provider` parameter set to `"WindowsLive"` so that Teams users can communicate with Skype users.

Guest access in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

With guest access, you can provide access to teams, documents in channels, resources, chats, and applications to people outside your organization, while maintaining control over your corporate data. See [Set up secure collaboration with Microsoft 365 and Microsoft Teams](#). Guest access in Teams is an organization-wide setting and is turned on by default. You can control guest access to individual teams by using [sensitivity labels](#).

NOTE

If you just want to find, call, chat, and set up meetings with people in other organizations, use [external access](#).

A guest is someone who isn't an employee, student, or member of your organization. They don't have a school or work account with your organization. For example, guests may include partners, vendors, suppliers, or consultants. Anyone who is not part of your organization can be added as guest in Teams. This means that anyone with a business account (that is, an Azure Active Directory account) or consumer email account (with Outlook.com, Gmail.com or others) can participate as a guest in Teams, with access to teams and channel experiences.

Guests in Teams are covered by the same compliance and auditing protection as the rest of Microsoft 365, and can be managed within Azure AD. Guest access is subject to Azure AD and Microsoft 365 or Office 365 service limits.

The guest experience has limitations by design. For a full list of what a guest can and can't do in Teams, see [comparison of team member and guest capabilities](#).

IMPORTANT

Guests follow Teams Org-wide settings for the coexistence Upgrade mode. This can't be changed.

To set up guest access, see [Collaborate with guests in a team](#).

To compare external access (federation) with guest access (and decide which one you should use), read [Communicate with users from other organizations in Teams](#).

Set up guest access

Guest access in Teams requires configuring other settings in Microsoft 365, including settings in Azure AD, Microsoft 365 Groups, and SharePoint. If you're ready to start inviting guests to teams, read one of the following:

- To configure guest access for Teams for general use, see [Collaborate with guests in a team](#).
- To collaborate with a partner organization that uses Azure Active Directory and allow guests to self-enroll for team access, see [Create a B2B extranet with managed guests](#).

NOTE

If you're an administrator, and you're having trouble with Guest Access in Microsoft Teams, select **Run Tests** below, which will populate the Guest Access diagnostic in the Microsoft 365 Admin Center. These tests will check your configuration and quickly recommend next steps to enable Guest Access for your tenant.

[Run Tests: Guest Access](#)

Turning guest access off

If you turn guest access off in Teams, existing guests lose access to their team. However, they are not removed from the team. They are still visible to the team members and can be @mentioned. If you turn Teams guest access on again, they will regain access.

If you plan to leave guest access off, you may want to advise your team owners to manually remove the guest accounts from their teams. While these guests won't have access, having their accounts visible in the team could lead to confusion for other team members.

How a guest becomes a member of a team

1. A team owner or a Microsoft 365 admin [adds a guest to a team](#).
2. The guest receives a welcome email from the team owner, with information about the team and what to expect now that they're a member.
3. The guest accepts the invitation. Guests who have a work or school account in Azure Active Directory can accept the invitation and authenticate directly. Other users are sent a one-time pass code to validate their identity ([One-time passcode authentication](#) required).
4. After accepting the invitation, the guest can [participate in teams and channels](#), receive and respond to channel messages, [access files in channels](#), participate in chats, join meetings, collaborate on documents, and more.

In Teams, guests are clearly identified. A guest's name includes the label **(Guest)**, and a channel includes an icon to indicate that there are guests on the team. For more details, see [What the guest experience is like](#).

Guests can leave the team at any time from within Teams. For details, see [How do I leave a team?](#)

NOTE

Leaving the team doesn't remove the guest account from your organization's directory. This must be done by a Microsoft 365 global admin or an Azure AD admin.

Licensing for guest access

Guest access can be used with all Microsoft 365 Business Standard, Microsoft 365 Enterprise, and Microsoft 365 Education subscriptions. No additional Microsoft 365 license is necessary. The [billing model for Azure AD External Identities](#) applies to guests in Microsoft 365. Only people from outside your organization can be invited as guests.

Guest access reviews

You can use Azure AD to create an access review for group members or users assigned to an application. Creating recurring access reviews can save you time. If you need to routinely review users who have access to an application, a team, or are members of a group, you can define the frequency of those reviews.

You can perform a guest access review yourself, ask guests to review their own membership, or ask an

application owner or business decision maker to perform the access review. Use the Azure portal to perform guest access reviews. For more information, see [Manage guest access with Azure AD access reviews](#).

Guest experience in Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

When a guest is invited to join a team, they receive a welcome email message. This message includes some information about the team and what to expect now that they're a member. The guest must accept the invitation by selecting **Open Microsoft Teams** in the email message before they can access the team and its channels.

All team members see a message in the channel thread announcing that the team owner has added a guest and providing the guest's name. Everyone on the team can identify easily who is a guest. A tag in the upper-right corner of the channel thread indicates the number of guests on the team and a **(Guest)** label appears next to each guest's name.

Check out these videos about the guest experience in Teams:

- [Join a team as a guest](#)
- [Join a Teams meeting with guests](#)

Comparison of team member and guest capabilities

The following table compares the Teams functionality available for an organization's team members and its guests. Teams admins control the features available to guests.

CAPABILITY IN TEAMS	TEAMS USER IN THE ORGANIZATION	GUEST
Create a channel <i>Team owners control this setting.</i>	✓	✓
Participate in a private chat	✓	✓

Become team owner	✓	

The following table shows the calling and meeting features available to guests, compared to other types of users.

CALLING FEATURE	GUEST	E1 AND E3 USER	E5 AND ENTERPRISE VOICE USER
VOIP calling	Yes	Yes	Yes
Group calling	Yes	Yes	Yes

CALLING FEATURE	GUEST	E1 AND E3 USER	E5 AND ENTERPRISE VOICE USER
Core call controls supported (hold, mute, video on/off, screen sharing)	Yes	Yes	Yes
Transfer target	Yes	Yes	Yes
Can transfer a call	Yes	Yes	Yes
Can consultative transfer	Yes	Yes	Yes
Can add other users to a call via VOIP	Yes	Yes	Yes
Can add users by phone number to a call	No	No	Yes
Forward target	No	Yes	Yes
Call group target	No	Yes	Yes
Unanswered target	No	Yes	Yes
Can be the target of a federated call	No	Yes	Yes
Can make a federated call	No	Yes	Yes
Can immediately forward their calls	No	No	Yes
Can simultaneously ring their calls	No	No	Yes
Can route their unanswered calls	No	No	Yes
Missed calls can go to voicemail	No	No ¹	Yes
Have a phone number that can receive calls	No	No	Yes
Can dial phone numbers	No	No	Yes
Can access call settings	No	No	Yes
Can change voicemail greeting	No	No ¹	Yes
Can change ringtones	No	No	Yes

CALLING FEATURE	GUEST	E1 AND E3 USER	E5 AND ENTERPRISE VOICE USER
Supports TTY	No	No	Yes
Can have delegates	No	No	Yes
Can be a delegate	No	No	Yes

¹ This feature will be available soon.

NOTE

The **Guest user access restrictions** policy in Azure Active Directory (Azure AD) determines permissions for guests in your directory. There are three policy options.

- The **Guest users have the same access as members (most inclusive)** setting means guests have the same access to directory data as regular users in your directory.
- The **Guest users have limited access to properties and membership of directory objects** settings means that guests don't have permissions for certain directory tasks, such as enumerating users, groups, or other directory resources using Microsoft Graph.
- The **Guest user access is restricted to properties and memberships of their own directory objects (most restrictive)** setting means guests can only access their own directory objects.

To learn more, see [What are the default user permissions in Azure Active Directory?](#)

Turn on or turn off guest access to Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Until **February 2021**, guest access is turned off by default. You must turn on guest access for Teams before admins or team owners can add guests. After you turn on guest access, it might take a few hours for the changes to take effect. If users see the message **Contact your administrator** when they try to add a guest to their team, it's likely that either guest access hasn't been turned on or the settings aren't effective yet.

After **February 2021**, guest access in Microsoft Teams will be turned on by default for new customers & existing customers who haven't configured this setting. When this change is implemented, if you've not already configured guest access capability in Microsoft Teams, that capability will be enabled in your tenant. If you want guest access to remain disabled for your organization, you'll need to confirm that the guest access setting is set to **Off** instead of **Service default**.

IMPORTANT

Turning on guest access depends on settings in Azure Active Directory, Microsoft 365, SharePoint, and Teams. For more information, see [Collaborate with guests in a team](#).

Configure guest access in the Teams admin center

1. Sign in to the [Microsoft Teams admin center](#).
2. Select **Users > Guest access**.
3. Set **Allow guest access in Teams** to **On**.

4. Under **Calling, Meeting, and Messaging**, select **On** or **Off** for each capability, depending on what you want to allow for guests.
 - **Make private calls** – Turn this setting **On** to allow guests to make peer-to-peer calls.
 - **IP video** – Turn this setting **On** to allow guests to use video in their calls and meetings.
 - **Screen sharing mode** – This setting controls the availability of screen sharing for guests.
 - Turn this setting to **Disabled** to remove the ability for guests to share their screens in Teams.
 - Turn this setting to **Single application** to allow sharing of individual applications.
 - Turn this setting to **Entire screen** to allow complete screen sharing.
 - **Meet Now** – Turn this setting **On** to allow guests to use the Meet Now feature in Microsoft Teams.

- **Edit sent messages** - Turn this setting **On** to allow guests to edit messages they previously sent.
- **Delete sent messages** – Turn this setting **On** to allow guests to delete messages they previously sent.
- **Chat** – Turn this setting **On** to give guests the ability to use chat in Teams.
- **Giphy in conversations** – Turn this setting **On** to allow guests to use Giphys in conversations. Giphy is an online database and search engine that allows users to search for and share animated GIF files. Each Giphy is assigned a content rating.
- **Giphy content rating** – Select a rating from the drop-down list:
 - **Allow all content** - Guests will be able to insert all Giphys in chats, regardless of the content rating.
 - **Moderate** - Guests will be able to insert Giphys in chats, but will be moderately restricted from adult content.
 - **Strict** – Guests can insert Giphys in chats, but will be restricted from inserting adult content.
- **Memes in conversations** - Turn this setting **On** to allow guests to use Memes in conversations.
- **Stickers in conversations** – Turn this setting **On** to allow guests to use stickers in conversations.
- **Immersive reader for messages** - Turn this setting **On** to allow guests to use [immersive reader in Teams](#).

Meeting

Turn on or turn off settings for guests in meetings.

Save **Discard**

5. Select **Save**.

External access (federation) vs. guest access

External access (federation) and guest access are different:

- External access gives access permission to an entire domain.
- Guest access gives access permission to an individual.

For a detailed comparison, see [Communicate with users from other organizations](#).

Monitor and improve call quality for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article introduces three key tools you can use to monitor, troubleshoot, manage, and improve call quality in Microsoft Teams.

- **Call Quality Dashboard (CQD)**: To analyze org-wide trends or problems, drive improvements to performance
- **Call analytics**: To analyze call and meeting quality for individual users
- **Quality of Service (QoS)**: To prioritize important network traffic

Monitor and troubleshoot call quality

You'll use per-user **Call analytics** and **Call Quality Dashboard** to find and troubleshoot call-quality problems that come up during ongoing operation. This lets you drive performance improvements across your network. Both of these tools are in the Teams admin center.

- **Call analytics** shows detailed information about the devices, networks, and connectivity related to *specific calls and meetings* for each user in Teams. Teams admin and helpdesk agents will use this information to troubleshoot call quality and connection problems in a specific call. To learn more, read [Set up call analytics](#) and [Use Call Analytics to troubleshoot poor call quality](#).
- **Call Quality Dashboard (CQD)** gives you a *network-wide view* of call quality across your organization. Use CQD information to help you identify and fix problems. First, [Set up CQD](#). Then read [Manage call and meeting quality in Teams](#).

Call analytics and CQD run in parallel and can be used independently or together. For example, if a communications support specialist determines that they need more help troubleshooting a user's call problem, they escalate the call to a communications support engineer, who has access to additional information about the call. In turn, the communications support engineer alerts a network engineer to a possible site-related issue they noticed in the call analytics. The network engineer checks CQD to see if an overall site-related issue could be a contributing cause of the user's call problem.

Prioritize important network traffic using QoS

As your users start using Teams for calls and meetings, they may experience a caller's voice breaking up or cutting in and out of a call or meeting. Shared video may freeze or pixelate, or fail altogether. This is due to the IP packets that represent voice and video traffic encountering network congestion and arriving out of sequence or not at all. If this happens (or to prevent it from happening in the first place), use **Quality of Service (QoS)**.

With QoS, you prioritize delay-sensitive network traffic (for example, voice or video streams), allowing it to "cut in line" in front of traffic that is less sensitive (like downloading a new app, where an extra second to download isn't a big deal). QoS identifies and marks all packets in real-time streams using Windows Group Policy Objects and a routing feature called Port-based Access Control Lists, which instructs your network to give voice, video, and screen sharing their own dedicated network bandwidth.

Ideally, you'll implement QoS on your internal network while getting ready to roll out Teams, but you can do it anytime. If you're small enough, you might not need QoS.

When you're ready, read [Implement Quality of Service \(QoS\) in Microsoft Teams](#).

To use QoS to manage meeting traffic, read [Set how you want to handle real-time media traffic for Teams meetings](#).

What is Call Quality Dashboard (CQD)?

12/7/2021 • 2 minutes to read • [Edit Online](#)

The Microsoft Call Quality Dashboard (CQD) - <https://cqddashboard.microsoft.com> - shows call and meeting quality, at an **org-wide level**, for Microsoft Teams, Skype for Business Online, and Skype for Business Server 2019.

The latest version of CQD features a **near-real-time (NRT) data feed**, which means that call records are available in CQD within 30 minutes of the end of a call.

Wherever CQD includes **end-user identifiable information (EUII) data**, it's managed in the same way as **EUII throughout Microsoft 365**.

CQD is designed to help Teams admins, Skype for Business admins, and network engineers monitor call and meeting quality at an org-wide level. You'll use CQD to help you **optimize your network** to drive performance quality. When you need to look into call and meeting information for a **specific user**, use CQD data in conjunction with per-user **call analytics**.

For example, using CQD, you can determine that a user's poor call quality (which you observed using per-user call analytics) is due to a network issue that also affects many other users. CQD captures both the individual call experience and the overall quality of calls made using Teams or Skype for Business. With CQD, overall patterns may become apparent, so network engineers can make informed assessments of call quality. CQD provides reports of call quality metrics that give you insight into overall call quality, server-client streams, client-client streams, and voice quality **SLA**.

For the best experience, try uploading your building data.

In CQD, we encourage you to upload building and endpoint information, which lets you use Location-Enhanced Reports to analyze call quality and reliability within a user's building. The data can be assessed to determine if the problem is isolated to a single user or affects a larger segment of users. To turn on building or endpoint-specific views in CQD, an admin must [upload building or endpoint information](#) on the CQD Tenant Data Upload page.

Don't miss our [Manage call and meeting quality](#) article, which offers in-depth guidance for the Teams admin or support engineer responsible for managing service quality in Teams.

Use Power BI to analyze CQD data

New in January 2020: [Download Power BI query templates for CQD](#). Customizable Power BI templates you can use to analyze and report your CQD data.

Read [Use Power BI to analyze CQD data](#) to learn more.

Set up Call Quality Dashboard

12/7/2021 • 2 minutes to read • [Edit Online](#)

Open the Microsoft Call Quality Dashboard (CQD) at <https://cqd.teams.microsoft.com> (sign in with your admin credentials). Or go to the Teams admin center and select **Analytics & reports** > **Call Quality Dashboard**.

On the page that opens, click **Sign in** and enter your Global Administrator account or Microsoft Teams Administrator account information. After the first time you sign in, CQD will begin collecting and processing data. Keep in mind that it may take one or more hours to process enough data to display meaningful results in the reports.

CQD shows call and meeting quality, at an org-wide level, for Microsoft Teams, Skype for Business Online, and Skype for Business Server 2019.

IMPORTANT

To use CQD with Skype for Business Server 2019, you'll have to [Configure Call Data Connector](#). See [Plan Call Data Connector](#) before you start.

Assign admin roles for access to CQD

Assign [roles](#) for accessing CQD to the people who need to use it.

If you want non-admin users (such as support engineers and helpdesk agents) to use Call Quality Dashboard, you can assign those users one of the following roles, which gives access to CQD.

	VIEW REPORTS	VIEW EUUI FIELDS	CREATE REPORTS	UPLOAD BUILDING DATA
Global Administrator	Yes	Yes	Yes	Yes
Teams Administrator	Yes	Yes	Yes	Yes
Teams Communications Administrator	Yes	Yes	Yes	Yes
Teams Communications Support Engineer	Yes	Yes	Yes	No
Teams Communications Support Specialist	Yes	No	Yes	No
Skype for Business Administrator	Yes	Yes	Yes	Yes
Global Reader	Yes	Yes	Yes	No
Reports Reader ¹	Yes	No	Yes	No

¹ In addition to reading CQD reports, the Reports Reader can view all the [activity reports](#) in the admin center and any reports from the [Microsoft 365 Adoption content pack](#).

NOTE

If you're not seeing [EUUI \(end-user identifiable information\)](#) and you have one of the roles that's permitted to see this information, keep in mind that CQD only keeps EUUI for 28 days. Anything older than 28 days is deleted.

For more information about these roles, see [About Office 365 admin roles](#).

After the first time you sign in, CQD will begin collecting and processing data.

Use Power BI to analyze CQD data

New in January 2020: [Download Power BI query templates for CQD](#). Customizable Power BI templates you can use to analyze and report your CQD data.

Read [Use Power BI to analyze CQD data](#) to learn more.

Upload tenant and building data in Call Quality Dashboard (CQD)

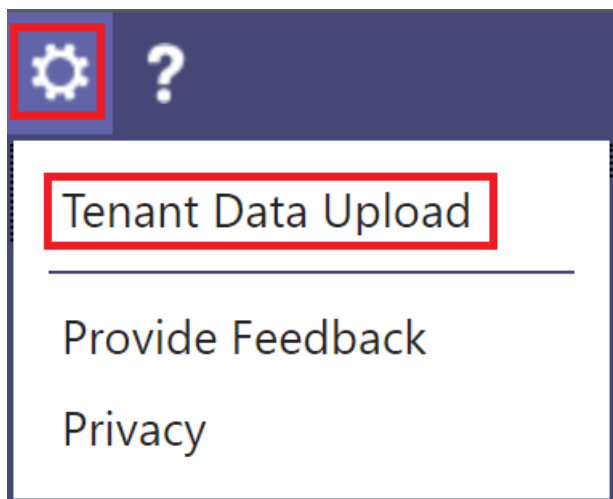

12/7/2021 • 10 minutes to read • [Edit Online](#)

To get the most out of Call Quality Dashboard (CQD), we recommend that you upload your tenant and building data. There are 2 types of tenant data files, [Building](#) and [Endpoint](#).

You can download a sample tenant data template [here](#). For help with building mapping, read [Create a building map for CQD](#).

From the CQD Summary Reports dashboard, select **Tenant Data Upload** from the CQD **Settings** menu (a gear icon at the top of CQD). From here, admins can upload their organization's building and endpoint information, such as mapping of IP addresses and geographical information, mapping each wireless access point and its MAC address, etc.

1. Open CQD (from the Teams admin center, or at <https://cqdl.teams.microsoft.com>), then select the gear icon in the upper-right corner and choose **Tenant Data Upload** from the **Summary Reports** page.

2. Alternatively, if this is your first time visiting CQD, you'll be asked to upload building data. You can select **Upload Now** to quickly navigate to the **Tenant Data Upload** page.

For the best experience, try uploading your building data.

[Upload now →](#)

3. On the **Tenant Data Upload** page, select **Browse** to choose a data file.
4. After selecting a data file, specify **Start date** and, optionally, specify an end date.
5. After selecting **Start date**, select **Upload** to upload the file to CQD.

Before the file is uploaded, it's validated. If validation fails, an error message is displayed requesting that you correct the file. The following figure shows an error occurring when the number of columns in the data file is incorrect.

Please upload your data file. The file uploaded must be a tsv file (Tab-separated values)

Browse

BuildingData.tsv

Upload

Error: Incorrect number of columns at row: 1

6. If no errors occur during validation, the file upload will succeed. You can then see the uploaded data file in the **My uploads** table, which shows the full list of all uploaded files for the current tenant at the bottom of that page.

NOTE

It can take up to four hours to finish processing the building file.

If you've already uploaded a building file and need to add subnets that might have been missed or excluded, modify the original file by adding the new subnets, remove the current file, and re-upload the newly edited file. There can be only one active building data file in CQD.

Upload building data file

The first type of tenant data file in CQD is the **Building** data file. The Subnet column is derived by expanding the Network+NetworkRange column, then joining the Subnet column to the call record's First Subnet or Second Subnet column to show Building, City, Country, or Region information. The format of the data file you upload must meet the following criteria to pass the validation check before upload:

- The file must be either a .tsv file (columns are separated by a TAB) or a .csv file (columns are separated by a comma).
- The data file doesn't include a table header row. The first line of the data file is expected to be real data, not header labels like "Network".
- Data types in the file can only be String, Integer, or Boolean. For the Integer data type, the value must be a numeric value. Boolean values must be either 0 or 1.
- If a column uses the String data type, a data field can be empty but must still be separated by a tab or comma. An empty data field just assigns an empty String value.
- There is a 1,000,000 expanded row limit per tenant data file.
- There must be 15 columns for each row, each column must have the appropriate data type, and the columns must be in the order listed in the following table (comma or tab delimited):

Building data file format

COLUMN NAME	DATA TYPE	EXAMPLE	GUIDANCE
NetworkIP	String	192.168.1.0	Required
NetworkName	String	USA/Seattle/SEATTLE-SEA-1	Required ¹
NetworkRange	Number	26	Required
BuildingName	String	SEATTLE-SEA-1	Required ¹
OwnershipType	String	Contoso	Optional

COLUMN NAME	DATA TYPE	EXAMPLE	GUIDANCE
BuildingType	String	IT Termination	Optional
BuildingOfficeType	String	Engineering	Optional
City	String	Seattle	Recommended
ZipCode	String	98001	Recommended
Country	String	US	Recommended
State	String	WA	Recommended
Region	String	MSUS	Recommended
InsideCorp ²	Bool	1	Required
ExpressRoute ³	Bool	0	Required
VPN	Bool	0	Optional

¹ While not required by CQD, the templates are configured to display Building and Network name.

² This setting can be used to reflect whether or not the subnet is inside the corporate network. You can customize usage for other purposes.

³ This setting can be used to reflect whether or not the network uses Azure ExpressRoute. You can customize usage for other purposes.

Sample row:

```
192.168.1.0,USA/Seattle/SEATTLE-SEA-1,26,SEATTLE-SEA-1,Contoso,IT
Termination,Engineering,Seattle,98001,US,WA,MSUS,1,0,0
```

IMPORTANT

The network range can be used to represent a supernet (combination of several subnets with a single routing prefix). All new building uploads will be checked for any overlapping ranges. If you have previously uploaded a building file, you should download the current file and re-upload it to identify any overlaps and fix the issue before uploading again. Any overlap in previously uploaded files may result in the wrong mappings of subnets to buildings in the reports. Certain VPN implementations do not accurately report the subnet information.

The VPN column is optional and will default to 0. If the VPN column's value is set to 1, the subnet represented by that row will be fully expanded to match all IP addresses within the subnet. Please use this sparingly and only for VPN subnets since fully expanding these subnets will have a negative impact on query times for queries involving building data. If the expansion of the subnet results in the expansion row limit of 1,000,000 being exceeded, the building file will not be accepted.

Supernetting

You can use supernetting, commonly called Classless Inter-Domain Routing (CIDR,) in place of defining each subnet. A *supernet* is a combination of several subnets that share a single routing prefix. Instead of adding an entry for each subnet, you can use the supernetted address. Supernetting is supported, but we don't recommend using it.

For example, Contoso's marketing building is made up of the subnets below:

- 10.1.0.0/24—first floor
- 10.1.1.0/24—second floor
- 10.1.2.0/24—third floor
- 10.1.3.0/24—fourth floor

Instead of adding an entry for each subnet, you can use the supernetted address—in this example, 10.1.0.0/22.

- Network = 10.1.0.0
- Network Range = 22

Here are a few things to consider before you implement supernetting:

- Supernetting can only be used in a subnet mapping with 8-bit to 28-bit mask.
- Supernetting takes less time up front, but it comes at the cost of reducing the richness of your data. Let's say there's a quality problem involving subnet 10.1.2.0. If you implemented supernetting, you won't know where in the building the subnet is located or what type of network it is (for example, a lab). If you'd defined all the subnets for a building and uploaded floor location information, you'd be able to see that distinction.
- It's important to ensure that the supernetted address is correct and isn't catching unwanted subnets.
- It's quite common to find 192.168.0.0 in data. For many organizations, this indicates that the user is at home. For others, this is the IP address scheme for a satellite office. If your organization does have offices that use this configuration, don't include it in your building file because it's difficult to distinguish between home and internal networks by using [common subnets](#).

IMPORTANT

The network range can be used to represent a supernet. All new building data file uploads will be checked for any overlapping ranges. If you've previously uploaded a building file, you should download the current file and upload it again to identify any overlaps and fix the issue. Any overlap in previously uploaded files might result in the wrong mappings of subnets to buildings in the reports.

VPN

The quality of experience (QoE) data that clients send to Microsoft 365 or Office 365—which is where CQD data is sourced from—includes a VPN flag. CQD will see this as the First VPN and Second VPN dimensions. However, this flag relies on VPN vendors' reporting to Windows that the VPN network adapter registered is a Remote Access adapter. Not all VPN vendors properly register Remote Access adapters. Because of this, you might not be able to use the built-in VPN query filters. Use the VPN column discussed above to accurately mark and identify VPN subnets. It is also good practice to label your VPN networks for easy identification in your reports. Below are two examples of how to label your VPN subnets:

- Define a **Network Name** by entering "VPN" in this field for VPN subnets.

Network	Network Name	Network Range	Building Name
10.16.7.0	BEIJING-BJW-1\FL2\VPN	26	BEIJING-BJW

- Define a **Building Name** by entering "VPN" in this field for VPN subnets.

Network	Network Name	Network Range	Building Name	Owner
10.16.7.0	CHN/Beijing/BEIJING-BJW-1	26	VPN	Co O

NOTE

VPN connections have been known to misidentify the network connection type as wired when the underlying connection is wireless. When looking at quality over VPN connections, you can't assume that the connection type has been accurately identified.

Endpoint data file

The other type of CQD tenant data file is the **Endpoint** data file. The column values are used in the call record's First Client Endpoint Name or Second Client Endpoint Name column to show Endpoint Make, Model, or Type information. The format of the data file you upload must meet the following criteria to pass the validation check before upload:

- The file must be either a .tsv file (columns are separated by a TAB) or a .csv file (columns are separated by a comma).
- The content of the data file doesn't include table headers. The first line of the data file is expected to be real data, not a header label like "EndpointName".
- All seven columns use the String data type only. The maximum allowed length is 64 characters.
- A data field can be empty but must still be separated by a tab or comma. An empty data field just assigns an empty String value.
- EndpointName must be unique, otherwise the upload fails. If there is a duplicate row or two rows that use the same EndpointName the conflict will cause incorrect joining.
- EndpointLabel1, EndpointLabel2, and EndpointLabel3 are customizable labels. They can be empty Strings or values such as "IT Department designated 2018 Laptop" or "Asset Tag 5678".
- There must be seven columns for each row and the columns must be in the following order:

Field order:

EndpointName, EndpointMake, EndpointModel, EndpointType, EndpointLabel1, EndpointLabel2, EndpointLabel3

Sample row:

```
1409W3534, Fabrikam, Model 123, Laptop, IT designated 2018 Laptop, Asset Tag 5678, Purchase 2018
```

Update a building file

While gathering building and subnet information, administrators will often upload the building file in multiple iterations over time, adding new subnets and their building information as it becomes available. When this occurs, you'll need to re-upload your building file. This process is like the initial upload as described in the previous section, with a few exceptions as noted in the following section.

IMPORTANT

Only one building file can be active at a time. Multiple building files aren't cumulative.

Add net new subnets

There are times when you'll need to add net new subnets to CQD that weren't originally part of your network topology. To add net new subnets, do the following from the **Tenant Data Upload** page in CQD:

1. Download the original file, if you don't already have an up-to-date copy.
2. Remove the current file in CQD.
3. Edit the original building file and provide an end date that occurs at least one day before the net new subnets were acquired.
4. Append the net new subnets to the original building file.
5. Upload the newly modified building file, and set the start date for one day after the previous building file ends.

Add missing subnets

After you upload building information for managed networks, every managed network should have a building association. However, this won't always be the case; typically, a few subnets are missed. To find these missing networks, review the **Missing Subnet Report** on the **Quality of Experience Reports** page in CQD. This presents all the subnets with 10 or more audio streams that aren't defined in the building data file and are being marked as outside. Ensure that there are no managed networks in this list. If subnets are missing, use the following procedure to update the original building data file and re-upload it to CQD.

1. Go to the **Tenant Data Upload** page in CQD.
2. Download the original file, if you don't already have an up-to-date copy.
3. Remove the current file in CQD.
4. Append the new subnets to the original file.
5. Upload the building file. Be sure to set the start date to at least eight months prior so that CQD will process historical data.

IMPORTANT

You'll need to add your tenant ID as a query filter for **Second Tenant ID** to this report to filter the report to view only your organization's tenant data. Otherwise, the report will show federated subnets.

NOTE

Be sure to adjust the Month Year report filter to the current month. Select **Edit**, and adjust the **Month Year** report filter to save the new default month.

Data and reports in Call Quality Dashboard (CQD)

12/7/2021 • 16 minutes to read • [Edit Online](#)

Microsoft Call Quality Dashboard (CQD) uses a near-real-time (NRT) data feed. Call records are available in CQD within 30 minutes of the end of a call. Call records from the NRT pipeline are only available for a few months before they are removed from the data set.

Many ways to access CQD data

You can access CQD data by several different avenues. Pick the one that best meets your needs:

Teams admin center (https://admin.teams.microsoft.com)	CQD data is included on the Users page in the Teams admin center, showing the most common data you need in an easy-to-read format. You can't customize CQD data that you find under Users .
CQD portal (https://cqd.teams.microsoft.com)	<p>Robust summary and detailed reports that meet most needs, with drill-through filtering. You can also customize reports in the CQD portal.</p> <p>Get two CQD report templates to help you analyze data in the CQD portal.</p>
Power BI	<p>Use direct queries to view your CQD data in Power BI using customizable Power BI templates. Download Power BI query templates for CQD.</p> <p>You can also use the REST API to access CQD data through Power BI. Use this method if you want to download your CQD data so you can work on it offline. The benefit of using this method is better performance, especially useful for large data sets that bog down in Power BI when you're online.</p>
Graph API	Access call quality data yourself using the Graph API . This is the most complex method, but it gives you the most control and flexibility in analyzing your call quality data. For example, if you need to join it with other data for your organization, you can use the Graph API to create a data model and incorporate call quality data.

Import the CQD report templates

Download [two curated CQD report templates](#) (All Networks and Managed Networks) to help you get up to speed quickly with CQD. The All Networks template, though optimized to work with a building data file, can be used while you work toward collecting and uploading building information into CQD, as described in the next section.

To import the templates (.CQDX) into CQD

1. In CQD, select **Detailed Reports** from the menu at the top of the page.
2. In the left panel, select **Import**. Browse to the first CQDX template and select **Open**.

3. After the template is uploaded, a pop-up window will display the message "Report import was successful."
4. Repeat steps 2 and 3 for the second CQD template.

NOTE

Each user must import the CQD templates into their CQD instance.

EUII data

For compliance reasons, end-user identifiable information (EUII) data (also known as personally-identifiable information or PII) is only kept for 28 days. As NRT data crosses the 28-day mark, fields that contain EUII are cleared, resulting in EUII-free NRT data. Fields that contain EUII data are:

- Full IP address
- Media Access Control (MAC) Address
- Basic Service Set identifier (BSSID)
- Session Initiation Protocol (SIP) URI (Skype for Business only)
- User Principal Name (UPN)
- Machine Endpoint Name
- User Verbatim Feedback
- Object ID (the Active Directory object ID of the endpoint's user)

Admin roles with and without EUII access

These [RBAC](#) roles **DO** have EUII access:

- Global Admin
- Teams Service Admin
- Teams Communications Admin
- Teams Communications Support Engineer
- Global Reader
- Skype for Business Admin

These RBAC roles **DON'T** have EUII access:

- Reports Reader
- Teams Communications Support Specialist

Date controls

CQD supports the following Rolling Trend types:

- 5-day
- 7-day
- 30-day
- 60-day
- 90-day

The URL Date parameter accepts a Day field. Rolling-day reports use dates specified in the YYYY-MM-DD format as the last day of the trend. The URL Date parameter "00" indicates "today".

URL	END DATE OF ROLLING DAY TREND
https://<cqdv3>/spd/#/Dashboard/<reportid>/2019-02/	Current Day of Feb 2019
https://<cqdv3>/spd/#/Dashboard/<reportid>/2019-02-15/	Feb 15, 2019
https://<cqdv3>/spd/#/Dashboard/<reportid>/00/	Current Day

By default, the current day of the month is used as the last day of the Rolling Day Trend.

Data available in CQD reports

The default summary and detailed CQD reports may be all you need to manage call quality for your org. If you need to, you can [create custom reports](#).

If you want to use Power BI to analyze your CQD data, read [Use Power BI to analyze CQD data for Teams](#).

FEATURE	SUMMARY REPORTS	DETAILED REPORTS
Application sharing metric	No	Yes
Customer building information support	Yes	Yes
Customer endpoint information support	Only in cqdt.teams.microsoft.com	Only in cqdt.teams.microsoft.com
Drill down analysis support	No	Yes
Media reliability metrics	No	Yes
Out-of-the-box reports	Yes	Yes
Overview reports	Yes	Yes
Per-user report set	No	Yes
Report set customization (add, delete, modify reports)	No	Yes
Video-based screen sharing metrics	No	Yes
Video metrics	No	Yes
Amount of data available	Last 12 months	Last 12 months
Microsoft Teams data	Yes	Yes

Select product data to see in reports

In the Summary and Location-Enhanced Reports, you can use the **Product Filter** drop-down to show all

product data, only Microsoft Teams data, or only Skype for Business Online data.

In Detailed reports, you can use the **Is Teams** dimension to filter the data to Microsoft Teams or Skype for Business Online data.

Summary Reports

These are the reports that you'll see on the CQD Dashboard when you first sign in to CQD. They give you an at-a-glance look at quality trends with daily, monthly, and table reports to assist with identifying subnets that have poor quality.

TAB	DESCRIPTION
Overall Call Quality	Aggregate of the other 3 tabs.
Server—Client	Details of the streams between server and client endpoints.
Client—Client	Details of the streams between two client endpoints.
Voice Quality SLA	Info about calls included in the Skype for Business voice quality SLA .

Overall Call Quality tab

Use the data on this tab to evaluate call quality status and trends based on stream counts and poor percentages. The legend in the upper-right corner shows which color and visual elements represent these metrics.

Streams are classified in three groups: Good, Poor, and Unclassified. There are also calculated *Poor %* values that give you the ratio of streams classified as *Poor* to the total classified stream count. Since $Poor \% = \frac{Poor\ streams}{(Poor\ streams + Good\ streams)} * 100$, the *Poor %* is unaffected by the presence of multiple *Unclassified* streams. To see what classifies a stream as poor or good, refer to [Stream Classification in Call Quality Dashboard](#).

Use the scale on the left to measure the stream count values.

Use the scale on the right to measure the Poor % values.

You can also obtain the actual numerical values by hovering the mouse over a bar.

NOTE

The following example is from a very small sample data set, and the values aren't realistic for an actual deployment.

The overall stream volume helps determine how relevant the calculated Poor percentages are. The smaller the volume of overall streams, the less reliable the reported Poor percentage values are.

Server-Client tab and Client-Client tabs

These two tabs provide details for the streams that took place in their endpoint-to-endpoint scenarios. The Server-Client tab has four collapsible sections that represent four scenarios under which media streams would flow.

- Wired Inside
- Wired Outside
- WiFi Inside
- WiFi Outside

Similarly, the Client-Client tab has five collapsible sections:

- Wired Inside — Wired Inside
- Wired Inside — Wired Outside
- Wired Outside — Wired Outside
- Wired Inside — WiFi Inside
- Wired Inside — WiFi Outside

Inside versus Outside

CQD classifies a stream as *Inside* or *Outside* using Building information, if it exists. Endpoints of each stream are associated with a subnet address. If the subnet is in the list of the subnets marked InsideCorp in the uploaded Building information, then it is considered *Inside*. If Building information has not yet been uploaded, then Inside Test always classifies the streams as *Outside*.

The Inside Test for a Server-Client scenario only considers the client endpoint. Because servers are always outside from a user's perspective, this isn't accounted for in the test.

Wired versus WiFi

As the names indicate, the classification criteria is based on the type of client connections. Server is always wired and it isn't included in the calculation. In a given stream, if one of the two endpoints is connected to a WiFi network, then CQD classifies it as WiFi.

NOTE

Given a stream, if one of the two endpoints is connected to a WiFi network, then it is classified as WiFi in CQD.

Tenant Data information

The CQD Summary Reports dashboard includes a **Tenant Data Upload** page, accessed by selecting **Tenant Data Upload** from the settings menu in the top-right corner. This page is used for admins to upload their own information, such as:

- A map of IP address and geographical information.
- A map of each wireless AP and its MAC address.
- A map of Endpoint to Endpoint Make/Model/Type, etc.

We recommend that you upload your tenant, building, and location data so CQD can include this information in your reports. If you haven't already uploaded this data, read [Upload tenant and building data](#).

Detailed reports

NAME	DESCRIPTION
Location-Enhanced Reports	Shows quality trends based on location information. This report appears only if you've uploaded your tenant data .
Reliability Reports	Includes audio, video, video-based screen sharing (VBSS), and app sharing reports.
Quality of Experience Reports	Audio quality and reliability for all clients and devices, including meeting rooms. These reports are a “slimmed-down” version of the downloadable CQD templates , focusing on key areas for analyzing audio quality and reliability.

NAME	DESCRIPTION
Quality Drill Down Reports	Drill downs: Date by region, locations, subnets, hour, and users.
Failure Drill Down Reports	Drill downs: Date by region, locations, subnets, hour, and users.
Rate My Call Reports	Analyze user call ratings by region, location, or by user. Includes verbatim feedback.
Help Desk Reports	Help Desk Reports look at call and meeting data for individual users, groups of users, or everyone. Incorporating building and EUII data, these reports help identify possible system issues based on network location, conference details, devices, or firmware.
Client Version Reports	<p>Client Version Summary: View the Sessions and Users counts for each client app version</p> <p>Client Version by User: View user names for each client app version</p> <p>Pre-built filters for Product and Client Type help focus the versions to specific clients.</p>
Endpoint Reports	Shows call quality by machine endpoints (computer make and model). These reports include building data, if you've uploaded it.

Create custom detailed reports

If the default CQD reports don't meet your needs, use these instructions to create a custom report. Or (as of January 2020) [Use Power BI for CQD reports](#) instead.

From the pull-down list of reports at the top of the screen displayed at login (the **Summary Reports** screen) Select **Detailed Reports** and then **New**. Click **Edit** in a report to see the Query Editor. Each report is backed by a query into the cube. A report is a visualization of the data returned by its query. The Query Editor helps you edit these queries and the display options of the report.

IMPORTANT

The network range can be used to represent a supernet (combination of several subnets with a single routing prefix). All new building uploads will be checked for any overlapping ranges. If you have previously uploaded a building file, you should download the current file and re-upload it to identify any overlaps and fix the issue before uploading again. Any overlap in previously uploaded files may result in the wrong mappings of subnets to buildings in the reports. Certain VPN implementations do not accurately report the subnet information. It is recommended that when adding a VPN subnet to the building file, instead of one entry for the subnet, separate entries are added for each address in the VPN subnet as a separate 32-bit network. Each row can have the same building metadata. For example, instead of one row for 172.16.18.0/24, you should have 256 rows, with one row for each address between 172.16.18.0/32 and 172.16.18.255/32, inclusive.

The VPN column is optional and will default to 0. If the VPN column's value is set to 1, the subnet represented by that row will be fully expanded to match all IP addresses within the subnet. Please use this sparingly and only for VPN subnets since fully expanding these subnets will have a negative impact on query times for queries involving building data.

Point to bar charts and trend lines in the report to display detailed values. The report that has focus will show the action menu: **Edit, Clone, Delete, Download, and Export Report Tree.**

Query filters

Query filters are implemented by using the Query Editor in CQD. These filters are used to reduce the number of records returned by CQD, thus minimizing the report's overall size and query times. This is especially useful for filtering out unmanaged networks. The filters listed in the following table use regular expressions (RegEx).

FILTER	DESCRIPTION	CQD QUERY FILTER EXAMPLE
No blank values	Some filters don't have the option to filter for blank values. To filter blank values manually, use the blank expression and set the filter to Equals or Not Equals, depending on your needs.	Second Building Name <> ^\s*\$
Exclude common subnets	Without a valid building file to separate managed from unmanaged networks, home networks will be included in the reports. These home subnets are outside the scope of IT's control and can be quickly excluded from a report. Common subnets, as defined in this guide, are 10.0.0.0, 192.168.1.0 and 192.168.0.0.	Second Subnet <> 10.0.0.0 192.168.0.0 192.168.1.0
View inside only	Used to filter a report for managed (inside) or unmanaged (outside). The managed CQD template is already preconfigured with these filters.	Second Inside Corp = Inside

Report filters

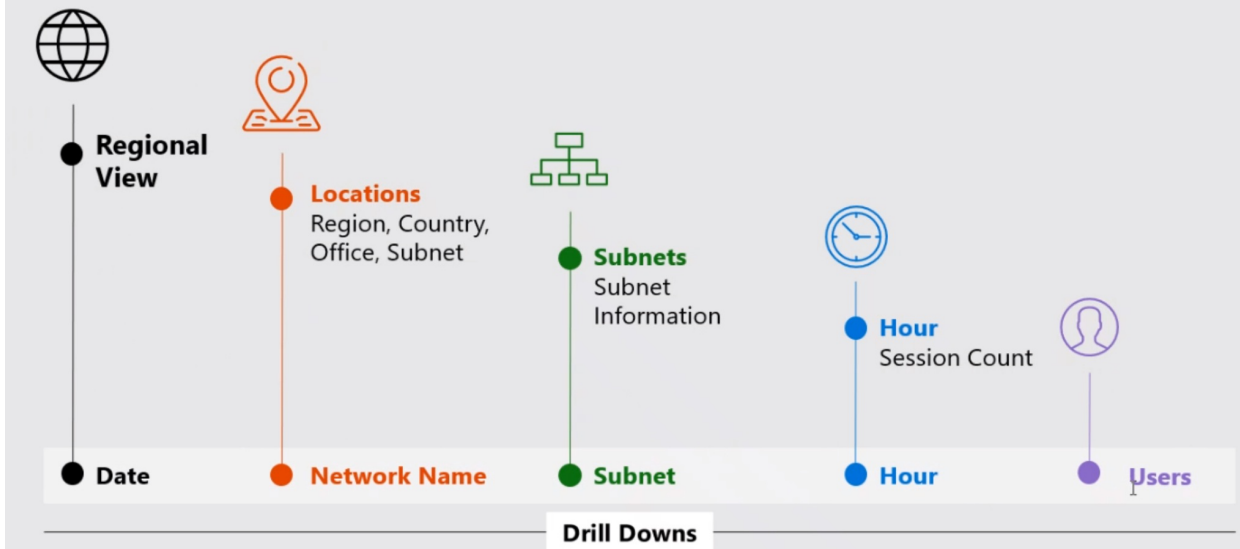

Use CQD report filters to narrow the focus of your investigations. Use report filters by adding a filter to the rendered report either in the Query Editor or directly in the report. The following report filters are used throughout the [CQD templates](#).

FILTER	DESCRIPTION	CQD REPORT FILTER EXAMPLE
Month	Start with the year first, then month.	2017-10
Alphabetic	Filters for any alphabetic characters.	[a-z]
Numeric	Filters for any numeric characters.	[0-9]
Percentage	Filters for a percentage.	(([3-9]\.)([3-9]))([1-9][0-9])

Drill-down filters

CQD reports feature several drill-down filters, which are powerful tools for narrowing the focus of your call-quality investigations. If you select a drill-down field, the report automatically opens the appropriate tab and filters on the selected value. If that tab has its own drill-down fields and one is selected, both sets of filters are applied, progressively narrowing the resulting data set.

Drill-Down Report Flow

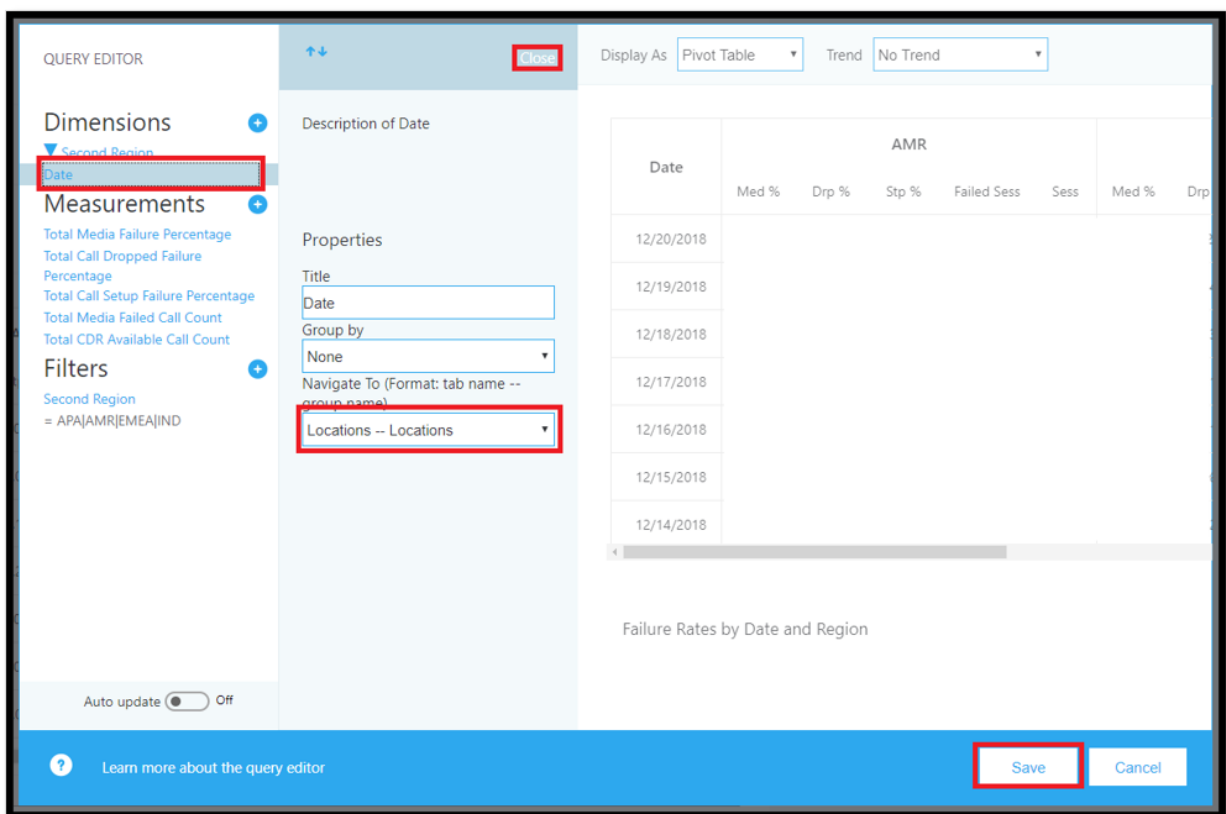

Adding and editing drill-down fields

When editing a report, you have the option to specify drill-down fields of your own using the Query Editor.

Start by clicking ... for the report you want to edit, then select **Edit**.

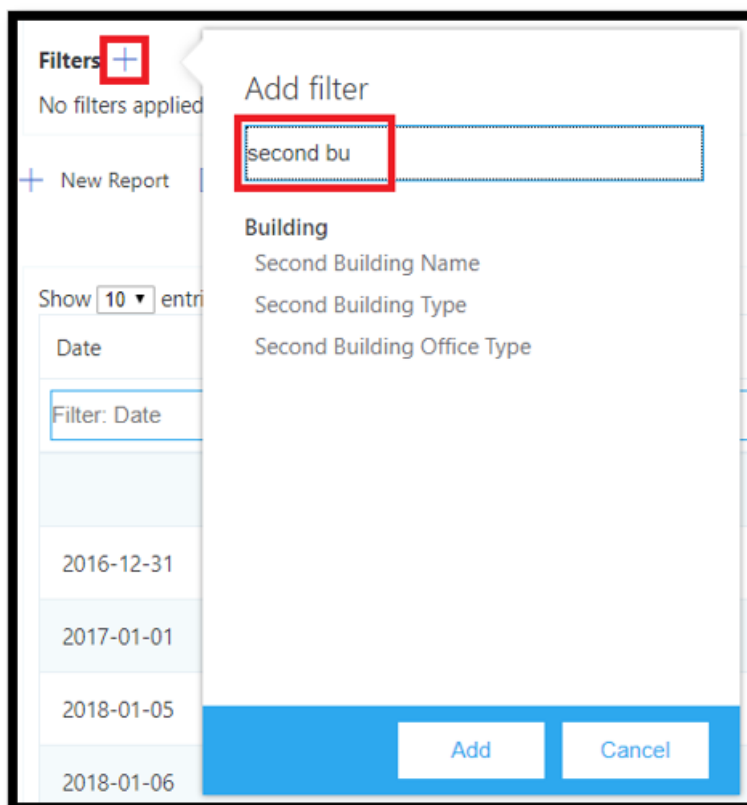

Select a Dimension from the list on the left side of the Query Editor. Then click on the dropdown below the **Navigate To** label and select the tab and expander group that you want that Dimension to drill through to. Note: Presently, drill-down functionality only works by navigating to different tabs. Support for drilling through to a specific expander will be added later. Finally, click **Close** to save your changes to the Dimension, then click **Save** to save and close the Query Editor.

Multi-select filters

In addition to drill-down functionality, CQD also supports specifying Filters with multiple values (OR filters).

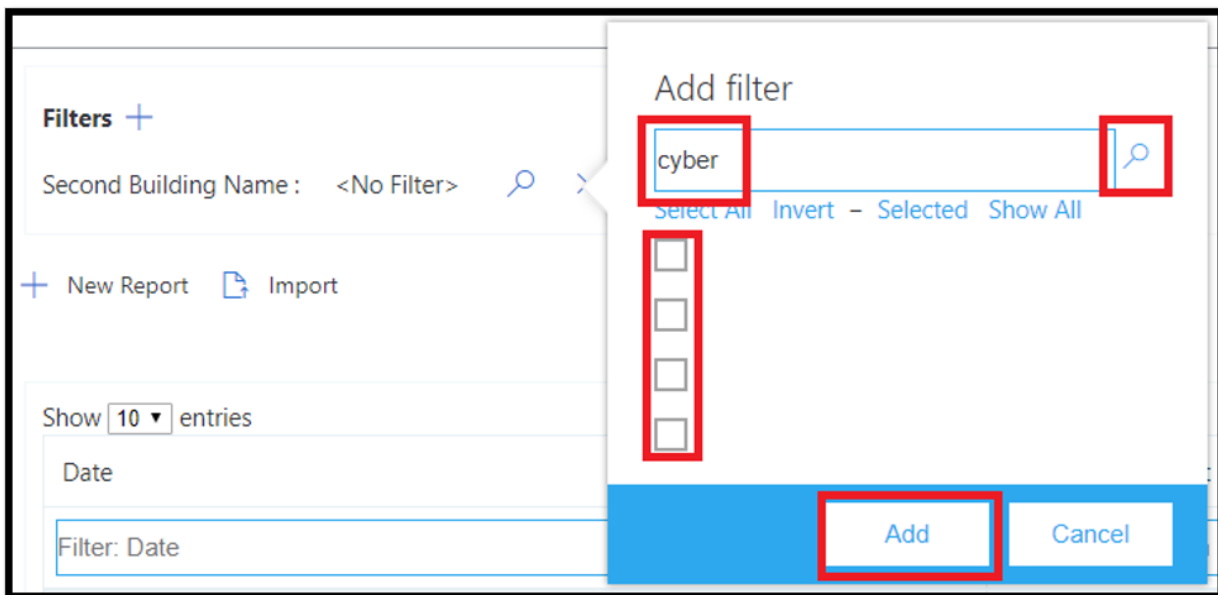

In order to select multiple filter values, begin by adding a new filter to the report. Click + beside the **Filters** label, enter the name of the Dimension you want to use, and click **Add**.

Then, click **Search** (a magnifying glass icon next to the new filter). You'll see a text field, and a number of options, including **Select All** and **Invert**. Enter a value, and click **Search** next to that field to search. Alternatively, leave the text field empty and click **Search** to view up to the first 100 options.

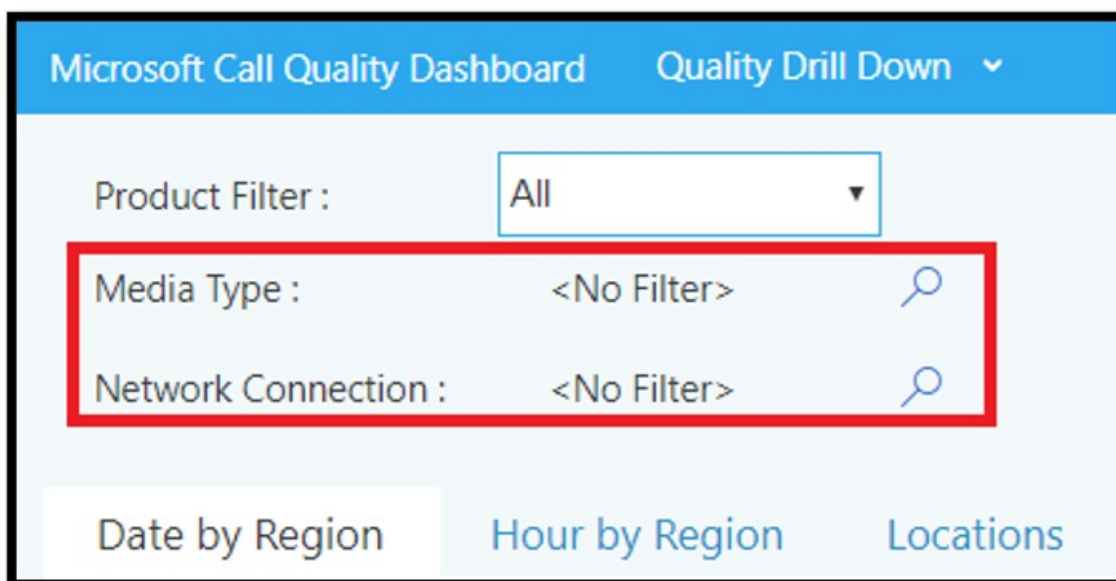

```
/filter/[AllStreams].[Second Tenant Id]\\[YOUR TENANT ID HERE]
```

Example:

Dashboard level filters

Certain CQD reports have dashboard-level filters added to them, making it easy to filter by common parameters. These filters appear outside the regular report tabs and directly beneath the Product filter, and they apply to all filters in the Dashboard.

```
/filter/[AllStreams].[Is Teams]|[TRUE | FALSE]
```

URL filters

CQD supports adding filters to the URL. This makes it easy to share or bookmark a CQD query. You can define parameters in the URL, such as Trending Month, tenant ID, or language. You can also add Product or Dashboard level filters to the URL. Excluding federated data from CQD reports is useful when you're remediating managed buildings or networks where federated endpoints might influence your reports.

To add a filter, append the following to the end of the URL:

```
/filter/[AllStreams].[Second Tenant Id]\|[YOUR TENANT ID HERE]
```

Example:

```
https://cqd.teams.microsoft.com/cqd/#/1234567/2018-08/filter/[AllStreams].[Second Tenant Id]|[TENANTID]
```

To add a Dashboard-level filter to a URL, that filter must exist in CQD as either a Product or Dashboard level filter. Add these filters to the URL after the Trending Month and before the URL parameters:

```
filter/DATA_MODEL_NAME|VALUE
```

For example, to apply a Product filter value of Microsoft Teams, you'd add the following:

```
filter/[AllStreams].[Is%20Teams]|[True]
```

Your entire URL would look something like this:

```
https://cqd.teams.microsoft.com/spd/#/Dashboard/2624085/2018-9/filter/[AllStreams].[Is%20Teams]|[True]
```

To apply URL filters with multi-select values, separate each value with a pipe (|) character. For example:

```
filter/[AllStreams].[Media%20Type]|[Video]|[Audio]|[VBSS]
```

If you specify an invalid name or value, the URL filter won't be applied.

You can use a URL filter to filter every report for a specific dimension. The most common URL filters are used to filter reports to exclude federated participant telemetry, or focus on only Teams or Skype for Business Online. Excluding federated data from CQD reports is useful when you're remediating managed buildings or networks where federated endpoints might influence your reports.

FILTER	DESCRIPTION	CQD QUERY FILTER EXAMPLE
No blank values	Some filters don't have the option to filter for blank values. To filter blank values manually, use the blank expression and set the filter to Equals or Not Equals, depending on your needs.	Second Building Name <> ^\s*\$
Exclude common subnets	Without a valid building file to separate managed from unmanaged networks, home networks will be included in the reports. These home subnets are outside the scope of IT's control and can be quickly excluded from a report. Common subnets, as defined in this article, are 10.0.0.0, 192.168.1.0 and 192.168.0.0.	Second Subnet <> 10.0.0.0 192.168.0.0 192.168.1.0
View inside only	Used to filter a report for managed (inside) or unmanaged (outside). The managed CQD template is already preconfigured with these filters.	Second Inside Corp = Inside

How to find your tenant ID

The tenant ID in CQD corresponds to the Directory ID in Azure. If you don't know your Directory ID, you can find it in the Azure portal:

1. Sign in to the Microsoft Azure portal: <https://portal.azure.com>

2. Select **Azure Active Directory**.

3. Under **Manage**, select **Properties**. Your tenant ID is in the **Directory ID** box.

You can also find your tenant ID by using PowerShell:

```
Login-AzureRmAccount
```

Comparing Teams and Skype for Business CQD data

When reviewing your data, you may see differences in data between Teams and Skype for Business. Some reasons:

- Differences in the mechanisms for ensuring performance and reliability:
 - Teams has auto-reconnect and fast roaming. Skype for Business doesn't.
 - Teams has dynamic bandwidth management. Skype for Business doesn't.
- Differences in [IP address ranges](#) between Teams and Skype for Business. The Teams IP ranges are newer, which could cause connectivity problems at the firewall.

Use CQD to manage call and meeting quality in Microsoft Teams

12/7/2021 • 47 minutes to read • [Edit Online](#)

This article will help you - the Teams admin or support and helpdesk engineer - to develop a process for monitoring and maintaining call and meeting quality for your organization by using Microsoft Teams Call Quality Dashboard (CQD). Our guidance emphasizes audio-quality scenarios because any network improvements you make to improve the audio experience will translate to improvements in video and sharing.

Key to this guidance are the two [curated CQD templates](#) - we recommend that you download them before you go through the guidance in this article.

This article assumes that you've already [set up CQD](#).

Categories to monitor and maintain

Once you've rolled out meetings and voice in Teams, you'll need a plan for ongoing monitoring and maintenance. Doing so will ensure that Teams is always running optimally. This plan should include the key areas listed below. You should also establish targets for quality metrics and a plan for troubleshooting and isolating problems when they happen.

CATEGORY	DESCRIPTION
Call quality	<p>Break down the metrics by internal calls (within your organization, such as VPN, WiFi, wired) or external calls</p> <p>Break down the metrics by building or network</p> <p>VPN calls</p> <p>Calls using TCP, UDP, or proxy</p>
Call reliability	<p>Identify and remediate any network or firewall problems</p> <p>Gain insights into the percentages of call setup and drop failures</p> <p>Learn where the majority of call setup and drop failures occur</p>
User survey	<p>Use Rate My Call data to learn about users' actual experience</p> <p>Where are the poor experiences occurring?</p> <p>Correlate the poor experience with call quality, reliability, and devices</p>
Devices	<p>Learn which microphones and speakers are most commonly used and their impact on call quality</p> <p>Are the supporting audio, video, USB, and WiFi drivers being regularly patched?</p>

CATEGORY	DESCRIPTION
Clients	Learn which client types and versions are being used and their impact on call quality and reliability

By continually assessing and remediating the areas described in this article, you can reduce their potential to negatively affect your users. Most user problems can be grouped into the following categories:

- Incomplete firewall or proxy configuration
- Poor Wi-Fi coverage
- Insufficient bandwidth
- VPN
- Inconsistent or outdated client versions and drivers
- Unoptimized or built-in audio devices
- Problematic subnets or network devices

Through proper planning and design before deploying Teams or Skype for Business Online, you can reduce the amount of effort that will be required to maintain high-quality experiences.

This article focuses on using the Call Quality Dashboard (CQD) Online as the primary tool to report and investigate each area, with a special emphasis on audio to maximize adoption and impact. Any improvements made to the network to improve the audio experience will also directly translate to improvements in video and desktop sharing.

To accelerate your assessment, [two curated CQD templates](#) are provided: one is for managing all networks and the other is filtered for managed (internal) networks only. Although the All Networks template reports are configured to display building and network information, they can still be used while you work toward collecting and uploading building information. Uploading building information into CQD enables the service to enhance reporting by adding custom building, network, and location information while differentiating internal from external subnets. For more information, read [Building mapping](#).

Intended audience

This article is intended to be used by partner and customer stakeholders with roles such as Collaboration Lead/Architect, Consultant, Change Management/Adoption Specialist, Support/Help Desk Lead, Network Lead, Desktop Lead, and IT Admin.

This article is also intended to be used by the designated quality champion(s). For more information, see [the Quality Champion role](#).

What is quality?

In this context, quality is a combination of service metrics and user experience.

Service metrics

Service metrics consist of specific client-based metrics. During each call, the client collects telemetry for the call and submits a report at the end of each call that can later be accessed in CQD or in [per-user call analytics](#). These metrics include (but aren't limited to):

- Poor Stream (incoming and outgoing)
- Setup Failure Rate
- Drop Failure Rate

Poor stream rate

The poor stream rate (PSR) represents the organization's overall percentage of streams that have poor quality.

This metric is meant to highlight areas where your organization can concentrate effort to have the strongest impact toward reducing this value and improving the user experience, which is why [managed networks](#) are the primary focus when looking at PSR. External users are important too, but investigation differs on an organizational basis. Consider providing best practices for external users, and investigate external calls independently from the overall organization.

The actual measurement in CQD varies by workload, but for the purposes of this article, we focus primarily on the *Audio Poor Percentage* measurement. PSR is made up of the five network metric averages described in the following table. For a stream to be classified as poor, only one metric needs to exceed the defined threshold. CQD provides the "Poor Due To..." measurements to better understand what condition caused the stream to be classified as poor. To learn more, read [Stream classification in CQD](#).

NOTE

CQD provides the "Poor due to..." measurements to better understand what condition caused the stream to be classified as poor.

Audio poor quality metrics

METRIC AVERAGE	DESCRIPTION	USER EXPERIENCE
Jitter > 30 ms	This is the average change in delay between successive packets. Teams and Skype for Business can adapt to some levels of jitter through buffering. It's only when the jitter exceeds the buffering that a participant notices the effects of jitter.	The packets arriving at different speeds cause a speaker's voice to sound robotic.
Packet loss rate > 10% or 0.1	This is often defined as a percentage of packets that are lost. Packet loss directly affects audio quality—from small, individual lost packets that have almost no impact to back-to-back burst losses that cause audio to cut out completely.	The packets being dropped and not arriving at their intended destination cause gaps in the media, resulting in missed syllables and words, and choppy video and sharing.
Round-trip time > 500 ms	This is the time it takes to get an IP packet from point A to point B and back to point A. This network propagation delay is tied to the physical distance between the two points and the speed of light, and includes additional overhead taken by the various devices in the network path.	The packets taking too long to arrive at their destination cause a walkie-talkie effect.
NMOS degradation average > 1.0	Average Network Mean Opinion Score (NMOS) degradation for the stream. Represents how much the network loss and jitter has affected the quality of received audio that caused the NMOS to drop by more than one point.	This is a combination of jitter, packet loss, and—to a lesser degree—increased round-trip time. The user might be experiencing a combination of these symptoms.

METRIC AVERAGE	DESCRIPTION	USER EXPERIENCE
Average ratio of concealed samples >7% or 0.07	Average ratio of the number of audio frames with concealed samples generated by packet loss healing to the total number of audio frames. A concealed audio sample is a technique used to smooth out the abrupt transition that would usually be caused by dropped network packets.	High values indicate that significant levels of loss concealment were applied and resulted in distorted or lost audio.

Why do we prefer to use streams instead of calls?

Streams let us know which particular leg of the call was poor - outgoing or incoming. When you're looking at call analytics for a poor call, determine whether the poor call was due to that caller's stream (outbound) or callee's stream (inbound). Determining which stream is impacting call quality is even more important for conferences. If you're only looking at call data, you'll see how many conferences a person participates in, but you won't see which people are active speakers, doing the most screen sharing.

Call data gives you usage metrics, but it won't necessarily lead you to the root cause for poor call quality. By looking at stream direction, you can identify factors such as a call that's not on a managed network, a call from a non-employee (e.g., a vendor or someone on a different network). In these cases, if the other person's network connection was poor, the entire call will be flagged as poor. You can't do anything about external factors, so this data isn't helpful.

Stream direction can also help you identify problematic devices or clients.

- For example, If you have a limited budget for devices and want to provide devices only for heavy audio users, use the audio usage report (VoIP) and filter for outbound streams and conferencing. Look for high-volume audio users who are speaking into built-in microphones - these may correlate to poorer call quality (and you might want to provide audio devices for these people). For added clarity, you could filter for packet utilization, which will let you target especially high-volume audio users.
- Another example involves screen sharing. If a customer is using an old Teams client, screen sharing performance may be affected. You could address this problem by prioritizing client upgrades for people who do a lot of screen sharing.
- By identifying which direction of a stream is causing poor call quality, you can determine whether you've got a QoS or bandwidth-related problem. If you haven't fully implemented QoS, or if you only mark packets at the client and not at the inbound stream, you might see poorer call quality. By looking at stream direction, you can get a more granular view of packet loss, latency, or jitter in a specific direction.
 - For example, let's say a user complains of robotic audio while on a wired connection (jitter). By looking at stream and direction, you can determine that the problem happens on the inbound stream, only for a specific set of subnets. After you give this information to your networking team, they can track it down to a misconfigured WAN accelerator that was not bypassing media traffic. Once the network team reconfigures the WAN accelerator, jitter disappears and call quality improves.

Setup Failure Rate

The setup failure rate, otherwise known as the *Total Call Setup Failure Percentage* measurement in CQD, is the number of streams where the media path couldn't be established between the endpoints at the start of the call.

This represents any media stream that couldn't be established. Given the severity of the impact of this problem on the user experience, the goal is to reduce this value to as close to zero as possible. A high value for this metric is more common in new deployments with incomplete firewall rules than a mature deployment, but it's still important to watch on a regular basis.

This metric is calculated by taking the total number of streams that failed to set up divided by the total number

of streams that submitted a successful call detail record (CDR):

- **Setup Failure Rate** = Total Call Setup Failed Stream Count / Total CDR Available Stream Count

Drop Failure Rate

The drop failure rate, otherwise known as the *Total Call Dropped Failure Percentage* measurement in CQD, is the percentage of successfully established streams where the media path didn't terminate normally.

This represents any media stream that terminated unexpectedly. Although the impact of this isn't as severe as a stream that failed to set up, it still negatively affects the user experience. Sudden and frequent media drops not only can have a severe impact on the user experience, they result in the need for users to reconnect, resulting in lost productivity (not to mention frustration).

The metric is calculated by taking the total number of dropped streams divided by the total count of streams that set up successfully:

- **Drop Failure Rate** = Total Call Dropped Stream Count / Total Call Setup Succeeded Stream Count

Define your target metrics

This section discusses some of the core service metrics that we use to assess the health of the services. By continually assessing and driving efforts to keep these metrics below their defined targets, you'll help ensure that your users experience consistent, reliable call quality. As a starting point, use the suggested targets in the table below. Adjust the targets as needed to meet your business objectives.

NETWORK TYPE		QUALITY TARGETS	RELIABILITY TARGETS	
		AUDIO POOR STREAM RATE	SETUP FAILURE RATE	DROP FAILURE RATE
All	Internal	2.0%	0.5%	2.0%
	Overall	3.0%	1.0%	3.0%
Conferencing	Internal	2.0%	0.5%	2.0%
	Wired internal	1.0%	0.5%	1.0%
	Wi-Fi 5 GHz internal	1.0%	0.5%	1.0%
	Wi-Fi 2.4 GHz internal	2.0%	0.5%	2.0%
	Overall	2.0%	0.5%	3.0%
P2P	Internal	2.0%	0.5%	2.0%
	Wired/Wi-Fi 5 GHz internal	1.0%	0.5%	1.0%
	Wired/Wi-Fi 5 GHz overall	2.0%	1.0%	1.0%
	Overall	2.0%	1.0%	3.0%

User experience

Analyzing the user experience is more art than science, because the metrics gathered here don't always mean

that there's a problem with the network or service but rather, they simply indicate that the user perceives a problem. CQD includes a built-in survey mechanism — Rate My Call (RMC) — to help gauge overall user experience. RMC will give you insight into the following questions from the perspective of your users:

- Do I know how to use the solution?
- Is the solution easy to use and intuitive, and does it support my day-to-day communication needs?
- Does the solution help me get my job done?
- What's my overall perception of the solution?
- Can I use the solution at any point in time, regardless of where I am?
- Can I set up and maintain a call?

Rate My Call

Rate My Call (RMC) is built into Teams and Skype for Business. It automatically pops up after one in every 10 calls, or 10 percent. This brief survey asks the user to rate the call and provide a little context for why the call quality might have been poor. A one or two rating is considered poor, three to four is good, and five is excellent. Although it's somewhat of a lagging indicator, this is a useful metric for uncovering issues that service metrics can miss.

NOTE

The human factor: Users often ignore the survey when call quality is good, and they fill it out when call quality is bad. As a result, your RMC reports might be skewed to the poor side even while service metrics are good.

You can use CQD to report on RMC user responses, and sample reports are included in the CQD template. However, they aren't discussed in detail in this article.

Client and device readiness

You need a solid client and device strategy to help ensure that your users have a consistent and positive user experience. A few key principles drive each readiness strategy.

Client readiness

Keeping the Teams client up-to-date ensures that your users are always getting the best-possible experience. Microsoft releases frequent [updates to the Teams client](#) (the update installs itself in the background unless you've turned off this functionality - which we don't recommend). It's also important to remember to patch network, video, USB, and audio drivers, because they're often overlooked and can affect call and meeting quality. Consider adding network, Wi-Fi, video, USB, and audio drivers to your current patch management process.

Device readiness

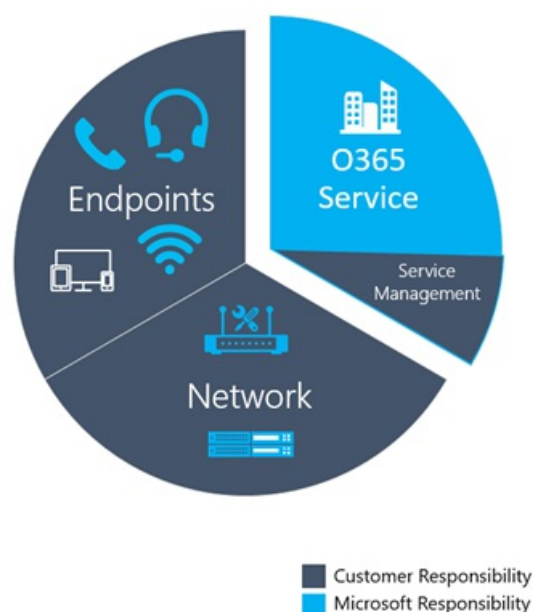

No one single strategy can affect the user experience more than your device readiness strategy. For example, users who rely on their laptop speakers and microphone will experience a lot of background noise in calls and meetings. Teams is designed to work with almost any device, but if you're having device-related problems, check out [Phone for Teams](#).

Categories of quality

Operationalize a set of quality-management practices - this gives you the best chance of good call and meeting quality. A good quality management plan addresses these categories:

- **Network:** Audio quality focused on the Poor Stream Ratio (PSR) metric, TCP usage, wired and wireless subnets, and identifying the use of HTTP proxies and VPN
- **Endpoints:** Audio devices and up-to-date clients
- **Service Management:** This category comprises two sections:
 - First is Microsoft's responsibility to manage and maintain the Teams and Skype for Business Online services.

- Second are tasks your organization manages to ensure reliable access to the service, such as updating building information and maintaining firewalls for new Office 365 IP addresses as infrastructure is added to the service.

Review the following list of tasks recommended to maintain quality. You should perform these tasks regularly - for example, weekly.

Service management tasks

These tasks range from ensuring there is sufficient bandwidth to reach the service without saturating internet links, validating that quality of service (QoS) is in place on all managed network areas, and staying on top of [Office 365 IP ranges on firewalls](#).

Network tasks

There are two categories of network tasks: reliability and quality. Reliability focuses on measuring the user's ability to make calls successfully and stay connected. Quality focuses on the aggregated telemetry sent to Teams and Skype for Business Online by the user's client during the call and after it has ended.

Given the critical impact that reliability has on the user experience, we recommend that you assess and investigate reliability metrics before you dive into quality.

Endpoints tasks

The main task in this category removing any obstacles to regular [Teams client updates](#). By default, Teams automatically updates regularly (unless you turn off that setting, which we don't recommend).

You should also monitor devices and provide updates whenever you identify problems related to a device.

Use CQD to manage call quality

Once you've [set up CQD](#), you're ready to start using it to manage call and meeting quality for your organization.

Most problems with Teams performance fall into the following categories:

- Incomplete firewall or proxy configuration
- Poor Wi-Fi coverage
- Insufficient bandwidth
- VPN
- Inconsistent or outdated client versions and drivers
- Unoptimized or built-in audio devices

- Problematic subnets or network devices

If you take the time before you roll out Teams to assess these areas and remediate any deficiencies, you'll reduce the amount of effort needed to maintain a high-quality Teams experience for all your users. For help assessing your network in preparation for your Teams rollout, read [Advisor for Teams](#) and [Prepare your network for Teams](#).

Expectations using CQD

Use the Call Quality Dashboard (CQD) to gain insight into the quality of calls made by using Teams and Skype for Business services. CQD is designed to help Teams and Skype for Business admins and network engineers optimize the network and keep a close eye on quality, reliability, and the user experience. CQD looks at aggregate telemetry for an entire organization, where overall patterns can become apparent; this lets you make informed assessments and plan remediation. CQD provides reports of metrics that provide insight into overall quality, reliability, and user experience.

CQD, although useful for analyzing trends and subnets, doesn't always provide a specific cause for a given scenario. It's important to understand this and set the correct expectation when using CQD:

- CQD won't provide the root cause for every scenario
- CQD won't contain Phone System or Audio Conferencing streams
- CQD will call out areas for further investigation based on trends

CQD reports overview

Use the drop-down menu at the top of the screen to open a report. For a list of the data provided in each report, read [Data available in CQD reports](#).

New in January 2020: [Download Power BI query templates for CQD](#). Customizable Power BI templates you can use to analyze and report your CQD data.

Teams vs. Skype for Business

CQD can report on both Teams and Skype for Business. However, there might be times when you want to develop a report to look at Teams telemetry separate from Skype for Business.

Summary reports

To modify the summary reports page to look at only Teams or Skype for Business, select the **Product Filter** drop-down menu from the top of the screen, and then select the product you want.

Detailed reports

To filter all detailed reports, in the browser bar, append the following to the end of the URL:

```
/filter/[AllStreams].[Is Teams]|[FALSE]
```

Example:

```
https://cq.d.teams.microsoft.com/cqd/#/1234567/2018-5/filter/[AllStreams].[Is Teams]|[FALSE]
```

For more information about URL filters, read [Filtering reports](#) later in this section.

To filter an individual detailed report, add the filter `Is Teams` to the report and set it to True or False.

Add filter

Managed versus unmanaged networks

By default, all endpoints in CQD are classified as external. As soon as a building file is introduced, we can begin to look at managed endpoint data. As previously discussed, networks in CQD are defined as:

- A *managed network*, often referred to as internal or inside, can be influenced and controlled by the organization. This includes the internal LAN, the remote WAN, and VPN.
- An *unmanaged network*, often referred to as external or outside, can't be influenced or controlled by the organization. An example of an unmanaged network is a hotel or airport network.

Dimensions, measures, and filters

A well-formed CQD query contains all three of the following parameters:

- **Dimension:** How I want to pivot on the data.
- **Measure:** What I want to report on.
- **Filter:** How I want to reduce the dataset the query returns.

Another way to look at this is that a *dimension* is the grouping function, a *measure* is the data I'm interested in, and a *filter* is how I want to narrow down the results to those that are relevant to my query.

An example of a well-formed query is **Show me Poor Streams [Measure] by Subnet [Dimension] for Building 6 [Filter]**. For more information, see [Dimensions and measures available in CQD](#).

First vs. second

Many of the dimensions and measures in CQD are classified as first or second. CQD doesn't use caller/callee fields—these have been renamed *first* and *second* because there are intervening steps between the caller and callee. The following logic determines which endpoint involved is labeled as first:

- **First** will always be a server endpoint (Conference Server, Mediation Server, and so on) if a server is involved in the stream or call.
- **Second** will always be a client endpoint unless the stream is between two server endpoints.
- If both endpoints are the same type, the choice of which is first is based on internal ordering of the user agent category. This ensures the ordering is consistent.

For more information about determining the first or second endpoint when they're both the same, see [Dimensions and measures available in CQD](#).

Stream vs. call

You need to understand the difference between a call and a stream to properly choose which dimensions or measures you'll be looking at in CQD. Although CQD's primary focus is on streams, call-based measurements are also available.

- **Stream:** A *stream* exists between only two endpoints. There is only one stream for each direction, and two streams are required for communication. Streams are useful for investigating buildings, networks, or subnets. In some cases, both call and stream are used in the measurement's name (for example, Call Setup Stream or Call Dropped Stream). These are still classified as streams.
- **Call:** A *call* is a grouping of all streams from all participants. A call consists of—at minimum—two streams. A single call will have at least two endpoints, each with a minimum of one stream.

For additional guidance on whether the dimension or measure is referring to a call or a stream, see [Dimensions and measures available in CQD](#)

Good, poor, and unclassified calls

A call is categorized either as good, poor, or unclassified. Let's take a moment to talk about each one in more detail.

- **Good or poor:** A good or poor call consists of a call that contains a complete set of service metrics, for which a full QoE report was generated and received by the service. Determining whether a stream is good or poor is described [earlier in this article](#).
- **Unclassified:** An unclassified stream doesn't contain a full set of service metrics. These can be short calls—usually less than 60 seconds—where averages couldn't be computed and a QoE report wasn't generated. The most common reason for calls to be unclassified is that there was little to no packet utilization. An example of this would be a participant who joins a meeting on mute and never speaks. The participant is receiving, but not transmitting, media. Without media being transmitted, there won't be any metrics available for CQD to use to classify the endpoint's outbound media stream.

To learn more, read [Stream classification in CQD](#).

Common subnets

Common subnets are specific private subnets that are used by hotels, home networks, hotspots, and similar areas. These subnets are difficult to triage due to their widespread use. If your organization uses one of these common subnets, we recommend that you move that network to another subnet. This will make reporting easier in CQD. When noted, reports in the All Networks template have been configured to exclude these subnets to eliminate them as a source of poor quality. Common subnets are defined below; their impact will vary by organization.

- 10.0.0.0/24
- 192.168.0.0/24
- 192.168.1.0/24
- 192.168.2.0/24
- 172.20.10.0/24
- 192.168.43.0/24

When investigating a managed network that uses a common subnet, you'll need to use the Second Reflexive Local IP dimension to group subnets. This dimension contains the endpoint's public IP address.

Reliability investigations

The first step to improving quality is to assess the state of reliability across the organization. Because reliability is vital to a positive user experience, we start with the two components that measure reliability:

1. **Setup failures:** The call couldn't be established.

2. **Drop failures:** The call was established and unexpectedly terminated.

Throughout this section, we'll cover methods to investigate both areas.

NOTE

Not all reports included in the templates are covered in this article. However, the methods of investigation explained below still apply. Please refer to the individual report description for more information.

Setup failures

Prioritize remediating setup failures in this area first, because these failures have a significant negative impact on the user experience.

Begin your investigation by assessing the percentage of overall setup failures for the organization, and then prioritize areas of investigation based on the highest percentage by building or network.

Setup failure trend analysis

This report displays the total amount of streams, stream setup failures, and the stream setup failure rate. Point to any one of the columns to display its individual values.

Analysis

By using this report, you can answer the following questions and determine your next course of action:

- What is the total call setup failure percentage for the current month?
- Is the total call setup failure percentage below or above the defined target metric?
- Is the failure trend worse or better than the previous month?
- Is the failure trend increasing, steady, or decreasing?

Irrespective of your answers to these questions, take the time to investigate further by using the companion sub-reports to look for any individual buildings or subnets that might need remediation. Although the overall failure rate might be below the target metric, the failure rates for one or more buildings or networks might be above the target metric and need investigation.

Setup failure investigations

This summary report is used to discover and isolate any buildings or networks that might need remediation.

NOTE

Be sure to adjust the Month Year report filter to the current month. Select **Edit**, and adjust the **Month Year** report filter to save the new default month.

Remediation

Focus your first remediation efforts on buildings or subnets that have the largest volume of failures. This will maximize impact on the user experience and help to quickly reduce the rate of organizational call setup failures. The following table lists the two reasons for setup failures as reported by CQD.

CALL SETUP FAILURES REASON	TYPICAL CAUSE
Missing FW Deep Packet Inspection Exemption Rule	Indicates that network equipment along the path prevented the media path from being established due to deep packet inspection rules. This is likely due to firewall rules not being correctly configured. In this scenario, the TCP handshake succeeded but the SSL handshake didn't.

CALL SETUP FAILURES REASON	TYPICAL CAUSE
Missing FW IP Block Exception Rule	Indicates that network equipment along the path prevented the media path from being established to the Microsoft 365 or Office 365 network. This might be due to proxy or firewall rules not being correctly configured to allow access to IP addresses and ports used for Teams and Skype for Business traffic.

As you begin your remediation, you can focus your efforts on a particular building or subnet. As the preceding table shows, these issues are due to firewall or proxy configurations. Review the options in the following table for remediation actions.

REMEDIATION	GUIDANCE
Configure firewalls	<p>Work with your network team and verify your firewalls configuration against the Office 365 IP address list.</p> <p>Verify that the media subnets and ports are included in the firewall rules.</p> <p>Verify that the necessary ports are opened in the firewall. UDP should be given priority because TCP is considered a fallback protocol for audio, video, and video-based screen sharing, and its use will affect the quality of the call. Legacy RDP application sharing uses TCP only.</p>

Drop failures

Unlike setup failure codes, CQD has no drop failure code to indicate why drop failures occur, which makes it difficult to isolate a specific root cause. To better triage drop failures, use an inferred approach. By remediating any areas of interest for media, patching clients and drivers, and driving usage of certified devices for Teams and Skype for Business, you can expect drop failures to decline.

Drop failure trend analysis

This report displays the total amount of audio streams, total drop failures, and the drop failure rate. Point to any one of the columns to display its values.

Analysis

By using this type of report, you can answer the following questions:

- What is the current drop failure rate?
- Is the drop failure rate below the defined target metric?
- Is the failure trend worse or better than the previous month?
- Is the failure trend increasing, steady, or decreasing?

Irrespective of the answers to the questions above, take the time to investigate using the sub-reports to look for any buildings or networks that might need remediation. Although the overall drop failure rate might be below the target metric, the drop failure rate for one or more buildings or networks might be above the target metric and need investigation.

Drop failure investigations

Failures reported here indicate that the call was dropped unexpectedly and resulted in a negative user experience. Unlike the trending reports, these reports provide additional insights into specific subnets that need further investigation.

Remediation

Using the included table reports, you can isolate problem areas in the network where the drop rate is above the target metric you've defined. Focus your first remediation efforts on buildings or subnets that have the highest

total stream count, to make the biggest impact.

Common causes of call drops:

- Under-provisioned network or internet egress
- No QoS configured on constrained networks
- Older client versions
- User behavior

After you discover your problem areas, you can use [per-user call analytics](#) to further review users in that building for specific issues. Call analytics contains additional EUII data and can be useful for further isolating potential reasons for the drop failures.

Regardless of your next step, it's a good practice to notify your helpdesk that an issue has been discovered with specific buildings or subnets. This lets the helpdesk quickly respond to incoming calls and triage users more efficiently. Flagged users can then be reported back to the engineering team for further investigation.

The following table lists some common methods to manage and remediate drop failures.

REMEDIATION	GUIDANCE
Network/internet	<p>Congestion: Work with your network team to monitor bandwidth at specific buildings/subnets to confirm that there are issues with overutilization. If you do confirm that there is network congestion, consider increasing bandwidth to that building or applying QoS. Use the included Quality Poor Stream summary reports to review the problem subnets for issues with jitter, latency, and packet loss, because these will often precede a dropped stream.</p> <p>QoS: If increasing bandwidth is impractical or cost-prohibitive, consider implementing QoS. This tool is very effective at managing congested traffic and can guarantee that media packets on the managed network are prioritized above non-media traffic. Alternatively, if there's no clear evidence that bandwidth is the culprit, consider these solutions:</p> <ul style="list-style-type: none">• Microsoft Teams QoS guidance <p>Perform a network readiness assessment: A network assessment provides details about expected bandwidth usage, how to cope with bandwidth and network changes, and recommended networking practices for Teams and Skype for Business. Using the preceding table as your source, you have a list of buildings or subnets that are excellent candidates for an assessment.</p> <ul style="list-style-type: none">• Prepare your organization's network for Teams
Clients (Skype for Business Online only)	<p>Some older Skype for Business clients have known, documented issues with media reliability. Review the Call Analytics reports from multiple affected users, or create a custom Client Version table report in CQD filtered to specific buildings or subnets with Total Call Dropped Failure % measure. This information will help you understand whether a relationship exists between call drops in that specific building and a specific version of the client.</p>

REMEDIATION	GUIDANCE
Devices	If devices are the culprit in call-quality problems, consider updating offending devices. Read Phones for Teams to learn more.
User behavior	If you determine that neither network, devices, or clients are the issue, consider developing a user adoption strategy to educate users how to best join and exit meetings. A smarter Teams and Skype for Business user will produce a better user experience for all participants in the meeting. For example, a user who puts their laptop to sleep (by closing the lid) without exiting the meeting will be classified as an unexpected call drop.

Quality investigations

The next step to assess the state of audio quality across the organization is to investigate Poor Stream Rate (PSR), TCP, and proxy usage. It's important to remember that CQD data doesn't provide you a specific root cause, but instead provides you with likely problem areas to begin a collaborative conversation with the appropriate teams for remediation activities.

NOTE

Not all reports included in the templates are covered in this article; however, the methods of investigation explained below will still apply for those reports. Refer to the individual report description for more information.

Quality

The PSR percentages are used to indicate whether the organization is meeting defined metric targets for a given focus area. It's important to note that even if the high-level percentages are within the defined target, individual subnets or buildings might not meet the defined targets and, therefore, need further investigation. For example, if the overall audio PSR percentage is 2 percent in April, which meets the sample target, individual buildings and subnets might still be having poor experiences, depending on the overall distribution of that 2 percent.

To assess the percentage of poor streams, use the quality reports. Various quality reports are provided to review metrics for overall, conferencing, two-party, PSTN calling, VPN, and meeting rooms. Monthly, weekly, and daily reports are provided to assist in this process. Weekly and daily reports are limited to the Managed Networks template to increase their effectiveness and reduce noise.

Quality trend analysis

Trending reports display quality information over time and are used to help identify and understand quality trends within each area of interest. As noted above, there are report trees included in the templates for investigating quality; conferencing, two-party, PSTN calling, VPN, and meeting rooms. For the purposes of analyzing quality, the investigative process is the same. However, we recommend that you start with conferencing first, because any improvements in conference quality will also positively affect all other areas.

NOTE

Investigating two-party, PSTN calling, and meeting rooms are similar to investigating conferencing. The focus is to isolate buildings or subnets that have the worst quality and identify the reason for the poor quality.

IMPORTANT

VPN-based reports are filtered by using the Second VPN dimension. This dimension requires that the VPN network adapter be properly registered as a Remote Access Adapter. VPN vendors don't reliably use this flag, and your mileage will vary depending on the VPN vendor deployed at your organization. Modify the [VPN](#) reports if needed by using the building or network name.

Investigation

By using these reports, you can answer the following questions:

- What is the total PSR for the current month?
- Is the PSR below the defined target metric?
- Is PSR worse or better than the previous month?
- Is the PSR trend increasing, steady, or decreasing?

Irrespective of the answers to the questions above, take the time to investigate by using the sub-reports to look for any buildings or subnets that might need investigation. Although the overall PSR might be below the target metric, often the PSR for one or more buildings or networks is above the metric and needs remediation.

Quality investigations

The quality summary reports give you deeper insight into what contributed to the streams' being classified as poor and helps to isolate problem areas in the managed network.

Although the dimensions used might differ slightly between report, each report will include measures for total streams, total poor streams, PSR, and poor quality due to. Reports have been created for each area of interest: conferencing, two-party, PSTN calling, VPN, and meeting rooms. The Managed Network template includes additional reports to take advantage of the location information uploaded via the building file.

NOTE

Common subnets are difficult to triage due to their widespread use. A separate report that displays the client's public IP (Second Reflexive Local IP) has been added to the All Networks template to assist with remediating offices that use common networks.

Poor Audio Stream Summary by City, Building, Network and Subnet - Conferencing

Summary of managed conference audio streams. Sub-reports add additional dimensions and measures to help identify subnets for further investigation. The report is filtered to display subnets where PSR > 3%.

2018-04					2678	74	3.158	31	3	43

Remediation

Focus your remediation efforts on buildings or subnets that have the largest volume of streams, because this will maximize impact and help to improve the user experience quickly. Use the jitter, packet loss, and round-trip time (RTT) measurements to understand what's contributing to the poor quality (it's possible for there to be more than one problem):

- **Jitter:** Media packets are arriving at different speeds, which causes a speaker to sound robotic.
- **Packet loss:** Media packets are being dropped, which creates the effect of missing words or syllables.
- **RTT:** Media packets are taking a long time to get to their destination, which creates a walkie-talkie effect.

To assist your investigation into quality issues, use [per-user call analytics](#). With Call Analytics, you can look at a specific conference or user's call report. This report will contain EUII/PII data and is useful when you're looking for the cause of a failure. After you know which building is affected, it should be straightforward to track down users in that building.

Don't forget to let your helpdesk know that these networks are experiencing quality issues, so they can quickly triage and respond to incoming calls.

REMEDIATION	GUIDANCE
Networks	<p>Congestion: An overused or under-provisioned network can cause issues with media quality. Work with the network team to determine whether the network connections from the user to the internet egress point has enough bandwidth to support media.</p> <p>Perform a network readiness assessment: A network assessment provides details about expected bandwidth usage, how to cope with bandwidth and network changes, and recommended networking practices for Teams and Skype for Business. Using the preceding table as your source, you have a list of buildings or subnets that are excellent candidates for an assessment.</p> <ul style="list-style-type: none">• Prepare your organization's network for Teams
Quality of Service (QoS)	<p>QoS is a proven tool to help prioritize packets on a congested network to ensure they arrive at their destination intact and on time. Consider implementing QoS across your organization to maximize the quality of the user experience where bandwidth is constrained. QoS will help solve issues typically associated with high levels of packet loss, and—to a lesser degree—jitter and round-trip times.</p> <ul style="list-style-type: none">• Teams QoS guidance

REMEDIATION	GUIDANCE
Wi-Fi	<p>Wi-Fi can have a significant impact on call quality. Wi-Fi deployments don't typically take into consideration the network requirements for VoIP services and are often a source of poor quality. For more information about optimizing your Wi-Fi infrastructure, see this article about Wi-Fi planning.</p> <p>Wireless driver: Ensure that wireless drivers are up to date. This will help mitigate any poor user experience related to an outdated driver. Many organizations don't include wireless drivers in their patch cycles, and these drivers can go unpatched for years. Many wireless issues are solved by ensuring the wireless drivers are up to date.</p> <p>WMM: Wireless Multimedia Extensions (WMM), also known as Wi-Fi Multimedia, provides basic QoS features to wireless networks. Modern wireless networks must support many devices. These devices compete for bandwidth and can lead to quality issues for VoIP services, where speed and latency are vital. Consult your wireless vendor for specifics and consider implementing WMM on your wireless network to prioritize Skype for Business and Teams media.</p> <p>Access point density: Access points might be too far apart or not in an ideal location. To minimize potential interference, place extra access points in conference rooms and in locations that aren't obstructed by walls or other objects where the Wi-Fi signal is weak.</p> <p>2.4 GHz versus 5 GHz: 5 GHz provides less background interference and higher speeds, and should be prioritized when deploying VoIP over Wi-Fi. However, 5 GHz isn't as strong as 2.4 GHz and doesn't penetrate walls as easily. Review your building layout to determine which frequency you can rely on for the best connection.</p>
Network device	Larger organizations might have hundreds of devices spread out across the network. Work with your network team to ensure that the network devices from the user to the internet are maintained and up to date.
VPN	VPN appliances aren't traditionally designed to handle real-time media workloads. Some VPN configurations prohibit the use of UDP (which is the preferred protocol for media) and rely on TCP only. Consider implementing a VPN split-tunnel solution to help reduce VPN as a source of poor quality.
Clients (Skype for Business Online only)	Ensure all clients are being regularly updated.
Devices	If devices are the culprit in call-quality problems, consider updating offending devices. Read Phones for Teams to learn more.
Drivers	Patching network (Ethernet and Wi-Fi), audio, video, and USB drivers should be part of your overall patch management strategy. Many quality issues are solved by updating drivers.

REMEDIATION	GUIDANCE
Meeting rooms on Wi-Fi	<p>We highly recommend that meeting room devices be connected to the network by using at least a 1-Gbps Ethernet connection. Meeting room devices typically include multiple audio and video streams, along with meeting content such as screen sharing, and have higher network requirements than other Teams or Skype for Business endpoints. Meeting rooms are, by definition, stationary devices where Wi-Fi affords a benefit only during installation.</p> <p>Meeting rooms need to be treated with extra care and attention to ensure that the experience using these devices is meeting or exceeding expectations. Quality issues with meeting rooms are usually going to be escalated quickly, because they're often used by senior-level staff.</p> <p>With all things being equal (apart from convenience), Wi-Fi performance is often less than a wired connection. With the rise of "bring your own device" policies and the proliferation of laptops, Wi-Fi access points are often over-utilized. Real-time media might not be prioritized on Wi-Fi networks, which can lead to quality issues during peak use times. This heavy usage can coincide with a meeting where there might be a dozen people in attendance, each with their own laptop and smartphone, all connected to the same Wi-Fi access point as the meeting room device.</p> <p>Wi-Fi should only be considered as a temporary solution, for a mobile installation, or when Wi-Fi has been properly provisioned to support business-class, real-time-based media.</p>

TCP

Transmission Control Protocol (TCP) is considered a fallback transport and not the primary transport you want for real-time media. The reason it's a fallback transport is due to the stateful nature of TCP. For example, if a call is made on a latent network and media packets are delayed, then packets from a few seconds ago—which are no longer useful—compete for bandwidth to get to the receiver, which can make a bad situation worse. This makes the audio healer stitch and stretch audio, resulting in audible artifacts, often in the form of jitter.

The reports in this section don't make a distinction between good and poor streams. Given that UDP is preferred, the reports look for the use of TCP for audio, video, and video-based screen sharing (VBSS). Poor stream rates are provided to help compare UDP quality versus TCP quality so that you can focus your efforts where the impact is the greatest. TCP usage is primarily caused by incomplete firewall rules. For more information about firewall rules for Teams and Skype for Business Online, see [Microsoft 365 and Office 365 URLs and IP address ranges](#).

NOTE

Audio, video, and VBSS all prefer UDP as their primary transport. The legacy RDP Application Sharing workload only uses TCP.

TCP usage

TCP reports indicates the overall TCP usage over the last seven months. All further reports in this section will focus on narrowing down specific buildings and subnets where TCP is most commonly used. Separate reports are available for both conferencing and two-party streams.

TCP Usage

This report indicates the amount of TCP used on the managed network for UDP based (audio, video & VBSS) media conference streams. It is strongly recommended to use UDP wherever possible. High TCP usage typically indicates a network device configuration issue, typically a firewall. Sub-reports will provide specifics to assist in investigating further.

Edit Clone ...

Investigation

By using this report, you can answer the following questions:

- What is the total volume of TCP streams for the current month?
- Is it worse or better than the previous month?
- Is the TCP usage trend increasing, steady, or decreasing?
- Is the TCP PSR the same as my overall PSR?

If you notice that the TCP usage trend is increasing or above normal monthly usage, take the time to investigate by using the sub-reports to look for any buildings or networks that might need remediation. Ideally, you want as few TCP-based audio sessions as possible on the managed network.

TCP vs. UDP

This report identifies the volume of TCP versus UDP usage reporting on the latest month for audio, video, and video-based screen sharing (VBSS).

Edit Clone Add Sub-Report ...

Show 10 entries

Transport	Month	Audio Streams	Audio PSR (%)	Video Streams	Video PSR (%)	VBSS Streams	VBSS PSR (%)
Filter Transport	Filter Month	Filter Au	Filter Au	Filter Vic	Filter Vic	Filter VB	Filter VB
UDP	2018-05	 1,782,305	 1.092	 176,666	 7.088	 371,770	 7.212
TCP	2018-05	 21,469	 5.162	 968	 7.541	 4,151	 37.05

Analysis

Although you want TCP usage to be as low as possible, you might see a bit of TCP usage in an otherwise healthy deployment. TCP by itself won't contribute to a poor call, so stream rates are provided to help identify whether TCP usage is a contributor to poor quality.

TCP investigations

In the provided CQD templates, navigate to the TCP Streams by Building and Subnet reports by using either the Managed Networks or All Networks template. For the purpose of investigating TCP usage, the process is the same, so we'll focus the discussion here on conferencing.

Remediation

This report identifies specific buildings and subnets that are contributing to the volume of TCP usage. An additional report is also included to identify the Microsoft Relay IP that was used in the call to help isolate missing firewall rules. Focus your remediation efforts on those buildings that have the highest volume of TCP streams to maximize impact.

The most common cause of TCP usage is missing exception rules in firewalls or proxies. We'll be talking about proxies in the next section, so for now focus your efforts on the firewalls. By using the building or subnet provided, you can determine which firewall needs to be updated.

REMEDIATION	GUIDANCE
Configure firewall	Verify that Microsoft 365 or Office 365 IP ports and addresses are excluded from your firewall. For media-related TCP issues, focus your initial efforts on the following: <ul style="list-style-type: none">Verify that the client media subnets 13.107.64.0/18 and 52.112.0.0/14 are in your firewall rules.UDP ports 3478–3481 are the required media ports and must be opened, otherwise the client will fail back to TCP port 443.
Verify	Use the Microsoft Network Assessment Tool to check for issues with connectivity to specific Microsoft 365 or Office 365 IP addresses and ports from the affected building or subnet.

HTTP proxy

HTTP proxies aren't the preferred path for establishing media sessions, for a multitude of reasons. Many contain deep packet inspection features that can prevent connections to the service from being completed and

introduce disruptions. Additionally, almost all proxies force TCP as opposed to allowing UDP, which is recommended for optimal audio quality.

We always recommend that you configure the client to directly connect to Teams and Skype for Business services. This is especially important for media-based traffic.

IMPORTANT

We recommend that you upload a [valid building file](#) so you can distinguish inside from outside audio streams when analyzing proxy usage.

HTTP proxy usage

The HTTP proxy stream report in this section of the template is much like the TCP reports. It doesn't look at whether calls are poor or good, but whether the call is connected over HTTP.

HTTP Proxy Usage

This report indicates the overall amount of conferencing media streams traversing through an HTTP Proxy. It is strongly recommended to allow media to make a direct connection wherever possible. Navigate to <https://aka.ms/o365proxies> for more information.

Edit Clone ...

Analysis

You want to see as few HTTP media streams as possible. If you have streams traversing your proxy, consult your networking team to ensure that the proper exclusions are in place so that clients are directly routing to Teams or Skype for Business Online media subnets.

If you have only one internet proxy in your organization, verify the proper [Microsoft 365 or Office 365 URLs](#) and [IP address range exclusions](#). If more than one internet proxy is configured in your organization, use the HTTP sub-report to isolate which building or subnet is affected.

For organizations that can't bypass the proxy, ensure that the Skype for Business client is configured to sign in properly when it's located behind a proxy, as outlined in the article [Skype for Business should use proxy server to sign in instead of trying direct connection](#).

HTTP proxy investigations

This report identifies specific buildings and subnets that are contributing to HTTP usage.

Remediation

We [recommend](#) that you always bypass proxies for Skype for Business and Teams, especially media traffic. Proxies don't make Skype for Business more secure, because its traffic is already encrypted. Performance-related problems can be introduced to the environment through latency and packet loss. Issues such as these will result in a negative experience with audio, video and screen sharing, where real-time streams are essential.

The most common cause of HTTP usage is missing exception rules in proxies. By using the building or subnet provided, you can quickly determine which proxy needs to be configured for media bypass.

Verify that the required [Microsoft 365 or Office 365 FQDNs](#) are added to an allowlist in your proxy.

Endpoint investigations

This section is focused on the tasks for reporting on client versions and the use of certified devices. Reports are available to outline usage for client versions, client type, capture devices and drivers (microphone), video capture devices, and Wi-Fi vendor and driver versions.

NOTE

Not all reports included in the templates are covered in this article; however, the methods of investigation explained below still apply. Refer to the individual report description for more information.

Client versions

These reports focus on identifying Skype for Business client versions in use and their relative volume in the environment.

IMPORTANT

Currently, Teams clients are distributed and updated automatically through the Azure Content Delivery Network and will be kept up to date by the service. As a result, you don't need to monitor Teams client versions (unless you turn off the auto updating, which we don't recommend).

Unless you exclude federated participant data, these reports will include client telemetry from federated endpoints. To exclude federated endpoints, you must add a query filter for Second Tenant ID set to your organization's [tenant ID](#). Alternatively, you can use a [URL filter](#) to exclude federated participant telemetry.

Remediation

A critical part of driving high-quality user experiences is ensuring that managed clients are running up-to-date versions of Skype for Business, in addition to ensuring the supporting audio, video, network, and USB drivers are up to date. This provides several benefits, among them:

- It's easier to manage a few versions versus many versions.
- It provides a level of consistency of experience.
- It makes it easier to troubleshoot problems with call quality and usability.
- Microsoft continually makes general improvements and optimizations across the product. Ensuring that users receive these updates reduces their risk of running into a problem that has already been solved.

Limiting your deployment to client versions that are less than six months old will improve the overall user

experience and improve manageability by reducing the number of versions that need to be supported.

If you're using only Office Click-to-Run, you'll automatically be within the six-month window. No further action is required.

If you have a mix of Click-to-Run and installer packages (MSI), you can use the report to verify that the MSI clients are being updated regularly. If you notice clients are falling behind, work with the team responsible for managing Office updates and ensure that they're approving and deploying client patches regularly.

It's also important to consider and ensure that the network, video, USB, and audio drivers are being patched as well. It can be easy to overlook these drivers and not include them in your patch management strategy.

Version numbers for Skype for Business can be found via the links below:

- [Release information for updates to Microsoft 365 Apps](#)
- [Update history for Microsoft 365 Apps for enterprise](#)
- [Skype for Business downloads and updates](#)

Devices

To make use of the microphone device report, we need to understand the concept of the mean opinion score (MOS). MOS is the gold-standard measurement to gauge the perceived audio quality. It's represented as an integer rating from 0 to 5.

The basis of all measures of voice quality is how a person perceives the quality of speech. Because it's affected by human perception, it's inherently subjective. There are several different methodologies for subjective testing. Most voice quality measures are based on an absolute categorization rating (ACR) scale.

In an ACR subjective test, a statistically significant number of people rate their quality of experience on a scale of 1 (bad) to 5 (excellent). The average of the scores is the MOS. The resulting MOS depends on the range of experiences that were exposed to the group and to the type of experience being rated.

Because it's impractical to conduct subjective tests of voice quality for a live communication system, Microsoft Teams and Skype for Business generate MOS values by using advanced algorithms to objectively predict the results of a subjective test.

The available set of MOS and associated metrics provide a view into the quality of the experience being delivered to the users by an audio device.

By supplying users with devices certified for Teams and Skype for Business, you reduce the likelihood of encountering negative experiences due to the device itself (which is more likely, for example, with built-in laptop speakers and microphones). For more information, see these articles on the [certification program](#) and the [partner solutions catalog](#).

The device reports are used to assess device usage by volume and MOS score (audio only), and can be found in the accompanying templates under Clients & Devices.

IMPORTANT

Unless you exclude federated participant data, these reports will include client telemetry from federated endpoints. To exclude federated endpoints, you must add a query filter for **Second Tenant ID** set to your organization's [tenant ID](#). Alternatively, you can use a [URL filter](#) to exclude federated participant telemetry.

NOTE

You might notice when viewing this report that you see the same device reported multiple times. This is due to the way the device is reported being reported to CQD. Differences in hardware and OS locale cause differences in how device data is reported.

Remediation

Typically, you'll need to discover and phase out non-certified devices and replace them with certified devices. Some considerations when reviewing the device reports include:

- Are the devices in use certified for Teams and Skype for Business?
- You can identify users of a specific device by using [per-user call analytics](#). Check to make sure they have the latest device drivers and that their device isn't connected through a USB hub or docking station.
- How many different versions of various drivers are in use? Are they being patched regularly? Ensuring that audio, video, and Wi-Fi drivers are being patched regularly will help eliminate these as a source of quality issues and make the user experience more predictable and consistent.

Audio

The next task is to determine the overall usage of [certified audio devices](#). We recommend that at least 80 percent of all audio streams use a certified audio device. This is best accomplished by exporting the microphone devices report to Excel to calculate the usage of certified or approved devices. Organizations typically keep a list of all approved devices, so filtering and sorting the data should be straightforward.

Video

Video drivers are important to keep updated as well. Ensuring that video cards are being regularly patched will help exclude video drivers as a source of poor quality for video streams. Using [certified video devices](#) will help ensure a smooth and high-quality user experience. Video devices that support H.264 native encoding are preferred, to reduce CPU usage during video conferencing.

Wi-Fi

Wi-Fi drivers also need to be patched on a regular cadence as well and should be included in your patch management strategy. Many quality issues can be corrected by maintaining up-to-date Wi-Fi drivers. For more information about optimizing your Wi-Fi infrastructure, see [this article about Wi-Fi planning](#).

[Why do my custom reports only return a maximum of 10,000 rows when I know there should be more entries?](#)

[Why do Wi-Fi VPN connections show as Wired instead of Wi-Fi?](#)

Why does CQD mark a call as "Good" if one or more meeting participants had a poor experience?

Check out the rules CQD uses for [stream classification](#).

For audio streams, any of the five classifiers, which are calculated for the average based on the length of the call, could all be within "good" parameters. It doesn't mean the users didn't experience something that contributed to an audio drop out, static, or glitch.

To determine if it was a network problem, look at the delta between the average values for the session and the max values. Max values are the maximum detected and reported during the session.

Here's an example of how to troubleshoot this situation. Let's say you take a network trace during a call and the first 20 minutes there are no lost packets but then you have a gap of 1.5 seconds of packets and then good for the remainder of the call. The average is going to be <10% (0.1) Packet loss even in a Wireshark trace RTP analysis. What was the Max Packet Loss? 1.5 Seconds in a 5-second period would be 30% (0.3). Did that occur within the 5-second sampling period (maybe or it could be split over the sampling period)?

If network metrics look good in the averages and max values, then look to other telemetry data:

- Check CPU Insufficient Event Ratio to see if the detected CPU resources available were insufficient and caused poor quality.
- Was the audio device in Half Duplex mode to prevent feedback due to microphones that are too close to speakers?
- Check the Device Half Duplex AEC Event Ratio. Was the device glitching or the microphone glitching introducing noise or static due to USB Audio Drop outs when plugged into a Hub or Docking Station?
- Check the Device Glitches and Microphone glitches event ratios. Was the device itself functioning properly?
- Check the Capture and Render Device Not Functioning Event Ratios.

For more on dimensions and measures available in CQD telemetry, read [Dimensions and measurements available in Call Quality Dashboard](#).

For background noise, check mute event ratio to see the length of time participants were muted.

Create detailed reports in CQD and filter on Meeting ID to look at all users and streams in a meeting and add the fields you are interested in. A user reporting the issue may not be the one that was having the issue. They are

just reporting the experience.

The telemetry will not necessarily call out the issue, but it can help you better understand where to look and inform your decisions. Is it network, device, driver or firmware updates, usage, or user?

Why do I see up to 0.2% difference in call and user count values on measures and how to get most accurate volumes?

To compute call count and user count measures, a distinct countif operation is performed against the call or user identifiers in the data set. On large data sets, there is an up to 0.2% error inherent with the distinct countif operation. For the most accurate volume, you should rely on stream count measures since they do not rely on this distinct countif operation. Filtering to reduce the data volume may reduce the error but may not eliminate this source of error in distinct call and user counts. Refer to [Dimensions and measurements available in Call Quality Dashboard](#) for which measures are impacted.

Why can't I see EUUI in CQD?

These admin roles can access CQD, but they can't view EUUI (end-user identifiable information):

- Microsoft 365 Reports Reader
- Teams Communications Support Specialist

To learn more about roles that can access CQD - including EUUI - read [Assign roles for accessing CQD](#).

Why am I seeing Skype for Business information in CQD when I've filtered for Teams only?

When you filter for Teams only in CQD reports (isTeams = 1), you're filtering for all calls where the *first endpoint* is Teams. If the *second endpoint* is Skype for Business, that information will show up in your CQD report.

CQDv2 and CQDv3 will always have different total counts since CQDv3 will have new scenarios that CQDv2 will not have. That's why comparing Summary Total or Aggregated all-up numbers with no filters will have these expected differences.

Depending on Customers' scenario, CQDv3 will include SFB 2019 on-premises calls (if SFB 2019 is used with a data connector), Skype Bot calls (AA, CVI, VDI), Live Events, and PSTN calls. Scenarios/Features that are available for the customers, but their data are not in CQD V2.

For instance, it is expected that your customers and you will see 200,000 audio streams, with 5000 failures in CQD V2 Summary Report, versus 300,000 audio streams with 5500 failures (coming from 2019 on-prem calls, CVI calls, PSTN calls, and so on) in CQD V3.

In order to determine, if there are any unexpected differences, you must look at various breakdowns of the overall data. Compare with intent. Slicing the data by User Agent Category Pair is one of the first things we recommend. *First Product* and *Second Product* are also good slicers.

Why do my custom reports only return a maximum of 10,000 rows when I know there should be more entries?

CQD is designed for summarized data queries, and is not designed for data export. We recommend restructuring your reports, where possible, to prevent the 10,000 row limit from being exceeded. Start by looking at your KPIs using broader, lower-cardinality dimensions, such as Month, Year, Date, Region, Country, etc. From there, you can drill down into increasingly higher-cardinality dimensions. The Helpdesk and Location-Enhanced Reports both provide good examples of this drill down workflow.

Why do Wi-Fi VPN connections show as Wired instead of Wi-Fi?

This is expected. The VPN vendor created a virtual ethernet adapter that is treated like a wired connection. Since it's not properly labeled, the operating system doesn't know it's a WiFi connection and reports it as wired.

Dimensions and measurements available in Call Quality Dashboard (CQD)

12/7/2021 • 116 minutes to read • [Edit Online](#)

The Call Quality Dashboard (CQD) for Microsoft Teams and Skype for Business Online allows you to better understand call quality of calls made with these services. This topic provides detailed information about the dimensions and measurements visible through CQD. To learn more about CQD, see [Use CQD to manage call and meeting quality in Microsoft Teams](#).

First and Second endpoint classification

Many of the dimensions and measurements in CQD are labeled as first or second. The following logic determines which endpoint involved in the stream or call is labeled as first:

- A Server endpoint (AV MCU, Mediation Server, and so on) is considered First when a Server is involved in the stream or call.
- A Client endpoint is considered Second unless the stream is between two Server endpoints.
- If both endpoints are the same type, first vs. second is set based on internal ordering of the user agent category to ensure that the ordering is consistent.

For example, here each row represents a pair of User Agents involved in a stream:

USER AGENT CATEGORY OF CALLER	USER AGENT CATEGORY OF CALLEE	FIRST ENDPOINT	SECOND ENDPOINT	FIRST IS CALLER
AV-MCU	OC (Skype for Business client)	AV-MCU	OC (Skype for Business client)	TRUE
OC (Skype for Business client)	AV-MCU	AV-MCU	OC (Skype for Business client)	FALSE
OC (Skype for Business client)	OC (Skype for Business client)	OC (Skype for Business client)	OC (Skype for Business client)	FALSE
AV-MCU	Mediation Server	Mediation Server	AV-MCU	
Mediation Server	AV-MCU	Mediation Server	AV-MCU	TRUE
OC (Skype for Business client)	OC Phone (Skype for Business IP Phone)	OC (Skype for Business client)	OC Phone (Skype for Business IP Phone)	TRUE
OC Phone (Skype for Business IP Phone)	OC (Skype for Business client)	OC (Skype for Business client)	OC Phone (Skype for Business IP Phone)	FALSE

NOTE

That First and Second classification is separate from which endpoint is the caller or callee. The First Is Caller dimension can be used to help identify which endpoint was the caller or callee.

Dimensions

Dimensions information is based in part on data uploaded to the CQD portal. Many Dimension values can also be used as filters. The following table lists the dimensions currently available in CQD, in the order listed in the Query Editor used to create reports or edit previously defined reports.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Endpoint			
First CPU Name	String	Name of the CPU used by the first endpoint. Example value: Contoso CPU X11 @ 1.80 GHz	<ul style="list-style-type: none">• This data was not reported by the endpoint
Second CPU Name	String	Name of the CPU used by the second endpoint. Example value: Contoso CPU X11 @ 1.80 GHz	<ul style="list-style-type: none">• This data was not reported by the endpoint
First CPU Number Of Cores	Number of cores	Number of CPU cores available on the first endpoint. Example value: 8	<ul style="list-style-type: none">• This data was not reported by the endpoint

Building			
First Network	String	Subnet used for media stream by the first endpoint if the subnet exists in subnet to tenant building data. Example value: 10.0.1.12.0	<ul style="list-style-type: none"> • Network data was not reported by the endpoint • Network is not defined in subnet-mapping data.
First Network Name	String	Name of network used for media stream by first endpoint. Based on mapping subnet to tenant building data. Example value: USA/WA/REDMOND	<ul style="list-style-type: none"> • Network data was not reported by the endpoint • Network is not defined in subnet-mapping data
First Network Range	String	Network prefix/range of the subnet used for the media stream by the first endpoint, based on data-mapping subnet to tenant building. Example value: 24	<ul style="list-style-type: none"> • Network data was not reported by the endpoint • Network is not defined in subnet-mapping data
First Building Name	String	Name of the building where the first endpoint was located based on mapping subnet to tenant building data. Example value: Main	<ul style="list-style-type: none"> • Network data was not reported by the endpoint • Network is not defined in subnet-mapping data
First Ownership Type	String	Ownership type of the building where the first endpoint was located. Based on mapping subnet to tenant building data. Example value: Contoso-IT	<ul style="list-style-type: none"> • Network data was not reported by the endpoint • Network is not within the corporate network or network ownership is not defined in subnet-mapping data

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Building Type	String	Type of building where the first endpoint was located based on mapping subnet to tenant building data. Example value: Open Office	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network building type is not defined in subnet-mapping data
First Building Office Type	String	Type of building where the first endpoint was located based on mapping subnet to tenant building data. Example value: Open Office	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network building type is not defined in subnet-mapping data
First City	String	City where the first endpoint was located based on mapping subnet to tenant building data. Example value: Redmond	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a city defined in subnet-mapping data
First Zip Code	String	Zip/Postal code where the first endpoint was located based on mapping subnet to tenant building data. Example value: 98052	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a zip code defined in subnet-mapping data
First Country	String	Country where the first endpoint was located based on mapping subnet to tenant building data. Example value: USA	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a country defined in subnet-mapping data
First State	String	State where the first endpoint was located based on mapping subnet to tenant building data. Example value: WA	<ul style="list-style-type: none"> • Network data was not reported by the endpoint • Network is not within corporate network • Network does not have a State defined in subnet-mapping data.
First Region	String	Region where the first endpoint was located based on mapping subnet to tenant building data. Example value: North America	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a region defined in subnet-mapping data.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Express Route	Boolean	True if the subnet used for the media stream by the first endpoint is enabled for Azure ExpressRoute, based on mapping subnet to tenant building data. You can customize usage for other purposes if you decide to.	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have an ExpressRoute flag set in subnet-mapping data.
First Network Mapped VPN	Boolean	True if the subnet used for the media stream by the first endpoint is a VPN subnet, based on mapping subnet to tenant building data.	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a VPN flag set in subnet-mapping data.
Second Network	String	Subnet used for media stream by second endpoint if subnet exists in subnet to tenant building data. Example value: 10.0.1.12.0	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not defined in subnet-mapping data
Second Network Name	String	Name of the network used for the media stream by the second endpoint, based on mapping subnet to tenant building data. Example value: USA/ WA/ REDMOND	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network does not have a network name defined in subnet-mapping data
Second Network Range	String	Network prefix/range of the subnet used for the media stream by the second endpoint, based on mapping subnet to tenant building data. Example value: 24	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network does not have a network range defined in subnet-mapping data
Second Building Name	String	Name of the building where the second endpoint was located based on mapping subnet to tenant building data. Example value: Main	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a building name defined in subnet-mapping data
Second Ownership Type	String	Ownership type of building where the second endpoint was located based on mapping subnet to tenant building data. Example value: Contoso — IT	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have ownership defined in subnet-mapping data

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Building Type	String	Type of building where the second endpoint was located based on mapping subnet to tenant building data. Example value: Open Office	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network building type is not defined in subnet-mapping data
Second Building Office Type	String	Office building type where the second endpoint was located based on mapping subnet to tenant building data. Example value: Office	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a building office type defined in subnet-mapping data.
Second City	String	City where the second endpoint was located based on mapping subnet to tenant building data. Example value: Redmond	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a city defined in subnet-mapping data
Second Zip Code	String	Zip/Postal code where the second endpoint was located based on mapping subnet to tenant building data. Example value: 98052	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a zip code defined in subnet-mapping data
Second Country	String	Country where the second endpoint was located based on mapping subnet to tenant building data. Example value: USA	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have country defined in subnet-mapping data
Second State	String	State where the second endpoint was located based on mapping subnet to tenant building data. Example value: WA	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a state defined in subnet-mapping data

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Region	String	Region where the second endpoint was located based on mapping subnet to tenant building data. Example value: North America	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have region defined in subnet-mapping data.
Second Express Route	Boolean	True if the subnet used for the media stream by the second endpoint is enabled for ExpressRoute, based on mapping subnet to tenant building data.	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have an ExpressRoute flag set in subnet-mapping data
Second Network Mapped VPN	Boolean	True if the subnet used for the media stream by the second endpoint is a VPN subnet, based on mapping subnet to tenant building data.	<ul style="list-style-type: none"> • Network data not reported by the endpoint • Network is not within corporate network • Network does not have a VPN flag set in subnet-mapping data.
First Inside Corp	Enumeration Possible values: Inside, Outside	Indicates if the first endpoint was on a subnet within the corporate network, based on mapping subnet to tenant building data. By default, the endpoint is considered Outside. Example value: Inside	
Second Inside Corp	Enumeration Possible values: Inside, Outside	Indicates if the second endpoint was on a subnet within the corporate network, based on mapping subnet to tenant building data. By default, the endpoint is considered Outside. Example value: Inside	
Deployment			
First Tenant Id	String	Tenant ID for the first endpoint. Example value: 00000000 — 0000 -0000 - 0000 — 000000000000	<ul style="list-style-type: none"> • Tenant id for the first endpoint could not be determined. This may indicate that the endpoint was signed in to an on-premise Skype for Business Server deployment.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Tenant Id	String	Tenant ID for the second endpoint. Example value: 00000000 — 0000 - 0000 - 0000 — 000000000000	<ul style="list-style-type: none"> • Tenant id for the second endpoint could not be determined. This may indicate that the endpoint was signed in to an on-premise Skype for Business Server deployment.
First Pool	String	Skype for Business Online pool FQDN assigned to the first endpoint. Example value: pool1.lync.com	<ul style="list-style-type: none"> • Indicates that the endpoint was signed in to a Microsoft Teams or Skype for Business. This field will only be populated for streams using on-premise Skype for Business Server deployments.
Second Pool	String	Skype for Business Online pool FQDN assigned to the second endpoint. Example value: pool1.lync.com	<ul style="list-style-type: none"> • Skype for Business Online pool could not be determined for the second endpoint. This may indicate that the endpoint was signed in to an on-premise Skype for Business Server deployment.
Is Federated	Boolean	True if streams were between two federated tenants, False otherwise.	<ul style="list-style-type: none"> • It could not be determined if this was a federated stream • Some signaling data was not collected
Region	String	Region where the deployment was located based on the home region of the tenant. Example value: North America	<ul style="list-style-type: none"> • Network data not reported • Network is not within corporate network • Network does not have region defined in subnet-mapping data.
Stream			
QoE Record Available	Boolean	True if at least one Quality of Experience report was available for call/session. Many dimensions and measurements are available only if a QoE record was available. If the call setup fails, a QoE record will not be available.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
CDR Record Available	Boolean	True if at least one Call Detail Records was available for call/session.	
Media Line Label	Integer	Label in SDP for media line. Use Media Type to determine if label is used for video, audio, app sharing, or video based screen sharing. Example value: 0	<ul style="list-style-type: none"> This data was not reported by the endpoint.
Media Type	String	Type of media (video, audio, app sharing, or video based screen sharing). Example value: Audio	
Media Line Label Text	String	The Session Description Protocol (SDP) Label Attribute of the media line corresponding to the stream. See RFC 4574 for more detailed info. Example values: main-audio main-video main-video1 main-video2 main-video3 main-video4 main-video5 main-video6 main-video7 main-video8 main-video9 panoramic-video applicationsharing-video data	
First Is Server	Enumeration Possible values: <ul style="list-style-type: none"> Client Server 	Indicates if the first endpoint is a server endpoint such as a conferencing server (AVMCU, ASMCU) or other media servers (Mediation Server), or is a client endpoint. Example value: Client	
Second Is Server	Enumeration Possible values: <ul style="list-style-type: none"> Client Server 	Indicates if the second endpoint is a server endpoint, or is a client endpoint. Example value: Client	
First Is Caller	Boolean	True if the first endpoint was the caller who initiated the session.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Network Connection Detail	Enumeration Possible values: <ul style="list-style-type: none"> • Wired • WiFi • MobileBB • Tunnel • Other 	Type of network used by the first endpoint. Example value: Wired	<ul style="list-style-type: none"> • Data was not reported by the endpoint
Second Network Connection Detail	Enumeration Possible values: <ul style="list-style-type: none"> • Wired • WiFi • MobileBB • Tunnel • Other 	Type of network used by the second endpoint. Example value: Wired	<ul style="list-style-type: none"> • Data was not reported by the endpoint
Stream Direction	Enumeration Possible values: <ul style="list-style-type: none"> • First-to-Second • Second-to-First 	Indicates the direction of a stream. <ul style="list-style-type: none"> • Example value: First-to-Second 	<ul style="list-style-type: none"> • No data was reported to indicate the direction of the stream
Payload Description	String	Name of last codec used in the stream. Example value: SILKWide	<ul style="list-style-type: none"> • No data is available
Audio and Video Call	Boolean	True if call had both audio and video streams, False otherwise	<ul style="list-style-type: none"> • No data was reported to indicate the media types of the stream.
Duration 5 seconds or less	Boolean	True if stream had duration of 5 seconds or less, False otherwise.	
Duration 60 seconds or more	Boolean	True if stream had duration of 60 seconds or more, False otherwise.	
Is Teams	Boolean	True indicates that the first or second user agent for the stream is a Microsoft Teams endpoint. False indicates that the user agents are Skype for Business endpoints.	
Duration (Minutes)	Range (minutes)	Duration of stream in minutes. Values grouped by range. Example value: 065: [3–4)	
Duration (Seconds)	Range (seconds)	Duration of stream in seconds. Values grouped by range. Example value: 062: [1 -2)	
Date			

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
End Time	String	Time of day the call ended.	<ul style="list-style-type: none"> Call setup failed or was not established (see CDR Response Reason)
Year	Integer	Year of the end of the stream. Values are reported in the UTC time zone. Example value: 2018	
Month	Integer	Month of the end of the stream. Values are reported in the UTC time zone. Example value: 2	
Day	Integer	Day of the end of the stream. Values are reported in the UTC time zone. Example value: 1	
Date	String	Date the stream ended. Values are reported in the UTC time zone. Example value: 2018-06-01	
Hour	Integer	Hour of the end of the stream. Values are reported in the UTC time zone. Example value: 1	
Minute	Integer	Minute of the end of the stream. Values are reported in the UTC time zone. Example value: 30	
Second	Integer	Second of the end of the stream. Values are reported in the UTC time zone. Example value: 12	
Day Of Year	Integer	Day of year of the end of the stream. Values are reported in the UTC time zone. Example value: 32	
Day Of Week	String	Day of week of the end of the stream. Values are reported in the UTC time zone. Example value: Wednesday	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Day Number Of Week	Integer	Day number of week of the end of the stream. Values are reported in the UTC time zone. Example value: 3	
Week	String	Starting date of the week in which the call took place. Example value: 2019-09-01	<ul style="list-style-type: none"> • Call setup failed or was not established (see CDR Response Reason)
Month Year	String	Month and year of the end of the stream. Values are reported in the UTC time zone. Example value: 2017-02	
Full Month	Date time	Full Month of the end of the stream. Values are reported in the UTC time zone. Example value: 2017-02-01T00:00:00	
Start time	String	Time of day the call started.	<ul style="list-style-type: none"> • Call setup failed or was not established (see CDR Response Reason)
UserAgent			
First Domain	String	Domain of the first endpoint's user. If the first endpoint is a conference server, it uses the domain of the organizer of the meeting. May also be the domain of service accounts used in scenario. Example value: contoso.com	
Second Domain	String	Domain of the second endpoint's user. If the second endpoint is a conference server, it uses the domain of the organizer of the meeting. May also be the domain of service accounts used in scenario. Example value: contoso.com	
First User Agent Category	String	Category of the user agent of the first endpoint. Example value: OC	<ul style="list-style-type: none"> • A user agent does not currently have a mapping

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second User Agent Category	String	Category of the user agent of the second endpoint. Example value: OC	<ul style="list-style-type: none"> A user agent does not currently have a mapping
First User Agent	String	User agent string of the first endpoint. Example value: UCCAPI/16.0.7766.5281 OC/16.0.7766.2047 (Skype for Business)	<ul style="list-style-type: none"> No user agent reported by first endpoint
Second User Agent	String	User agent string of the second endpoint. Example value: UCCAPI/16.0.7766.5281 OC/16.0.7766.2047 (Skype for Business)	<ul style="list-style-type: none"> No user agent was reported by second endpoint
Conference Type	Enumeration Possible values: <ul style="list-style-type: none"> conf:applicationsharing conf:audio-video conf:focus 	Type of conference URI. Example value: conf:audio-video	<ul style="list-style-type: none"> Non-conference scenario.
Conference ID	String	Conference ID (or Call ID) associated with the streams. In <code>cqd.teams.microsoft.com</code> , all calls have a call ID regardless of whether they are a person-to-person (P2P) call or a conference call. This dimension may have too many rows to be used as dimension in a report. It can be used a filter instead. Example value (<code>cqd.teams.microsoft.com</code>): 5a962ccf-b9cb-436a-a433-f28bf5404ad8	
First Client App Version	String	Version of the application used for the first endpoint. Data is parsed from the user agent string. Example value: 16.0.7766.2047	<ul style="list-style-type: none"> The version string could not be parsed The value was not reported.
Second Client App Version	String	Version of the application used for the second endpoint. Data is parsed from the user agent string. Example value: 16.0.7766.2047	<ul style="list-style-type: none"> The version string could not be parsed The value was not reported.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Meeting Id	String	The identifier for the meeting, generated when the meeting was created. Example value: 19:meeting_MzB...zlw@thre ad.v2	
Network			
Transport	Enumeration Possible values: <ul style="list-style-type: none"> • UDP • TCP • Unrecognized 	Network transport type used by stream. Unrecognized indicates that the system could not determine if the transport type was TCP or UDP.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First Connectivity Ice	Enumeration Possible values: <ul style="list-style-type: none"> • DIRECT= Direct network path • RELAY = through relay • HTTP = through HTTP proxy • FAILED = connectivity failed 	ICE connectivity type used by the first endpoint.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second Connectivity Ice	Enumeration Possible values: <ul style="list-style-type: none"> • DIRECT= Direct network path • RELAY = through relay • HTTP = through HTTP proxy • FAILED = connectivity failed 	ICE connectivity type used by the second endpoint.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First IP Address	String	IP address for first endpoint. Note this dimension may have too many rows to be used as dimension in a report. It can be used as a filter instead. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second IP Address	String	IP address for second endpoint. Note: This dimension may have too many rows to be used as dimension in a report. It can be used as a filter instead. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Link Speed	Integer	Link speed in bits per second reported by the network adapter used by the first endpoint. Example value: 10000000	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second Link Speed	Integer	Link speed in bits per second reported by the network adapter used by the second endpoint. Example value: 10000000	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First Port	Port number	Network port number used by first endpoint for media. Example value: 50018	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second Port	Port number	Network port number used by second endpoint for media. Example value: 50018	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First Reflexive Local IP	String	IP address of first endpoint as seen by the media relay server. This is typically the public internet IP address associated to the first endpoint for the stream. Example value: 104.43.195.251	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second Reflexive Local IP	String	IP address of second endpoint as seen by the media relay server. This is typically the public internet IP address associated to the second endpoint for the stream. Example value: 104.43.195.251	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First Relay IP	String	IP address of the media relay server allocated by the first endpoint. Example value: 104.43.195.251	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second Relay IP	String	IP address of the media relay server allocated by the second endpoint. Example value: 104.43.195.251	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First Relay Port	Integer	Media port allocated on the media relay server by the first endpoint. Example value: 3478	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Relay Port	Integer	Media port allocated on the media relay server by the second endpoint. Example value: 3478	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First Subnet	String	Subnet used for media stream by first endpoint with dashes separating each octet. Example value: 104.43.195.0	<ul style="list-style-type: none"> • Data not reported by the endpoint • Media path was not established • IPv6 was used
Second Subnet	String	Subnet used for media stream by second endpoint with dashes separating each octet. Example value: 104.43.195.0	<ul style="list-style-type: none"> • Data not reported by the endpoint • Media path was not established • IPv6 was used
First VPN	Boolean	True if the network adapter used by first endpoint indicated it was a VPN connection, False otherwise. Some VPN's do not correctly report this data correctly.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second VPN	Boolean	True if the network adapter used by second endpoint indicated it was a VPN connection, False otherwise. Some VPN's do not correctly report this data correctly.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Applied Bandwidth Source	Enumeration Possible values: <ul style="list-style-type: none"> • Static Max • API Modality • API Modality_All • API SendSide BWLimit • Preference Value • TURN • ReceiveSide TURN • API SDP Modality • Remote Received • Side BWLimit • API ServiceQuality • API SDP • Receive SidePDP 	Identifies the source of bandwidth applied to the stream.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Bandwidth Est	Integer Range	Average estimated bandwidth available between first and second endpoint in bits per second. Example value: 026: [260000 - 270000)	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Mediation Server Bypass Flag	Boolean	True if the media stream bypassed the Mediation Server and went straight between client and PSTN Gateway/PBX, False otherwise.	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First CDR Connectivity Type	Enumeration Possible values: <ul style="list-style-type: none"> • OS • PeerDerived • Stun • Turn 	Identifies the ICE connectivity path selected by the first endpoint for use for this stream. Example value: OS	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
Second CDR Connectivity Type	Enumeration Possible values: <ul style="list-style-type: none"> • OS • PeerDerived • Stun • Turn 	Identifies the ICE connectivity path selected by the second endpoint for use for this stream. Example value: OS	<ul style="list-style-type: none"> • Transport type was not reported • The media path was not established
First BSSID	String	The Wireless LAN basic service set identifier of the First endpoint used to connect to the network.	
Second BSSID	String	The Wireless LAN basic service set identifier of the Second endpoint used to connect to the network.	
First Base Address	String	IP address of the interface that the first endpoint used for allocating media relay candidates. Only available for the past 28 days of data and only visible to users with roles allowing EUH access. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
Second Base Address	String	IP address of the interface that the second endpoint used for allocating media relay candidates. Only available for the past 28 days of data and only visible to users with roles allowing EUH access. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Local Address	String	IP address that the first endpoint used for media flow at the end of media connectivity checks. Only available for the past 28 days of data and only visible to users with roles allowing EUH access. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
Second Local Address	String	IP address that the second endpoint used for media flow at the end of media connectivity checks. Only available for the past 28 days of data and only visible to users with roles allowing EUH access. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
First Local Address Type	Enumeration Possible Values <ul style="list-style-type: none"> •IceAddrType_Os •IceAddrType_Stun •IceAddrType_Turn •IceAddrType_UPnP •IceAddrType_ISA_Proxy •IceAddrType_PeerDerived •IceAddrType_Invalid 	The candidate type of First Local Address. IceAddrType_Turn indicates a relayed call. The rest of the types indicate direct connections.	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
Second Local Address Type	Enumeration Possible Values <ul style="list-style-type: none"> •IceAddrType_Os •IceAddrType_Stun •IceAddrType_Turn •IceAddrType_UPnP •IceAddrType_ISA_Proxy •IceAddrType_PeerDerived •IceAddrType_Invalid 	The candidate type of Second Local Address. IceAddrType_Turn indicates a relayed call. The rest of the types indicate direct connections.	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
First Remote Address	String	IP Address of the second endpoint to which the first endpoint will send media to at the end of media connectivity checks. Only available for the past 28 days of data and only visible to users with roles allowing EUH access. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Remote Address	String	IP Address of the first endpoint to which the second endpoint will send media to at the end of media connectivity checks. Only available for the past 28 days of data and only visible to users with roles allowing EUH access. Example value: 10.0.0.10	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
First Remote Address Type	Enumeration Possible Values <ul style="list-style-type: none"> •IceAddrType_Os •IceAddrType_Stun •IceAddrType_Turn •IceAddrType_UPnP •IceAddrType_ISA_Proxy •IceAddrType_PeerDerived •IceAddrType_Invalid 	Candidate type of First Remote Address. IceAddrType_Turn indicates a relayed call. The rest of the values indicate direct connections.	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
Second Remote Address Type	Enumeration Possible Values <ul style="list-style-type: none"> •IceAddrType_Os •IceAddrType_Stun •IceAddrType_Turn •IceAddrType_UPnP •IceAddrType_ISA_Proxy •IceAddrType_PeerDerived •IceAddrType_Invalid 	Candidate type of Second Remote Address. NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Reflexive Local IP Network	String	IP subnet (/24) of first endpoint as seen by the media relay server. This is typically the subnet of the public internet IP address associated to the first endpoint for the stream. Example value: 52.114.5.0	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
Second Reflexive Local IP Network	String	IP subnet (/24) of second endpoint as seen by the media relay server. This is typically the subnet of the public internet IP address associated to the second endpoint for the stream. Example value: 52.114.5.0	<ul style="list-style-type: none"> • Transport Diagnostic type was not reported • The media path was not established
First VPN Estimated	Boolean	Indicates high probability of a connection over a Virtual Private Network (VPN). Possible values: 0 or 1	
Second VPN Estimated	Boolean	Indicates high probability of a connection over a Virtual Private Network (VPN). Possible values: 0 or 1	
First Roaming Count	Range (Integer)	Indicates number of times the first endpoint performed a lightweight reconnect mid-call where signaling was not involved. An example of this is when an endpoint switches wireless access points on the same network. Example value: 064: [1 - 2)	
Second Roaming Count	Range (Integer)	Indicates number of times the second endpoint performed a lightweight reconnect mid-call where signaling was not involved. An example of this is when an endpoint switches wireless access points on the same network. Example value: 064: [1 - 2)	
Device			

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Capture Dev	String	<p>Name of the capture device used by the first endpoint. For:</p> <p>Audio streams = device used for the microphone Video streams = device used for the camera Video-based-screen-sharing streams = screen scraper App sharing streams = blank Example value: Headset Microphone (Microsoft LifeChat LX-6000)</p>	<ul style="list-style-type: none"> • The data was not reported by the endpoint • The media path was not established • The stream was video-based screen sharing or application sharing.
Second Capture Dev	String	<p>Name of the capture device used by the second endpoint. For:</p> <p>Audio streams = device used for the microphone Video streams = device used for the camera Video-based-screen-sharing streams = screen scraper App sharing streams = blank Example value: Headset Microphone (Microsoft LifeChat LX-6000)</p>	<ul style="list-style-type: none"> • Data was not reported by the endpoint • Media path was not established • The stream was video-based screen sharing or application sharing
First Capture Dev Driver	String	<p>Name of the capture device driver used by the first endpoint in the form of "manufacturer : version". For:</p> <p>Audio streams = driver used for the microphone Video streams = driver used for the camera Video-based-screen-sharing and app sharing streams = blank Example value: Microsoft: 10.0.14393.0</p>	<ul style="list-style-type: none"> • Data was not reported by the endpoint • The media path was not established • The stream was video-based screen sharing or application sharing.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Capture Dev Driver	String	<p>Name of the capture device driver used by the second endpoint in the form of "manufacturer : version". For:</p> <p>Audio streams = driver used for the microphone Video streams = driver used for the camera Video-based-screen-sharing and app sharing streams = blank Example value: Microsoft: 10.0.14393.0</p>	<ul style="list-style-type: none"> • Data was not reported by the endpoint • The media path was not established • The stream was video-based screen sharing or application sharing.
First Render Dev	String	<p>Name of the render device used by the first endpoint. For:</p> <p>Audio streams - device used for the speaker Video and video-based-screen-sharing streams - device used for the display App sharing streams - blank Example value: Headset Earphone (Microsoft LifeChat LX-6000)</p>	<ul style="list-style-type: none"> • This data not reported by the endpoint • The media path was not established • The stream was application sharing
Second Render Dev	String	<p>Name of the render device used by the second endpoint. For:</p> <p>Audio streams - device used for the speaker Video and video-based-screen-sharing streams - device used for the display App sharing streams - blank Example value: Headset Earphone (Microsoft LifeChat LX-6000)</p>	<ul style="list-style-type: none"> • This data was not reported by the endpoint, • Media path was not established • The stream was application sharing

For:</p> <p>Audio streams - driver used for the speaker Video and video-based-screen-sharing streams - driver used for the display App sharing streams - blank Example value: Microsoft: 10.0.14393.0</p>	<ul style="list-style-type: none"> • This data was not reported by the endpoint • Media path was not established • The stream was application sharing

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Render Dev Driver	String	Name of the render device driver used by the second endpoint. For: Audio streams - driver used for the speaker Video and video-based-screen-sharing streams - driver used for the display App sharing streams - blank Example value: Microsoft: 10.0.14393.0	<ul style="list-style-type: none"> • This data was not reported by the endpoint • Media path was not established • The stream was application sharing
WiFi			
First Wi-Fi Microsoft Driver	String	Name of Microsoft WiFi driver used reported by the first endpoint. Value may be localized based on the language used by endpoint. Example value: Microsoft Hosted Network Virtual Adapter	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
Second Wi-Fi Microsoft Driver	String	Name of Microsoft WiFi driver used reported by the second endpoint. Value may be localized based on the language used by endpoint. Example value: Microsoft Hosted Network Virtual Adapter	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
First Wi-Fi Vendor Driver	String	Vendor and name of WiFi driver reported by the first endpoint. Example value: Contoso Dual Band Wireless-AC Driver	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
Second Wi-Fi Vendor Driver	String	Vendor and name of WiFi driver reported by the second endpoint. Example value: Contoso Dual Band Wireless-AC Driver	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
First Wi-Fi Microsoft Driver Version	String	Version of Microsoft WiFi driver reported by the first endpoint. Example value: Microsoft:10.0.14393.0	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Wi-Fi Microsoft Driver Version	String	Version of Microsoft WiFi driver reported by the second endpoint. Example value: Microsoft:10.0.14393.0	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
First Wi-Fi Vendor Driver Version	String	Vendor and version of WiFi driver reported by the first endpoint. Example value: Contoso:15.1.1.0	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
Second Wi-Fi Vendor Driver Version	String	Vendor and version of WiFi driver reported by the second endpoint. Example value: Contoso:15.1.1.0	<ul style="list-style-type: none"> • WiFi wasn't used by the endpoint • The driver information was not reported
First Wi-Fi Channel	String	WiFi channel used by the first endpoint. Example value: 10	<ul style="list-style-type: none"> • WiFi was not used • The channel was not reported
Second Wi-Fi Channel	String	WiFi channel used by the second endpoint. Example value: 10	<ul style="list-style-type: none"> • WiFi was not used • The channel was not reported
First Wi-Fi Radio Type	String	Type of WiFi radio used by the first endpoint. HRDSSS is equivalent to 802.11b. Example value: 802.11ac	<ul style="list-style-type: none"> • WiFi was not used • The WiFi type was not reported
Second Wi-Fi Radio Type	String	Type of WiFi radio used by the second endpoint. HRDSSS is equivalent to 802.11b. Example value: 802.11ac	<ul style="list-style-type: none"> • WiFi was not used • The WiFi type was not reported
First DNS Suffix	String	DNS suffix associated with the network adapter reported by the first endpoint. Note this value may be reported for any type of network adapter. Example value: corp.contoso.com	<ul style="list-style-type: none"> • This value was not reported by the endpoint
Second DNS Suffix	String	DNS suffix associated with the network adapter reported by the second endpoint. Note this value may be reported for any type of network adapter. Example value: corp.contoso.com	<ul style="list-style-type: none"> • This value was not reported by the endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Wi-Fi Band	String	WiFi band used as reported by the first endpoint. Example value: 5.0 Ghz	<ul style="list-style-type: none"> • The value was not computed by the endpoint • The value was not reported
Second Wi-Fi Band	String	WiFi band used as reported by the second endpoint. Example value: 5.0 Ghz	<ul style="list-style-type: none"> • The value was not computed by the endpoint • The value was not reported
First Wi-Fi Signal Strength	String	WiFi signal strength in percentage [0-100] reported by the first endpoint. Example value: 081: [90 - 100)	<ul style="list-style-type: none"> • The value was not computed by the endpoint • The value was not reported
Second Wi-Fi Signal Strength	String	WiFi signal strength in percentage [0-100] reported by the second endpoint. Example value: 081: [90 - 100)	<ul style="list-style-type: none"> • The value was not computed by the endpoint • The value was not reported
First Wi-Fi Battery Charge	Range (percentage)	Estimated remaining battery charge in percentage [0-99] reported by the first endpoint. Values grouped by range. 0 indicates that the device was plugged in. Example value: 081: [90 - 100)	<ul style="list-style-type: none"> • WiFi was not used • The charge value was not reported
Second Wi-Fi Battery Charge	Range (percentage)	Estimated remaining battery charge in percentage [0-99] reported by the second endpoint. Values grouped by range. 0 indicates that the device was plugged in. Example value: 081: [90 - 100)	<ul style="list-style-type: none"> • WiFi was not used • The charge value was not reported
Metrics			

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Audio Degradation Avg	Range (Mean opinion score 0-5)	Average Network Mean Opinion Score degradation for stream. Represents how much the network loss and jitter have impacted the quality of received audio. Not for use with SATIN or WebRTC/VDI. Values grouped by range. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> • No network MOS degradation was reported by the endpoint receiving the stream • The stream is not an audio stream.
Jitter	Range (millisecond)	Average jitter for stream in milliseconds. Values grouped by range. Example value: 065: [2 - 3)	<ul style="list-style-type: none"> • No jitter data was reported by the endpoint receiving the stream
Jitter Max	Range (millisecond)	Maximum jitter for stream in milliseconds. Values grouped by range. Example value: 065: [2 - 3)	<ul style="list-style-type: none"> • No jitter data was reported by the endpoint receiving the stream
Packet Loss Rate	Range (ratio)	Average packet loss rate for stream. Values grouped by range. 0.1 indicates 10% packet loss. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> • No packet loss data was reported by the endpoint receiving the stream
Packet Loss Rate Max	Range (ratio)	Maximum packet loss rate for stream. Values grouped by range. 0.1 indicates 10% packet loss. Example value: 023: [0.09 - 0.1)	<ul style="list-style-type: none"> • No packet loss data was reported by the endpoint receiving the stream • Packet utilization for a given stream is less than 100 packets
Send Listen MOS	Range (MOS)	Average MOS for stream. Values grouped by range. Example value: 076: [4.4 - 4.5)	<ul style="list-style-type: none"> • No MOS was reported by the endpoint receiving the stream • The stream is not an audio stream • Codec used does not report MOS
Overall Avg Network MOS	Range (MOS)	Average Network MOS for stream. Values grouped by range. Example value: 076: [4.4 - 4.5)	<ul style="list-style-type: none"> • No network MOS degradation was reported by the endpoint receiving the stream • The stream is not an audio stream • Codec used does not report MOS

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Ratio Concealed Samples Avg	Range (ratio)	Ratio of the number of audio frames with samples generated by packet loss concealment to the total number of audio frames. Values grouped by range. 0.1 indicates 10% of frames contained concealed samples. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> • This value was not reported by the receiver of the stream • The stream was not an audio stream
Conceal Ratio Max	Range (ratio)	The maximum seen number of audio frames with samples generated by packet loss concealment to the total number of audio frames. Values grouped by range. 0.1 indicates 10% of frames contained concealed samples. Example value: 015: [0.01 - 0.02)	
Ratio Stretched Samples Avg	Range (ratio)	Ratio of the number of audio frames with samples that have been stretched to compensate for jitter or loss to the total number of audio frames. Values grouped by range. 0.1 indicates 10% audio frames contained stretched samples. Example value: 017: [0.03 - 0.04)	<ul style="list-style-type: none"> • This value was not reported by the receiver of the stream • The stream was not an audio stream
Healer Packet Drop Ratio	Range (ratio)	Ratio of audio packets dropped by healer over total number of audio packets received by healer. See 2.2.1.12.1 Child Elements for more information.	
Healer FEC Packet Used Ratio	Range (ratio)	Ratio of used Forward Error Correction (FEC) packets over total number of received FEC packets. See 2.2.1.12.1 Child Elements for more information.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Round Trip	Range (milliseconds)	Average network propagation round-trip time computed as specified in RFC3550 in milliseconds. Values grouped by range. Example value: 070: [15 - 20)	<ul style="list-style-type: none"> • The value was not computed by the endpoint • The value was not reported
Round Trip Max	Range (milliseconds)	Maximum network propagation round-trip time computed as specified in RFC3550 in milliseconds. Values grouped by range. Example value: 098: [350 - 375)	<ul style="list-style-type: none"> • The value was not computed by the endpoint • The value was not reported
Packet Utilization	Number (Packets)	Number of Real-Time Transport Protocol (RTP) packets sent in the session.	
Jitter Buffer Size Avg	Number (Range)	Average size of jitter buffer during session.	
Jitter Buffer Size Max	Number (Range)	Maximum size of jitter buffer during session.	
Jitter Buffer Size Min	Number (Range)	Minimum size of jitter buffer during session.	
Relative OneWay Gap Duration	Duration of gaps in the relative one way delay of the peer.		
Audio Post FECPLR	Number	Reports packet loss rate after FEC has been applied for audio. Value between 0.00 and 1.00.	
Network Jitter Avg	Range (milliseconds)	Average of network jitter in milliseconds computed over 20 second windows during the session. Values grouped by range. Example value: 066: [3–4)	<ul style="list-style-type: none"> • The stream was not an audio stream • Data was not reported by the endpoint receiving the stream
Network Jitter Max	Number of events	Maximum of network jitter computed over 20 second windows during the session.	
Network Jitter Min	Number of events	Minimum of network jitter computed over 20 second window during the session.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Video Post FECPLR	Range (ratio)	Packet loss rate after FEC has been applied for aggregated across all video streams and codecs. Values grouped by range. Example value: 014: [0 - 0.01)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream
Video Local Frame Loss Percentage Avg	Range (percentage)	Average percentage of video frames lost as displayed to the user. Values grouped by range. This includes frames recovered from network losses. Example value: 160: [80 - 85)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream
Received Frame Rate Average	Range (frames per second)	Average frames per second received for all video streams computed over the duration of the session. Values grouped by range. Example value: 101: [14.5 - 15)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream
Low Frame Rate Call Percent	Range (percentage)	Percentage of time of the call where frame rate is less than 7.5 frames per second. Values grouped by range. Example value: 099: [13.5 - 14)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream
Video Packet Loss Rate	Range (ratio)	Average fraction of packets lost, as specified in RFC3550, computed over the duration of the session. Values grouped by range. Example value: 037: [0.75 - 0.8)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream
Video Frame Rate Avg	Range (frames per second)	Average frames per second received for a video stream, computed over the duration of the session. Values grouped by range. Example value: 135: [31.5 - 32)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream
Dynamic Capability Percent	Range (percentage)	Percentage of time that the client is running < 70% expected video processing capability for this type of CPU grouped by range Example value: 122: [25 - 25.5)	<ul style="list-style-type: none"> The stream was not a video or video-based-screen-sharing stream Data was not reported by the endpoint receiving the stream

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Spoiled Tile Percent Total	Range (percentage)	Percentage of tiles which are discarded instead of being sent to a remote peer (for example, from the MCU to a viewer). Values grouped by range. Discarded tiles may be caused by bandwidth restrictions between client and server. Example value: 140: [34 - 34.5)	<ul style="list-style-type: none"> • The stream was not an application sharing stream • The data was not reported by the endpoint sending the stream
AppSharing Relative OneWay Average	Range (seconds)	Average relative one-way delay between the endpoints in seconds for application sharing streams. Values grouped by range. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> • The stream was not an application sharing stream • The data was not reported by the endpoint sending the stream
AppSharing RDP Tile Processing Latency Average	Range (milliseconds)	Average latency in milliseconds processing tiles on the RDP Stack at the conferencing server. Values grouped by range. Example value: 103: [15.5 - 16)	<ul style="list-style-type: none"> • The stream was not an application sharing stream in a conference • The data was not reported by the endpoint sending the stream
First Network Delay Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the network delay was significant enough to impact the ability to have real-time two-way communication. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Network Delay Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the network delay was significant enough to impact the ability to have real-time two-way communication. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Network Bandwidth Low Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the available bandwidth or bandwidth policy was low enough to cause poor quality of the audio sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Network Bandwidth Low Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the available bandwidth or bandwidth policy was low enough to cause poor quality of the audio sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint
First Mic Glitch Rate	Number	Average glitches per 5 minutes for the microphone capture of the first endpoint. See 2.2.1.12.1 Child Elements for more information.	
Second Mic Glitch Rate	Number	Average glitches per 5 minutes for the microphone capture of the second endpoint. See 2.2.1.12.1 Child Elements for more information.	
First Speaker Glitch Rate	Number of events	Average glitches per 5 minutes for the first loudspeaker rendering.	
Second Speaker Glitch Rate	Number of events	Average glitches per 5 minutes for the second loudspeaker rendering.	
Audio			
Audio FEC Used	Boolean	True indicates that audio forward error correction (FEC) was used at some point during the call. False otherwise	<ul style="list-style-type: none"> • The stream was not an audio stream • The data was not reported by the endpoint sending the stream
First Audio Render Device In Use	String	Indicates which hardware device was used for playback of the audio stream on the first endpoint.	<ul style="list-style-type: none"> • The data was not reported by the endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Audio Render Device In Use	String	Indicates which hardware device was used for playback of the audio stream on the second endpoint.	<ul style="list-style-type: none"> The data was not reported by the endpoint
First Audio Capture Device In Use	String	Indicates which hardware device was used for capture of the audio stream on the first endpoint.	<ul style="list-style-type: none"> The data was not reported by the endpoint
Second Audio Capture Device In Use	String	Indicates which hardware device was used for capture of the audio stream on the second endpoint.	<ul style="list-style-type: none"> The data was not reported by the endpoint
Measure			
ClassifiedPoorCall	Boolean	True if one or more streams in the call were classified as poor based on the metrics listed in Stream Classification in Call Quality Dashboard .	<ul style="list-style-type: none"> The call did not have sufficient metrics reported to be classified as good or poor
Video Poor Due To VideoPostFecplr	Boolean	True if the stream was classified as poor based on the Video Post FEC PLR metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-video streams.	<ul style="list-style-type: none"> The endpoint did not report this data The stream was not a video stream.
Video Poor Due To VideoLocalFrameLossPercentageAvg	Boolean	True if the video stream was classified as poor based on the Video Local Frame Loss Percentage Avg metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-video streams.	<ul style="list-style-type: none"> The endpoint did not report this data The stream was not a video stream.
Video Poor Due To VideoFrameRateAvg	Boolean	True if the video stream was classified as poor based on the Video Frame Rate Avg metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-video streams.	<ul style="list-style-type: none"> The endpoint did not report this data The stream was not a video stream

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
VBSS Poor Due To VideoPostFecplr	Boolean	True if the video based-screen-sharing stream was classified as poor based on the Video Post FEC PLR metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-video based-screen-sharing streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not a video-based screen sharing stream
VBSS Poor Due To VideoLocalFrameLossPercentageAvg	Boolean	True if the video based-screen-sharing stream was classified as poor based on the Video Local Frame Loss Percentage Avg metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-video based-screen-sharing streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not a video-based screen sharing stream
Video Poor Due To Freeze	Boolean	1 if the video stream was classified as poor based on the Video Freeze instance : Stream Classification in Call Quality Dashboard	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not a video stream. This field is specific to Microsoft Teams only.
VBSS Poor Due To VideoFrameRateAvg	Boolean	True if the video based-screen-sharing stream was classified as poor based on the Video Frame Rate Avg metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-video based-screen-sharing streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not a video-based screen sharing stream
AppSharing Poor Due To SpoiledTilePercentTotal	Boolean	True if the application sharing stream was classified as poor based on the Spoiled Tile Percent Total metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-application sharing streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not an application sharing stream.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
AppSharing Poor Due To RelativeOneWayAverage	Boolean	True if the application sharing stream was classified as poor based on the Relative One Way Average metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-application sharing streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not an application sharing stream
AppSharing Poor Due To RDPTileProcessingLatencyAverage	Boolean	True if the application sharing stream was classified as poor based on the RDP Tile Processing Latency Average metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-application sharing streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not an application sharing stream

Will always be False for non-audio streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not an audio sharing stream
Audio Poor Due To RoundTrip	Boolean	True if the audio stream was classified as poor based on the Round Trip metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-audio streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not an audio sharing stream
Audio Poor Due To Packet Loss	Boolean	True if the audio stream was classified as poor based on the Packet Loss metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-audio streams.	<ul style="list-style-type: none"> • The endpoint did not report this data • The stream was not an audio sharing stream

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Audio Poor Due To Degradation	Boolean	True if the audio stream was classified as poor based on the Degradation metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-audio streams. Note: This has been deprecated in the classifier.	<ul style="list-style-type: none"> The endpoint did not report this data The stream was not an audio sharing stream
Audio Poor Due To Concealed Ratio	Boolean	True if the audio stream was classified as poor based on the Concealed Ratio metric threshold listed here: Stream Classification in Call Quality Dashboard . Will always be False for non-audio streams. Note: This has been deprecated in the classifier.	<ul style="list-style-type: none"> The endpoint did not report this data The stream was not an audio sharing stream
Poor Reason	Flags Possible values: <ul style="list-style-type: none"> Concealed Ratio Degradation Jitter Packet Loss Round Trip Video Frame Rate Avg Video Local Frame Loss Percentage Avg Video Post FEC PLR RDP Tile Processing Latency Average Relative OneWay Average Spoiled Tile Percent Total 	List of flags that identify why the stream was marked as poor. There may be multiple flags set since there may be multiple reasons why the stream was marked as Poor. Refer to Stream Classification in Call Quality Dashboard for details.	<ul style="list-style-type: none"> The stream was not classified as poor
Poor	Boolean	True if the stream has sufficient data to be classified as good or poor and stream is classified as poor. False otherwise.	
Good	Boolean	True if the stream has sufficient data to be classified as good or poor and stream is classified as good. False otherwise.	
Unclassified	Boolean	False if the stream has sufficient data to be classified as good or poor. True otherwise. Example value: 1	
OnePercent PacketLoss	Boolean	True if packet loss exceeded 1%, False otherwise.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Rating			
First Feedback Rating	User rating (1-5)	Rating of the call associated with the stream by the first endpoint on 1-5 scale (5 = excellent). 0 indicates the user was shown the call rating survey but did not rate their experience. Example value: 5	<ul style="list-style-type: none"> No survey was shown to the first endpoint
Second Feedback Rating	User rating (1-5)	Rating of the call associated with the stream by the second endpoint on 1-5 scale (5 = excellent). 0 indicates the user was shown the call rating survey but did not rate their experience. Example value: 5	<ul style="list-style-type: none"> No survey was shown to the second endpoint
First Feedback Tokens	String	String containing list of feedback tokens with boolean flag that indicates if token was set by the user providing feedback from the first endpoint. Example value: {DistortedSpeech:1; ElectronicFeedback:1; BackgroundNoise:1; MuffledSpeech:1; Echo:1;}	<ul style="list-style-type: none"> No feedback was provided by the user of the first endpoint
Second Feedback Tokens	String	String containing list of feedback tokens with boolean flag that indicates if token was set by the user providing feedback from the second endpoint. Example value: {DistortedSpeech:1; ElectronicFeedback:1; BackgroundNoise:1; MuffledSpeech:1; Echo:1;}	<ul style="list-style-type: none"> No feedback was provided by the user of the second endpoint
First Feedback Has Audio Issue	Boolean	True if feedback tokens from first endpoint indicate stream had an audio issue, false otherwise.	
Second Feedback Has Audio Issue	Boolean	True if feedback tokens from second endpoint indicate stream had an audio issue, False otherwise.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Feedback Has Video Issue	Boolean	True if feedback tokens from first endpoint indicate stream had a video issue, False otherwise.	
Second Feedback Has Video Issue	Boolean	True if feedback tokens from second endpoint indicate stream had a video issue, False otherwise.	
First Feedback Has AppSharing Issue	Boolean	True if feedback tokens from first endpoint indicate stream had an app sharing issue. False otherwise.	
Second Feedback Has Appsharing Issue	Boolean	True if feedback tokens from second endpoint indicate stream had an app sharing issue. False otherwise.	
Audio Signal			
First Echo Event Causes	Flags	<p>Flags that indicate the reasons the DeviceEchoEvent was raised on the first endpoint. There may be multiple flags for a single stream. Flags include:</p> <p>BAD_TIMESTAMP - audio sample timestamps from capture or render device used were poor quality</p> <p>POSTAEC_ECHO - high level of echo remained after echo cancellation</p> <p>MIC_CLIPPING - signal level from capture device had significant instances of maximum signal level</p> <p>EVENT_ANLP - audio samples from capture contain high noise.</p> <p>Example value: BAD_TIMESTAMP</p>	<ul style="list-style-type: none"> • This was a non-audio stream • No event causes were reported by the first endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Echo Event Causes	Flags	<p>Flags that indicate the reasons the DeviceEchoEvent was raised on the second endpoint. There may be multiple flags for a single stream. Flags include:</p> <p>BAD_TIMESTAMP - audio sample timestamps from capture or render device used were poor quality</p> <p>POSTAEC_ECHO - high level of echo remained after echo cancellation</p> <p>MIC_CLIPPING - signal level from capture device had significant instances of maximum signal level</p> <p>EVENT_ANLP - audio samples from capture contain high noise.</p> <p>Example value: BAD_TIMESTAMP</p>	<ul style="list-style-type: none"> • This was a non-audio stream • No event causes were reported by the first endpoint
First Echo Percent Mic In	Range (percentage)	<p>Percentage of time when echo is detected in the audio from the capture or microphone device prior to echo cancellation by the first endpoint. Values grouped by range.</p> <p>Example value: 068: [5 - 10)</p>	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Echo Percent Mic In	Range (percentage)	<p>Percentage of time when echo is detected in the audio from the capture or microphone device prior to echo cancellation by the second endpoint. Values grouped by range.</p> <p>Example value: 068: [5 - 10)</p>	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by second endpoint
First Echo Percent Send	Range (percentage)	<p>Percentage of time echo is detected in the audio after echo cancellation by the first endpoint. Values grouped by range.</p> <p>Example value: 068: [5 - 10)</p>	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Echo Percent Send	Range (percentage)	<p>Percentage of time echo is detected in the audio after echo cancellation by the second endpoint. Values grouped by range.</p> <p>Example value: 068: [5 - 10)</p>	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Send Signal Level	Range (dB decibels)	Average energy level of sent audio for audio classified as mono speech, or left channel of stereo speech by the first endpoint. Values grouped by range. Example value: 055: [-15 - -10)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Send Signal Level	Range (dB decibels)	Average energy level of sent audio for audio classified as mono speech, or left channel of stereo speech by the second endpoint. Values grouped by range. Example value: 055: [-15 - -10)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint
First Received Signal Level	Range (dB decibels)	Average energy level of received audio for audio classified as mono speech, or left channel of stereo speech by the first endpoint. Values grouped by range. Example value: 056: [-10 - -5)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Received Signal Level	Range (dB decibels)	Average energy level of received audio for audio classified as mono speech, or left channel of stereo speech by the second endpoint. Values grouped by range. Example value: 056: [-10 - -5)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint
First Send Noise Level	Range (dB decibels)	Average energy level of audio classified as mono noise or stereo left channel noise sent by the first endpoint. Values grouped by range. Example value: 048: [-50 - -45)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Send Noise Level	Range (dB decibels)	Average energy level of audio classified as mono noise or stereo left channel noise by the second endpoint. Values grouped by range. Example value: 048: [-50 - -45)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Received Noise Level	Range (dB decibels)	Average energy level of mono noise or stereo left channel noise received by the first endpoint. Values grouped by range. Example value: 048: [-50 - -45)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Received Noise Level	Range (dB decibels)	Average energy level of mono noise or stereo left channel noise received by the second endpoint. Values grouped by range. Example value: 048: [-50 - -45)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint
First Initial Signal Level RMS	Range (dB decibels)	The root-mean-square (RMS) of the received signal for the first 30 seconds of the call for the first endpoint. See 2.2.1.28.1 Child Elements	
Second Initial Signal Level RMS	Range (dB decibels)	The root-mean-square (RMS) of the received signal for the first 30 seconds of the call for the second endpoint. See 2.2.1.28.1 Child Elements for more information.	
First RxAGC Signal Level	Range (dB decibels)	Signal level received at the automatic gain control (AGC) for the first inbound audio stream.	
Second RxAGC Signal Level	Range (dB decibels)	Signal level received at the automatic gain control (AGC) for the second inbound audio stream.	
First RxAGC Noise Level	Range (dB decibels)	Noise level received at the automatic gain control (AGC) for the first inbound audio stream.	
Second RxAGC Noise Level	Range (dB decibels)	Noise level received at the automatic gain control (AGC) for the second inbound audio stream.	
First Render Loopback Signal Level	Range (dB decibels)	Loopback signal level for the first inbound audio stream.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Render Loopback Signal Level	Range (dB decibels)	Loopback signal level for the Second inbound audio stream.	
Client Event			
First Network Send Quality Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the network was causing poor quality of the audio sent. Values grouped by range. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the first endpoint
Second Network Send Quality Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the network was causing poor quality of the audio sent. Values grouped by range. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Network Receive Quality Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the network was causing poor quality of the audio received. Values grouped by range. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Network Receive Quality Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the network was causing poor quality of the audio received. Values grouped by range. Example value: 015: [0.01 - 0.02)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First CPU Insufficient Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the CPU resources available were insufficient and caused poor quality of the audio sent and received. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the first endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second CPU Insufficient Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the CPU resources available were insufficient and caused poor quality of the audio sent and received. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Half Duplex AEC Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected issues and operated the acoustic echo canceler in half-duplex mode, which impacted the ability to have real-time two-way communication. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Half Duplex AEC Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected issues and operated the acoustic echo canceler in half-duplex mode, which impacted the ability to have real-time two-way communication. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Render Not Functioning Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the render device was not working properly. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Render Not Functioning Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the render device was not working properly. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Capture Not Functioning Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected the capture device was not working properly. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Device Capture Not Functioning Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected the capture device was not working properly. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Glitches Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected as glitches or gaps that caused poor quality of the audio being sent or received. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Glitches Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected as glitches or gaps in the audio that caused poor quality of the audio being sent or received. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Low SNR Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected low speech to noise level that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the first endpoint
Second Device Low SNR Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected low speech to noise level that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Low Speech Level Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected low speech level that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Device Low Speech Level Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected low speech level that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Clipping Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected clipping in the captured audio that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the first endpoint
Second Device Clipping Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected clipping in the captured audio that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Echo Event Ratio	Range (ratio)	Fraction of the call that the first endpoint detected echo that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Echo Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected echo that caused poor quality of the audio being sent. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Near End To Echo Ratio Event Ratio	Range (ratio)	Fraction of the call where the first endpoint detected a ratio of near end signal to echo that caused poor quality audio. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Device Near End To Echo Ratio Event Ratio	Range (ratio)	Fraction of the call that the second endpoint detected a ratio of near end signal to echo level that caused poor quality audio. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Render Zero Volume Event Ratio	Range (ratio)	Fraction of the call that first endpoint detected device render volume is set to 0. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Render Zero Volume Event Ratio	Range (ratio)	Fraction of the call that second endpoint detected device render volume is set to 0. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Render Mute Event Ratio	Range (ratio)	Fraction of the call that first endpoint detected device render is muted. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Render Mute Event Ratio	Range (ratio)	Fraction of the call that second endpoint detected device render is muted. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint
First Device Multiple Endpoints Event Count	Range (ratio)	Number of times during the call that the first endpoint detected multiple endpoints in the same room or acoustic environment. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> This was a non-audio stream Data was not reported by first endpoint
Second Device Multiple Endpoints Event Count	Range (ratio)	Number of times during the call that the second endpoint detected multiple endpoints in the same room or acoustic environment. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> Indicates a non-audio stream Data was not reported by the second endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Device Howling Event Count	Range (ratio)	Number of times during the call that the first endpoint detected two or more endpoints in the same room that caused poor quality audio in the form of howling or screeching audio. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> • This was a non-audio stream • Data was not reported by first endpoint
Second Device Howling Event Count	Range (ratio)	Number of times during the call that the second endpoint detected two or more endpoints in the same room or acoustic environment that caused poor quality audio in the form of howling or screeching audio. Values grouped by range. Example value: 016: [0.02 - 0.03)	<ul style="list-style-type: none"> • Indicates a non-audio stream • Data was not reported by the second endpoint
Call Diagnostic			
Error Report Sender	String	Indicates which endpoint sent the call error report for the stream. This report contains additional telemetry and may indicate call setup or call drop issue with the call. Example value: First	<ul style="list-style-type: none"> • Indicates no call error report was received.
Is Media Error	String	Indicates if the call error report for the stream was a media level error or not. This report contains additional telemetry and may indicate call setup or call drop issue with the call.	<ul style="list-style-type: none"> • Indicates no call error report was received.
Media Failure Type	Enumeration Possible values: <ul style="list-style-type: none"> • Midcall • CallSetup • NotMediaFailure. 	The type of media failure associated with the stream. Note: "NotMediaFailure" does not indicate a non-media failure occurred, only that no media failures occurred.	<ul style="list-style-type: none"> • Indicates no call error report was received.
Call Classification	Enumeration	Reliability Classification assigned to the call. Possible values: Success, Failure, ClassificationUnavailable	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Classification Reason	String	Reason the classification was assigned to the stream.	
Test Call Type	Enumeration	<p>Indicates whether this call is a regular call or a test call. If it's a test call, this indicates the type of test call.</p> <p>Possible Values: NonTest, Silent, UserInitiated, Synthetic</p> <p>Meanings: NonTest – Regular Call Silent – Silent Test Call UserInitiated – User initiated test call Synthetic – ST endpoint-initiated call</p>	
Session			
RTP RTCP Mux	Boolean	True indicates that RTP and RTCP were multiplexed on the same ports. False otherwise.	<ul style="list-style-type: none"> • Data was not reported by the endpoint
Stun Version	Integer	Version of STUN protocol used for establishing the call.	<ul style="list-style-type: none"> • Data was not reported by the endpoint <p>Example value: 2</p>
Media Relay	String	<p>IP address for Media relay(s) used for the session. May report a pair of relay separated by a '+' if the stream.</p> <p>Example value: "13.107.8.2 + 13.107.8.2"</p>	<ul style="list-style-type: none"> • This data was not reported by the endpoints
Is Anonymous Join Session	Boolean	True if user joining conference was anonymous, False otherwise.	<ul style="list-style-type: none"> • No data to determine if user was joined anonymously or not
Has Media Diagnostic Blob	Boolean	True if session had media diagnostics data, False otherwise.	<ul style="list-style-type: none"> • Some signaling data was not collected for this stream

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Call Setup Failure Reason	Enumeration	<p>Classification of why media connection could not be established for a call.</p> <p>Possible values:</p> <p>Missing FW Deep Packet Inspection Exemption Rule - indicates that network equipment along the path likely prevented the media path from being established due to deep packet inspection rules. This may be due to proxy or firewall rules not being correctly configured.</p> <p>Missing FW IP Block Exemption Rule - indicates that network equipment along the path likely prevented the media path from being established to the Office 365 network. This may be due to proxy or firewall rules not being correctly configured to allow access to IP addresses and ports used for Skype for Business traffic.</p> <p>Other - indicates the media path for the call could not be established but the root cause could not be classified.</p> <p>Not Media Failure - indicates no issue was detected with the establishment of the media path.</p>	<ul style="list-style-type: none"> • Call set up failed due to an unknown media issue
Session Type	Enumeration Possible values: Conf, P2P	<p>Indicates if the call session type was a meeting (Conf) or peer-to-peer call (P2P) scenario.</p> <p>Example value: Conf</p>	
CDR Response Reason	Enumeration Possible values: 0 or 200 = "OK" 410 = "MediaConnectivityErrors" 480 = "UserUnavailable" 487 = "PickupTimedOut" 603 = "CallDeclined" All other CDR codes = "Other"	<p>Provides the reason for a call session concluding, whether the call was successful or not, and allows for differentiation between incomplete calls (no answer, busy, declined) and failed calls (media establishment).</p> <p>Example value: OK</p>	<ul style="list-style-type: none"> • A value of "Other" implies response code is not diagnostically useful outside of Microsoft's engineering teams
DNS			

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Used DNS Resolve Cache	Boolean	True if endpoint used DNS cache to resolve media relay address, False otherwise.	<ul style="list-style-type: none"> • This data was not reported by the endpoint
UserData			
First User ObjectID	String	The Active Directory object ID of the first endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	
Second User ObjectID	String	The Active Directory object ID of the second endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	
First MAC Address	String	The media access control (MAC) address of the first endpoint's network device. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	
Second MAC Address	String	The media access control (MAC) address of the second endpoint's network device. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	
First Sip Uri	String	The Session Initiation Protocol (SIP) URI of the first endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	<ul style="list-style-type: none"> • Populated only for Skype for Business endpoints. • User does not have permissions to view EUIL.
Second Sip Uri	String	The SIP URI of the first endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	<ul style="list-style-type: none"> • Populated only for Skype for Business endpoints. • User does not have permissions to view EUIL.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
First Phone Number	String	<p>The phone number of the first endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access. The last four digits of PSTN numbers are always obfuscated in CQD irrespective of EUIL viewing privileges.</p> <p>Example value: +1425555****</p>	<ul style="list-style-type: none"> • Populated only for PSTN endpoints. • User does not have permissions to view EUIL.
Second Phone Number	String	<p>The phone number of the second endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access. The last four digits of PSTN numbers are always obfuscated in CQD irrespective of EUIL viewing privileges.</p> <p>Example value: +1425555****</p>	<ul style="list-style-type: none"> • Populated only for PSTN endpoints. • User does not have permissions to view EUIL.
First UPN	String	The user principal name (UPN) of the first endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	<ul style="list-style-type: none"> • Not all UserTypes have UPNs; include the Second UserType or Second User ObjectId dimensions to learn more about these endpoints.
Second UPN	String	The user principal name (UPN) of the second endpoint's user. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	<ul style="list-style-type: none"> • Not all UserTypes have UPNs; include the Second UserType or Second User ObjectId dimensions to learn more about these endpoints.
First Feedback Text	String	Verbatim feedback text, if any, provided by first endpoint's user at the end of a call. Only available for the past 28 days of data and only visible to users with roles allowing EUIL access.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Feedback Text	String	Verbatim feedback text, if any, provided by second endpoint's user at the end of a call. Only available for the past 28 days of data and only visible to users with roles allowing EUII access.	
First Client Endpoint Name	String	The machine name of the first endpoint. Only available for the past 28 days of data and only visible to users with roles allowing EUII access.	
Second Client Endpoint Name	String	The machine name of the second endpoint. Only available for the past 28 days of data and only visible to users with roles allowing EUII access.	
First Endpoint Product Name	String	The product name of the first endpoint (either Skype for Business or Microsoft Teams).	
Second Endpoint Product Name	String	The product name of the second endpoint (either Skype for Business or Microsoft Teams).	
First UserType	Enumeration string	<p>The type of user on the first endpoint.</p> <p>Possible values: User, Server, Anonymous, Application, PSTN, Voicemail, Unknown</p> <p>Unknown - the default value if UserType can't be determined based on the info received.</p> <p>PSTN - a PSTN User.</p> <p>Anonymous - a Teams user or Skype for Business visitor.</p> <p>Application - a bot.</p> <p>User - an AAD User, can be either Skype for Business User or Teams User.</p> <p>Server - for conferences, at least one side is a server.</p> <p>Voicemail - the endpoint was answered by the voicemail service.</p>	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second UserType	Enumeration string	<p>The type of user on the second endpoint.</p> <p>Possible values: User, Server, Anonymous, Application, PSTN, Voicemail, Unknown</p> <p>Unknown - the default value if UserType can't be determined based on the info received.</p> <p>PSTN - a PSTN User.</p> <p>Anonymous - a Teams user or Skype for Business visitor.</p> <p>Application - a bot.</p> <p>User - an AAD User, can be either Skype for Business User or Teams User.</p> <p>Server - for conferences, at least one side is server.</p> <p>Voicemail - the endpoint was answered by voicemail service.</p>	
Organizer ObjectID	String	The Active Directory object ID of the meeting organizer's user. Only available for the past 28 days of data and only visible to users with roles allowing EUH access.	<ul style="list-style-type: none"> • User does not have permissions to view EUH. • Record is older than 28 days.
Organizer UPN	String	The user principal name (UPN) of the meeting organizer's user. Only available for the past 28 days of data and only visible to users with roles allowing EUH access.	<ul style="list-style-type: none"> • User does not have permissions to view EUH. • Record is older than 28 days.
Organizer Sip Uri	String	The Session Initiation Protocol (SIP) URI of the meeting organizer's user. Only available for the past 28 days of data and only visible to users with roles allowing EUH access.	<ul style="list-style-type: none"> • Populated only for Skype for Business endpoints. • User does not have permissions to view EUH. • Record is older than 28 days.
Devices			
First Capture Device Form Factor	Enumeration string	The form factor of the audio capture device (microphone) on the first endpoint.	<ul style="list-style-type: none"> • Not reported by the endpoint.

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Second Capture Device Form Factor	Enumeration string	The form factor of the audio capture device (microphone) on the first endpoint.	<ul style="list-style-type: none"> Not reported by the endpoint.
First Render Device Form Factor	Enumeration string	The form factor of the audio capture device (speakers) on the first endpoint.	<ul style="list-style-type: none"> Not reported by the endpoint.
Second Render Device Form Factor	Enumeration string	The form factor of the audio capture device (speakers) on the first endpoint.	<ul style="list-style-type: none"> Not reported by the endpoint.
Video			
First Video Duration Seconds	Range (seconds)	Duration of the first endpoint's video stream, measured in seconds and displayed as a range. Example value: 254: [1000 - 1500]	<ul style="list-style-type: none"> Not reported by the endpoint.
Second Video Duration Seconds	Range (seconds)	Duration of the second endpoint's video stream, measured in seconds and displayed as a range. Example value: 254: [1000 - 1500]	<ul style="list-style-type: none"> Not reported by the endpoint.
PSTN			
First PSTN Country Region	String	If FirstIsCaller is true, First PSTN Country Region is the caller's country. If it is false, then Second PSTN Country region is the caller's country. Example: US	
Second PSTN Country Region	String	If FirstIsCaller is false, Second PSTN Country Region is the caller's country. If it is true, then First PSTN Country region is the caller's country. Example: US	
PSTN Trunk FQDN	String	FQDN is the fully qualified domain name (FQDN) of the Session Border Controller (SBC). Example: sbcgw.contoso.com	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
PSTN Carrier Name	String	The company that is authorized by regulatory agencies to operate a telecommunications system. Example: Colt	Direct Routing does not have a carrier. Only a calling plan has a carrier.
PSTN Call Type	String	This string combines the service type and call type. Service type: user -> calling plan byot -> direct routing conf -> audio conferencing ucap -> voice app emergency -> emergency number Call type: In -> inbound call Out -> outbound call Out_transfer -> outbound call gets transferred to third person Out_forward -> outbound call gets forwarded to third person Out_conf -> outbound call with ad-hoc PSTN participant Example: ByotIn	
PSTN Connectivity Type	String	PSTN connectivity type includes Direct Routing, Calling Plan, or Audio Conferencing. At this time, only Direct Routing is available in the Call Quality Dashboard (CQD). Example: Direct Routing	
PSTN Final SIP Code Phrase	String	The reason phrase corresponding to the SIP response code and Microsoft response code. Example: BYE	
PSTN Call End Sub Reason	Int	A response code sent out from the Microsoft component that indicates specific actions that occurred. Example: 540000	
PSTN Event Type	String	An event type that provides telemetry. Example: End	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
PSTN Event Info Time	Date	The time in UTC format when an outbound call starts from the Microsoft network or an inbound call reaches the Microsoft network. Example: 2020-02-06 20:57:53.1750000	
PSTN MP Location	String	The Media Processor location will show the media path when in non-bypass mode. Example: USWE	
PSTN Call End Reason	Int	A three-digit integer response code shows the final status of the call. For more information about SIP explanation, please see the List of SIP response codes . Example: 404	
Voice Apps (Preview)		For this category, see Auto Attendant & Call Queue Historical Report for more information.)	
Auto Attendant Identity	String	Name of the resource account attached to the Auto Attendant.	
Auto Attendant Chain Index	Integer	Order of the Auto Attendant in the call.	
Auto Attendant Chain Start Time	String	The Auto Attendant call start time and date.	
Auto Attendant Chain Duration Seconds	Integer	The duration of the call in the Auto Attendant, measured in seconds.	
Auto Attendant Caller Action Count	Integer	Count of actions selected by the caller in an Auto Attendant during the call.	
Auto Attendant Call Flow	String	Encapsulates the different states of the Auto Attendant call.	
Auto Attendant Transfer Action	Enumeration	The call transfer target type.	
Auto Attendant Call Result	Enumeration	Final call result with the Auto Attendant.	

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Auto Attendant Directory Search Method	Enumeration	The last address book search method used.	
Auto Attendant Count	Integer	Number of Auto Attendants involved in the call.	
Call Queue Identity	String	Name of the resource account attached to the Call Queue.	
Call Queue Is Conference Mode	Boolean	If True, Call Queue is configured to use conference mode otherwise Call Queue is configured to use transfer mode.	
Call Queue Agent Count	Integer	Number of agents configured in the queue.	
Call Queue Agent Opt In Count	Integer	Number of configured agents that have opted into the queue.	
Call Queue Target Type	Enumeration	The call redirection target type.	
Call Queue Call Result	Enumeration	The Call Queue call final state.	
Call Queue Final State Action	Enumeration	The Call Queue final action.	
Call Queue Timed Out Time	Integer	The configured timed out value for the Call Queue.	
Is Auto Attendant Involved	Boolean	If True, an Auto Attendant was involved in a given call or stream.	
Is Call Queue Involved	Boolean	If True, a Call Queue was involved in a given call or stream.	
Meeting			
Scheduling Source App Id	String	The AppID of the first or third-party scheduling client that booked the meeting.	The scheduling client has not provided this parameter through its telemetry.
Datapair			

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Network Connection Detail Pair	Enumerated pair Possible values: wifi : wifi wifi : wired Wired : wifi Wired : Wired MobileBB : MobileBB MobileBB : Other MobileBB : Tunnel MobileBB : wifi MobileBB : Wired Other : Other Other : wifi Other : Wired Tunnel : Tunnel Tunnel : wifi Tunnel : Wired : MobileBB : Other : Tunnel : wifi : Wired :	Pair of network connection detail for the first and second endpoint.	<ul style="list-style-type: none"> Endpoint network connectivity type was unknown. This may happen if the call could not be established.
User Agent Category Pair	Enumerated pair	Pair of User Agent Category for first and second endpoint. Example value: AV-MCU : OC	<ul style="list-style-type: none"> Endpoint user agent was not a known type
Is Server Pair	Enumerated pair Possible values: Client : Client Client : Server Server : Server	Pair of identification of first and second endpoints as either Client or Server.	no Blank values
Connectivity Ice Pair	Enumerated pair Possible values: DIRECT : DIRECT DIRECT : FAILED DIRECT : HTTP FAILED : FAILED FAILED : RELAY HTTP : RELAY : : DIRECT : FAILED : HTTP : RELAY	Pair of type of ICE connectivity used by each endpoint.	<ul style="list-style-type: none"> ICE connectivity used by endpoint was not known or reported
OS Pair	Enumerated pair	Pair of the OS name and version for first and second endpoint. Example value: Windows 10 : Windows 10	<ul style="list-style-type: none"> OS name could not be parsed or was not reported by endpoint

NAME	DATA TYPE	DESCRIPTION	POSSIBLE REASONS FOR BLANK VALUES
Tenant Id Pair	Enumerated pair	Pair of the tenant ids for first and second endpoint. Example value: 00000000 — 0000 - 0000 - 0000 — 000000000000 : 00000000 — 0000 - 0000 - 0000 — 000000000000	<ul style="list-style-type: none"> The tenant identifier could not be determined. This may happen if endpoint is signed in to an on-premise Skype for Business Server deployment.
Building Name Pair	Enumerated pair	Pair of the building name for the first and second endpoint.	<ul style="list-style-type: none"> The building name for an endpoint could not be determined. This could be because the endpoint is located outside the corporate network, or is accessing the network from a site without a subnet mapping. Example value: Main Building : Branch Site Building
Inside Corp Pair	Enumerated pair Possible values: Inside : Inside Inside : Outside Outside : Outside	Pair showing if the endpoints were located inside or outside the corporate network based on the subnet mapping.	
Scenario			
Scenario Pair	Enumerated pair	Pair showing if the endpoints were located inside or outside the corporate network based on the subnet mapping and the network connection detail. Note: The pairs are separated by '--'. Example value: Client-Inside--Client-Inside-wifi	<ul style="list-style-type: none"> The network connectivity type was unknown for either or both endpoints.

Notes on dimension data type/units

Boolean

Boolean values are always either True or False. In some cases, True can also be represented as 1 and False can be represented as 0.

Range

Dimensions that are provided as range or group of values are shown using the following format:

<sort order string> [<lower bound inclusive> - <upper bound exclusive>

For example, the Duration (Minutes) dimension represents the call duration in seconds with the value reported as a range of values.

DURATION (MINUTES)	HOW TO INTERPRET
062: [0 - 0)	Stream duration = 0 minutes
064: [1 - 2)	1 minute < = stream duration < 2 minutes
065: [2 - 3)	2 minutes < = stream duration < 3 minutes
066: [3-4)	3 minutes < = stream duration < 4 minutes

The <sort order string> is used to control the sort order when presenting the data and can be used for filtering. For example, a filter on Duration (Minutes) < "065", would show streams with duration less than 2 minutes (The leading '0' is needed for the filter to work as expected). The actual value of the sort order string isn't significant.

NOTE

You may notice ranges that seem to be invalid for a given dimension. An example would be Wifi Signal Strength showing calls in the 082: [100 - 110) range when 100 is the maximum possible value for Wifi Signal Strength. This is due to how numbers are assigned to ranges in CQD's data model. If a whole number value is 99, it will be counted in the 081: [90 - 100) range. If that value is 100, it will be counted in the 082: [100 - 110) range. This does not indicate that there are Wifi Signal Strength values greater than 100% being reported.

Enumeration strings

Strings used by CQD are often derived from data files, and these can be nearly any combination of character within the allowed length. Some dimensions look like strings, but since they can only be one of a short list of predefined values, they are enumerations and not true strings. Some enumerations strings are also used in pairs.

Enumeration pair

Dimensions that are provided as an enumeration pair are shown using the following format:

<enumeration value from one end point> : <enumeration value from the other endpoint>

The ordering of the enumeration values is consistent but doesn't reflect ordering of the first or second endpoints.

For example, the Network Connection Detail Pair shows the Network Connection Detail values for the two endpoints:

NETWORK CONNECTION DETAIL PAIR	HOW TO INTERPRET
Wired : Wired	First and second endpoints both used wired ethernet connections.
Wired : wifi	First endpoint used wired ethernet connection and second endpoint used Wi-Fi connection, or the second endpoint used wired ethernet connection and first endpoint used Wi-Fi connection.
: wifi	First endpoint used a WiFi connection and the network connection used by the second endpoint is unknown, or the second endpoint used a WiFi connection and the network connection used by the first endpoint is unknown.

Blank values

The table above lists possible reasons why a dimension may be blank. Many dimensions and measurements will be blank if the QoE Record Available dimension is false. This typically occurs when the call wasn't successfully established.

Measurements

Many Measurement values can also be used as filters. The following table lists the measurements currently available in CQD, shown in the order listed in the Query Editor

MEASURE NAME	UNITS	DESCRIPTION
Total Stream Count	Number of streams	Number media streams regardless of type of media, including reliability/diagnostics streams that may not have a media type.
Total CDR Available Stream Count	Number of streams	Number of media streams with reliability/diagnostics information available. See Call detail recording (CDR) in Skype for Business Server
Total Media Failed Stream Count	Number of streams	Number of streams where either media path could not be established or did not terminate normally.
Total Call Setup Failed Stream Count	Number of streams	Number of streams where media path could not be established between the endpoints at the start of the call.
Total Call Dropped Stream Count	Number of streams	Number of streams where media path did not terminate normally.
Total Media Succeeded Stream Count	Number of streams	Number of streams where media path was established and terminated normally.
Total Call Setup Succeeded Stream Count	number of streams	Number of streams where media path could be established between the endpoints at the start of the call.
Total Call Setup Failure Percentage	Percentage	Percentage of all streams where media path could not be established between the endpoints at the start of the call.
Total Call Dropped Failure Percentage	Percentage	Percentage of successfully established streams where media path did not terminate normally.
Total Answer Seizure Ratio	Ratio	Ratio of calls with duration less than 5 seconds over the total number of calls.
Total Short Call Percentage	Percentage	Percentage of total calls less than 1 minute long.

MEASURE NAME	UNITS	DESCRIPTION
Total Media Failure Percentage	Percentage	Percentage of all streams where either media path could not be established or did not terminate normally.
Total Audio Stream Duration (Minutes)	Minutes	Total audio stream duration in minutes in the selected time range.
Media Failed Due To Firewall DPI Stream Count	Number of streams	Number of streams that failed to be established due to network equipment blocking access due to deep packet inspection not allowing Skype for Business traffic. These failures typically indicate a proxy, firewall or other network security device is not correctly configured to access the IP address and ports used by Skype for Business in Microsoft 365 or Office 365.
Firewall DPI Media Failure Percentage	Percentage	Percentage of streams that failed to be established due to network equipment blocking access due to deep packet inspection not allowing Skype for Business traffic. These failures typically indicate a proxy, firewall or other network security device is not correctly configured to access the IP address and ports used by Skype for Business in Microsoft 365 or Office 365.
Media Failed Due To Firewall IP Blocked Stream Count	Number of streams	Number of streams that failed to be established due to network equipment blocking access to Skype for Business servers. These failures typically indicate a proxy, firewall or other network security device is not correctly configured to access the IP address and ports used by Skype for Business in Microsoft 365 or Office 365.
Firewall IP Blocked Media Failure Percentage	Percentage	Percentage of streams that failed to be established because network equipment blocked access to Skype for Business servers. These failures typically indicate a proxy, firewall, or other network security device is not correctly configured to access the IP address and ports used by Skype for Business in Microsoft 365 or Office 365.
Media Failed Due To Other Stream Count	Number of streams	Number of streams where media path could not be established between the endpoints due to an undetermined/unclassified reason.

MEASURE NAME	UNITS	DESCRIPTION
Other Media Failure Percentage	Percentage	Percentage of streams where media path could not be established between the endpoints due to an undetermined/unclassified reason.
Total CDR Available Call Count	Number of streams	Total number of media streams with reliability/diagnostics information available. There is an up to 0.2% error for this measure. See note below for details.
Total Media Failed Call Count	Number of streams	Number of streams where media path could not be established between the endpoints. There is an up to 0.2% error for this measure. See note below for details.
Audio Stream Count	Number of streams	Number of audio streams.
Audio Poor Stream Count	Number of streams	Number of audio streams classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Audio Good Stream Count	Number of streams	Number of audio streams classified as good based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Audio Unclassified Stream Count	Number of streams	Number of audio streams that did not have sufficient data to be classified as good or poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Audio Poor Percentage	Percentage	Percentage of all audio streams that were classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Audio OnePercent PacketLoss Count	Number of streams	Number of audio streams with packet loss greater than 1%.
Audio OnePercent PacketLoss Percentage	Percentage	Percentage of all audio streams with packet loss greater than 1%.
Audio Poor Due To Jitter Count	Number of streams	Number of audio streams where the jitter metric exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .

MEASURE NAME	UNITS	DESCRIPTION
Audio Poor Due To PacketLoss Count	Number of streams	Number of audio streams where the packet loss metric exceeds thresholds listed here: Stream Classification in Call Quality Dashboard
Audio Poor Due To Degradation Count	Number of streams	Number of audio streams where the degradation metric exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
Audio Poor Due To RoundTrip Count	Number of streams	Number of audio streams where the round trip exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
Audio Poor Due To ConcealedRatio Count	Number of streams	Number of audio streams where the concealed ratio exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
Audio SLA Good Call Count	Number of calls	Number of audio calls within scope of the Skype for Business Voice Quality SLA (Volume Licensing for Microsoft Products and Online Services) classified as meeting the network performance targets.
Audio SLA Poor Call Count	Number of calls	Number of audio calls within scope of the Skype for Business Voice Quality SLA (Volume Licensing for Microsoft Products and Online Services) classified as not meeting the network performance targets.
Audio SLA Call Count	Number of calls	Number of audio calls within scope of the Skype for Business Voice Quality SLA (Volume Licensing for Microsoft Products and Online Services).
Audio SLA Good Call Percentage	Percentage	Percentage of audio calls within scope of the Skype for Business Voice Quality SLA (Volume Licensing for Microsoft Products and Online Services) that were classified as meeting the network performance targets.
Audio Good Call Stream Count	Number of streams	Number of audio streams where both audio streams in the call (call-leg) are not classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .

MEASURE NAME	UNITS	DESCRIPTION
Audio Poor Call Stream Count	Number of streams	Number of audio streams where at least one audio stream in the call (call-leg) was classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Audio Unclassified Call Stream Count	Number of streams	Number of audio streams where both audio streams in the call (call-leg) could not be classified due to missing network metrics.
Audio Poor Call Level Percentage	Percentage	Percentage of all audio streams where at least one audio stream in the call (call-leg) was classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Audio Call Count	Number	Number of calls involving audio. There is an up to 0.2% error for this measure. See note below for details.
Audio Poor Call Count	Number	Number of calls involving audio classified as poor. There is an up to 0.2% error for this measure. See note below for details.
Audio Good Call Count	Number of calls	Number of calls involving audio classified as good. There is an up to 0.2% error for this measure. See notes below for details.
Audio Unclassified Call Count	Number of calls	Number of calls involving audio that could not be classified Good or Poor. There is an up to 0.2% error for this measure. See note below for details.
Audio Poor Call Percentage	Percentage of calls	Percentage of calls involving audio classified as poor. There is an up to 0.2% error for this measure. See note below for details.
AppSharing Stream Count	Number of streams	Number of RDP-based application sharing streams.
AppSharing Poor Due To SpoiledTilePercentTotal Count	Number of streams	Number of application sharing streams where the spoiled tile percent total metric exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
AppSharing Poor Due To RelativeOneWayAverage Count	Number of streams	Number of application sharing streams where the spoiled tile percent total metric exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .

MEASURE NAME	UNITS	DESCRIPTION
AppSharing Poor Due To RDPTileProcessingLatencyAverage Count	Number of streams	Number of application sharing streams where the RDP tile processing latency average exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
AppSharing Poor Stream Count	Number of streams	Number of application sharing streams classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
AppSharing Good Stream Count	Number of streams	Number of application sharing streams classified as good based on network metrics listed here: Stream Classification in Call Quality Dashboard .
AppSharing Unclassified Stream Count	Number of streams	Number of application sharing streams that did not have sufficient data to be classified as good or poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
AppSharing Poor Percentage	Percentage	Percentage of total application sharing streams that were classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Video Stream Count	Number of streams	Number of video streams.
Video Poor Due To VideoPostFecplr Count	Number of streams	Number of video streams where the Video Post Fec plr exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
Video Poor Due To VideoLocalFrameLossPercentageAvg Count	Number of streams	Number of video streams where the Video Local Frame Loss Percentage Avg exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
Video Poor Due To VideoFrameRateAvg Count	Number of streams	Number of Video streams where the Video Frame Rate Avg exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
Video Poor Due to Freeze Count	Number of streams	Number of main video streams where the Video Freeze metric exceeds thresholds listed here. Stream Classification in Call Quality Dashboard . This field is specific to Microsoft Teams only

MEASURE NAME	UNITS	DESCRIPTION
Video Poor Stream Count	Number of streams	Number of video streams classified as poor based on network metrics listed here Stream Classification in Call Quality Dashboard .
Video Good Stream Count	Number of streams	Number of video streams classified as good based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Video Unclassified Stream Count	Number of streams	Number of video streams that did not have sufficient data to be classified as good or poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Video Poor Percentage	Percentage	Percentage of total video streams that were classified as poor based on network metrics listed here Stream Classification in Call Quality Dashboard .
Video Poor Percentage Due to Freeze	Percentage	Percentage of main video streams that were classified as poor based on the Video Poor metric Due to Freeze listed here Stream Classification in Call Quality Dashboard . This field is specific to Microsoft Teams only
VBSS Stream Count	Number of streams	Number of video-based-screen sharing streams.
VBSS Poor Due To VideoPostFecplr Count	Number of streams	Number of video-based-screen-sharing streams where the Video Post Fec plr exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
VBSS Poor Due To VideoLocalFrameLossPercentageAvg Count	Number of streams	Number of video-based-screen-sharing streams where the Video Local Frame Loss Percentage Avg exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
VBSS Poor Due To VideoFrameRateAvg Count	Number of streams	Number of video-based-screen-sharing streams where the Video Frame Rate Avg exceeds thresholds listed here: Stream Classification in Call Quality Dashboard .
VBSS Poor Stream Count	Number of streams	Number of video-based-screen-sharing streams classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .

MEASURE NAME	UNITS	DESCRIPTION
VBSS Good Stream Count	Number of streams	Number of video-based-screen-sharing streams classified as good based on network metrics listed here: Stream Classification in Call Quality Dashboard .
VBSS Unclassified Stream Count	Number of streams	Number of video-based-screen-sharing streams that did not have sufficient data to be classified as good or poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
VBSS Poor Percentage	Percentage	Percentage of total video-based-screen-sharing streams that classified as poor based on network metrics listed here: Stream Classification in Call Quality Dashboard .
Avg Call Duration	Seconds	Average duration of streams in seconds.
First Feedback Rating Avg	User rating (1-5)	Average rating of streams reported by the user using the first endpoint. Calls are rated from 1-5 and the rating is applied to all streams of the call.
Second Feedback Rating Avg	User rating (1-5)	Average rating of streams reported by the user using the second endpoint. Calls are rated from 1-5 and the rating is applied to all streams of the call.
First Feedback Rating Count	Number of rated streams	Number of streams rated by the user using the first endpoint. Calls are rated from 1-5 and the rating is applied to all streams of the call.
Second Feedback Rating Count	Number of rated streams	Number of streams rated by the user using the second endpoint. Calls are rated from 1-5 and the rating is applied to all streams of the call.
First Feedback Rating Poor Count	Number of rated streams	Number of streams rated by the user using the first endpoint as either 1 or 2. Calls are rated from 1-5 and the rating is applied to all streams of the call.
Second Feedback Rating Poor Count	Number of rated streams	Number of streams rated by the user using the second endpoint as either 1 or 2. Calls are rated from 1-5 and the rating is applied to all streams of the call.

MEASURE NAME	UNITS	DESCRIPTION
First Feedback Rating Poor Percentage	Number of rated streams	Percentage of all rated streams that were rated by the user using the first endpoint as either 1 or 2. Calls are rated from 1-5 and the rating is applied to all streams of the call.
Second Feedback Rating Poor Percentage	Number of rated streams	Percentage of all rated streams that were rated by the user using the second endpoint as either 1 or 2. Calls are rated from 1-5 and the rating is applied to all streams of the call.
First Feedback Token Audio Issue Count	Number rated streams	Number of streams where user using the first endpoint indicated an issue with audio.
Second Feedback Token Audio Issue Count	Number rated streams	Number of streams where user using the second endpoint indicated an issue with audio.
First Feedback Token Video Issue Count	Number of rated streams	Number of streams where user using the first endpoint indicated an issue with video.
Second Feedback Token Video Issue Count	Number of rated streams	Number of streams where user using the second endpoint indicated an issue with video.
Avg First Echo Percent Mic In	Percentage	Average percentage of time during the stream that the first endpoints detected echo in the audio from the capture or microphone device prior to echo cancellation.
Avg Second Echo Percent Mic In	Percentage	Average percentage of time during the stream that the second endpoints detected echo in the audio from the capture or microphone device prior to echo cancellation.
Avg First Echo Percent Send	Percentage	Average percentage of time during the stream that the first endpoints detected echo in the audio from the capture or microphone device after echo cancellation.
Avg Second Echo Percent Send	Percentage	Average percentage of time during the stream that the second endpoints detected echo in the audio from the capture or microphone device after echo cancellation.
Avg First Initial Signal Level RMS	Range (Decibels)	Average of the root-mean-square (RMS) of the received signal for the first 30 seconds of the call for the first endpoint. See 2.2.1.28.1 Child Elements for more information

MEASURE NAME	UNITS	DESCRIPTION
Avg Second Initial Signal Level RMS	Range (Decibels)	Average of the root-mean-square (RMS) of the received signal for the first 30 seconds of the call for the second endpoint.
Avg First RxAGC Signal Level	Range (Decibels)	Average signal level received at the automatic gain control for the first inbound audio stream.
Avg Second RxAGC Signal Level	Range (Decibels)	Average signal level received at the automatic gain control for the second inbound audio stream.
Avg First RxAGC Noise Level	Range (Decibels)	Average noise level received at the automatic gain control for the first inbound audio stream.
Avg Second RxAGC Noise Level	Range (Decibels)	Average noise level received at the automatic gain control for the second inbound audio stream.
Avg First Render Loopback Signal Level	Range (Decibels)	Average level of first speaker loopback signal (after any device offload effects have been applied).
Avg Second Render Loopback Signal Level	Range (Decibels)	Average level of second speaker loopback signal (after any device offload effects have been applied).
Avg First Audio Send Signal Level	Decibels	Average energy level of sent audio for audio classified as mono speech, or left channel of stereo speech sent by first endpoints.
Avg Second Audio Send Signal Level	Decibels	Average energy level of sent audio for audio classified as mono speech, or left channel of stereo speech sent by second endpoints.
Avg First Audio Received Signal Level	Decibels	Average energy level of received audio for audio classified as mono speech, or left channel of stereo speech by the first endpoints.
Avg Second Audio Received Signal Level	Decibels	Average energy level of received audio for audio classified as mono speech, or left channel of stereo speech by the second endpoints.
Avg First Audio Send Noise Level	Decibels	Average energy level of sent audio for audio classified as mono noise or left channel of stereo noise by the first endpoints.

MEASURE NAME	UNITS	DESCRIPTION
Avg Second Audio Send Noise Level	Decibels	Average energy level of sent audio for audio classified as mono noise or left channel of stereo noise by the second endpoints.
Avg First Audio Received Noise Level	Decibels	Average energy level of received audio for audio classified as mono noise or left channel of stereo noise by the first endpoints.
Avg Second Audio Received Noise Level	Decibels	Average energy level of received audio for audio classified as mono noise or left channel of stereo noise by the second endpoints.
First Audio Echo BAD_TIMESTAMP Count	Number of streams	Number of streams where the echo was caused by bad device timestamps from the first endpoints that limited echo cancellation in audio sent.
First Audio Echo POSTAEC_ECHO Count	Number of streams	Number of streams where the high echo was detected after echo cancellation for audio sent by the first endpoints.
First Audio Echo EVENT_ANLP Count	Number of streams	Number of streams where the first endpoints detected noise in the captured audio that limited echo cancellation in audio sent.
First Audio Echo EVENT_DNLP Count	Number of streams	Number of streams where the first endpoints detected noise in the captured audio that limited echo cancellation in audio sent.
First Audio Echo MIC_CLIPPING Count	Number of streams	Number of streams where the first endpoints detected clipping in the captured audio that limited echo cancellation in audio sent.
First Audio Echo BAD_STATE Count	Number of streams	Number of streams where the first endpoints detected issues with the internal state that limited echo cancellation in audio sent.
Second Audio Echo BAD_TIMESTAMP Count	Number of streams	Number of streams where the echo was caused by bad device timestamps from the second endpoints that limited echo cancellation in audio sent.
Second Audio Echo POSTAEC_ECHO Count	Number of streams	Number of streams where the high echo was detected after echo cancellation for audio sent by the second endpoints.

MEASURE NAME	UNITS	DESCRIPTION
Second Audio Echo EVENT_ANLP Count	Number of streams	Number of streams where the second endpoints detected noise in the captured audio that limited echo cancellation in audio sent.
Second Audio Echo EVENT_DNLP Count	Number of streams	Number of streams where the second endpoints detected noise in the captured audio that limited echo cancellation in audio sent.
Second Audio Echo MIC_CLIPPING Count	Number of streams	Number of streams where the second endpoints detected clipping in the captured audio that limited echo cancellation in audio sent.
Second Audio Echo BAD_STATE Count	Number of streams	Number of streams where the second endpoints detected issues with the internal state that limited echo cancellation in audio sent.
Avg Audio Degradation	Mean Opinion Score (0-5)	Average Network Mean Opinion Score degradation for streams. Represents how much the network loss and jitter have impacted the quality of received audio.
Avg Jitter	Milliseconds	Average network jitter for streams in milliseconds.
Avg Jitter Max	Milliseconds	Maximum network jitter for streams in milliseconds.
Avg Packet Loss Rate	Ratio	Average of average percentage of packets lost computed using 5 second interval for streams. 0.1 indicates 10% packet loss.
Avg Packet Loss Rate Max	Ratio	Average of maximum percentage of packets lost during any 5 second interval for streams. 0.1 indicates 10% packet loss.
Avg Send Listen MOS	Number	Average of the prediction of the Wideband Listening Quality Mean Opinion Score (MOS-LQ) of the audio stream that is being sent from the user. See "Avg. sending MOS" at Lync Monitoring Reports Decoder
Avg Overall Avg Network MOS	Mean Opinion Score (0-5)	Average or average network Mean Opinion Score for streams. Represents the average predicted quality of received audio factoring in network loss, jitter, and codec.

MEASURE NAME	UNITS	DESCRIPTION
Avg Ratio Concealed Samples	Ratio	Average of average ratio of the number of audio frames with samples generated by packet loss concealment to the total number of audio frames for streams. 0.1 indicates 10% of frames contained concealed samples.
Avg Conceal Ratio Max	Ratio	Average of the maximum ratios of the number of audio frames with samples generated by packet loss concealment to the total number of audio frames for streams. 0.1 indicates 10% of frames contained concealed samples.
Avg Ratio Stretched Samples	Ratio	Average of average ratio of the number of audio frames with samples that have been stretched to compensate for jitter or loss to the total number of audio frames for streams. 0.1 indicates 10% audio frames contained stretched samples.
Avg Healer Packet Drop Ratio	Range (Ratio)	Average ratio of audio packets dropped by healer over total number of audio packets received by healer.
Avg Healer FEC Packet Used Ratio	Range (Ratio)	Average ratio of used FEC packets over total number of received FEC packets.
Avg Round Trip	Milliseconds	Average of average network propagation round-trip time computed as specified in RFC3550 in milliseconds for streams.
Avg Round Trip Max	Milliseconds	Average of maximum network propagation round-trip time computed as specified in RFC3550 in milliseconds for streams.
Avg Packet Utilization	Number of packets	Average number of Real-Time Transport Protocol (RTP) packets sent per second in the session.
Avg Network Jitter	Milliseconds	Average of network jitter computed over 20 second windows during the session.
Avg Network Jitter Max	Milliseconds	Average of maximum network jitter in milliseconds computed over 20 second windows during the session.
Avg Network Jitter Min	Milliseconds	Average of minimum network jitter values in milliseconds computed over 20 second windows during the session for streams.

MEASURE NAME	UNITS	DESCRIPTION
Avg Jitter Buffer Size Max	Milliseconds	Maximum size of jitter buffer during session.
Avg Jitter Buffer Size Min	Milliseconds	Minimum size of jitter buffer during session.
Avg Relative OneWay	Milliseconds	Average computed relative one way delay of the peer.
Avg Relative OneWay Gap Occurrences	Milliseconds	Average number of instances of gaps in the relative one way delay of the peer.
Avg Relative OneWay Gap Density	Milliseconds	Average density of gaps in the relative one way delay of the peer.
Avg Relative OneWay Gap Duration	Number (Milliseconds)	Average duration of gaps in the relative one way delay of the peer.
Avg Audio Post FECPLR	Ratio	Average of packet loss rate after FEC has been applied for aggregated across all audio streams and codecs for streams.
Avg Video Post FECPLR	Ratio	Average of packet loss rate after FEC has been applied for aggregated across all video streams and codecs for streams.
Avg Video Local Frame Loss Percentage	Percentage	Average percentage of video frames lost as displayed to the user for streams. This includes frames recovered from network losses.
Avg Video Received Frame Rate Average	Frames per second	Average of average frames per second received for all video streams computed over the duration of the session for streams.
Avg Video Low Frame Rate Call Percent	Percentage	Average of percentage of time of the call where frame rate is less than 7.5 frames per second for streams.
Avg Video Packet Loss Rate	Ratio	Average of average fraction of packets lost, as specified in RFC3550 , computed over the duration of the session for streams.
Avg Video Frame Rate	Frames per second	Average frames per second received for a video stream, computed over the duration of the session. Values grouped by range.

MEASURE NAME	UNITS	DESCRIPTION
Avg Video Dynamic Capability Percent	Milliseconds	Average of percentage of time that the client is running < 70% expected video processing capability for this type of CPU for streams.
Avg AppSharing Spoiled Tile Percent Total	Milliseconds	Average of percentage of tiles which are discarded instead of being sent to a remote peer (for example, from the MCU to a viewer) for streams. Discarded tiles may be caused by bandwidth restrictions between client and server.
Avg AppSharing Relative OneWay	Seconds	Average of average relative one-way delay between the endpoints in seconds for application sharing streams.
Avg AppSharing RDP Tile Processing Latency	Milliseconds	Average of average latency in milliseconds processing tiles on the RDP Stack at the conferencing server for streams.
Avg First Device Capture Not Functioning Event Ratio	Ratio	Average of the fraction of the call that the first endpoint detected the capture device was not working properly.
Avg Second Device Capture Not Functioning Event Ratio	Ratio	Average of the fraction of the call that the second endpoint detected the capture device was not working properly.
Avg First Device Render Not Functioning Event Ratio	Ratio	Average of the fraction of the call that the first endpoint detected the render device was not working properly.
Avg Second Device Render Not Functioning Event Ratio	Ratio	Average of the fraction of the call that the second endpoint detected the render device was not working properly.
Avg First Mic Glitch Rate	Number of glitches	Average First Mic Glitch Rate (glitches per 5 minutes for the endpoint microphone) for the stream.
Avg Second Mic Glitch Rate	Number of glitches	Average Second Mic Glitch Rate (glitches per 5 minutes for the endpoint microphone) for the stream.
Avg First Speaker Glitch Rate	Number of glitches	Average First Speaker Glitch Rate (glitches per 5 minutes for the endpoint loudspeaker) for the stream.
Avg Second Speaker Glitch Rate	Number of glitches	Average Second Speaker Glitch Rate (glitches per 5 minutes for the endpoint loudspeaker) for the stream.

MEASURE NAME	UNITS	DESCRIPTION
First User Count	Number	Number of unique or distinct first endpoint users. Only available for the past 28 days of data. There is an up to 0.2% error for this measure. See note below for details.
Second User Count	Number	Number of unique or distinct second endpoint users. Only available for the past 28 days of data. There is an up to 0.2% error for this measure. See note below for details.
Avg First Device Glitches Event Ratio	Percentage	Average fraction of the calls that the first endpoint detected glitches or gaps in the media played or captured that caused poor quality of the media being sent or received.
Avg Second Device Glitches Event Ratio	Percentage	Average fraction of the call that the second endpoint detected glitches or gaps in the media played or captured that caused poor quality of the media being sent or received.
First Device Glitches Event Count	Number	Number of streams where the first endpoint detected significant glitches or gaps in the media played or captured that caused poor quality of the media being sent or received.
Second Device Glitches Event Count	Number	Number of stream where the second endpoint detected significant glitches or gaps in the media played or captured that caused poor quality of the media being sent or received.
PSTN Total Attempts Count	Number of calls	Total attempted calls, including successful calls and failed calls in the selected time range. There is an up to 0.2% error for this measure. See note below for details.
PSTN Total Connected Count	Number of calls	Total successfully connected calls in the selected time range. There is an up to 0.2% error for this measure. See note below for details.
PSTN Inbound Attempts Count	Number of calls	Total inbound attempted calls, including successful calls and failed calls in the select time range. There is an up to 0.2% error for this measure. See note below for details.
PSTN Inbound Connected Count	Number of calls	Total inbound successfully connected calls in the selected time range. There is an up to 0.2% error for this measure. See note below for details.

MEASURE NAME	UNITS	DESCRIPTION
PSTN Outbound Attempts Count	Number of calls	Total outbound attempted calls, including successful calls and failed calls in the selected time range. There is an up to 0.2% error for this measure. See note below for details.
PSTN Outbound Connected Count	Number of Calls	Total outbound successfully connected calls in the selected time range. There is an up to 0.2% error for this measure. See note below for details.
PSTN Total Minutes	Minutes	Total minute usage in the selected time range.
PSTN Inbound Total Minutes	Minutes	Total inbound minute usage in the selected time range.
PSTN Outbound Total Minutes	Minutes	Total outbound minute usage in the selected time range.
PSTN Active User Count	Number of users	The number of users who made at least one connected call during that day.
PSTN Average Call Duration	Minutes	The average duration of all connected calls in the selected time range. Normally, a 1:1 PSTN call is four to five minutes. However, this average can differ for each company.
PSTN Total Inbound Concurrent Call Count	Number of calls	Maximum number of simultaneous active inbound calls in a minute.
PSTN Total Outbound Concurrent Call Count	Number of calls	Maximum number of simultaneous active outbound calls in a minute.
P50 Latency	Milliseconds	50% of the requests should be faster than given latency.
P50 Jitter	Milliseconds	50% of the requests should be faster than given Jitter.
P50 Packet Loss Rate	Percentage	50% of the requests should have lower than the given Packet Loss Rate.
PSTN Outgoing Post Dial Delay	Milliseconds	The delay that occurs on outgoing calls measured from the time a number has been dialed until the caller or called party hears ringing.
PSTN Incoming Post Dial Delay	Milliseconds	The time or delay that occurs on incoming calls measured from the time a number has been dialed until the caller or called party hears ringing.

MEASURE NAME	UNITS	DESCRIPTION
PSTN NER Good Percentage	Percentage	The NER measures the ability of a network to deliver calls by measuring the number of calls sent versus the number of calls delivered to a recipient. $\text{NER} = (\text{Answered calls} + \text{User Busy} + \text{Ring no Answer} + \text{Terminal Reject Seizures}) / \text{Total Attempt Calls} \times 100.$ There is an up to 0.2% error for this measure. See note below for details.

Notes on measurements

Accuracy limitations

Certain user and call count measurements rely on performing a distinct countif operation on the data set to compute the count. There is currently an up to 0.2% error inherent with the distinct countif operation depending on the number of rows the operation is performed on. For the most accurate volume, you should use stream count measures since they do not rely on this distinct countif operation. Filtering to reduce the data volume may reduce the error but may not eliminate this source of error in distinct call and user counts. More information about this limitation can be found here [dcount aggregate function](#).

Filters

Many Dimension and Measurement values can also be used as filters. You can use filters in your query to eliminate information in the same way you'd select a Dimension or Measurement to add or include information in the query.

Stream Classification in Call Quality Dashboard (CQD)

12/7/2021 • 5 minutes to read • [Edit Online](#)

The Call Quality Dashboard (CQD) for Microsoft Teams and Skype for Business Online allows you to gain insights into the quality of calls made using Microsoft Teams and Skype for Business services. This topic provides detailed information about the quality classification of media streams. To learn more about CQD and how to set it up, see [Set up Call Quality Dashboard](#).

Classifier Definitions

Streams in CQD are classified as *Good*, *Poor*, or *Unclassified* based on the values of the available key quality metrics. The metrics and conditions used to classify stream are shown in the tables that follow. CQD's "Poor Due To" dimensions can be used to understand which metric is responsible for a *Poor* classification. For more information on these dimensions, see [Dimensions and measures available in Call Quality Dashboard](#).

Audio Classifier

If one or more of the following conditions are met, an audio stream is marked as *Poor*:

METRIC	SCENARIO	CONDITION	EXPLANATION
Round Trip	ALL	> 500	Average round-trip network propagation time, computed in milliseconds. Details available in RFC3550 .
Packet Loss Rate	ALL	> 0.1	Average packet loss rate for stream.
Jitter	ALL	> 30	Average jitter for stream in milliseconds.

Video Classifier due to Freeze

The video stream is marked *Good* or *Poor* based on the value of a classifier score generated to estimate that the end user experienced Frozen Video. This classifier is available for Microsoft Teams product only.

STEP #	METRIC	SCENARIO	CONDITION	CLASSIFICATION IF CONDITION IS TRUE	CLASSIFICATION IF CONDITION IS FALSE	CLASSIFICATION IF METRIC IS UNAVAILABLE	EXPLANATION

STEP #	METRIC	SCENARIO	CONDITION	CLASSIFICATION IF CONDITION IS TRUE	CLASSIFICATION IF CONDITION IS FALSE	CLASSIFICATION IF METRIC IS UNAVAILABLE	EXPLANATION
1	Video Poor Due to Freeze Classifier	Is Server Pair is Client : Server	>0.246	<i>Poor</i>	<i>Good</i>	<i>Unclassified</i>	A Score between 0 and 1 that is generated based on a combination of user experience, freeze duration statistics and overall call experience
2	Video Poor Due to Freeze Classifier	Is Server Pair is Client : Client	>0.524	<i>Poor</i>	<i>Good</i>	<i>Unclassified</i>	A Score between 0 and 1 that is generated based on a combination of user experience, freeze duration statistics and overall call experience

Video Classifier

A video stream is marked as *Good* or *Poor* based on the value of the first available metric in the following order:

STEP #	METRIC	CONDITION	CLASSIFICATION IF CONDITION IS TRUE	CLASSIFICATION IF CONDITION IS FALSE	CLASSIFICATION IF METRIC IS UNAVAILABLE	EXPLANATION
1	Video Local Frame Loss Percentage Avg	> 50%	<i>Poor</i>	<i>Good</i>	Proceed to step 2	Average percentage of video frames lost as displayed to the user. The average includes frames recovered from network losses.

STEP #	METRIC	CONDITION	CLASSIFICATION IF CONDITION IS TRUE	CLASSIFICATION IF CONDITION IS FALSE	CLASSIFICATION IF METRIC IS UNAVAILABLE	EXPLANATION
2	Video Frame Rate Avg	< 7	<i>Poor</i>	<i>Good</i>	Proceed to step 3	Average frames per second received for a video stream, computed over the duration of the session.
3	Video Post FECPLR	> 0.15	<i>Poor</i>	<i>Good</i>	<i>Unclassified</i>	Packet loss rate after FEC has been applied aggregated across all video streams and codecs.

VBSS Classifier

A VBSS stream is marked as *Good* or *Poor* based on the value of the first available metric in the following order:

STEP #	METRIC	CONDITION	CLASSIFICATION IF CONDITION IS TRUE	CLASSIFICATION IF CONDITION IS FALSE	CLASSIFICATION IF METRIC IS UNAVAILABLE	EXPLANATION
1	Video Local Frame Loss Percentage Avg	> 50%	<i>Poor</i>	<i>Good</i>	Proceed to step 2	Average percentage of video frames lost as displayed to the user. The average includes frames recovered from network losses.
2	Video Frame Rate Avg	< 2	<i>Poor</i>	<i>Good</i>	Proceed to step 3	Average frames per second received for a video stream, computed over the duration of the session.

STEP #	METRIC	CONDITION	CLASSIFICATION IF CONDITION IS TRUE	CLASSIFICATION IF CONDITION IS FALSE	CLASSIFICATION IF METRIC IS UNAVAILABLE	EXPLANATION
3	Video Post FECPLR	> 0.15	<i>Poor</i>	<i>Good</i>	<i>Unclassified</i>	Packet loss rate after FEC has been applied aggregated across all video streams and codecs.

Application Sharing Classifier

An application sharing stream is marked as *Poor* if one or more of the following conditions are met:

METRIC	CONDITION	EXPLANATION
Spoiled Tile Percent Total	> 36	Percentage of tiles that are discarded instead of sent to a remote peer (for example, from the MCU to a viewer). Discarded (or spoiled) tiles might be caused by bandwidth restrictions between client and server.
AppSharing RDP Tile Processing Latency Average	> 400	Average latency in milliseconds processing tiles on the RDP Stack at the conferencing server.
AppSharing Relative OneWay Average	> 1.75	Average relative one-way delay between the endpoints in seconds for application sharing streams.

Unclassified Streams

In CQD, a stream is marked *Unclassified* when Interactive Connectivity Establishment (ICE) connectivity fails or when all the metrics required to compute the stream classification are not reported.

To check for ICE connectivity failures, examine the dimensions "First Connectivity Ice" and "Second Connectivity Ice" for a "FAILED" value. If either value indicates a failure, the stream is marked as *Unclassified*.

If ICE connectivity succeeded for an *Unclassified* stream, the stream is likely considered *Unclassified* because key stream metrics were not reported. There are a few reasons these metrics may not be reported:

- **QoE reports were not received** — The metrics used for classification are reported in a QoE report sent at the end of a call. If this report is not produced (for example, because some third-party endpoints may not send QoE) or could not be sent (for example, because of a network outage), CQD is unable to classify the stream.

TIP

The "QoE Record Available" dimension can be used to determine whether a QoE report was received for a stream. Note that this dimension will have a value of "True" if a QoE report was received from either endpoint. A QoE report from both endpoints is required for the most accurate reporting of metrics.

- **Short calls** — Short calls may not have enough media activity to compute key stream metrics. Without these metrics, CQD is unable to classify the stream.

TIP

The dimensions "Duration (Seconds)", "Duration (Minutes)", "Duration 5 seconds or less", and "Duration 60 seconds or more" can be used to determine the duration of a stream. The measurement "Avg Call Duration" can also be used to compute the average duration for a set of streams.

- **Low packet utilization** — Like the "short call" scenario, sufficient packet utilization is required for computation of key stream metrics. Without these metrics, CQD is unable to classify the stream.
 - A common low packet utilization scenario occurs when an attendee joins a meeting to listen to the presenter, but never speaks (the microphone is muted for most of the call). Here, the audio stream inbound to the client has high packet utilization while the audio stream outbound from the client has little to no packet utilization. The duration of the stream may be an hour or longer but the packet utilization on the stream from the client to the server is low since the microphone was muted, and an *Unclassified* stream results.

TIP

The "Packet Utilization" dimension and "Avg Packet Utilization" measurement can be used to determine the packet activity of a stream.

Create a building map for Call Quality Dashboard (CQD)

12/7/2021 • 2 minutes to read • [Edit Online](#)

In a Microsoft Teams or Skype for Business Online deployment, all clients are external. As a result, by default, all clients are reported as outside in Call Quality Dashboard (CQD), regardless of whether the client is connected on an internal corporate network.

When you work with CQD, you need to know the location of an endpoint and whether it was connected to a network you can manage or a network you can't manage, the assumption being that you can only improve networks you can manage. By uploading subnet and building information to CQD, you enable CQD to determine whether the endpoint was connected to an internal (managed) network or to an external (unmanaged) network. That's why it's important to create a building map for your organization and [upload it to CQD](#).

Building mapping tools

There are many ways to map your organization's subnets. If you need help, you can use the CQDTools PowerShell Module described in this [blog post](#). These tools are based on PowerShell and use Active Directory (AD) Sites and Services and Microsoft DHCP services to help pre-populate your building file. These tools will help with the following tasks:

1. Query AD Sites and Services, and create a building file based on the information contained within.
2. Query a Microsoft DHCP server or servers to pull subnet information and automatically create a building file.
3. Validate an existing building file, checking for duplicates and overlaps.
4. Find unmapped subnets in CQD.

Use Power BI to analyze CQD data for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

New in January 2020: [Download Power BI query templates for CQD](#). Customizable Power BI templates you can use to analyze and report your CQD data.

For Call Quality Dashboard (CQD) reports in Teams, if you'd rather use Power BI to query and report your data, download our CQD Power BI templates. When you open the templates in Power BI, you'll be prompted to sign in with your CQD admin credentials. You can customize these query templates and distribute them to anyone in your organization who has a Power BI license and CQD admin permissions.

Before you can use these PBIT files, you'll need to [Install the Power BI Connector for Microsoft CQD](#) using the *MicrosoftCallQuality.pqx* file included in the [download](#).

Make sure you have the right [CQD access role](#) to access the Power BI reports.

(New!) CQD Teams Auto Attendant & Call Queue Historical Report.pbit	<p>This template provides the following three reports:</p> <ul style="list-style-type: none">• Auto Attendant – showing analytics for calls coming into your Auto Attendants.• Call Queue – showing analytics for calls coming into your Call Queues.• Agent Timeline – showing a timeline view of agents being active in Call Queue calls. <p>To learn more, read Auto Attendant & Call Queue Historical Report.</p>
CQD Helpdesk Report.pbit	<p>Integrating building and EUII data, this report is designed to let you drill up from a single user to find the upstream root cause of poor call quality for that user (for example, the user is in a building that's experiencing network problems).</p>
CQD Location Enhanced Report.pbit	<p>Re-imagining CQD SPD location reports. Includes 9 reports, providing Call Quality, Building WiFi, Reliability, and Rate My Call (RMC) information with additional drill-thrus by Building or by User. Make sure you upload the building data to maximize your reporting experience.</p>
CQD Mobile Device Report.pbit	<p>Provides insights specifically tuned towards mobile device users, including Call Quality, Reliability, and Rate My Call. View mobile network, WiFi network, and mobile operating system reports (Android, iOS).</p>
CQD PSTN Direct Routing Report.pbit	<p>Provides insights specific for PSTN calls that go through Direct Routing. To learn more, read Using the CQD PSTN Direct Routing Report.</p>

CQD Summary Report.pbit	<p>Better visualizations, improved presentation, increased information density, and rolling dates. These reports make it easier to identifier outliers. Drill into call quality by location with an easy-to-use interactive map. 9 new reports:</p> <ul style="list-style-type: none"> - Quality Overall - Reliability Overall - RMC (Rate My Call) Overall - Conference Quality - P2P Quality - Conference Reliability - P2P Reliability - Conference RMC - P2P RMC
(New!) CQD Teams Utilization Report.pbit	<p>Shows how users in your organization are using Teams and how much. Make sure you upload the building data to maximize your reporting experience. To learn more, read Use CQD Power BI report to view Microsoft Teams utilization.</p>
CQD User Feedback (Rate My Call) Report.pbit	<p>Shows Rate My Call data in a way that you can easily use to help support calling for your organization. Cross reference with verbatims to identify end user education opportunities.</p>

TIP

Once you've set up your Power BI reports for CQD data, add them as a tab to a channel. After you select + in a channel, select **Power BI** and then find your report. To learn more, read [Embed report with the Power BI tab for Teams](#). Remember, only people with a Power BI license and CQD admin credentials can access these reports.

Install Microsoft Call Quality connector for Power BI to use Call Quality Dashboard query templates

12/7/2021 • 11 minutes to read • [Edit Online](#)

Before you can use the Power BI query templates (PBIX files) for Microsoft Teams Call Quality Dashboard (CQD), you'll need to install the Microsoft Call Quality connector for Power BI, using the *MicrosoftCallQuality.pqx* file included in the [download](#).

Read [Use Power BI to analyze CQD data for Teams](#) to learn about these templates.

Make sure you have the right [CQD access role](#) to access the Power BI reports.

NOTE

The Microsoft Call Quality connector only supports DirectQuery in Power BI; Import mode is not supported.

Installation

The process for installing a custom connector and adjusting security to enable use of the connector is described in detail in the [Power BI documentation](#). For the sake of simplicity, here's a quick explanation:

1. Check to see if your computer already has a *[Documents]\Power BI Desktop\Custom Connectors* folder. If not, create this folder.¹
2. Download the connector file (either a *.mez or *.pqx file) and place it in the *Custom Connectors* directory.
3. **If the connector file is a *.mez file**, you will also need to adjust your security settings as described in the [custom connector setup documentation](#).

If a new version of the Microsoft Call Quality connector is released, replace the old connector file in the *Custom Connectors* directory with the new file.

Setup

In order to build a report and run queries, you will first need to connect to the CQD data source. Follow the steps below in order to connect:

1. In the Home tab of Power BI Desktop, click on *Get Data*.

2. The *Get Data* window should appear at this point. Navigate to *Online Services*, then select *Microsoft Call Quality (Beta)* and hit *Connect*.

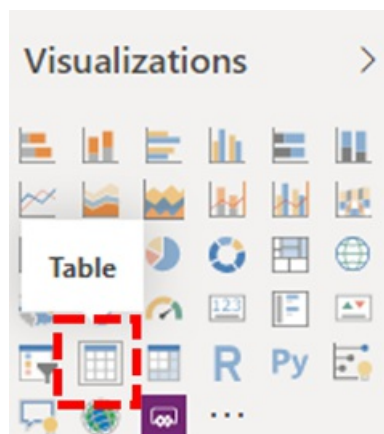

3. You will be prompted to sign in next. Use the same credentials that you use for Call Quality Dashboard.²
4. The next prompt will give you the option between two *Data Connectivity modes*. Select *DirectQuery* and hit *OK*.
5. Finally, you will be given a final prompt showing you the entire data model for Call Quality Dashboard. No data will be visible at this point, only the data model for CQD. Select *Load* to complete the setup process.
6. At this point, Power BI will load the data model onto the right side of the window. The page will remain otherwise blank, and no queries will be loaded by default. Proceed to **Building Queries** below in order to build a query and return data.

If any of the steps during this setup process weren't clear, a more detailed explanation of the process can be found in [Quickstart: Connect to data in Power BI Desktop](#).

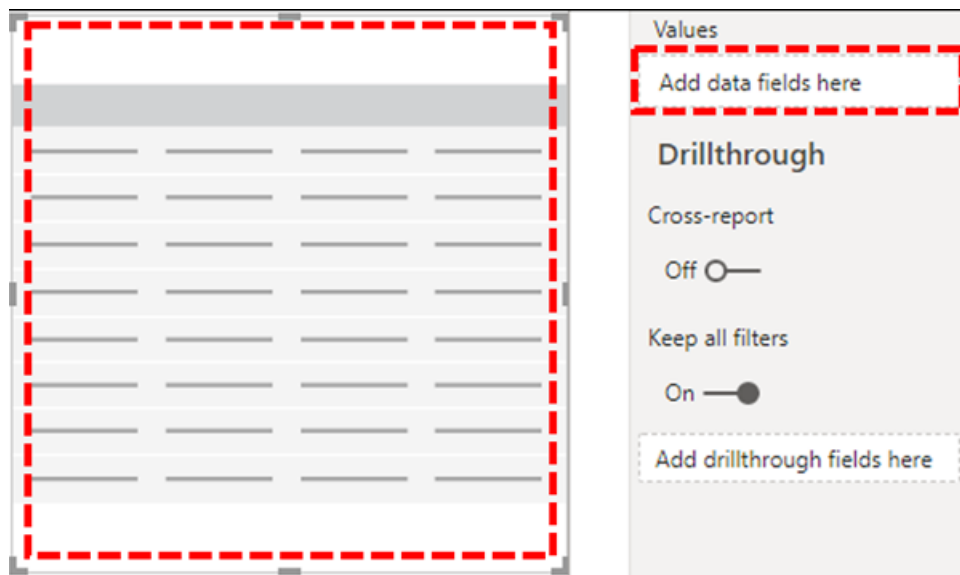

Building Queries

Once setup is complete, you should see the names of several hundred dimensions and measures load in the *Fields* pane. Constructing actual queries from here is simple, just select the dimensions and measures you want for your query, then drag and drop them onto the page. Here's a more detailed explanation, with a simple example:

1. Select the visualization you want to use from the *Visualizations* pane. A blank version of that visualization should appear on the page. For the purposes of this example, we will be using the *Table* visualization.

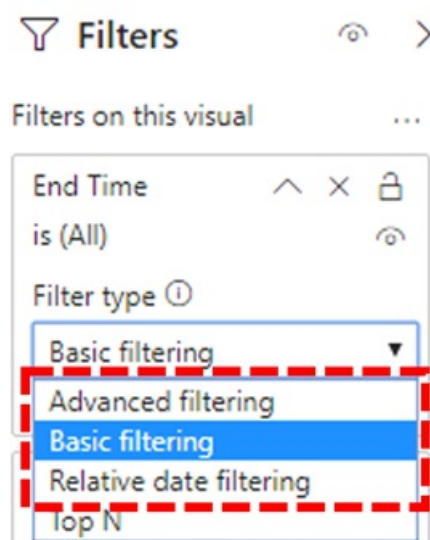

2. Determine which dimensions and measures (denoted by an aggregation symbol by their name) you wish to use for your query, then manually select them and drag them onto the black visualization. Alternately, drag them onto the *Values* field beneath the visualization options.

IMPORTANT

Call Quality Dashboard requires a measure for any query to run. Failure to add a measure to a query will cause that query to fail.

- Next, select any dimensions you want to filter on and drag them to the *Filters on this visual* field in the *Filters* pane. The Microsoft Call Quality connector currently supports *Basic filtering* (select values from a list of possible dimension values), *Advanced filtering* (manually specify values and operands to filter on, similar to Call Quality Dashboard), and *Relative date filtering* (only available for the *End Time* and *Start Time* dimensions). Filtering according to *Top N* is not supported by Call Quality Dashboard.

IMPORTANT

Filters are only supported when applied to Dimensions. Filtering on the values of Measurements is not supported in Call Quality Dashboard.

- Finally, select the *Format* tab within the *Visualizations* pane to style and format your query.

NOTE

Call Quality Dashboard queries require at least one measure in order to run. If your query does not load, double check that you have included a measure in the query.

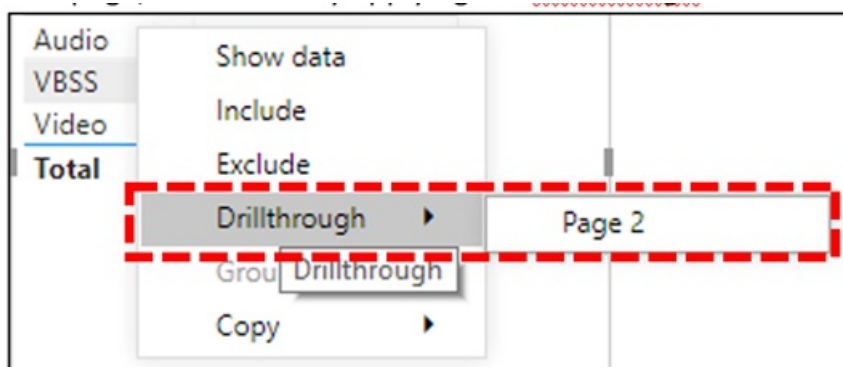

Creating a Drillthrough Report

[Drillthrough in Power BI](#) allows you to create focused reports that you can quickly filter using the values of other reports as context. Once you know how to create your first query with the Microsoft Call Quality connector, creating a drillthrough is even simpler.

1. Create another page for the focused report, and then add your queries to that page.
2. Select the dimension you want to use as a drillthrough filter and drag them onto the *Drillthrough* field under on the *Visualizations* pane.

3. **That's it!** Any other query on another page that uses that dimension can now drill through to that page, automatically applying the drillthrough dimension's value as a filter.

Unlike Call Quality Dashboard, Power BI supports non-sequential drillthrough. If a query includes the necessary dimension, it can drill through to any other page.

Best practice

Microsoft Call Quality connector queries should be designed with drillthrough functionality in mind. Instead of trying to load all the data at once, and then slicing down with filters, start with broader, low-cardinality queries and drill down to high-cardinality queries. For instance, when attempting to diagnose which subnets contribute most to quality issues, it's helpful to first identify those regions and countries that contribute to the problem, then drill down to the subnets in that region or country. The Call Quality connector templates have been designed in this manner in order to act as an example.

Limitations

Despite making use of Power BI, not all Power BI functionality is supported by the Microsoft Call Quality connector, either as a result of limitations on Call Quality Dashboard's data model or on DirectQuery connectors in general. The list below notes some of the Connector's more noteworthy limitations, but this list should not be considered exhaustive:

1. **Calculated Columns** – DirectQuery connectors in general have limited support for calculated columns in Power BI. Some calculated columns might work with the Connector, but those columns are exceptions. As a general rule, calculated columns don't function.
2. **Aggregations** – The Call Quality Dashboard data model is built on a cube model, meaning that aggregations are already supported in the form of measures. Attempting to manually add aggregations to different dimensions or changing the aggregation type of a measure will not work with the Connector, and it will generally result in an error.
3. **Custom Visuals** – While the Microsoft Call Quality connector does work with a range of custom visuals, we are unable to guarantee compatibility with all custom visuals. Many custom visuals rely on the use of calculated columns or imported data, neither of which is supported by DirectQuery connectors.
4. **Referencing Cached Data** – Power BI currently does not support referencing cached data from a DirectQuery connector in any way. Any attempt to reference the results of a query will result in a new query.
5. **Relative Data Filtering** – Is supported in the Microsoft Call Quality connector, but only with the *Start Time* and *End Time* dimensions. Although the *Date* dimension may be the obvious choice for relative date filtering, *Date* is not stored as a date time object and thus does not support relative date filtering in Power BI.
6. **Measurement Only Queries** – Are not supported at this time in the Microsoft Call Quality connector. When creating a visualization with three or more measurements and no dimensions, the column data will be transposed. To avoid this, always include at least one dimension (eg: Month Year) in your visualizations. This is slated to be resolved in an upcoming release of the Microsoft Call Quality connector for Power BI.
7. **Government Community Cloud (GCC) Support** – For customers in the GCC environment, the Microsoft Call Quality connector will work when using Power BI Desktop only. The Microsoft Call Quality connector is not presently compatible with the Power BI service for GCC customers.

Most of these issues are either restrictions to DirectQuery connector design in Power BI or fundamental to the design of the CQD data model.

Troubleshooting

I'm trying to use the Date column as a Date slicer. As soon as I convert the data type of this column to Date, I get this error

Couldn't load the data for this visual: OLE DB or ODBC error: [Expression.Error] We couldn't fold the expression to the data source. Please try a simpler expression.

Date slicers aren't supported with the Microsoft Call Quality connector. To specify a date range, apply two filters to the report, specifying a less than and greater than date.

Alternatively, if the dates you want to view are recent, apply a relative date filter to show only data for the last N days/weeks/months.

Error Codes

Because the Microsoft Call Quality connector for Power BI is less restricted than the browser app in terms of kinds of queries you can construct, you may occasionally encounter a number of errors while building your queries. In the event that you receive an error message of the type "CQDError. RunQuery – Query Execution Error", reference the list below with the ErrorType number provided in order to troubleshoot the possible issue with the query. The following are the most common Error Type codes you may encounter with the CQD Power BI Connector:

- **ErrorType 1 - Query Structure Error:** A query structure error is typically caused by the Connector failing to build a properly formatted query. This happens most often when using unsupported functionality, as specified in the Limitations above. Double check that you are not using any calculated columns or custom visuals for that query.
 - **ErrorType 2 - Query Building Error:** A query building error is caused by the Microsoft Call Quality connector being unable to properly parse the query you are attempting to build. This happens most often when using unsupported functionality, as specified in the Limitations above. Double check that you are not using any calculated columns or custom visuals for that query.
 - **ErrorType 5 - Execution Timeout:** The query has reached the maximum possible runtime before timing out. Try adding more filters to the query in order to limit its scope. Narrowing the data range is often the most effective way to achieve this.
 - **ErrorType 7 - No Measurements Error:** Call Quality Dashboard queries require a measure in order to function. Double check that your query includes measure. Measures in the Microsoft Call Quality connector are denoted by the aggregation (sum) symbol before their name.

If you encounter any additional errors outside of this scope, please notify the Call Quality Dashboard team so that we can help troubleshoot the issue and update the documentation as appropriate.

Footnotes

¹ Certain processes and apps (e.g., OneDrive) may cause your Documents root folder to change; make sure that the *Power BI Desktop\Custom Connectors* directory is placed inside of the current root folder Documents folder.

² The login credentials you use for Call Quality Dashboard *do not* need to be the same credentials you use for logging into the Power BI Desktop app itself.

Frequently asked questions

When will the Power BI Connector be updated from "Beta" status?

Despite the Beta tag, the Microsoft Call Quality (Beta) connector for Power BI is the first 'release' version of the connector and has been officially security signed by the Power BI team to reflect this. At the time of the connector's initial release, the Power BI team was unable to provide support and broader certification, but was still prepared to attest to the security, authenticity, and general functionality of the Microsoft Call Quality connector. Looking ahead, we are planning to invest in the Microsoft Call Quality connector for Power BI in the near future.

Why does the connector seem slower compared to Call Quality Dashboard in the browser? What can I do to improve performance?

Query performance for the various templates is actually the same in both the browser and in the connector. Just like any other standalone app, Power BI adds its authentication and rendering time to our performance. In addition, the difference comes in the number of concurrent queries being run. Because the in-browser version of Call Quality Dashboard had less well-developed and information-dense visualization options, most of our reports were limited to loading 2-3 queries at a time. On the other hand, the connector templates often display

20+ concurrent queries. If you wish to build reports that are just as responsive as the older ones you were used to, try creating reports with no more than 2-3 queries per tab.

For more information, see the following articles:

- [Optimization guide for Power BI](#)
- [DirectQuery model guidance](#)

I find that I routinely run into the 10,000-row limit when running queries. How can I get the connector to return more than 10,000 rows?

The 10,000-row limit is actually specified on the API end, and it is designed to help significantly improve performance and reduce the risk of query execution errors resulting from low memory conditions.

Instead of attempting to increase the result row count, it is best to restructure your reports according to connector best practices. The templates we have included are designed to demonstrate these best practices. Where possible, start by looking at your KPIs using broader, lower-cardinality dimensions, such as Month, Year, Date, Region, Country, etc. From there, you can drill down into increasingly higher-cardinality dimensions. The Helpdesk and Location-Enhanced Reports both provide good examples of this drill down workflow.

[Use Power BI to analyze CQD data for Teams](#)

View Microsoft Teams utilization in Power BI using CQD data

12/7/2021 • 6 minutes to read • [Edit Online](#)

New in March 2020, we've added a Teams Utilization report to our downloadable [Power BI query templates for CQD](#).

This new Teams Utilization reports lets you see how (and how much) your users are using Microsoft Teams by accessing Teams Call Quality Dashboard (CQD) data. These reports are intended to be a centralized location that both administrators and business leaders can quickly go to for this data.

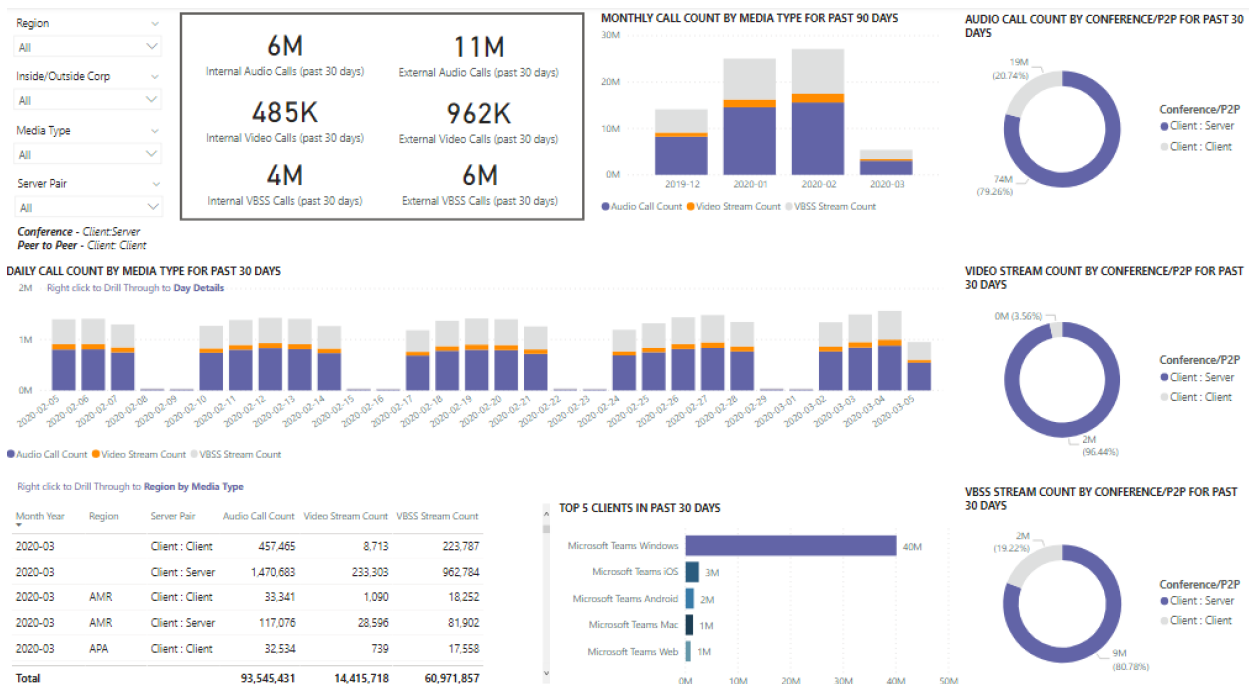

The Teams Utilization Power BI report consists of two primary reports: [Call Count Summary](#) and [Audio Minutes Summary](#). The [Daily Usage](#), [Regional Audio Details](#), [Conference Details](#) and [User List](#) reports come into play when a user takes advantage of the drill-down reports, noted in the descriptions below.

NOTE

Building and subnet data must be populated to provide regional and network filtering capabilities.

Call Count Summary Report

The main page (Call Count Summary) immediately provides the number of audio, video and screen sharing sessions over the last 30 and 90 days as noted in the section title. The data initially displayed is for the organization as a whole and can be filtered using the slicer dropdown options on the left side of the page.

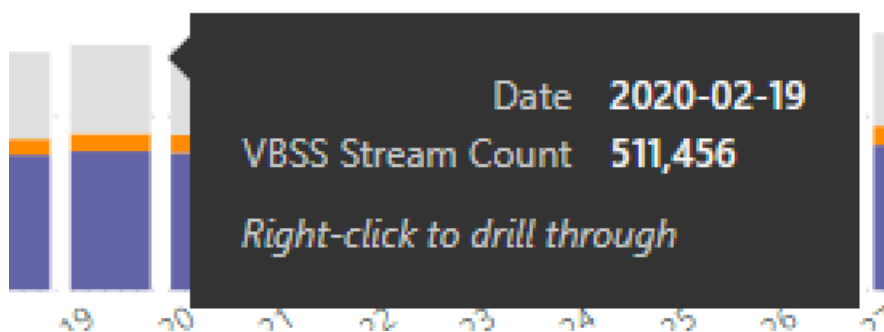

1. To the right of the slicer dropdowns, the number of calls by media type is broken down to an internal/external view over the past thirty days. We can see through the above screenshot that there are more calls happening from outside organizational locations, which makes sense considering the current global environment.

- To the right of the media type count box, we have the Monthly Call Count by Media Type for the last 90 days. Each column and media type can be hovered over to display the count for a previous month or the current month to date, providing usage trend information.

- The middle graph functions as the 90-day graph does, however it provides a daily usage view for the past 30 days and allows a user to right click and drill down into details for a specific day.

On the bottom left section of the page, you'll find a table providing total values for each media type over the past year.

Month Year	Region	Server Pair	Audio Call Count	Video Stream Count	VBSS Stream Count
2020-03		Client : Client	457,465	8,713	223,787
2020-03		Client : Server	1,470,683	233,303	962,784
2020-03		Client : Client	33,341	1,090	18,252
2020-03		Client : Server	117,076	28,596	81,902
2020-03		Client : Client	32,534	739	17,558
Total			93,545,431	14,415,718	60,971,857

Right click to Drill Through to **Region by Media Type**

Month Year	Region	Server Pair	Audio Call Count	Video Stream Count	VBSS Stream Count
2020-03		Client : Client	457,465	8,713	223,787
2020-03		Client : Server	1,470,683	233,303	962,784
2020-03	AMR	Client : Client	33,341	1,090	18,252
2020-03	AMR	Client : Server	117,076	28,596	81,902
2020-03	APA	Client : Client	32,534	739	17,558
Total			93,545,431	14,415,718	60,971,857

To the right of the table, a bar chart shows clients with the most use (calls/streams) for the past 30 days.

TOP 5 CLIENTS IN PAST 30 DAYS

The last set of charts for this page show each media type individually, with a breakdown showing conference and P2P usage. The charts below show that there is a significantly higher number of conference usage as

AUDIO CALL COUNT BY CONFERENCE/P2P FOR PAST 30 DAYS

VIDEO STREAM COUNT BY CONFERENCE/P2P FOR PAST 30 DAYS

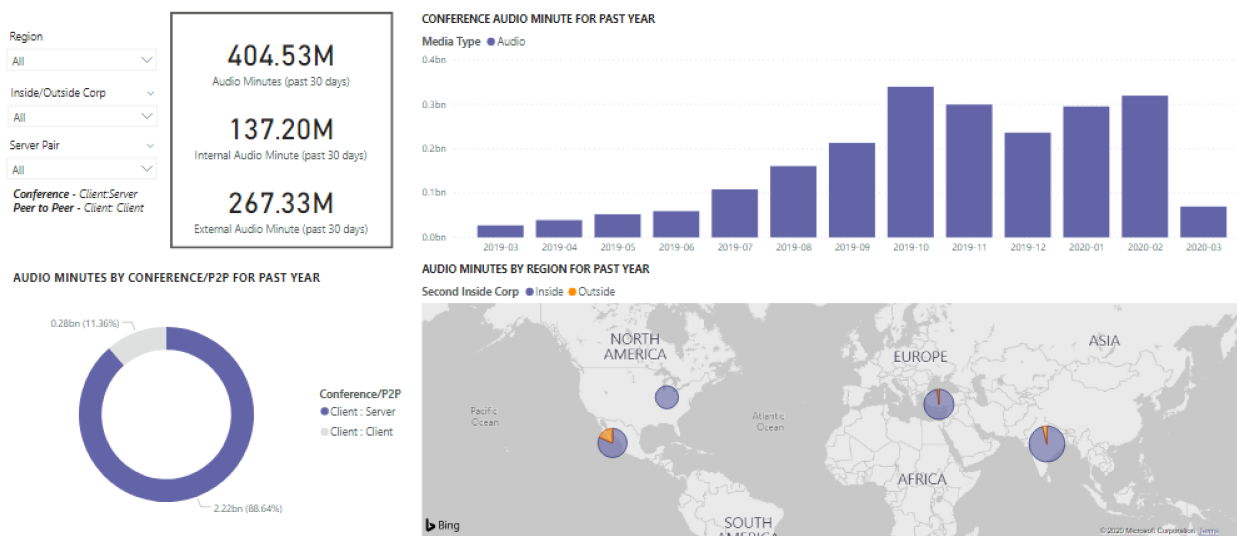

VBSS STREAM COUNT BY CONFERENCE/P2P FOR PAST 30 DAYS

compared to P2P.

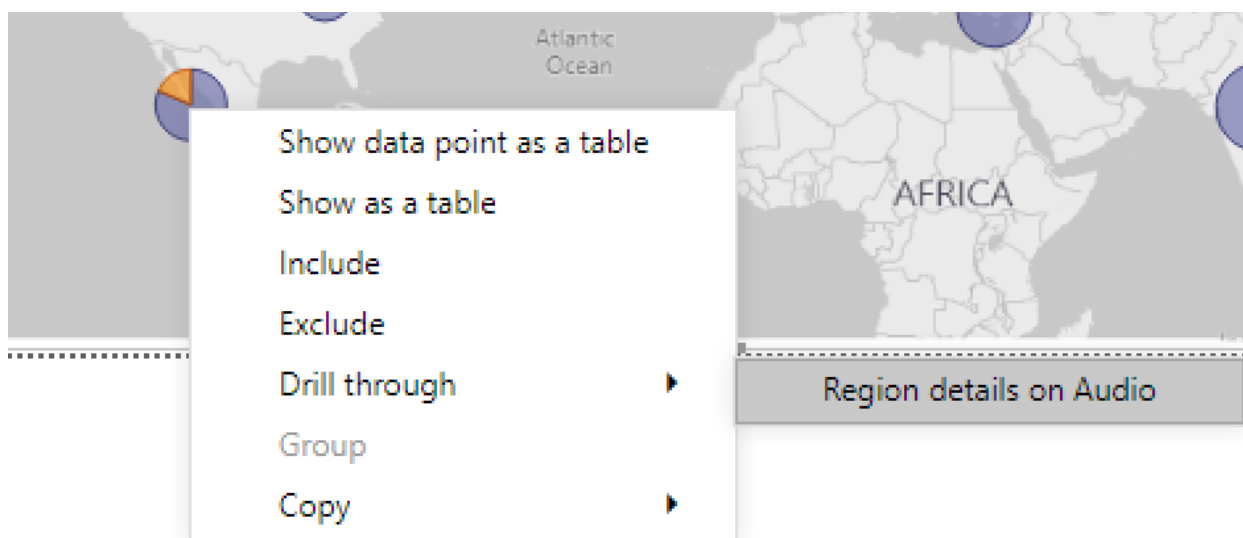

On the Audio Minutes usage report, the total minute usage is provided through a few different views.

We have the thirty-day usage summary shown next to the slicers as easy to consume text boxes. The top number shows the thirty-day total, with internal and external breakdowns below that.

The top right bar graph provides a yearlong view of conference audio usage. Hover over the month to show the conference audio minutes.

To show the difference in P2P and conference audio, the bottom left chart takes all audio for the past year and breaks it up between the two types.

The last chart for the Audio minutes page shows audio minute usage on a global map overlay. This chart will only work if building and subnet data is uploaded to the tenant. The pie chart overlay on the map can be drilled into, subsequently providing regional audio usage.

Drill-through capabilities

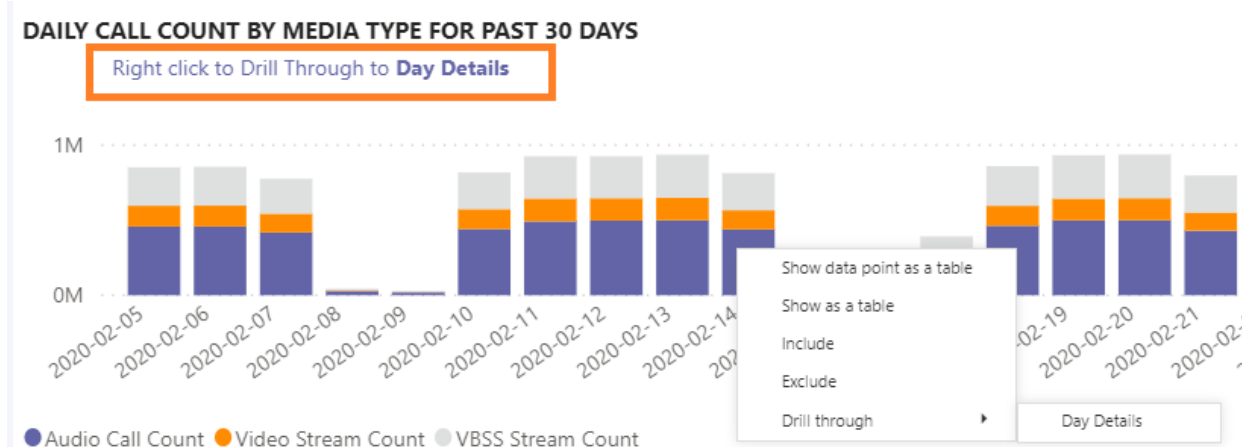

As previously noted, users can drill into the daily and regional usage reports.

Daily Usage

The Daily Usage report allows an administrator to identify peak consumption periods through the course of a day. In addition to usage, we are also able to capture overall user sentiment and feedback for that day.

The Daily usage report displays the number of Audio, Video and Screen shares for the selected day with the added ability to differentiate between internal and external connectivity. A Conference and Peer to Peer breakdown is to the immediate right of the modality total box. The top right of the report provides a list of conferences with their associated ID and participants for the day. The conference list provides an additional drill down to the Conference Details report as well. REPLACE GRAPHIC

The bar graph in the center area allows the user to identify peak consumption periods through the course of a day. Users may drill down into the hour represented on the graph which will present the User List report for the hour.

To the right of the bar graph, User Feedback is presented in a visual format. While user sentiment can be subjective, it does provide insight that can be used to identify potential issues.

The bottom table provides a range of metrics for the day. Poor percentages along with failure rates can provide an administrator with potential areas of improvement. Each hour can also be selected individually as shown below.

This data can be used to identify regions having problems during peak consumption times.

Click on the column for that day to display metrics for that hour.

HOURLY TREND BY MEDIA TYPE (UTC)

1. The table below the chart will display the metrics for that hour. This can be sorted by any column header; however, we would be interested in finding problematic areas.

Hour	Region	Media Type	Server Pair	Audio Call Count	Video Call Count	VBSS Stream Count	nPCR	Setup Failure Rate	Dropped Failure Rate	User Rating Count	Avg Rating	Rating Poor Percent
10		Video	Client : Server	0	2,614	0	11.39	0.11	2.57	45	4.58	8.89
10		Audio	Client : Server	28,016	0	0	5.84	0.32	1.30	500	4.54	8.40
10		Audio	Client : Client	10,339	0	0	10.99	0.79	1.66	320	4.74	6.88
10		VBSS	Client : Server	0	0	19,011	4.37	0.03	1.59	188	4.61	6.38
10		VBSS	Client : Client	0	0	5,103	4.07	21.44	8.18	78	4.81	3.85
10	AMR	Video	Client : Client	0	4	0		40.00	0.00	0	NaN	NaN
10	ARA	Video	Client : Client	0	13	0	7.69	14.29	0.00	0	NaN	NaN
10	IND	Video	Client : Server	0	746	0	12.98	0.00	0.51	15	3.93	26.67
10	IND	Audio	Client : Server	13,308	0	0	2.69	0.03	0.14	362	4.76	3.87
10	IND	VBSS	Client : Server	0	0	10,100	3.80	0.00	0.30	140	4.84	2.14
10	IND	Audio	Client : Client	6,136	0	0	8.07	0.28	0.69	224	4.79	1.79

2. We see that the IND region is experiencing poor video performance in conferences during this time frame. Subsequently, the CQD QER Microsoft reports can be used to narrow down the problematic location as the region and time frame has been identified.

Conference Details

The Conference Details report provides additional insight for meetings, from an attendee list, to the media types used during the session.

Right click a conference the participant bar in the conference ID chart on the Daily usage page to drill down into the conference details.

Regional Audio Details

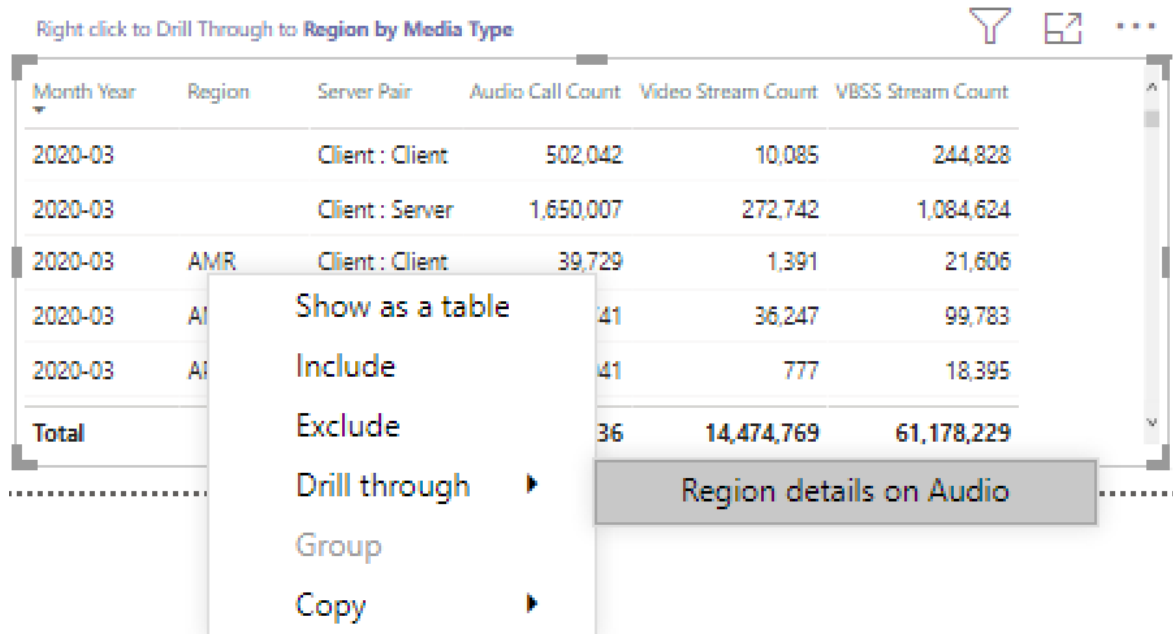

The Regional Audio Details drill down specifically shows the audio minute usage for the selected region. Users with access to CQD can see usage trends for both P2P and conference audio within the selected region.

1. On the Call Count Summary page, drill-through to as specific region through the table.

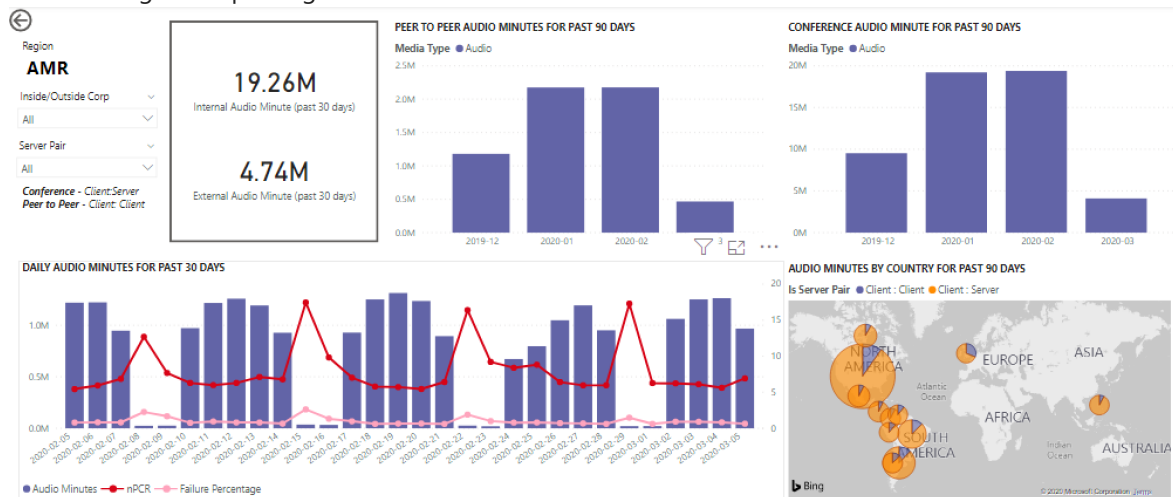

Right click to Drill Through to Region by Media Type

Month Year	Region	Server Pair	Audio Call Count	Video Stream Count	VBSS Stream Count
2020-03		Client : Client	211,943	15,891	80,915
2020-03		Client : Server	1,164,776	414,309	690,201
2020-03	ASIA	Client : Client	21,336	1,333	10,585
2020-03	ASIA	Client : Server	84,521	22,122	60,110

2. Select the row with the region additional information is needed for.

3. The data trends show a significant number of minutes being used on the internal network, with conferencing far surpassing P2P use.

The regional audio trend can be used to show how users are impacted by external influences in the world. Specifically, right now, we would expect to see the external usage for the EMEA and APAC regions to increase with people being asked to work remotely.

User List

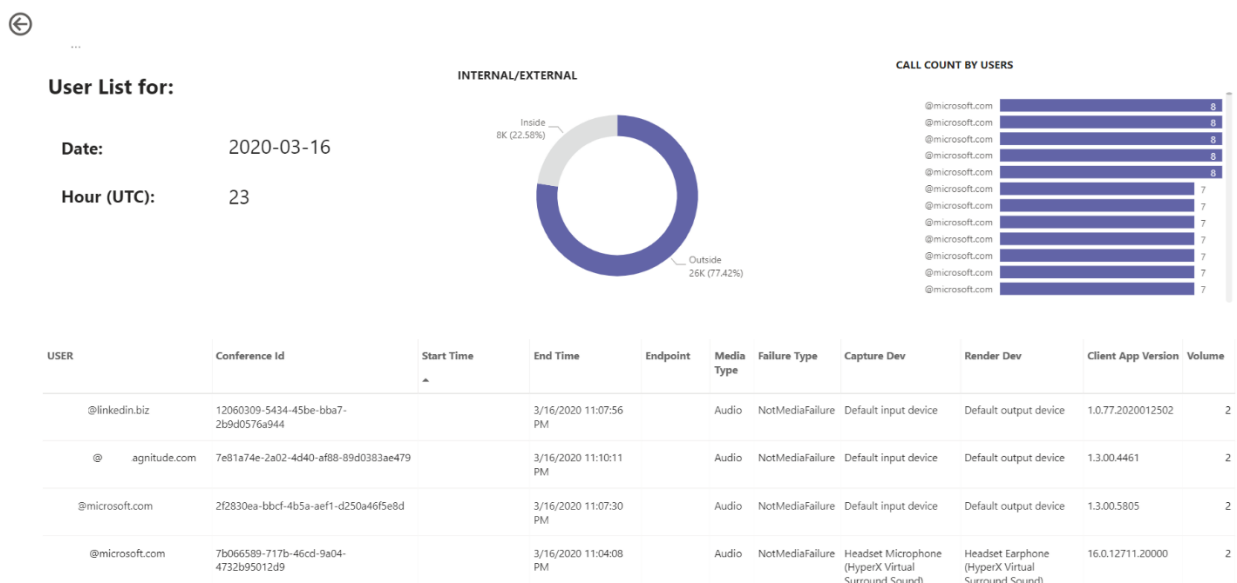

The User List drill down provides, as one might expect, user specific information for a specific hour selected by the person viewing the report. The User List report is accessible through a drill down in the Hourly Trends graph on the Daily Usage report. Right click on the hour additional information is needed for and select Drill through and User List, as shown below.

The User List report shows internal/external connectivity through the doughnut chart in the top center of the

page. We can see that there is a large amount of participation from Outside the corporate network in the below image.

The top right of the graph shows the number of calls made by each user within that hour.

The bottom table provides detailed information for the sessions each user participated in during that hour. The Failure Type column is useful in determining what caused a call to drop. The Capture and Render Device columns are useful in identifying why a call was reported having poor quality.

Using the CQD PSTN Direct Routing report

12/7/2021 • 5 minutes to read • [Edit Online](#)

New in March 2020, we've added a Microsoft Teams Call Quality Dashboard (CQD) PSTN Direct Routing report to our downloadable [Power BI query templates for CQD](#).

The CQD PSTN Direct Routing report (CQD PSTN Direct Routing Report.pbit) helps you understand the usage patterns and quality of your PSTN services. Use this report to monitor service usage, information about your Session Border Controller (SBC), the telephony service, network parameters, and Network Effectiveness Ratio details. This information can help you identify issues, including the reason for dropped calls. For example, you'll be able to see when volume drops, or how many calls get affected and for what reason.

The CQD PSTN Direct Routing Report has four sections:

- [PSTN Overview](#)
- [Service Details](#)
- [Network Effectiveness Ratio](#)
- [Network Parameters](#)

Highlights

1. Analyze by call type, SBC, caller and callee country

The CQD PSTN Direct Routing report aggregates reliability and usage metrics for all SBCs on your tenant for the last 7, 30, or 180 days (6 months). You can analyze data by call type, SBC, caller and callee country. If you're interested in a particular SBC or country, you'll be able to identify changes in trends over the selected time range.

PSTN Call Type	Session Border Controller (SBC)	Caller Country	Callee Country	Hour
All	All	All	All	All

2. Track trends

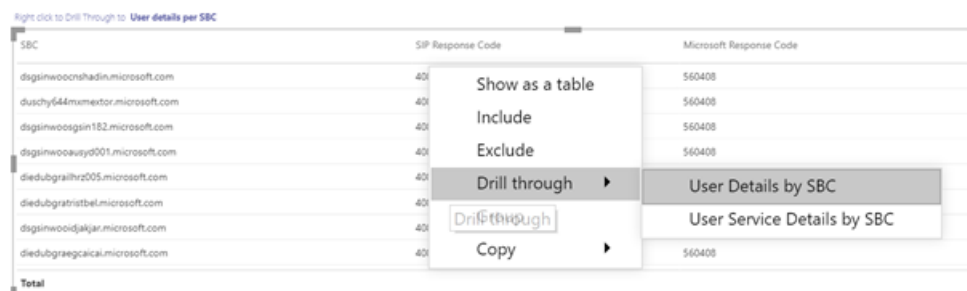

Trends analysis is essential when trying to understand service usage and reliability. Hourly trends provide a close look at daily performance, which helps identify real-time incidents. Daily trends let you see your service health from a long-term perspective. It's important to be able to shift between those two modes with appropriate data granularity. The CQD PSTN Direct Routing report provides 6-month trends overview, 7- and 30-day daily trends, and hourly trends so you can analyze performance at each level.

3. Drill through to SBC or user level

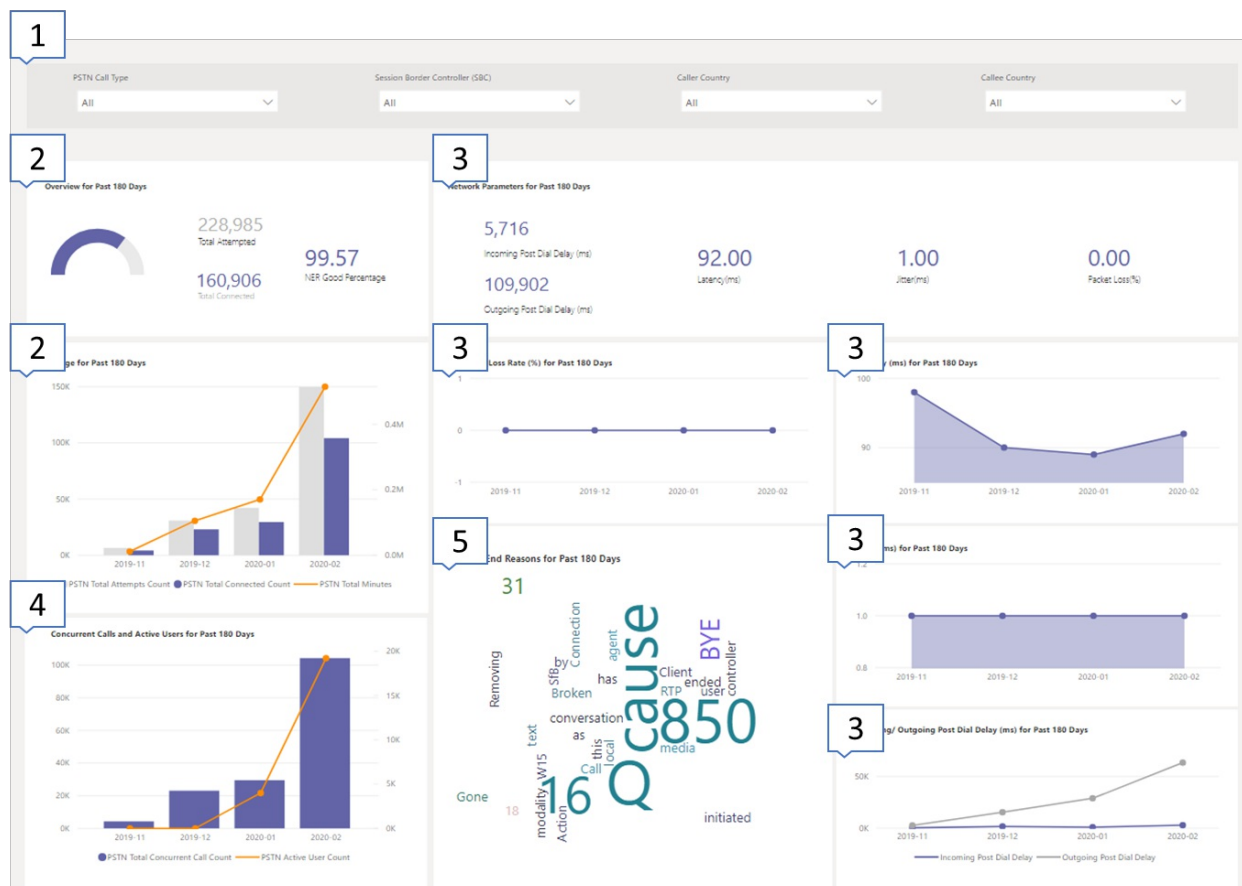

We've been building in drill-through capability on many data categories in CQD, which lets you quickly understand usage or reliability distribution at the SBC or user level. By using drill through, you can quickly pinpoint issues and understand real user impact. The CQD PSTN Direct Routing report features

drill through on the Service Detail and Network Effectiveness Ratio metrics. Click the data point you're interested in to drill through to SBC- or user-level details.

PSTN Overview

The CQD PSTN Direct Routing Report provides the following information related to overall health of the service for the past 180 days.

For example, if you are interested in the overall usage and health about all inbound calls going through SBC abc.bca.adatum.biz with US as the internal country:

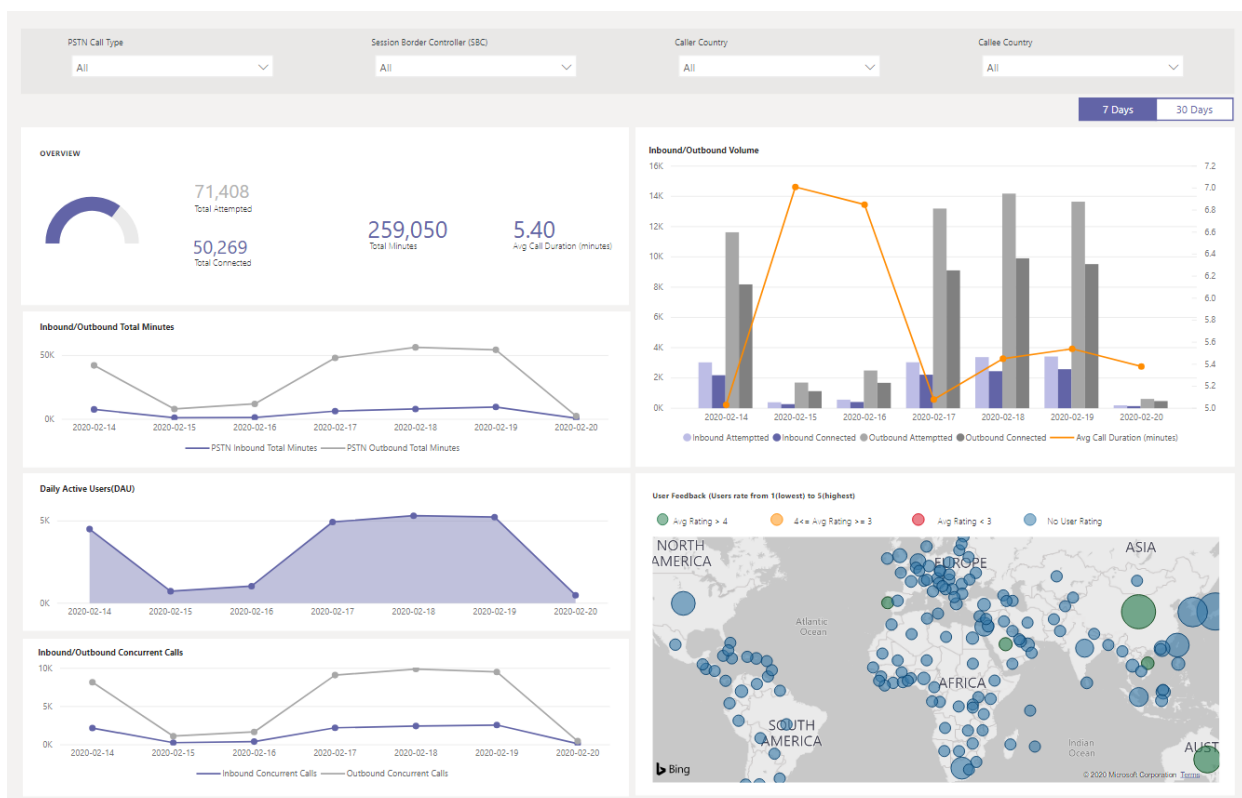

CALL OUT	DESCRIPTION
1	You can use the filters at the top to drill down and select ByotIn as call type, abc.bca.contoso.com as Session Boarder Controller, and US as internal country.
2	Usage trend for the past 180 days. You can find usage detail report on Service Detail page.
3	Post Dial Delay, Latency, Jitter, and Packet Loss trend for the past 180 days. You can find detail report on Network Parameters page.

CALL OUT	DESCRIPTION
4	Concurrent Call and Daily Active User trend for the past 180 days. This chart can help you understand the max volume of the service.
5	Top Call End Reason affected service quality for the past 180 days. You can find service health detail on Network Effective Ratio(NER) page.

Service Details

This page provides service usage trends per day and user feedback breakdown by geographic.

- **Total Attempt Calls** – Total attempt calls in that time range, including both success and failed calls
- **Total Connected Calls** - Total connected calls in that time range
- **Total Minutes** – Total minute usage in that time range
- **Daily Active Users(DAU)** – Count of daily active user who made at least one connected call in that day
- **Concurrent Calls** – Max of simultaneous active calls in a minute
- **User Feedback** – "Rate My Call" score comes from the user. 3-5 is considered as a good call. 1-2 is considered as a bad call.

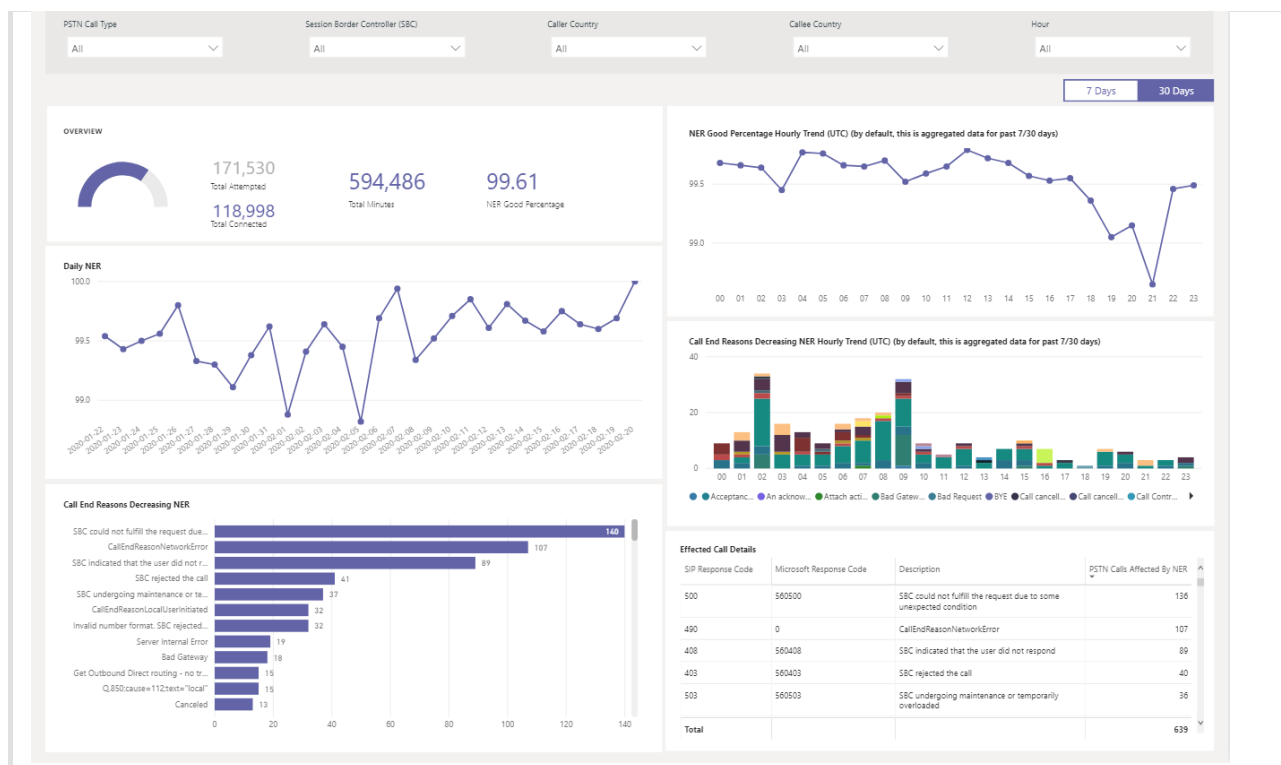

For example:

1. If you see average call duration drops to 0 at 02/14/2020, you can first check if the call volume looks normal and see if there is a big discrepancy between total connect calls and total attempt calls. Then go to Network Effectiveness Ratio page to invest on call failure reasons.
2. If you see increasing red spots on the user feedback map, you could go to Network Effectiveness Ratio page and Network Parameter to see if there are any anomalies and you could raise a ticket using MS

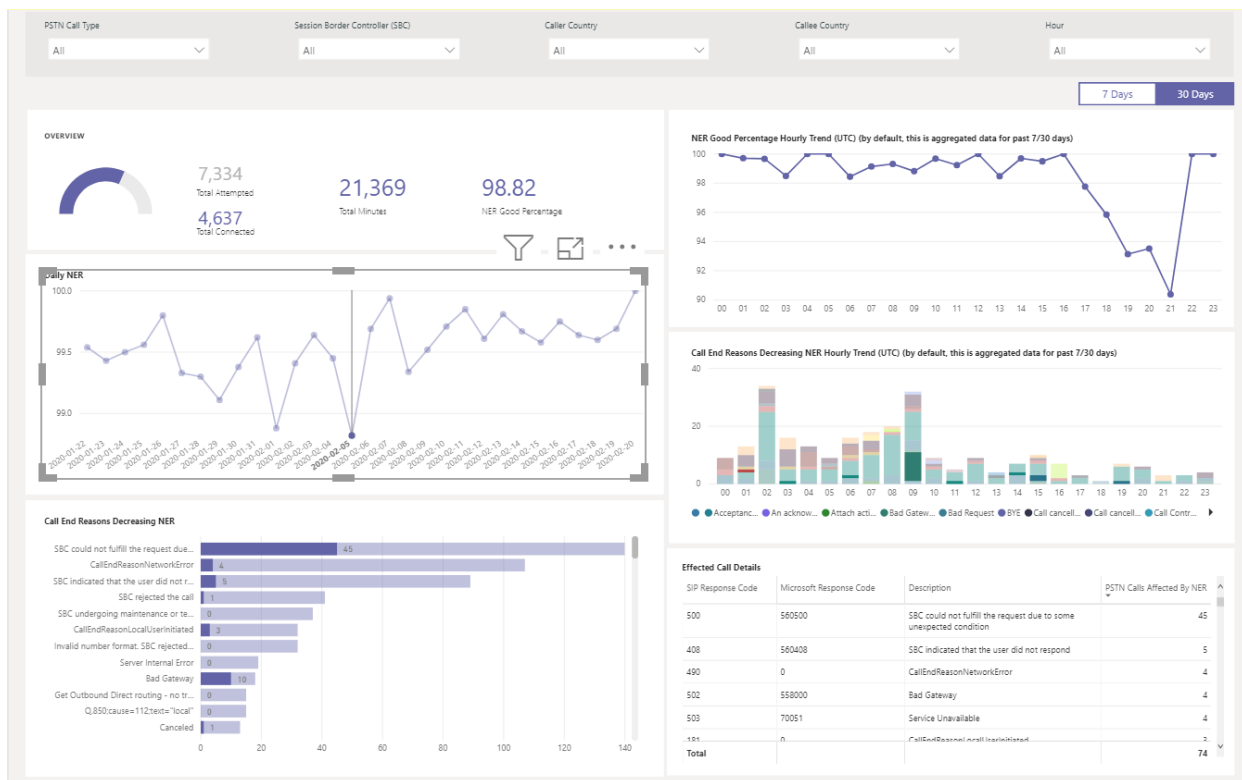

Network Effectiveness Ratio

This is the same metric that appears on the Overall Health dashboard. You can check hourly NER number with affected calls detail for both call directions (inbound/outbound) on the Hourly network effectiveness ratio and call ending reason chart below.

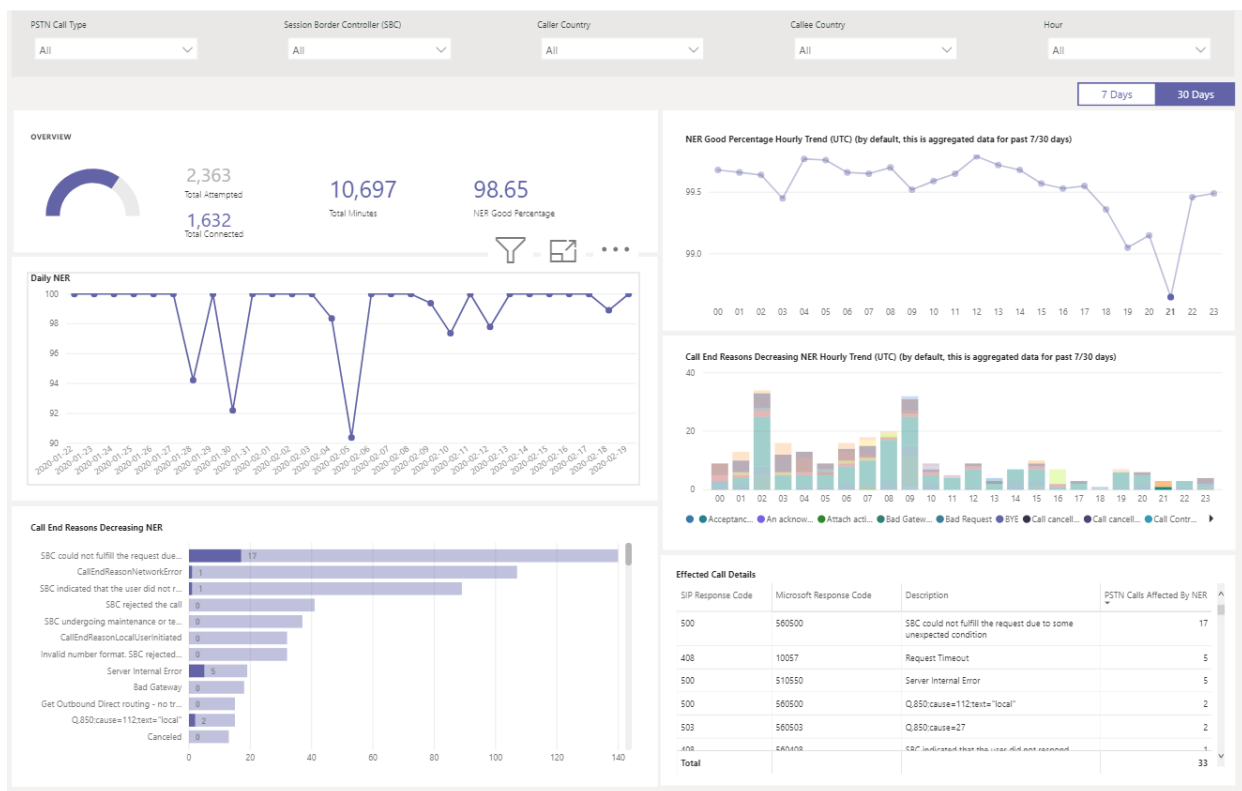

- **NER** - The ability (%) of a network to deliver calls by measuring the number of calls sent versus the number of calls delivered to a recipient.
- **SIP response code**- A three-digit integer response code shows the call status.
- **Microsoft response code**-A response code sent out from Microsoft component.
- **Description** – The reason phase that corresponding to the SIP response code and Microsoft response code.
- **Number of calls affected** – The total number of calls got affected during the selected time range.

For example:

If Daily NER has a dip on 02/05/2020, you can click on the date and other charts will zoom to that specific date.

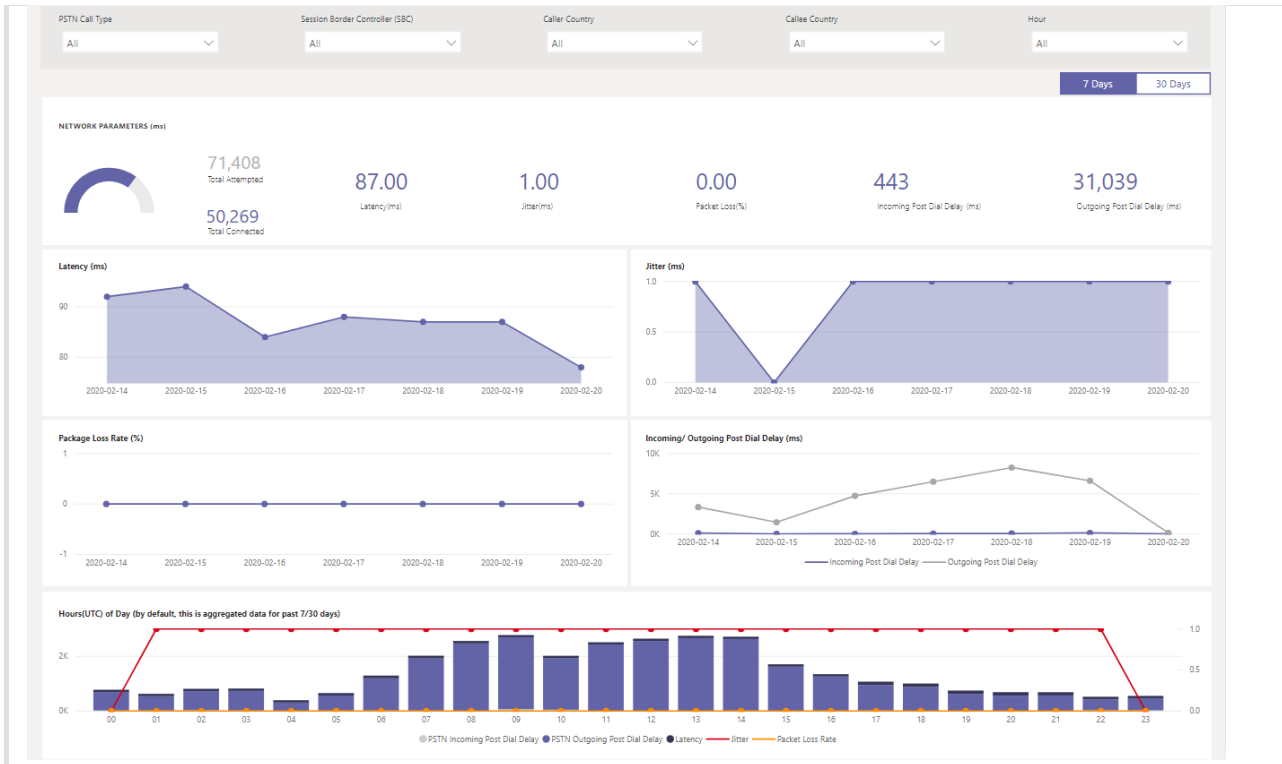

From the NER Good Percentage Hourly Trend, you can find the dip happens around 21:00. Then click again to zoom to hour 21 and check Effectuated Call Details to see how many calls failed in that hour and what are the call end reasons. You can start with self-trouble shooting on any SBC problems or report to Service Desk if the problem is not related to SBC.

Network Parameters

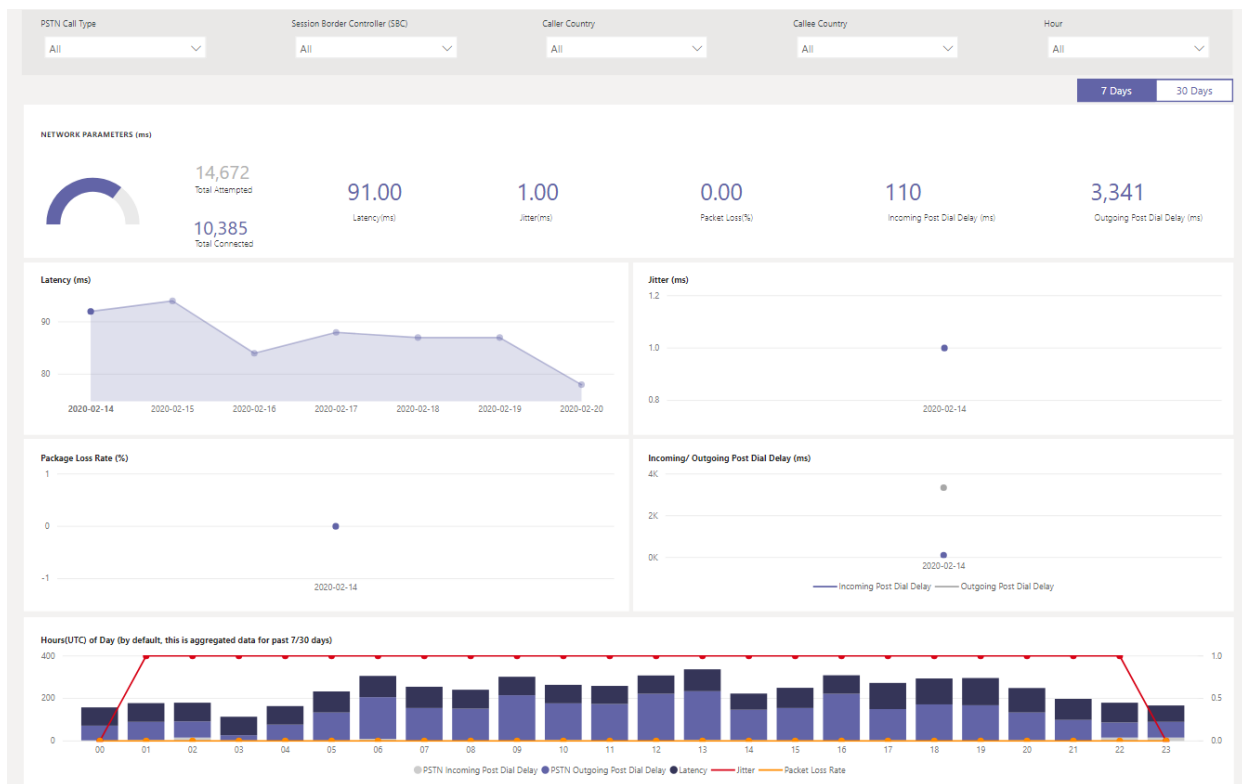

All network parameters are measured from the Direct Routing interface to the Session Border Controller. For information about the recommended values, see [Prepare your organization's network for Microsoft Teams](#), and look at the Customer Edge to Microsoft Edge recommended values.

- **Jitter** – Is the millisecond measure of variation in network propagation delay time computed between two endpoints using RTCP (The RTP Control Protocol).
- **Packet Loss** – Is a measure of packet that failed to arrive; it is computed between two endpoints.
- **Latency** - (Also known as round trip time) is the length of time it takes for a signal to be sent plus the length of time it takes for the acknowledgment of that signal to be received. This time delay consists of the propagation times between the two points of a signal.

For example:

If you see a spike on any of the four charts (Latency, Jitter, Package Loss Rate, Post Dial Delay) for a specific date, for example, Latency on 02/14/2020, click on the date point. And the hourly trend chart at the bottom will refresh to show the hourly number. You can check the SBCs or raise a ticket with MS Service Desk.

[Teams Troubleshooting](#)

Set up call analytics for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

As a Microsoft Teams admin, you can use per-user call analytics to troubleshoot Teams call quality and connection problems for **individual users**. To take full advantage of call analytics, set up the following:

- Assign specialized support roles to people, such as helpdesk agents, to let them view call analytics for users. These support roles can't access the rest of the Teams admin center.
- Add building, site, and tenant information to per-user call analytics by uploading a .tsv or .csv data file.

When you're ready to start using per-user call analytics, read [Use per-user call analytics to troubleshoot poor call quality](#).

Give permission to support and helpdesk staff

As the Teams admin, you have full access to call analytics information for all users. We've created some specialized Azure Active Directory roles that you can assign to support staff and helpdesk agents so they can also access per-user call analytics (without having access to the rest of the Teams admin center). Assign the **Teams communications support specialist** role to users who should have a limited view of per-user call analytics (Tier 1 support). Assign the **Teams communications support engineer** role to users who need full access to per-user call analytics (Tier 2 support). Neither role has access to the rest of the Teams admin center.

To learn what each of these roles does, read [What does each Teams Support role do?](#)

For more information about Teams admin roles, see [Use Teams admin roles to manage Teams](#). To learn how to assign admin roles in Azure Active Directory, see [View and assign roles in Azure Active Directory](#).

To learn how to assign administrative roles in Azure Active Directory, see [View and assign roles in Azure Active Directory](#).

Upload a .tsv or .csv file to add building, site, and tenant information

You can add building, site, and tenant information to per-user call analytics by uploading a .csv or .tsv file. With all this information, call analytics can map IP addresses to physical locations. Admins and helpdesk agents can use this information to help spot trends in call problems. For example, why are users in the same building having similar call quality problems?

If you're a Teams or Skype for Business admin, you can use an existing tenant and building data file from the Teams or Skype for Business Call Quality Dashboard (CQD). First, you download the file from CQD, then upload it to call analytics.

- To download an existing data file, go to **Microsoft Teams admin center** > **Analytics & reports** > **Call Quality Dashboard** > **Upload now**. In the **My uploads** list, click **Download** next to the file you want.
- To upload the new file, go to **Microsoft Teams admin center** > **Locations**, and then select **Upload location data** or **Replace location data**.

If you're creating the .tsv or .csv file from scratch, see [Upload tenant and building data](#).

Use per-user call analytics to troubleshoot poor call quality

Teams Troubleshooting

Use Call Analytics to troubleshoot poor call quality

12/7/2021 • 5 minutes to read • [Edit Online](#)

This article explains how to use Call Analytics to troubleshoot poor Microsoft Teams call or meeting quality for individual users if you hold the Teams Administrator, Teams communications support specialist, or Teams communications support engineer role.

Call Analytics permissions

This article assumes that you've already set up Call Analytics. If you haven't, read [Set up call analytics for Teams](#).

Introduction to Call Analytics

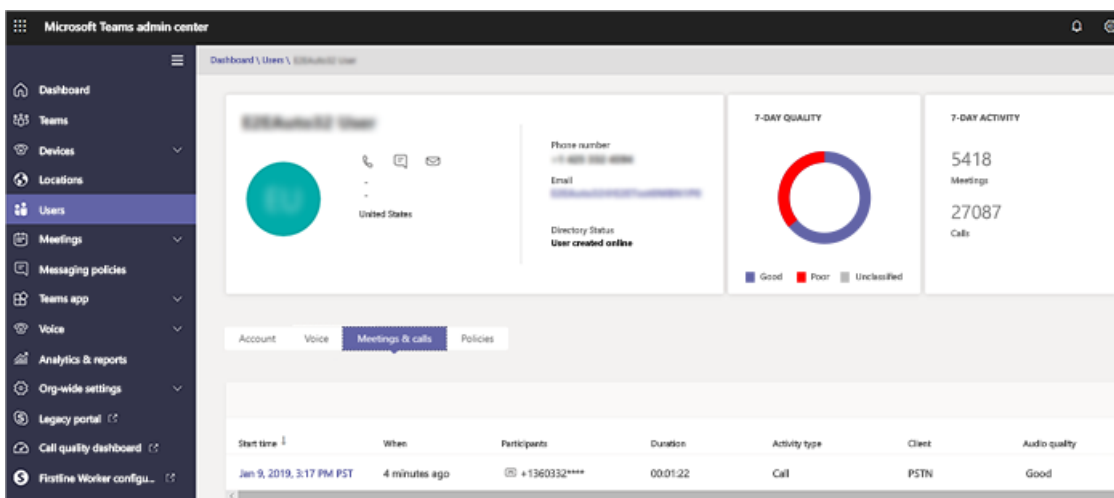

Call Analytics shows detailed information about Teams calls and meetings for each user in your Office 365 account. It includes information about devices, networks, connectivity, and call quality (any of these can be a factor in poor call or meeting quality). If you upload building, site, and tenant information, this information will also be shown for each call and meeting. Use Call Analytics to help you figure out why a user had a poor call or meeting experience.

Call Analytics shows you each leg of a call or meeting - for example, from one participant to a second participant. By analyzing these details, a Teams admin can isolate problem areas and identify the root cause for poor quality.

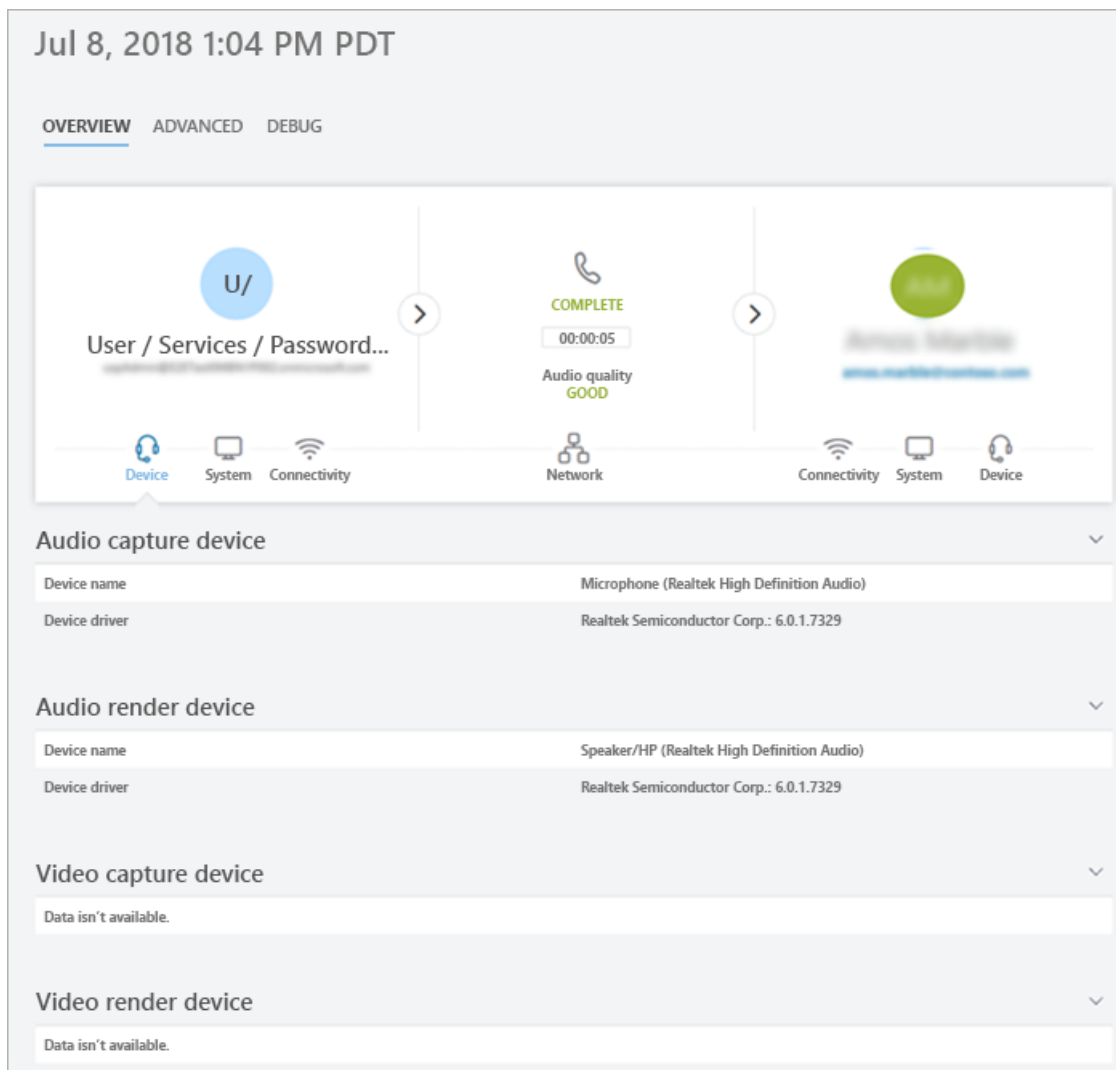

As the Teams admin, you get full access to all Call Analytics data for each user. In addition, you can assign Azure Active Directory roles to support staff. To learn more about these roles, read [Give permission to support and helpdesk staff](#). Don't miss [What does each Teams Support role do?](#) below.

Where to find per-user Call Analytics

To see all call information and data for a user, go to the [Teams admin center](#). Under **Users**, select a user and then open the **Meetings & Calls** tab on the user's profile page. Here you'll find all calls and meetings for that user for the last 30 days.

To get additional information about a given session, including detailed media and networking statistics, click a session to see the details.

What does each Teams Support role do?

The **Teams communications support specialist** (Tier 1 support) handles basic call-quality problems. They don't investigate issues with meetings. Instead, they collect related information and then escalate to a Teams communications support engineer.

The **Teams communications support engineer** (Tier 2 support) sees information in detailed call logs that are hidden from the Teams communications support specialist. The table below lists the information available to each Teams communication support role.

The following table tells you what per-user information is available for each communications support role.

ACTIVITY	INFORMATION	WHAT THE COMMUNICATIONS SUPPORT <i>SPECIALIST</i> SEES	WHAT THE COMMUNICATIONS SUPPORT <i>ENGINEER</i> SEES
Calls	Caller name	Only the name of the user for whom the agent searched.	User name.
	Recipient name	Shows as Internal User or External User.	Recipient name.

ACTIVITY	INFORMATION	WHAT THE COMMUNICATIONS SUPPORT <i>SPECIALIST</i> SEES	WHAT THE COMMUNICATIONS SUPPORT <i>ENGINEER</i> SEES
	Caller phone number	Entire phone number except last three digits are obfuscated with asterisk symbols. For example, 15552823***.	Entire phone number except last three digits are obfuscated with asterisk symbols. For example, 15552823***.
	Recipient phone number	Entire phone number except last three digits are obfuscated with asterisk symbols. For example, 15552823***.	Entire phone number except last three digits are obfuscated with asterisk symbols. For example, 15552823***.
	Call Details > Advanced tab	Information not shown.	All details shown, such as device names, IP address, subnet mapping, and more.
	Call Details > Advanced > Debug tab	Information not shown.	All details shown, such as DNS suffix and SSID.
Meetings	Participant names	Only the name of the user for whom the agent searched. Other participants identified as Internal User or External User.	All names shown.
	Participant count	Number of participants.	Number of participants.
	Session details	Session details shown with exceptions. Only the name of the user for whom the agent searched is shown. Other participants identified as Internal User or External User. Last three digits of telephone number obfuscated with asterisk symbols.	Session details shown. User names and session details shown. Last three digits of telephone number obfuscated with asterisk symbols.

NOTE

The information contained in the Debug tab contains telemetry and service diagnostic data meant to assist Microsoft support engineers. Without the context of the additional data available to support engineers, it may appear to be redundant, inaccurate, or confusing. While we make it available for advanced users who are looking for another level of detail in troubleshooting call issues, we don't recommend making judgments based on this data without Microsoft support.

Troubleshoot user call quality problems

1. Open the Teams admin center (<https://admin.teams.microsoft.com>) and sign in with your Teams communications support or Teams Administrator credentials.
2. On the **Dashboard**, in **User Search**, start typing either the name or SIP address of the user whose calls

you want to troubleshoot, or select **View users** to see a list of users.

3. Select the user from the list.
4. Select **Call history**, and then select the call or meeting that you want to troubleshoot.
5. Select the **Advanced** tab, and then look for yellow and red items which indicate poor call quality or connection problems.

In the session details for each call or meeting, minor issues appear in yellow. If something is yellow, it's outside of normal range, and it may be contributing to the problem, but it's unlikely to be the main cause of the problem. If something is red, it's a significant problem, and it's likely the main cause of the poor call quality for this session.

In rare cases, Quality of Experience data isn't received for audio sessions. Often this is caused by the a dropped call or when the connection with the client terminates. When this occurs, the session rating is **unavailable**.

For audio sessions that do have Quality of Experience (QoE) data, the following table describes major issues that qualify a session as **poor**.

ISSUE	AREA	DESCRIPTION
Call setup	Session	The error code Ms-diaq 20-29 indicates the call setup failed. The user couldn't join the call or meeting.
Audio network classified poor call	Session	Network quality issues (such as packet loss, jitter, NMOS degradation, RTT, or concealed ratio) were encountered.
Device not functioning	Device	A device isn't functioning correctly. Device not functioning ratios are: DeviceRenderNotFunctioningEventRatio >= 0.005 DeviceCaptureNotFunctioningEventRatio >= 0.005

Use real-time telemetry to troubleshoot poor meeting quality

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article explains how to use Real-Time Analytics (RTA) to troubleshoot poor Microsoft Teams meeting quality for individual users. You can access Real-Time Analytics if you have one of the following roles:

- Teams Administrator
- Teams Communications Support Specialist
- Teams Communications Support Engineer

For more information on Teams admin roles, see [Use Microsoft Teams administrator roles to manage Teams](#).

Real-Time Analytics lets IT admins look at their important users' scheduled meetings and see audio, video, content sharing, and network-related issues. As an admin, you can use this telemetry to investigate these issues during meetings and troubleshoot in real time.

What is Real-Time Analytics?

Today, individual meeting troubleshooting is available for Teams administrators through [Call Analytics](#) after the meeting ends. Real-Time Analytics lets admins troubleshoot scheduled meetings while they're in progress.

Real-Time Analytics shows detailed information about Teams meetings for each user in your Office 365 account, updated in real time. It includes information about devices, network, connectivity, audio, video, and content sharing issues, which will help admins troubleshoot call quality more effectively.

As a Teams admin, you get full access to all real-time telemetry data for each user. In addition, you can assign Azure Active Directory roles to support staff. To learn more about these roles, see [Give permission to support and help desk staff](#).

Where to find per-user real-time troubleshooting telemetry

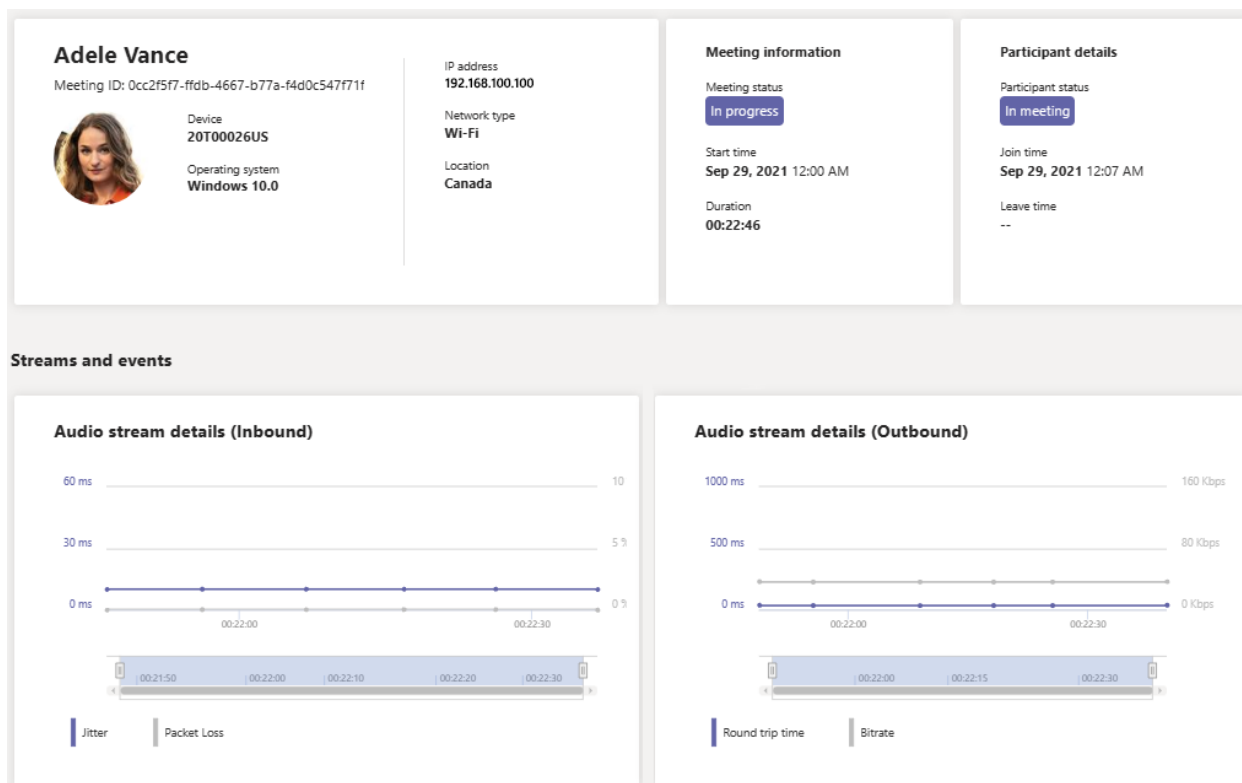

To see all meeting information and data for a user, go to the [Teams admin center](#). Under **Users > Manage users**, select a user, and open the **Meetings & calls** tab on the user's profile page. Under **Recent meetings**, you'll see a list of meetings the user has attended within the past 24 hours *for which real-time telemetry is available*, including any in progress meetings. If the meeting is not in progress or doesn't have real-time telemetry data, it will show up in **Past meetings**.

Meetings & calls

 Grady Archie	12:00 AM	--	00:21:22	192.168.60.9	Canada	--	--	--	--

To look at the telemetry of a given user for an in-progress meeting, including information around device, network, audio, video, and content sharing details, select the **Meeting ID**.

Measures available in Real-Time Analytics

MEASURE NAME	UNITS	GOOD THRESHOLD	DESCRIPTION
Jitter	Milliseconds	Less than 30 ms	Jitter is a measure of the variation in packet delay for a data stream. When this is too high, audio can become choppy.
Packet Loss	Percentage	Less than 5%	Packet loss occurs when data packets fail to reach their destination. The percentage of packets lost is based on the total number of packets sent.

MEASURE NAME	UNITS	GOOD THRESHOLD	DESCRIPTION
Round Trip Time	Milliseconds	Less than 500 ms	Round trip time is the time it takes for a single packet to travel from the client to the remote endpoint and back to the client. High round trip time can cause delays in stream playback. An example of this is when two people in a meeting are unintentionally speaking over each other due to the delay.
Bitrate (Audio)	Kilobits per second (Kbps)	Greater than 24 Kbps	Throughput of the audio stream expressed in kilobits per second.
Bitrate (Video & App sharing)	Megabits per second (Mbps)	Information only	Throughput of the video stream expressed in megabits per second.
Frame Rate (Video)	Frames per second	360p or better: 25-30 FPS 270p or lower: 7-15 FPS	For outbound video streams, frame rate (FPS) is the number of frames per second of video the client is sending. Lower than expected values here may suggest system resource constraints, insufficient network bandwidth, or misbehaving video capture devices. Different resolutions have different acceptable FPS ranges.
Frame Rate (App sharing)	Frames per second (FPS)	Information only	For app sharing, frame rate is content-aware to ensure as many frames as necessary are sent to ensure a good experience while avoiding sending frames if they're not needed. For example, sharing a text document on-screen only requires 1 frame-per-second to produce a good experience, whereas sharing a video or content with more activity will increase frames per second to a maximum of 30 FPS to produce a smoother experience.

Client platforms supported for real-time telemetry

- Windows
- macOS

- Linux
- Android
- iOS

Teams devices with support for real-time telemetry

- MTR - Surface Hub
- MTR - Teams Display
- MTR - Collaboration bar
- IP Phone devices

Limitations

- Real-time telemetry is only available for scheduled meetings. For ad hoc meetings like Meet Now, PSTN, 1:1 calls, and group calls, real-time telemetry isn't available.
- Real-time telemetry is only available for presenters of scheduled live event. It's currently not available for live event attendees.
- Real-time telemetry data is available for a meeting under **Recent meetings** for 24 hours after the meeting has ended. After 24 hours, you can't access the data and the meeting moves to **Past meetings**. If a meeting is longer than 3 hours, real-time telemetry will only be available for the *last 3 hours*.
- Telemetry isn't available in real time when using older versions of Teams. If no telemetry is available, try updating your client.
- If external participants or anonymous users join a meeting, their display name will show as **unavailable** to retain cross-tenant privacy.

Implement Quality of Service (QoS) in Microsoft Teams

12/7/2021 • 11 minutes to read • [Edit Online](#)

Quality of Service (QoS) in Microsoft Teams allows real-time network traffic that's sensitive to network delays (for example, voice or video streams) to "cut in line" in front of traffic that's less sensitive (like downloading a new app, where an extra second to download isn't a large deal). QoS uses Windows Group Policy Objects and Port-based Access Control Lists to identify and mark all packets in real-time streams. This helps your network to give voice, video, and screen share streams a dedicated portion of network bandwidth.

If you support a large group of users who are experiencing any of the problems described in this article, then you probably need to implement QoS. A small business with few users might not need QoS, but even there it should be helpful.

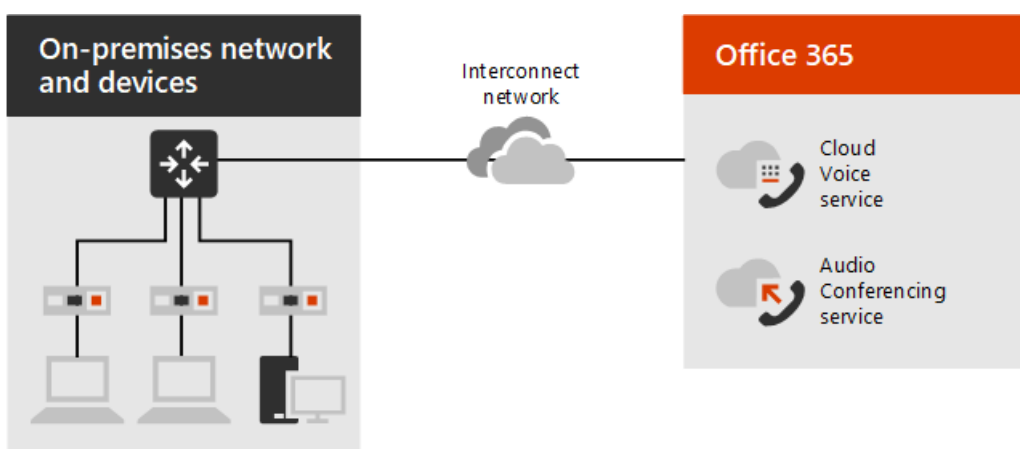

Without some form of QoS, you might see the following quality issues in voice and video:

- Jitter – media packets arriving at different rates, which can result in missing words or syllables in calls
- Packet loss – packets dropped, which can also result in lower voice quality and hard to understand speech
- Delayed round-trip time (RTT) – media packets taking a long time to reach their destinations, which result in noticeable delays between two parties in a conversation and causes people to talk over each other

The least complex way to address these issues is to increase the size of the data connections, both internally and out to the internet. Since that is often cost-prohibitive, QoS provides a way to more effectively manage the resources you have instead of adding bandwidth. To address quality issues, we recommend that you first use QoS, then add bandwidth only where necessary.

For QoS to be effective, you must apply consistent QoS settings throughout your organization. Any part of the path that fails to support your QoS priorities can degrade the quality of calls, video, and screen sharing. This includes applying settings to all user PCs or devices, network switches, routers to the internet, and the Teams service.

Figure 1. The relationship between an organization's networks and Microsoft 365 or Office 365 services

QoS implementation checklist

At a high level, do the following to implement QoS:

1. [Make sure your network is ready.](#)

2. [Select a QoS implementation method.](#)
3. [Choose initial port ranges for each media type.](#)
4. Implement QoS settings:
 - a. On clients using a Group Policy Object (GPO) to [set client device port ranges and markings.](#)
 - b. On routers (see the manufacturer documentation) or other network devices. This might include port-based Access Control Lists (ACLs) or simply defining the QoS queues and DSCP markings, or all of these.

IMPORTANT

We recommend implementing these QoS policies using the client source ports and a source and destination IP address of "any." This will catch both incoming and outgoing media traffic on the internal network.

- c. [Set how you want to handle media traffic for Teams meetings.](#)
5. [Validate your QoS implementation](#) by analyzing Teams traffic on the network.

As you prepare to implement QoS, keep the following guidelines in mind:

- The shortest path to Microsoft 365 is best.
- Closing ports will only lead to quality degradation.
- Any obstacles in between, such as proxies, aren't recommended.
- Limit the number of hops:
 - Client to network edge – 3 to 5 hops
 - ISP to Microsoft network edge – 3 hops
 - Microsoft network edge to final destination – irrelevant

For information about configuring firewall ports, go to [Office 365 URLs and IP ranges](#).

Make sure your network is ready

If you're considering a QoS implementation, you should already have determined your bandwidth requirements and other [network requirements](#).

Traffic congestion across a network will greatly impact media quality. A lack of bandwidth leads to performance degradation and a poor user experience. As Teams adoption and usage grows, use reporting, [per-user call analytics](#), and [Call Quality Dashboard \(CQD\)](#) to identify problems and then make adjustments using QoS and selective bandwidth additions.

VPN considerations

QoS only works as expected when implemented on all links between callers. If you use QoS on an internal network and a user signs in from a remote location, you can only prioritize within your internal, managed network. Although remote locations can receive a managed connection by implementing a virtual private network (VPN), a VPN inherently adds packet overhead and creates delays in real-time traffic. We recommend that you avoid running real-time communications traffic over a VPN.

In a global organization with managed links that span continents, we strongly recommend QoS because bandwidth for those links is limited in comparison to the LAN.

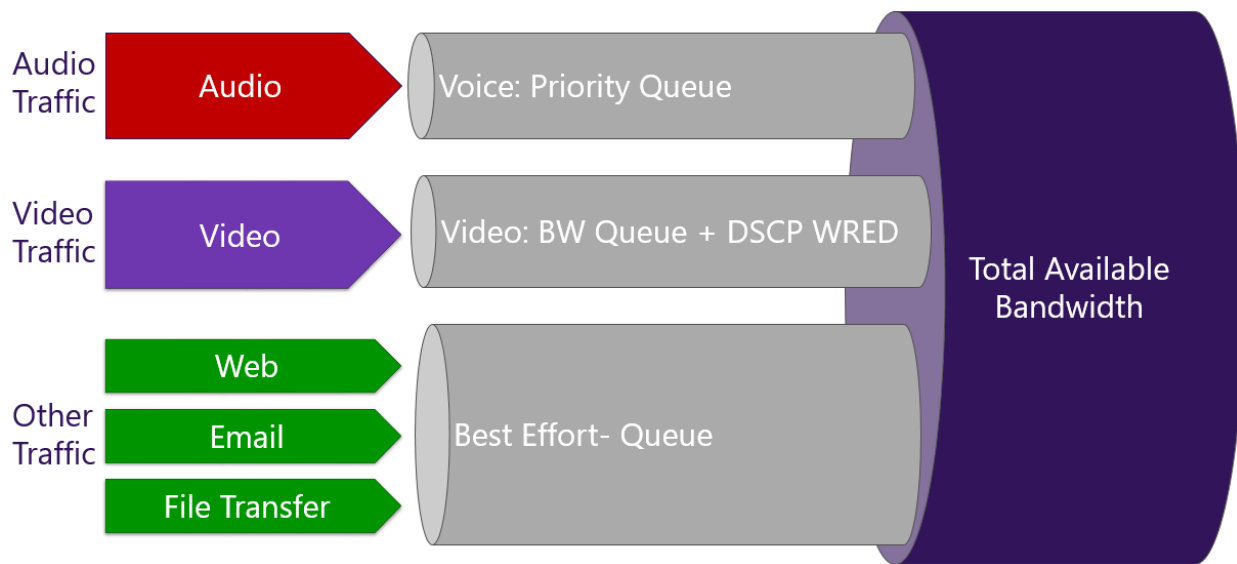

Introduction to QoS queues

To provide QoS, network devices must have a way to classify traffic and must be able to distinguish voice or video from other network traffic.

When network traffic enters a router, the traffic is placed into a queue. If a QoS policy isn't configured, there is only one queue, and all data is treated as first-in, first-out with the same priority. That means voice traffic (which is very sensitive to delays) might get stuck behind traffic where a delay of a few extra milliseconds wouldn't be a problem.

When you implement QoS, you define multiple queues using one of several congestion management features, such as Cisco's priority queuing and [Class-Based Weighted Fair Queueing \(CBWFQ\)](#) and congestion avoidance features, such as [weighted random early detection \(WRED\)](#).

Figure 2. Examples of QoS queues

A simple analogy is that QoS creates virtual "carpool lanes" in your data network so some types of data never or rarely encounter a delay. Once you create those lanes, you can adjust their relative size and much more effectively manage the connection bandwidth you have, while still delivering business-grade experiences for your organization's users.

Select a QoS implementation method

You could implement QoS via port-based tagging, using Access Control Lists (ACLs) on your network's routers. Port-based tagging is the most reliable method because it works in mixed Windows, Mac, and Linux environments and is the easiest to implement. Mobile clients don't provide a mechanism to mark traffic by using DSCP values, so they'll require this method.

Using port-based tagging, your network's router examines an incoming packet, and if the packet arrived using a certain port or range of ports, it identifies it as a certain media type and puts it in the queue for that type, adding a predetermined [DSCP](#) mark to the IP Packet header so other devices can recognize its traffic type and give it priority in their queue.

Although port-based tagging works across platforms, it only marks traffic at the WAN edge (not all the way to the client machine) and creates management overhead. Refer to the documentation provided by the router manufacturer for instructions on implementing this method.

Insert DSCP markers

You could also implement QoS by using a Group Policy Object (GPO) to direct client devices to insert a DSCP marker in IP packet headers identifying it as particular type of traffic (for example, voice). Routers and other network devices can be configured to recognize this and put the traffic in a separate, higher-priority queue.

Although this scenario is entirely valid, it will only work for domain-joined Windows clients. Any device that isn't

a domain-joined Windows client won't be enabled for DSCP tagging. Other clients, such as those running macOS, have hard-coded tags and will always tag traffic.

On the plus side, controlling the DSCP marking via GPO ensures that all domain-joined computers receive the same settings and that only an administrator can manage them. Clients that can use GPO will be tagged on the originating device, and then configured network devices can recognize the real-time stream by the DSCP code and give it an appropriate priority.

Best practice

We recommend a combination of DSCP markings at the endpoint and port-based ACLs on routers, if possible. Using a GPO to catch the majority of clients, and also using port-based DSCP tagging will ensure that mobile, Mac, and other clients will still get QoS treatment (at least partially).

DSCP markings can be likened to postage stamps that indicate to postal workers how urgent the delivery is and how best to sort it for speedy delivery. Once you've configured your network to give priority to real-time media streams, lost packets and late packets should diminish greatly.

Once all devices in the network are using the same classifications, markings, and priorities, it's possible to reduce or eliminate delays, dropped packets, and jitter by changing the size of the port ranges assigned to the queues used for each traffic type. From the Teams perspective, the most important configuration step is the classification and marking of packets. However, for end-to-end QoS to be successful, you also need to carefully align the application's configuration with the underlying network configuration. Once QoS is fully implemented, ongoing management is a question of adjusting the port ranges assigned to each traffic type based on your organization's needs and actual usage.

Choose initial port ranges for each media type

The DSCP value tells a correspondingly configured network what priority to give a packet or stream, whether the DSCP mark is assigned by clients or the network itself based on ACL settings. Each media workload gets its own unique DSCP value (other services might allow workloads to share a DSCP marking, Teams doesn't) and a defined and separate port range used for each media type. Other environments might have an existing QoS strategy in place, which will help you determine the priority of network workloads.

The relative size of the port ranges for different real-time streaming workloads sets the proportion of the total available bandwidth dedicated to that workload. To return to our earlier postal analogy: a letter with an "Air Mail" stamp might get taken within an hour to the nearest airport, while a small package marked "Bulk Mail" mark can wait for a day before traveling over land on a series of trucks.

Recommended initial port ranges

MEDIA TRAFFIC TYPE	CLIENT SOURCE PORT RANGE	PROTOCOL	DSCP VALUE	DSCP CLASS
Audio	50,000–50,019	TCP/UDP	46	Expedited Forwarding (EF)
Video	50,020–50,039	TCP/UDP	34	Assured Forwarding (AF41)
Application/Screen Sharing	50,040–50,059	TCP/UDP	18	Assured Forwarding (AF21)

Be aware of the following when you use these settings:

- If you plan to implement ExpressRoute in the future and haven't yet implemented QoS, we recommend

that you follow the guidance so that DSCP values are the same from sender to receiver.

- All clients, including mobile clients and Teams devices, will use these port ranges and will be affected by any DSCP policy you implement that uses these source port ranges. The only clients that will continue to use dynamic ports are the browser-based clients (clients that let participants join meetings by using their browsers).
- Although the Mac client uses the same port ranges, it also uses hard-coded values for audio (EF) and video (AF41). These values aren't configurable.
- If you later need to adjust the port ranges to improve user experience, the port ranges can't overlap and should be adjacent to each other.

Migrate QoS to Teams

If you've previously deployed Skype for Business Online, including QoS tagging and port ranges, and are now deploying Teams, Teams will respect the existing configuration and will use the same port ranges and tagging as the Skype for Business client. In most cases, no additional configuration will be needed.

NOTE

If you're using Application Name QoS tagging via Group Policy, you must add Teams.exe as the application name.

Implement QoS in Teams on Windows using PowerShell

Set QoS for audio

```
new-NetQosPolicy -Name "Teams Audio" -AppPathNameMatchCondition "Teams.exe" -IPProtocolMatchCondition Both -  
IPSrcPortStartMatchCondition 50000 -IPSrcPortEndMatchCondition 50019 -DSCPAction 46 -NetworkProfile All
```

Set QoS for video

```
new-NetQosPolicy -Name "Teams Video" -AppPathNameMatchCondition "Teams.exe" -IPProtocolMatchCondition Both -  
IPSrcPortStartMatchCondition 50020 -IPSrcPortEndMatchCondition 50039 -DSCPAction 34 -NetworkProfile All
```

Set QoS for sharing

```
new-NetQosPolicy -Name "Teams Sharing" -AppPathNameMatchCondition "Teams.exe" -IPProtocolMatchCondition Both -  
IPSrcPortStartMatchCondition 50040 -IPSrcPortEndMatchCondition 50059 -DSCPAction 18 -NetworkProfile All
```

Managing source ports in the Teams admin center

In Teams, QoS source ports used by the different workloads should be actively managed, and adjusted as necessary. Referring to the table in [Choose initial port ranges for each media type](#), the port ranges are adjustable, but the DSCP markings aren't configurable. Once you have implemented these settings, you might find that more or fewer ports are needed for a given media type. [Per-user call analytics](#) and [Call Quality Dashboard \(CQD\)](#) should be used in making a decision to adjust port ranges after Teams has been implemented, and periodically as needs change.

NOTE

If you've already configured QoS based on source port ranges and DSCP markings for Skype for Business Online, the same configuration will apply to Teams and no further client or network changes to the mapping will be required, though you may have to [set the ranges used in Teams](#) to match what was configured for Skype for Business Online.

If you've previously deployed Skype for Business Server on-premises, you might need to re-examine your QoS policies. Adjust the policies to match port range settings you've verified provide a quality user experience for Teams.

Validate your QoS implementation

For QoS to be effective, the DSCP value set by the GPO needs to be present at both ends of a call. By analyzing the traffic generated by the Teams client, you can verify that the DSCP value isn't changed or stripped out when the Teams workload traffic moves through the network.

Preferably, you capture traffic at the network egress point. You can use port mirroring on a switch or router to help with this.

Implement QoS for other devices

Read these topics for information about implementing QoS for Intune, Surface, iOS, Android, and Mac

- [QoS for Surface Hub 2S](#)
- [QoS for Surface Hub](#)
- [QoS for iOS, Android, and Mac](#)

- [Implement QoS in the Teams client](#)

Implement Quality of Service (QoS) in Microsoft Teams clients

12/7/2021 • 4 minutes to read • [Edit Online](#)

You can use policy-based Quality of Service (QoS) within Group Policy to set the source port range for the predefined DSCP value in the Teams client. The port ranges specified in the following table are a starting point to create a policy for each workload.

Table 1. Recommended initial port ranges

MEDIA TRAFFIC TYPE	CLIENT SOURCE PORT RANGE	PROTOCOL	DSCP VALUE	DSCP CLASS
Audio	50,000–50,019	TCP/UDP	46	Expedited Forwarding (EF)
Video	50,020–50,039	TCP/UDP	34	Assured Forwarding (AF41)
Application/Screen Sharing	50,040–50,059	TCP/UDP	18	Assured Forwarding (AF21)

Wherever possible, configure policy-based QoS settings within a Group Policy object. The following steps are very similar to [Configuring port ranges and a Quality of Service policy for your clients on Skype for Business Server](#), which has some additional details that may not be necessary.

To create a QoS audio policy for domain-joined Windows 10 computers, first log on to a computer on which Group Policy Management has been installed. Open Group Policy Management (click Start, point to Administrative Tools, and then click Group Policy Management), and then complete the following steps:

1. In Group Policy Management, locate the container where the new policy should be created. For example, if all your client computers are located in an OU named **Clients**, the new policy should be created in the Clients OU.
2. Right-click the appropriate container, and then click **Create a GPO in this domain, and Link it here**.
3. In the **New GPO** dialog box, type a name for the new Group Policy object in the **Name** box, and then click **OK**.
4. Right-click the newly created policy, and then click **Edit**.
5. In the Group Policy Management Editor, expand **Computer Configuration**, expand **Windows Settings**, right-click **Policy-based QoS**, and then click **Create new policy**.
6. In the **Policy-based QoS** dialog box, on the opening page, type a name for the new policy in the **Name** box. Select **Specify DSCP Value** and set the value to **46**. Leave **Specify Outbound Throttle Rate** unselected, and then click **Next**.
7. On the next page, select **Only applications with this executable name** and enter the name **Teams.exe**, and then click **Next**. This setting instructs the policy to only prioritize matching traffic from the Teams client.

8. On the third page, make sure that both **Any source IP address** and **Any destination IP address** are selected, and then click **Next**. These two settings ensure that packets will be managed regardless of which computer (IP address) sent the packets and which computer (IP address) will receive the packets.
9. On page four, select **TCP and UDP** from the **Select the protocol this QoS policy applies to** drop-down list. TCP (Transmission Control Protocol) and UDP (User Datagram Protocol) are the two networking protocols most commonly used.
10. Under the heading **Specify the source port number**, select **From this source port or range**. In the accompanying text box, type the port range reserved for audio transmissions. For example, if you reserved ports 50000 through ports 50019 for audio traffic, enter the port range using this format: **50000:50019**. Click **Finish**.
11. Repeat steps 5-10 to create policies for Video and Application/Desktop Sharing, substituting the appropriate values in steps 6 and 10.

The new policies you've created won't take effect until Group Policy has been refreshed on your client computers. Although Group Policy periodically refreshes on its own, you can force an immediate refresh by following these steps:

1. On each computer for which you want to refresh Group Policy, open a Command Prompt as administrator (*Run as administrator*).
2. At the command prompt, enter

```
gpupdate /force
```

Verify DSCP markings in the Group Policy object

To verify that the values from the Group Policy object have been set, perform the following steps:

1. Open a Command Prompt as administrator (*Run as administrator*).
2. At the command prompt, enter

```
gpresult /R > gp.txt
```

This will generate a report of applied GPOs and send it to a text file named *gp.txt*.

For a more readable HTML report named *gp.html*, enter the following command:

```
gpresult /H gp.html
```

3. In the generated file, look for the heading **Applied Group Policy Objects** and verify that the names of the Group Policy objects created earlier are in the list of applied policies.
4. Open the Registry Editor, and go to

HKEY_LOCAL_MACHINE\Software\Policies\Microsoft\Windows\QoS

Verify the values for the registry entries listed in Table 2.

Table 2. Values for Windows registry entries for QoS

NAME	TYPE	DATA
Application Name	REG_SZ	Teams.exe
DSCP Value	REG_SZ	46
Local IP	REG_SZ	*
Local IP Prefix Length	REG_SZ	*
Local Port	REG_SZ	50000-50019
Protocol	REG_SZ	*
Remote IP	REG_SZ	*
Remote IP Prefix	REG_SZ	*
Remote Port	REG_SZ	*
Throttle Rate	REG_SZ	-1

5. Verify that the value for the Application Name entry is correct for the client you're using, and verify that both the DSCP Value and Local Port entries reflect the settings in the Group Policy object.

[Implement Quality of Service \(QoS\) in Teams](#)

Operate your service

12/7/2021 • 28 minutes to read • [Edit Online](#)

This article is part of the Operational Excellence stage of your upgrade journey, which begins as soon as you've completed your upgrade from Skype for Business to Teams.

This article gives an overview of the requirements for successfully operating Teams for your organization after you've upgraded. By properly operating your Teams services, you can be sure you're providing a high-quality, reliable experience for your organization.

Introduction to the Operations Guide

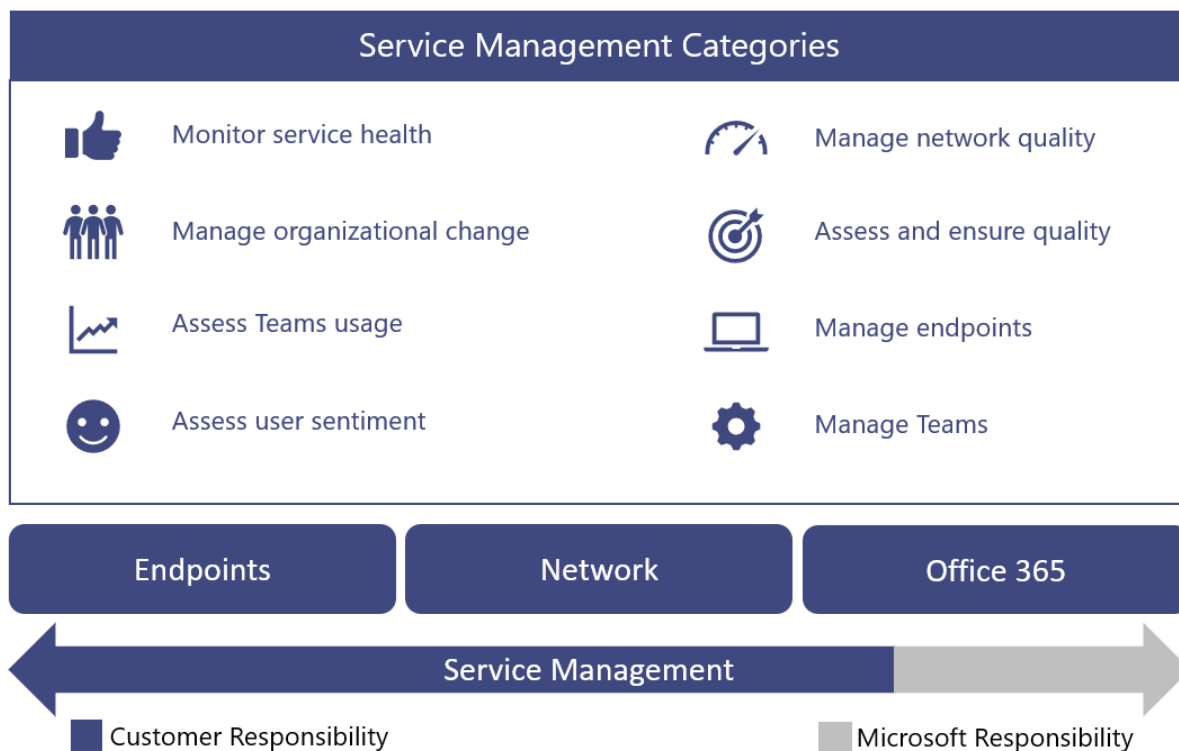

The Operations Guide gives you an overview of all the tasks and activities required as part of the service management function for Microsoft Teams.

Service management is a broad topic that covers day-to-day operations of the Microsoft Teams service after it has been deployed and enabled for users. The Teams service encompasses Microsoft 365 or Office 365 and the infrastructure components that are deployed on-premises (for example, networking).

The notion of service management is most likely not a new concept for most organizations. You might have already implemented processes and tasks that are associated with existing services. That said, you can probably augment your current processes when you plan for service management today to support Teams in the future.

Service management encompasses all the activities and processes involved in managing Teams end to end. As noted earlier, some components of service management—the infrastructure that the Microsoft 365 or Office 365 service itself comprises—are Microsoft's responsibility, whereas you, the customer, are accountable to your users to manage the various aspects of Teams, the network, and endpoints you provide.

The tasks and activities in this guide are grouped into eight categories as depicted in the following diagram. Each of these categories will be expanded upon in the following sections.

<p>Decision points</p>	<ul style="list-style-type: none"> Decide how operations will be implemented for Teams.
<p>Next steps</p>	<ul style="list-style-type: none"> Review the Operations Guide in full. Implement an operations strategy that aligns with your organization's goals to deliver the quality and reliability of Teams workloads. Review the Quality of Experience Review guide. Implement an operations strategy to regularly perform Quality of Experience Reviews to make sure your Teams deployment is operating at its peak capabilities.

Operational role mapping

The planning you undertook for operations during the Envision phase is critical, because operations activities begin when the first pilot users are enabled. This guide lists the activities and tasks that must be performed on a daily, weekly, monthly, or as-needed basis to maintain a high-quality Teams deployment. This guide provides knowledge and guidance for how to perform these critical activities and tasks.

One crucial component of a successful deployment is to ensure that the planning you do early in the Envision phase includes determining who will be responsible for performing specific activities. After you've figured out which tasks and activities apply to your deployment, they need to be understood and followed by the groups or individuals that you assign to them.

Each team you identify must review and agree on the tasks and responsibilities identified and start preparation. This might include training and readiness, providing updates to the staffing plan, or ensuring that external providers are ready to deliver.

The activities and roles defined in this guide should be valid in most scenarios, but every Teams deployment is unique; therefore, you can use this guide as a starting point to customize the activities and default roles to meet your needs.

Ensure that each accountable team has a good understanding of the activities that are required to run the

service. It's critical that each team accepts and signs off on their accountability in your organization before the first pilot begins.

After an agreement is in place, the corresponding teams should start to operationalize their roles.

 Next steps	<ul style="list-style-type: none">• Use this document to facilitate the operational role mapping exercise.• Meet with the respective support teams to assign names to each item in the list of required activities.• Gain acceptance or sign-off on the assigned roles.• Ensure that the corresponding teams have the appropriate training, readiness, and resources to complete the activities required of them.
---	--

Teams service dependencies

Microsoft Teams brings together technologies across Microsoft 365 and Office 365 to provide a hub for teamwork. Examples include:

- Azure Active Directory (Azure AD) provides authentication and authorization services for Teams.
- Exchange Online provides advanced features like legal hold and e-discovery.
- SharePoint Online provides the ability to share files in channels, and OneDrive for Business provides a mechanism for sharing files within a private chat.

Organizations can also leverage existing investments in on-premises infrastructure. For example, existing on-premises Active Directory accounts can be used for authentication by leveraging Azure AD Connect. Certain versions of Exchange Server can be used in place of Exchange Online.

These technologies come together to provide a rich, collaborative, and intelligent communications suite for users. This tight integration is a key benefit of Teams, but it also drives a requirement for service management across these technologies.

This guide covers the key areas of focus to manage the Teams service. Most likely, you have service management plans in place for the supporting technologies that Teams depends on. If not, you'll need to establish proper service management plans for those technology components (both on-premises and online) as well. This will help ensure your users enjoy a high-quality, reliable experience with Teams.

Operations Guide activities

The following sections give an overview of the activities that are required to successfully operate the Microsoft Teams service. They include reference to tools, contextual information, and additional content to help you understand the activity and to assist in readiness initiatives.

Monitor service health

It's important that you understand the overall health of the Microsoft Teams service so that you can proactively alert others in your organization of any event that affects the service. As described earlier, Teams is dependent on other Microsoft 365 and Office 365 services such as Azure Active Directory, Exchange Online, SharePoint

Online, and OneDrive for Business. Because of this, it's equally important that you monitor the health of the dependent services.

Incorporate this activity into your incident management process to proactively inform users, the helpdesk, and your operations teams to prepare to handle user escalations.

The following sections describe the tools that you can leverage to monitor for [service incidents](#) that affect the Teams service. A summary of the benefits of each tool, and when you should use each one, is included in the following table.

MONITORING TOOL	BENEFITS	WHEN TO USE
Microsoft 365 admin center	Available from any device with a supported browser.	Use when you don't need real-time notifications.
Microsoft 365 Admin app	Provides push notifications to your mobile device.	Use when you need to be notified of service incidents while you're on the go.
Microsoft System Center	Integration with Microsoft System Center.	Use when you need advanced monitoring capabilities and notification support.
Microsoft 365 Service Communications API	Programmatic access to Microsoft 365 or Office 365 service health.	Use when you need integration with a third-party monitoring tool or want to build your own solution.

NOTE

Only individuals who are assigned the **global admin** or **service administrator** role can view service health.

Monitoring with the Microsoft 365 admin center

The [Microsoft 365 admin center](#) provides a [Service Health dashboard](#) where you can view the current health of the Teams service in addition to dependent services.

Monitoring with the mobile app

The Microsoft 365 Admin app is available on Apple iOS, Android, and Windows (PC and mobile). The app provides administrators information about service health and upcoming changes. The app supports push notifications that can alert you almost immediately after an advisory has been posted. This helps you stay current on the status, health, and any upcoming changes to the service. The notification support makes it the recommended monitoring tool for administrators. For more information, see:

[Microsoft 365 Admin Mobile App](#)

[Download the Microsoft 365 Admin Mobile App](#)

Monitoring with Microsoft System Center

Microsoft System Center is an integrated management platform that helps you manage datacenter, client devices, and hybrid cloud IT environments. Microsoft 365 or Office 365 administrators who use System Center now have the option to import the Management Pack, which enables them to view all service communications within Operations Manager in System Center. Using this tool gives you access to the status of your subscribed services, active and resolved service incidents, and your Message Center communications (upcoming changes). For more information, refer to the following [blog post](#).

If you leverage System Center to monitor Teams service health (and dependent services), you can further customize the management pack to alert or notify specific groups or individuals who have been identified to

react to incidents. These groups can include service owners, helpdesks, second-level and third-level support groups, and incident managers in your organization.

Monitoring for advanced scenarios

You can monitor service health and upcoming changes by leveraging the Service Communications API to access service health and changes programmatically. Use this API to create your own monitoring tool, or connect your existing monitoring tools to Microsoft 365 or Office 365 service communications, potentially simplifying how you monitor your environment. For more information, see [Microsoft 365 or Office 365 for Enterprise developers](#).

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Monitor service health	Proactively monitor Microsoft Teams service health, (and dependent services) by using the tools available. Dependent services include: Exchange Online, SharePoint Online, OneDrive for Business, Azure Active Directory.	Real-time	
Incident notification	Notify internal stakeholders of events that affect the Teams service. Internal stakeholders can include users, helpdesks, and incident managers.	As needed

[Verify service health for Microsoft Teams](#)

[Service Health and Continuity](#)

Manage organizational change

Microsoft Teams is a cloud-based service. With that comes the ability to provide new features and functionality at a rapid pace. Delivering ongoing innovation provides an obvious benefit to organizations, but these changes need to be managed appropriately within your organization to avoid user resistance or escalations to your helpdesk.

Updates to Teams are rolled out automatically to your users. Your users will always have the latest client and features available in the Teams service. It's not possible to manage the rollout of Teams updates to your users, therefore it's critically important to manage change through effective communication, training, and adoption programs. If your users are aware of the change, educated about the benefits, and empowered to leverage the new capabilities—they'll be able to adapt more quickly and welcome the change.

Monitoring for change

The first step in change management is monitoring the changes that are planned for Teams. The best source for monitoring these changes is the [Microsoft 365 Roadmap](#), which lists features that are currently in development, being rolled out to customers, or have fully launched. You can search for Teams-specific features by using the filter provided, or you can download the roadmap to an Excel file for further analysis. For each feature, the roadmap gives a short description, along with the anticipated release date.

In the [Microsoft Teams blog](#), you can learn about best practices, trends, and news about Teams product updates. Expect to find major feature updates to Teams to be announced here. You can also subscribe to the blog through an RSS feed. You can then add [the RSS feed](#) directly into a Teams channel, so all the important news is delivered directly inside of Teams.

All features that are released are documented in the [Release Notes for Microsoft Teams](#). Here you'll find a list of features that were released for desktop, web, and mobile devices. The same set of release notes are also available on the **What's new** tab in [Help](#).

Become familiar with the resources available, and ensure that you assign applicable owners to monitor for change.

Planning for change

Now that you're aware of upcoming changes to the Teams service, the next step is to prepare and plan accordingly. Assess each change to determine which changes require communication to users, awareness campaigns, training for support teams or users, or feature evaluation and adoption campaigns. This is the primary role of a change management team in your organization. Below is a collection of sample tables that can help you plan for change.

Feature: Cloud Recording (Release date: January 2018)

General track

CHANGE READINESS	STATUS	NOTES/NEXT STEPS	OWNER
Legal review	Completed	This feature is a prerequisite to onboarding the training team.	Project team

Technical change management

CHANGE READINESS	STATUS	NOTES/NEXT STEPS	OWNER
IT changes required	Yes	Admin needs to enable recording for identified users only.	Support team
Technical readiness complete	Yes		Support team

User change management

CHANGE READINESS	STATUS	NOTES/NEXT STEPS	OWNER
User impact	Low		
User readiness required	Yes		
Communications ready	No	Communication email has been drafted—pending review.	Communications Team
Training ready	Yes	Training will leverage existing Microsoft video.	Training Team

Status track

CHANGE READINESS	STATUS	NOTES/NEXT STEPS	OWNER
Release status	in progress	Pending review by executive sponsor.	Change Management Team
Release sign-off			
Release date			

For more information about planning for change management with Teams, see [Create a change management strategy for Microsoft Teams](#).

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Monitor for change	Monitor for upcoming changes to Microsoft Teams service.	Daily	
Planning for change	Evaluate and plan for new features and capabilities, including communication plans, awareness campaigns, and training.	As needed	
User readiness	Perform targeted communication, awareness, or training campaigns to ensure users are ready for the upcoming change.	As needed	
Support team readiness	Perform targeted communication, awareness, or training campaigns to ensure the support team is ready. Support teams can include the "white glove" team, helpdesks, Tier 2 or Tier 3 support, external partners, and so on.	As needed	

Assess Teams usage

After the initial pilot begins, it's critical to establish a regular cadence for measuring actual Teams usage. This enables your organization to gain insights into how actual usage aligns with the usage you predicted during the Envision phase. Although this section focuses on Teams usage, this should be part of a broader effort to measure and assess Microsoft 365 or Office 365 usage overall.

Reviewing usage frequently early in the deployment gives you the opportunity to:

- Validate whether users are using Teams.
- Identify potential adoption challenges before they create critical issues across the organization.
- Understand whether there are discrepancies between the Envision phase requirements and actual usage.

If usage isn't what you expect, this could be due to a deployment issue, or the adoption plan isn't being executed

properly, or some other problem. Depending on the actual reason behind the low usage, the administrator must collaborate with the related teams to help remove usage barriers.

Measuring usage with the Microsoft 365 admin center

Usage data from Teams is available in the Reporting dashboard. Teams usage data can be found in three different reports. The first report provides a cross-product view of how users communicate and collaborate by using the various services in Microsoft 365 or Office 365. This report can be found here: [Microsoft 365 Reports in the admin center - Active Users](#)

The other two reports are Teams-specific, and they provide further detail about Teams usage from a user and device perspective. Both reports can be found here:

[Microsoft Teams device usage report](#)

[Microsoft Teams user activity report](#)

Required permissions

The usage reports in the admin center can be accessed by people who have been assigned a **Global administrator** role, or a product-specific admin role (**Exchange administrator**, **Skype for Business administrator**, **SharePoint administrator**).

In addition, the **Reports reader** role is available for users who require access to the reports, but don't perform any tasks that require administrator-level permissions. You assign this role to provide usage reports to anyone who is a stakeholder, to monitor and drive adoption. For more information about the different roles available, see [About Microsoft 365 admin roles](#).

Assessing usage

After you've used the Reporting dashboard to measure usage, it's important to compare the measured usage against any key success indicators (KSIs) that you defined during the project's Envision phase. You can define a KSI that might be defined as active usage, or one that's indirectly linked to active usage.

It's important to identify any variances between actual and planned usage before resuming the rollout to additional sites or users. You'll likely identify organizational learnings as part of this activity that you can leverage to ensure that the next batch of sites or users don't encounter the same issues.

First, pinpoint whether this is an adoption or technical problem. Begin by investigating the items below, in order, to determine where the problem is.

1. Validate quality by performing a [Quality of Experience Review](#).
2. Work with the helpdesk team to check that there are no trending technical issues preventing users from accessing or using the service. If issue trends do exist, use the [endpoint troubleshooting](#) section later in this article to try to solve the problem before engaging support.
3. Work with the training and adoption team to gather direct feedback from users (see [Assess user sentiment](#) later in this article), and to check the effectiveness of awareness and adoption activities.

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Measure usage (enablement phase)	Measure and assess Teams usage as sites continue to be onboarded during the enablement phase. Address usage issues as required.	Weekly	

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Measure usage	Measure and assess Teams usage in the Drive Value phase (after deployment has been completed). Address usage issues as required.	Biweekly	
(drive value phase)			
Update adoption plan	Update your adoption plan based on how measured usage compares to your planning targets.	As needed

[About the Microsoft 365 admin center](#)

[Activity Reports in the Microsoft 365 admin center](#)

Assess user sentiment

Understanding user sentiment can act as a key indicator for gauging the success of your Teams deployment. User feedback can drive changes in your organization; this might include changes to your communication plans, training programs, or the way that you offer support to your users.

It's important to get feedback early and continue with assessing user sentiment throughout the lifecycle of the project and beyond. Use the following guidance to determine the interval in which your organization will seek out feedback:

- **Beginning of the project:** By assessing user sentiment at the beginning of the project, you can get an early view into how your users feel about their Teams experience.
- **After major milestones:** By collecting feedback throughout the project lifecycle, you can gauge user sentiment on a continuous basis and make changes as needed. This is especially useful after major milestones.
- **Project conclusion:** Assessing user sentiment at the end of a project will tell you how well you've done and where work still needs to be done, and allow you to compare results against the previous survey.
- **Ongoing:** Continue to measure user sentiment indefinitely. Changes in user sentiment might be due to changes in your organization's environment or changes in the Teams service. By gauging user sentiment at regular intervals, you can understand how well your service management teams are performing and how your organization is responding to changes in the Teams service.

User sentiment can be assessed through many different methods. These can include email surveys, in-person or telephone-style interviews, or simply creating a feedback channel in Teams or Yammer. For more information, see [Best practices for user feedback methods in Microsoft Teams](#).

You can also use an industry-wide approach to assess user sentiment called net promotor score (NPS), which is described in the following section.

NPS

Net promoter score (NPS) is an industry-wide customer loyalty metric and a good approach to use to assess user sentiment. NPS can be calculated by asking two questions: "How likely are you to recommend Teams to a colleague?", followed by the freeform question, "Why?"

NPS is an index ranging from –100 to 100 that measures a customer's willingness to recommend a company's product or service. NPS is based on an anonymous survey that's delivered to users through email or other electronic means. NPS measures the loyalty between a provider and a consumer. It consists of only one question, which asks users to rate their experience from 1 through 10, with the option of providing additional comments. Users are then classified based on the following ratings:

- 9 or 10 are Promoters: Loyal enthusiasts who will promote your service and fuel others.
- 7 or 8 are Passive: Satisfied but unenthusiastic, vulnerable to another service or offering.
- From 1 through 6 are Detractors: Unhappy customers who can damage your service and impede growth.

$$\text{NPS} = \% \text{ Promoters} - \% \text{ Detractors}$$

Although the base NPS number is useful, you'll get the most value from analyzing user comments. They'll help you understand why the user would (or wouldn't) recommend Teams to others. These comments can provide valuable feedback to help the project or service management teams understand the adjustments necessary to provide a quality service.

To provide NPS surveys to your organization, you can leverage your favorite online survey tool.

Daily/weekly/monthly/as needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Assess user sentiment	Capture and assess user sentiment by using surveys or interviews, or through a feedback channel in Teams or Yammer.	As needed	
Update adoption plans	Drive change in your organization based on user feedback; this can include changes to your communication plans, training programs, or the way that you offer support to your users.	As needed

Manage network quality

Many core planning elements go into optimizing, right-sizing, and remediating your network infrastructure to ensure a high-quality, efficient path to the Microsoft Teams service. The planning tasks and requirements are covered in our [network readiness](#) guidance. Networks often evolve over time due to upgrades, expansion, or other business requirements. It's important that you account for your requirements for Teams in your network planning activities.

Although network planning is a critical aspect of a Teams deployment, it's equally important to ensure the network remains healthy and stays current, based on changing business or technical requirements.

To ensure the health of your network, a number of operations activities need to be performed at regular intervals.

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Monitor Microsoft 365 or Office 365 IPs and URLs	Monitor any changes to the Office 365 URLs and IP address ranges by using the provided RSS feed and initiate a change request to applicable networking groups.	Daily	
Update the network based on changes to Microsoft 365 or Office 365 IPs and URLs	Make updates to the applicable network components (firewalls, proxy servers, VPNs, client-side firewalls, and so on) to reflect changes to the Office 365 URLs and IP address ranges .	As needed	
Provide building data	Provide updated subnet information to the quality champion (or relevant stakeholders) to ensure that the building definitions in CQD are kept up to date.	As needed	
Implement change	Implement changes on the network to support changing Teams business and technical requirements. Network elements can include: <ul style="list-style-type: none">• Firewalls• VPNs• Wired and Wi-Fi networks• Internet connectivity and ExpressRoute• DNS	As needed	

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Network monitoring and reporting	Monitor the network end to end for availability, utilization, and capacity trends by using your existing third-party network management tools and reporting capabilities available from your network providers. Use trending data for network capacity planning.	Daily, weekly, monthly	
Capacity planning	Collaborate with the Teams service owners to understand changing business and technical requirements that might drive additional capacity changes.	As needed	
Network troubleshooting and remediation	Assist the Teams helpdesks, service owners, and key stakeholders to troubleshoot and remediate issues to related to Teams connectivity, reliability, or quality. Network elements can include: <ul style="list-style-type: none"> • Firewalls • VPNs • Wired and Wi-Fi networks • Internet connectivity and ExpressRoute • DNS 	As needed	
Disaster recovery and high availability testing	Perform regular high availability and disaster recovery testing on the network infrastructure to ensure that it meets the stated service level objectives (SLOs) or service level agreements (SLAs) for the Teams service.	Monthly

Assess and ensure quality

All organizations need a group or individual to be accountable for quality. This is the most important role in service management. The Quality Champion role is assigned to a person or group who is passionate about their users' experience. This role requires the skills to identify trends in the environment and the sponsorship to work with other teams to drive remediation. The best candidate for the quality champion is typically the customer

service owner. Depending on the organization's size and complexity, this could be any person or group with a passion for ensuring a high-quality user experience.

The quality champion leverages existing tools and documented processes, such as Call Quality Dashboard (CQD) and [Improve and monitor call quality for Teams](#), to monitor user experience, identify quality trends, and drive remediation where needed. The quality champion should work with the respective teams to drive remediation actions and report to a steering committee about progress and any open issues.

[Improve and monitor call quality for Teams](#) includes activities that assess and provide remediation guidance in key areas that have the greatest impact on improving user experience. The guidance provided in the Quality Experience Review Guide focuses on using CQD Online as the primary tool to report and investigate each area, with a focus on audio to maximize adoption and impact. Any optimizations made to the network to improve the audio experience will also directly translate to improvements in video and desktop sharing.

We strongly recommend that you nominate the quality champion early on. After being nominated, they should start to familiarize themselves with the content in [Improve and monitor call quality for Teams](#) and associated training materials.

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Nominate and train quality champion(s)	Nominate and train a quality champion.	As needed	
Perform Quality of Experience Reviews (QERs)	Perform a QER to identify trends in quality and reliability, review against defined targets, and report out to key stakeholders in the organization.	Monthly (weekly during deployments)	
Drive remediation	Coordinate remediation efforts across the organization based on the QER assessments and findings.	As needed	
Update building data in CQD	Update or add new building definitions in CQD when changes are made to the network (see Upload Building information).	As needed	

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Fill the Quality Champion role	<p>End-to-end responsibility for quality in the organization. This includes:</p> <ul style="list-style-type: none"> • Ensure that the QER is being conducted regularly. • Report out to key stakeholders on quality status. • Ensure the building data definitions are up to date. • Coordinate remediation efforts across the organization to ensure that users have a high-quality experience with Teams. 	Daily

[Upload Building information](#)

[Improve and monitor call quality for Teams](#)

Manage endpoints

Microsoft Teams endpoints can be defined as any PC, Mac, tablet, or mobile (or any other) device running the Teams client. The term *endpoint* not only encompasses the device itself, but how a user connects to the device—for example, by using the device's built-in mic or speaker, earbuds, or an optimized headset. After they're deployed, endpoints must not be forgotten. The Teams endpoints require ongoing care and maintenance. The following sections describe specific areas to focus on.

Endpoint requirements

One of the key benefits of Teams is that the client is kept up to date automatically. The clients on the PC and Mac are updated by using a background process that checks for new builds and downloads the new client when the app is idle. The Teams mobile apps are kept current through their respective app stores.

The Teams client has minimum requirements in terms of the underlying software platform. These requirements might change over time, and therefore it's important that you monitor them for changes. For example, the Teams client has a minimum iOS version. If the client uses an internet browser, the browser needs to be kept current as well. A list of supported platforms can be found in [Get clients for Microsoft Teams](#).

Endpoint firewalls

Client-side firewalls can have a significant impact on the user experience. Client-side firewalls can affect call quality and even prevent a call from being established. After the appropriate exclusions on the client firewall have been configured, they need to be kept up to date based on the information in [Office 365 URLs and IP address ranges](#). Your third-party vendor will have specific guidance for how to update the exclusions.

Wi-Fi drivers

Wi-Fi drivers might be problematic. As an example, a driver might have very aggressive roaming behaviors between access points that can induce unnecessary access-point switching, leading to poor call quality. A poorly performing Wi-Fi driver might be discovered through a Quality of Experience Review (see [Improve and monitor](#)

[call quality for Teams](#) for more detail). It's essential to implement a quality-driven process that monitors new Wi-Fi drivers and ensures that they're tested before being deployed to the general user population.

Endpoint management

A catalog of supported endpoints and interface devices (such as headsets) should be available and maintained. This catalog will include a list of approved devices that were selected and validated as part of the Envision and Onboard phases. Typically, specific devices are selected for each persona type in your organization to meet the needs of that persona's attributes. All endpoints have a lifecycle, and you need to manage the vendor contracts, warranty, replacement, distribution, and repair policies associated with these devices.

Endpoint troubleshooting

Even if you've followed the previous guidance, users in your organization still might run into issues with Teams. Although the problem might not be with the endpoint itself, the symptoms of the issue are typically surfaced through the client to the user. The following guidance is intended to provide general steps you can take to resolve the issue; it's not meant to be a comprehensive troubleshooting guide. The steps are provided in a specific order, but they don't have to be followed explicitly and might not be applicable, depending on the nature of the issue.

1. **Validate service health:** The issue a user might be experiencing can be related to an event that negatively affects the Teams service or its dependent services. As a first step, we recommend that you confirm there are no active service issues. Consult [How to check Microsoft 365 service health](#). Remember to check for the status of dependent services (for example, Exchange, SharePoint, OneDrive for Business). Monitoring for service health is discussed in more detail in the previous section, [Monitor service health](#).
2. **Validate client connectivity:** Connectivity issues cause functionality or sign-in issues in Teams. We recommend (especially for new sites or locations) that you validate connectivity to the service. Ensure the following [Office 365 URLs and IP address ranges](#) guidance is followed for each site. You can leverage the [Microsoft Network Assessment Tool](#) to perform a connectivity test to validate that the media ports have been opened correctly for Teams capabilities. Detailed steps on how to run the connectivity tests are provided in the [network readiness](#) guidance.
3. **Check the known issues list:** Consult [Teams Troubleshooting](#) to determine whether the user has been negatively affected by one of these issues. Follow the workaround provided (if there is one) to resolve the issue.
4. **Visit the Microsoft Teams community:** The [Microsoft Teams community](#) offers dedicated spaces for Teams. The Teams community provides a discussion list, blog posts, and announcements centered around Teams. You can post a question or search previous discussions for solutions to your issue.
5. **Contact Microsoft Support:** You can contact Microsoft Support for issues with Teams online or by phone. For information, see [Contact support for business products - Admin Help](#). For Premier customers, support requests can be initiated by following the guidance at [Contact support for Microsoft Teams \(Premier customers\)](#).

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Endpoint requirements	Ensure that the Teams endpoint continues to meet all the software requirements for Teams listed in Get clients for Microsoft Teams .	Monthly	

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Endpoint firewalls	Maintain the appropriate exclusions on the endpoint firewall based on the information in Office 365 URLs and IP address ranges . Your third-party vendor will have specific guidance for how to maintain the exclusions. Subscribe to the RSS feed to be notified automatically of changes.	As needed	
Wi-Fi drivers	Test and update Wi-Fi drivers on the PC. Validate the results by using CQD (Improve and monitor call quality for Teams).	As needed	
Endpoint management	Maintain the catalog of supported endpoints and interface devices (such as headsets). Manage vendor contracts, warranty, distribution, replacement, and repair policies.	Monthly	
Endpoint troubleshooting	Troubleshooting tasks can include verifying connectivity, consulting the known issues list, log gathering, analysis, and escalation to Microsoft Support or third-party vendors.	As needed

Manage Teams

After the Microsoft Teams service has been deployed, you'll need to perform several activities relating to its administration. The activities range from administering the service and individual users to capacity planning and provisioning licensing and telephone numbers. The following sections cover some of these common

administration tasks.

Service administration

The Teams service has multiple settings that can be configured tenant-wide. Changes made to the tenant settings affect all users who have been enabled for Teams. For a detailed list of these settings, see [Manage Microsoft Teams settings for your organization](#).

User administration

To support users, an organization might require any number of related tasks—the specific tasks vary from one organization to the next. Ultimately, these tasks need to be managed by a support team that has been assigned these operational duties. The following tasks are commonly required to support users in Teams.

General tasks

[Manage user access to Microsoft Teams](#)

Team creation (optional)

By default, all users with a mailbox in Exchange Online have permissions to create Microsoft 365 groups and, therefore, a team in Microsoft Teams. If you want to have tighter control and [restrict the creation of new teams](#) (and thus the creation of new Microsoft 365 groups), you can delegate group creation and management rights to a set of administrators. If your organization wants to pursue this option, see the process described in this article to allow users to submit requests that are processed by an assigned team.

Daily/weekly/monthly/as-needed tasks

ACTIVITY	DESCRIPTION	CADENCE	TEAM ASSIGNED
Service administration	Administration of tenant-wide Teams settings.	As needed	
User administration	Administration of user-based settings and licensing in Teams.	As needed	
License management	Plan for current and future needs for both user and consumption-based licensing (Calling Plans and Communication Credits) by leveraging the PSTN usage report and PSTN minute pools report.	Weekly	
Telephone number management	Manage the telephone numbers available for future growth, and adjust inventory levels to meet your organizational needs.	Weekly	
Team creation (optional)	Review and process requests for team creation.	As needed	

Get the most out of Teams after upgrading

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article is part of the Operational Excellence stage of your upgrade journey, which begins as soon as you've completed your upgrade from Skype for Business to Teams.

This article gives an overview of the requirements for getting the most out of operating Teams after your upgrade. By continuously monitoring Teams service capabilities, you can be sure you're delivering the most value for your organization.

Enhance your service overview

After you've successfully deployed Teams to your organization, and are operating the service with quality and reliability, the next step is to regularly evaluate whether you have any opportunities to enhance your services. This is a part of continuous service improvement planning that is a modern standard for cloud service management.

A great way to make sure you're always getting the most out of your services is to monitor the [Teams public roadmaps](#) for new feature enhancements that might be of interest to your organization. If you have access to the Microsoft 365 admin center, you'll receive regular updates from us about new and changing features through our Message Center.

When you do see opportunities to enhance your service, take the time to do it right. Revisit [Deploy chat, teams, channels, and apps in Microsoft Teams](#) and our [implementation phases](#) and apply the same guidance end to end. When making small, incremental changes, it's unlikely that you'll need to complete all activities and tasks in full, but you should be sure to evaluate each activity and task along the way to give yourself the best chance at a successful outcome.

Decision points

- Decide who will monitor public roadmaps and other service announcements for new features or services that your organization might benefit from.
- Decide on the cadence in which to report those new features or services back to the key stakeholders, via your steering committee.

Next steps

- Implement a strategy for staying up to date with your services to get the most value for your organization.
- Drive service enhancements through a full project lifecycle to make sure you've properly accounted for the impact they have on your deployment.

Microsoft Teams Public Preview

12/7/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Features included in preview might not be complete and could undergo changes before becoming available in the public release. They're provided for evaluation and exploration purposes only. The preview features aren't supported in Office 365 Government Community Cloud (GCC).

Public Preview for Microsoft Teams provides early access to unreleased features in Teams. Previews allow you to explore and test upcoming features. We also welcome feedback on any feature in public previews. Public preview is enabled per Team user, so you don't need to worry about affecting your entire organization.

For a list of what's available in the Teams public preview, visit [Microsoft Teams Public Preview tech notes](#), [Release Notes for Teams Admin Features](#), and [What's new in Teams](#).

Set the Update policy

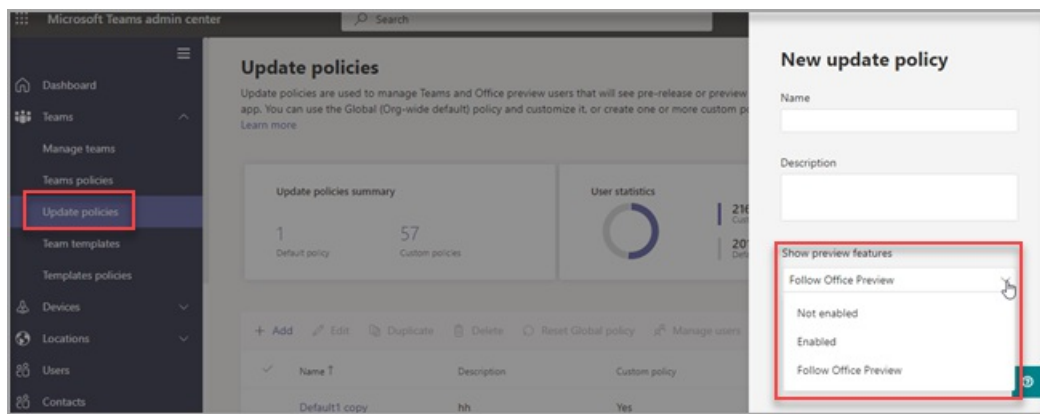

Public preview is enabled on a per-user basis, and the option to turn on public preview is controlled in an admin policy. Update policies are used to manage Teams and Office preview users who will see pre-release or preview features in the Teams app. You can use the Global (Org-wide default) policy and customize it, or create one or more custom policies for your users. The policy needs to be assigned to specific users because it doesn't overwrite the global policy.

1. Sign in to the [Microsoft Teams admin center](#).
2. Select **Teams** > **Teams Update policies**.
3. Select **Add** to create a new policy or select an existing policy to open **Update policy**.
4. Name the update policy, add a description, and select the setting for **Show preview features**.
 - **Follow Office Preview** (default): This new default option will automatically enable Teams Public Preview features for any user enrolled in Office Current Channel (Preview). There are no more actions required by the end user.
 - **Enabled**: This option enables Teams Public Preview regardless of whether a user is enrolled in Office Current Channel (Preview). The end user must also opt in to Teams public preview in their Teams app.

NOTE

For existing users in Teams Public Preview who are NOT in the **Current Channel (Preview)**, IT admins need to switch from default, **Follow Office Preview** to **Enabled**.

- **Not enabled**: Teams Public Preview features will not be available to end users.

You can also set the policy using the PowerShell `Set-CsTeamsUpdateManagementPolicy` cmdlet with the `-AllowPublicPreview` parameter.

NOTE

AllowPreview parameter will be deprecated soon.

Enable public preview

To enable public preview on a desktop or web client, you need to complete the following tasks:

1. Select the three dots to the left of your profile to display the Teams menu.
2. Select **About** > **Public preview**.
3. Select **Switch to Public preview**.

NOTE

This option is only available when **Show preview features** is set to **Enabled**.

Teams now follows Office Preview users

The new global policy default of **Follow Office Preview** will allow users to automatically be in the Public Preview channel of Teams if they are in Current Channel (Preview) for the Office 365 Client on Windows.

Microsoft Office will continue to receive updates from Current Channel (Preview) and Teams client will receive updates via Public Preview channel. This policy will NOT switch Office channels based on Teams channels.

How to retain your existing Teams preview users who are NOT using Office Current Channel (Preview)?

For existing users who you have allowed to opt-in or opt-out of Teams Public Preview and want to maintain that setting in its current form, you will need to switch from the new default, **Follow Office Preview** to **Enabled** (Refer to [Set the Update policy](#))

How to opt-out of this setting?

You can disable the setting from Teams Admin Center from **Follow Office Preview** to **Not Enabled** (Refer to [Set the Update policy](#))

Known Issues

Office Current Channel (Preview) users may exit Teams Public Preview through Teams client About menu while their update policy is set to **Follow Office Preview**. This functionality is not intended and will be removed in

the future. Teams client may automatically set itself back to Public Preview when the device is idle the next time if user is in Current Channel (Preview) for Office.

[Public developer preview](#)

Turn off inline message translation in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Inline message translation is a Microsoft Teams feature that lets users translate Teams messages into the [language](#) specified by their personal language settings.

Inline message translation is rolled out by default for your organization. You don't need to make changes if you want to allow users to use this feature within the Teams client.

NOTE

This rollout is excluded from Office 365 subscriptions in our Office 365 Government Community Cloud and Office 365 Germany environments.

Use PowerShell to turn off inline message translation

You can use the messaging policy to turn off the inline message translation.

Turn off the policy by using the [Set-CsTeamsMessagingPolicy](#) cmdlet. The policy takes a few minutes to apply. Users might need to sign out and sign back in to Teams.

Use the Microsoft Teams admin center to turn off inline message translation

In the **Microsoft Teams admin center**, select **Messaging Policies** from the left navigation, then either create a new policy or edit an existing policy, and set the **Translate messages** option to **Off**.

NOTE

The service does the translation and delivers it to the client with no effect on the content captured in the compliance records. To learn more about translation, see [What is Microsoft Translator?](#)

Use Microsoft Teams scoped directory search

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams scoped directory search allows organizations to create virtual boundaries that control how users can find and communicate with other users in their organization.

Microsoft Teams lets organizations provide custom views of the directory to their users. Microsoft Teams uses [Information Barrier policies](#) to support these custom views. Once the policies are enabled, the results returned by searches for other users (for example, to initiate a chat or to add members to a team) will be scoped according to the configured policies. Users will not be able to search or discover any teams when scoped search is in effect, but existing members in those teams can add users, as allowed by active Information Barrier policies.

NOTE

In Exchange hybrid environments, this feature only works with Exchange Online mailboxes, and not with on-premises mailboxes.

See also [Address book policies in Exchange Online](#).

When should you use scoped directory searches?

Scenarios that benefit from scoped directory searches are similar to address book policy scenarios. For example, you may want to use scoped directory search in the following situations:

- Your organization has multiple companies within its tenant that you want to keep separate.
- Your school wants to limit chats between faculty and students.

To learn how to use address book policies, read [Information Barrier policies in Exchange Online](#).

IMPORTANT

Address book policies provide only a virtual separation of users from directory perspective. It is also important to note that any user data that had already been cached, prior to the enforcement of new or updated address book policies, will remain available to users for up to 30 days.

Turn on scoped directory search

1. Use Information Barrier policies to configure your organization into virtual subgroups. For more information, see [Define Information Barrier policies](#).
2. In the Microsoft Teams admin center, select **Teams** > **Teams settings**.
3. Under **Search by name**, next to **Scope directory search in Teams using an Exchange address book policy**, turn the toggle **On**.

Search by Name

Manage how search operates in Microsoft Teams.

Scope directory search in Teams using an Exchange address book policy (ABP)

IMPORTANT

This change can take a few hours to replicate.

FAQ: Support your remote workforce

12/7/2021 • 7 minutes to read • [Edit Online](#)

This article answers the most frequently asked questions about how IT admins can manage the increased number of users working remotely. Use this information to support your remote workforce to be productive when they're working from home (WFH).

Check out [Support your remote workers with Teams](#), which will answer many of your questions and help you get ready to support a remote workforce.

Is Microsoft taking proactive action to be ready for the added workload of users working from home to avoid service disruption? All those 1:1 calls will now use Microsoft infrastructure.

Microsoft has been significantly expanding capacity in key regions with the recent announcements regarding the COVID-19 (coronavirus) outbreak. We are monitoring the situation and our services very closely to ensure that our services are available for our customers. One of the benefits of a cloud service is the ability to scale dynamically, including utilization of our significant supply chain, reallocation of resources between services, and redistribution of load. We have seen an increase in the utilization of Microsoft Teams which we have responded to and continue to monitor closely. We are also working to stay ahead of Calling Plans demand, and working to procure enough telephone numbers as needed.

NOTE

If you're already set up with Microsoft 365, and want to know more about the actions Microsoft is taking, please go to the Message Center and review the **MC205458** message center post.

Don't miss our March 5, 2020 blog post from Jared Spataro, Corporate Vice President for Microsoft 365: [Our commitment to customers during COVID-19](#).

With the actions that Microsoft is taking, do we anticipate problems?

Although Microsoft is doing what we can to avoid problems, an unexpected peak in an area due to a spread of the virus may create temporary issues. While we're actively monitoring and adding capacity as needed, you might feel impact until we're able to add capacity in those areas. Also, there are external situations that Microsoft doesn't have control over. We foresee ISPs and telephony carriers are also taking proactive action, but they may or may not have the capacity to handle more load with more people working from home. We are working across industry with a focus on networking infrastructure. If you have an outage concern, check the Message Center to learn about any current outages.

What can admins do if attendees are having trouble joining meetings by dialing in, such as if calls aren't getting through?

During the duration of the COVID-19 outbreak, we recommend that users join meetings by clicking the **Join Teams Meeting** button rather than dialing in by using the PSTN conference numbers or by using **Call me at**. This is primarily because of congestion in the telephony infrastructures of countries impacted by COVID-19. By avoiding PSTN calls, you'll likely experience better audio quality.

What are the general Microsoft guidelines regarding network optimization for Microsoft 365? Some of my users in China are having a bad experience; what should I do to optimize our network?

Because of unique needs in China, customers may need to take specific actions:

- [Office 365 global tenant performance optimization for China users](#)
- [General guidelines for any network where Microsoft 365 is being used](#)

- [Prepare your organization's network for Teams](#)

My users are reporting bad calls, or their calls are not connecting. What should I do to get help?

We're here to help. Before you [contact Support](#), make sure you've followed all of our [networking recommendations](#). To help you troubleshoot call quality, use [Call Analytics and Call Quality Dashboard](#). We also recommend checking the [Service health dashboard](#) in the Microsoft 365 admin center for any current advisories or issues with Microsoft services.

What other actions can I take to have a better experience?

We recommend that users install and use our rich desktop clients instead of web clients (e.g., Outlook, [Teams desktop](#)). Desktop clients will cache information and deliver a better performance under bandwidth restrictions or networking problems. From a communications perspective, we strongly recommend using Teams instead of Skype for Business, as Teams has more modern communications protocols and will better handle networking issues. We suggest you experiment with Teams in case of issues - read [Get started with your Teams upgrade](#) to learn more.

Is Teams free to help with the COVID-19 (coronavirus) outbreak? How does this work? I don't have Microsoft 365.

Teams is available for free through a couple of different programs:

Individuals

- Sign in with your work or school credentials at <https://products.office.com/microsoft-teams>. We'll automatically route you to the version of Teams associated with your organization's account, even if you don't have a license.
- If your organization doesn't have a Microsoft cloud account, sign up for the free version of Teams at <https://products.office.com/microsoft-teams/free> and invite your co-workers to join. To learn more, read [Welcome to Teams free](#). IT admins, read [Manage the free version of Teams](#).

IT professionals

- If you work for a business and want to get employees set up on Teams, you can sign up for [Teams Exploratory](#).
- If you work in Education and want to set up teachers, students, and administrators on Teams, use Office 365 A1, the free version of Office 365 available to educational institutions. Sign up at <https://www.microsoft.com/microsoft-365/academic/compare-office-365-education-plans>.

I have Microsoft 365 already, but I don't use Teams. Are you providing trial licenses?

If you have Microsoft 365, then you already have Teams. [Turn it on](#) for all your users. Once it's turned on, your users can run Teams, either by installing [desktop](#) and [mobile](#) clients, or [from the browser](#) at <https://teams.microsoft.com>.

How do I get help to get started with Teams and make sure the deployment is successful?

Microsoft offers the [FastTrack Center Benefit for Office 365](#), which will help you to plan, deploy, drive usage, and adopt best practices. This service is offered at no cost when you have at least 150 users. To find out more, read [Requesting FastTrack assistance for Microsoft 365 just got easier](#). FastTrack setup guidance for Microsoft 365 is available to all Office 365 organization administrators. To access this guidance, sign into <https://aka.ms/setupguidance> with your admin credentials.

If you want to get started on your own, read [How to roll out Teams](#) and check out our [Teams in 30](#) webinar series, designed to get you up and running with Teams in as few as 30 days.

For Education (EDU) tenants, Microsoft offers [School Data Sync](#), which helps you to sync information from a school's Student Information System (SIS). For help deploying Microsoft 365, read [Microsoft 365 Education deployment overview](#). Don't miss our new article, [Get started with Teams for remote learning](#).

Where do I find help getting Teams running for my company so my users can work from home during this crisis?

Read [Support remote workers using Teams](#). It covers most of the common tasks and questions on getting started with Teams for remote workers.

I just got started with Microsoft 365 so I can use Teams to support my remote workers or students. I've signed up for the service, but when a user tries to use Teams, they get this error: "You're missing out! Ask your admin to enable Microsoft Teams." What should I do?

After you activate one of the free Teams offers, you'll still need to turn it on for your users. Read [Manage user access to Teams](#) and [Add users individually or in bulk](#).

If you're licensing or enabling a user for the first time but you've had Microsoft 365 for a while, you might need to [Turn on Teams](#) for your organization. Check [I have Microsoft 365 already, but I don't use Teams. Are you providing trial licenses?](#) in this article.

In meetings, attendees are having trouble joining by dialing in - calls aren't getting through.

During periods of high meeting volume (which we've been experiencing in conjunction with the COVID-19 outbreak), we recommend that users join meetings by clicking the **Join Teams Meeting** button rather than dialing in by using the PSTN conference numbers or by using **Call me at**. This helps ensure quality audio during times when high meeting volume is causing congestion on the PSTN network.

Can I use Calling Plans with the Office 365 E1 Trial that Microsoft is offering? Can I assign a telephone number to my users? How much am I going to pay?

Users can make app-to-app audio and video calls in any version of Teams. To assign a number to an employee, you'll need [Phone System](#). We recommend working with your Microsoft partner or sales representative to obtain and deploy this. Learn more at [Voice and video calling with Teams](#).

Can I set up an Auto Attendant with the new Teams E1 Trial so I can have an emergency line internally at my company to deal with COVID-19 (coronavirus)?

To set up a [Cloud Auto Attendant](#) in Teams, you'll need [Phone System](#) in addition to Teams. We recommend working with your Microsoft partner or sales representative to obtain and deploy this.

Where can I find more information to help remote workers?

End users: [Collaborate with Microsoft 365](#) - how to work better together across all Microsoft 365 workloads

IT admins/ITPro: [Support remote workers using Teams](#).

What is Microsoft doing to support its own employees during the COVID-19 outbreak?

Read our March 5, 2020 blog from Brad Smith, Microsoft President: [As we work to protect public health, we also need to protect the income of hourly workers who support our campus](#).

Also be sure to visit [Responding to COVID-19 together](#) on Microsoft.com.

Use activity reports for Microsoft Teams

12/7/2021 • 8 minutes to read • [Edit Online](#)

You can use activity reports in the Microsoft 365 admin center to see how users in your organization are using Microsoft Teams. For example, if some don't use Microsoft Teams yet, they might not know how to get started or understand how they can use Teams to be more productive and collaborative. Your organization can use the activity reports to decide where to prioritize training and communication efforts.

How to view the Teams reports in the Reports dashboard

1. In the [Microsoft 365 admin center](#), select **Reports** > **Usage**.
2. On the **Usage** page, choose **Select a report**, and then under **Microsoft Teams** in the list of reports, choose the report you want to view.

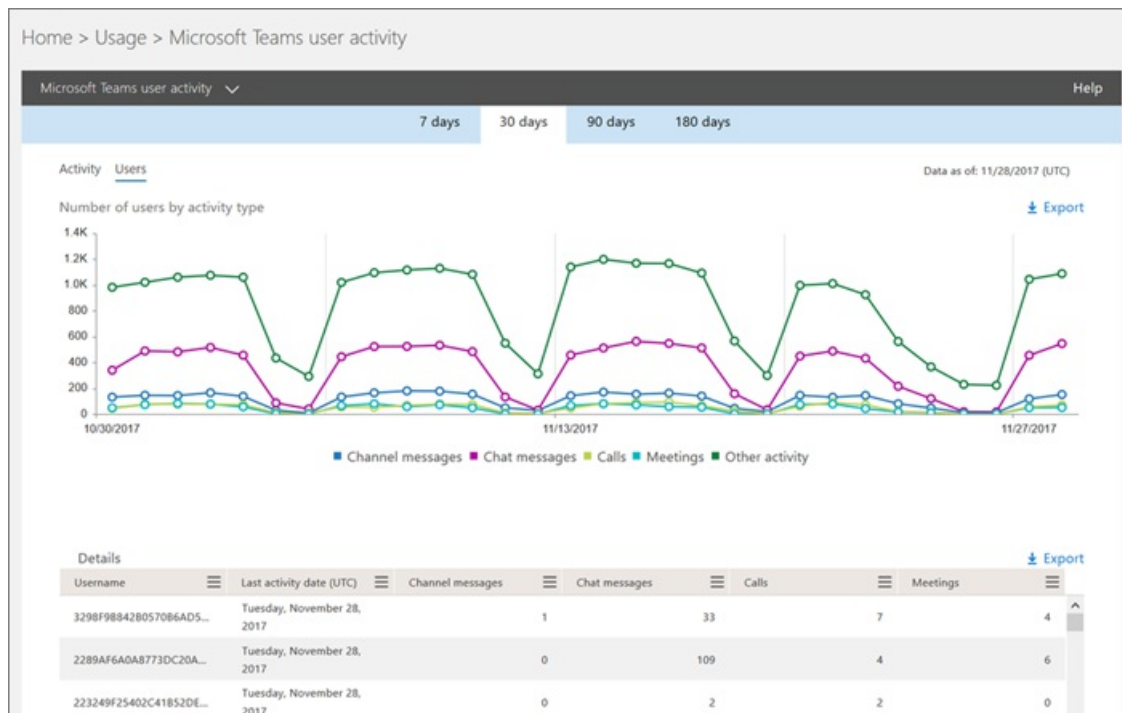

Teams activity reports that are available

There are currently two activity reports you can view:

- [Microsoft Teams user activity report](#)
- [Microsoft Teams device usage report](#)

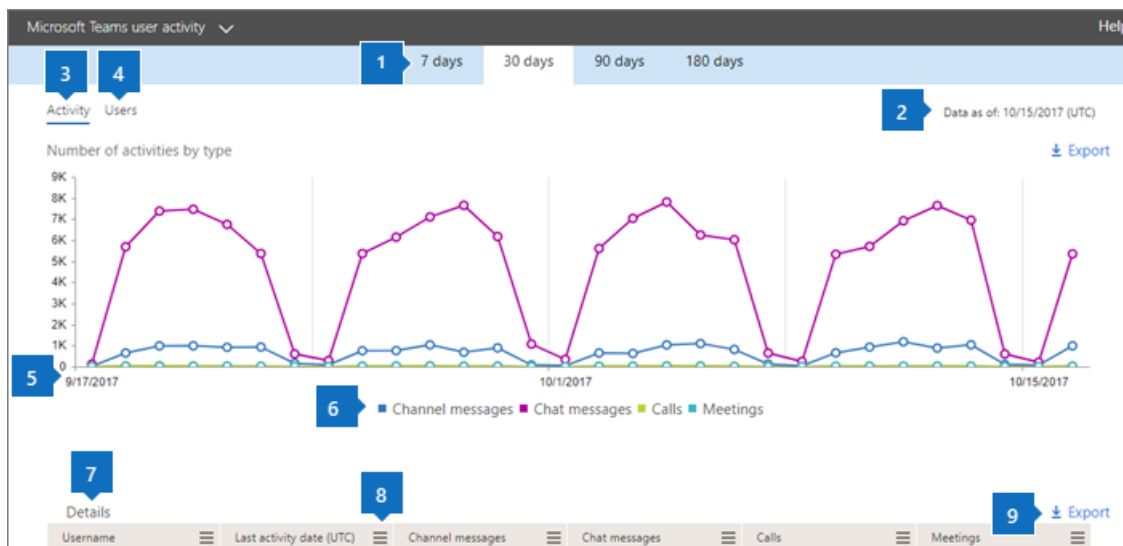

Microsoft Teams user activity report

The Teams user activity report gives you a view of the most common activities that your users perform in Teams. This includes how many people engage in a chat in a channel, how many communicate via private chat message, and how many participate in calls or meetings. You can see this information for your whole organization, as well as for each individual user.

Interpret the Microsoft Teams user activity report

You can get a view into Teams user activity by looking at the **Activity** and **Users** charts.

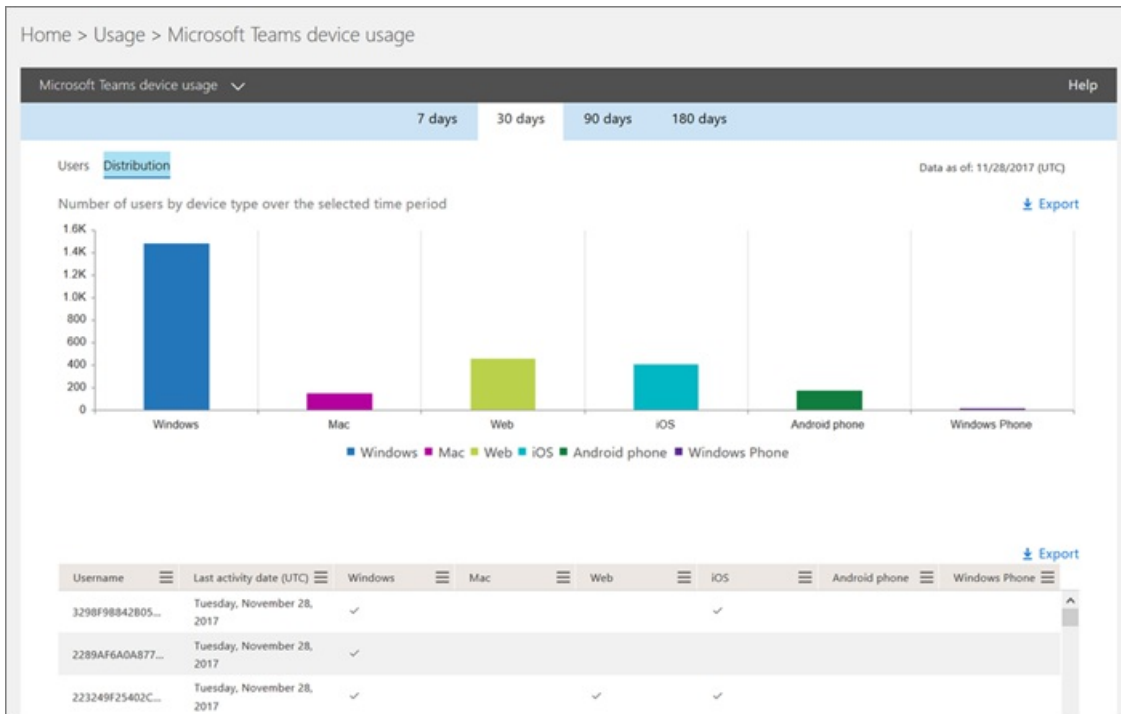

CALLOUT	DESCRIPTION
1	The Teams user activity report can be viewed for trends over the last 7 days, 30 days, 90 days, or 180 days. However, if you click into a particular time range in the report, the table (7) will show data for 30 days, up to the date (2) for when the report was generated.
2	Each report has a date for when this report was generated. The reports usually reflect a 24 to 48 hour latency from time of activity.
3	The Activity view shows you the number of Microsoft Teams activities by activity type. The activity types are number of team chat messages, private chat messages, calls, and meetings.
4	The Users view shows you the number of users by activity type. The activity types are number of team chat messages, private chat messages, calls, and meetings.
5	The X axis on the charts is the selected date range for the specific report. <ul style="list-style-type: none"> On the Activity chart, the Y axis is the count of the specified activity. On the Users chart, the Y axis is the number of users participating in teams chats, private chats, calls, or meetings.
6	You can filter the series you see on the chart by clicking on an item in the legend. For example, on the Activity chart, click or tap Channel messages , Chat messages , Calls , or Meetings to see only the info related to each one. Changing this selection doesn't change the information in the grid table.

CALLOUT	DESCRIPTION
7	<p>The list of active teams across the widest (180-day) reporting time frame. The activity count will vary according to the date selection.</p> <p>To see the following information the table, make sure you add the columns to the table.</p> <ul style="list-style-type: none"> • Username is the email address of the user. You can display the actual email address or make this field anonymous. • Last Activity Date (UTC) refers to the last date that the user participated in a Microsoft Teams activity. • Channel messages is the number of unique messages that the user posted in a team chat during the specified time period. • Chat messages is the number of unique messages that the user posted in a private chat during the specified time period. • Calls is the number of calls that the user participated in during the specified time period. • Meetings is the number of online meetings that the user participated in during the specified time period. • Other activity is the number of other team activities by the user some of which include, and not limited to: liking messages, apps, working on files, searching, following teams and channel and favoriting them. • Deleted indicates if the team is deleted. If the team is deleted, but had activity in the reporting period, it will show up in the grid with deleted set to true. • Deleted date is the date that the user was deleted. • Product assigned is the list of products that are assigned to the user. <p>If your organization's policies prevents you from viewing reports where user information is identifiable, you can change the privacy setting for all these reports. Check out the How do I hide user level details? section in the Activity Reports in the Microsoft 365 Admin Center Preview.</p>
8	<p>Click or tap Columns to add or remove columns in the table.</p>
9	<p>Click or tap Export to export report data to an Excel .csv file. This exports data of all users and enables you to do simple sorting and filtering for further analysis. If you have less than 2,000 users, you can sort and filter within the table in the report itself. If you have more than 2,000 users, you will have to export the data to filter and sort the report.</p>

Microsoft Teams device usage report

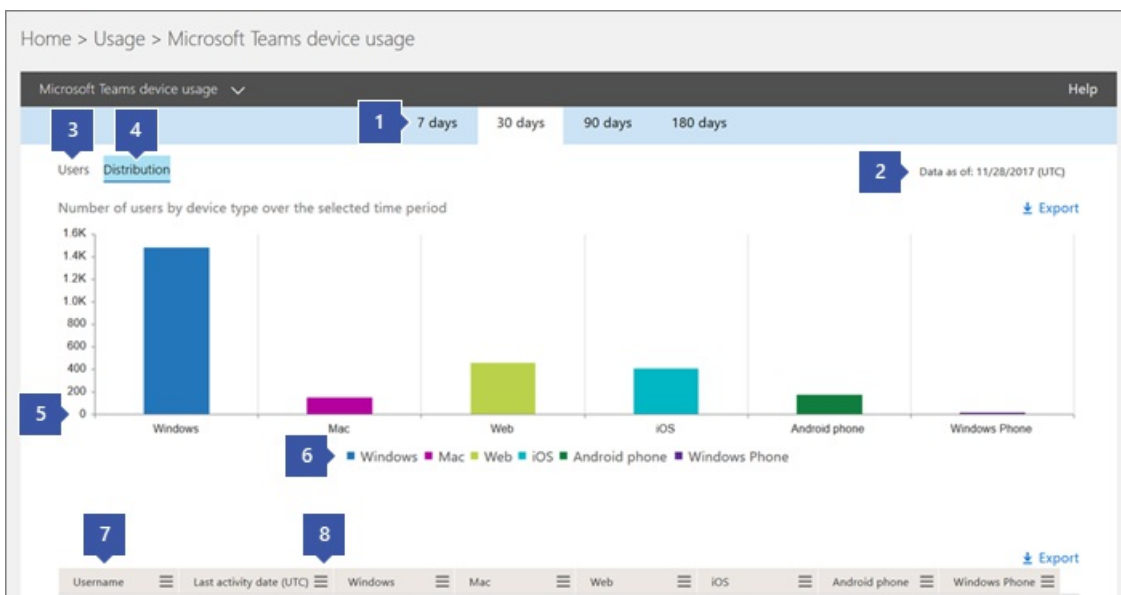

The Teams device usage report provides you with information about how your users connect to Teams, including mobile apps. The report helps you understand which devices are popular in your organization and

how many users work on the go.

Interpret the Microsoft Teams device usage report

You can get a view into Teams device usage by looking at the **Users** and **Distribution** charts.

CALLOUT	DESCRIPTION
1	The Teams device report can be viewed for trends over the last 7 days, 30 days, 90 days, or 180 days. However, if you click into a particular time range in the report, the table (7) will show data for 30 days, up to the date (2) for when the report was generated.
2	Each report has a date for when this report was generated. The reports usually reflect a 24 to 48 hour latency from time of activity.
3	The Users view shows you the number of daily users by device type.

CALLOUT	DESCRIPTION
4	<p>The Distribution view shows you the number of users by device over the selected time period.</p>
5	<ul style="list-style-type: none"> On the Users chart, the X axis is the selected date range for the report and the Y axis is the number of users by device type. On the Distribution chart, the X axis shows the different devices used to connect to Teams and the Y axis is the number of users using the device.
6	<p>You can filter the series you see on the chart by clicking on an item in the legend. For example, on the Distribution chart, click or tap Windows, Mac, Linux, Web, iOS, or Android to see only the info related to each one. Changing this selection doesn't change the information in the grid table.</p>
7	<p>The list of active teams across the widest (180-day) reporting time frame. The activity count will vary according to the date selection.</p> <p>To see the following information in the table, make sure you add the columns to the table.</p> <ul style="list-style-type: none"> Username is the email address of the user. You can display the actual email address or make this field anonymous. Last Activity Date (UTC) refers to the last date that the user participated in a Teams activity. Deleted indicates if the team is deleted. If the team is deleted, but had activity in the reporting period, it will show up in the grid with deleted set to true. Deleted date is the date that the user was deleted. Windows is selected if the user was active in the Teams desktop client on a Windows-based computer. Mac is selected if the user was active in the Teams desktop client on a macOS computer. Linux is selected if the user was active in the Teams desktop client on a Linux computer. Web is selected if the user was active on the Teams web client. iOS is selected if the user was active on the Teams mobile client for iOS. Android phone is selected if the user was active on the Teams mobile client for Android. <p>If your organization's policies prevents you from viewing reports where user information is identifiable, you can change the privacy setting for all these reports. Check out the How do I hide user level details? section in the Activity Reports in the Microsoft 365 Admin Center Preview.</p>

CALLOUT	DESCRIPTION
8	Click or tap Columns to add or remove columns in the table.
9	Click or tap Export to export report data to an Excel .csv file. This exports data of all users and enables you to do simple sorting and filtering for further analysis. If you have less than 2,000 users, you can sort and filter within the table in the report itself. If you have more than 2,000 users, you will have to export the data to filter and sort the report.

Who can access the Teams activity reports

The activity reports can be accessed by users that are assigned:

- Global admin role
- Product-specific admin role (Exchange, Skype for Business, or SharePoint)
- Reports reader role

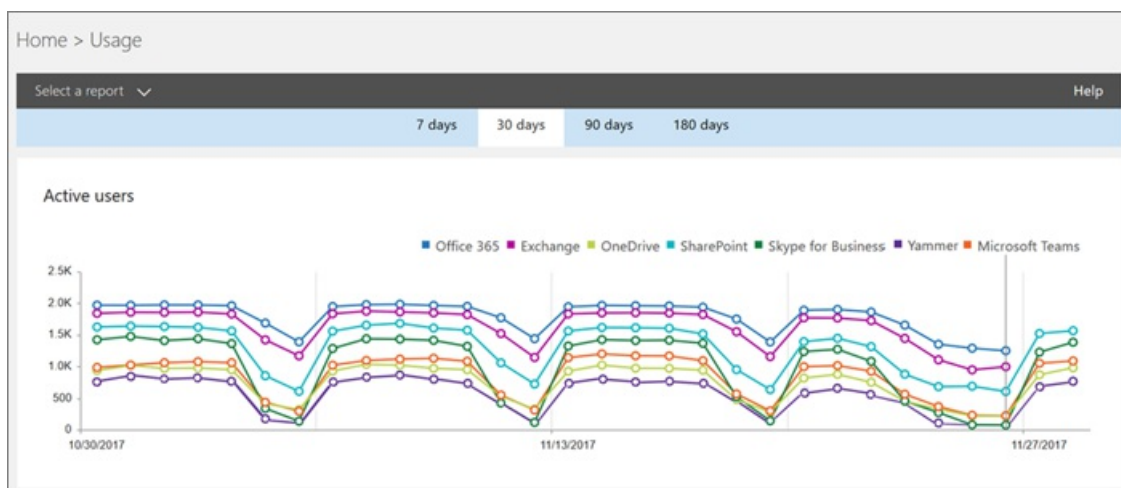

Reports reader role

You can assign the Reports reader role to people who don't have administrator rights but are responsible for driving adoption or tracking license usage of Teams. To learn how to assign roles, read [Assign administrator and non-administrator roles to users with Azure Active Directory](#).

Other information on the Reports dashboard

At-a-glance activity widget

The Reports dashboard includes the usage data from Teams in the at-a-glance activity widget, which gives you a cross-product view of how users communicate and collaborate using the other various services in Microsoft 365 or Office 365.

Teams activity card

The Teams activity card on the Reports dashboard gives you an overview of the activity in Teams, including the number of active users, so that you can quickly understand how many users are using the service. Clicking the activity card on the dashboard takes you to the Teams user activity report.

Microsoft Teams activity

216.0K

Microsoft Teams analytics and reporting

12/7/2021 • 3 minutes to read • [Edit Online](#)

A new analytics and reporting experience for Microsoft Teams is available in the Microsoft Teams admin center. You can run different reports to get insights into how users in your organization are using Teams. For example, you can see how many users communicate through channel and chat messages and the kinds of devices they use to connect to Teams. Your organization can use the information from the reports to better understand usage patterns, help make business decisions, and inform training and communication efforts.

How to access the reports

To access the reports, you must be a global admin in Microsoft 365 or Office 365, global reader in Microsoft 365 or Office 365, Teams service admin, or Skype for Business admin. To learn more about Teams admin roles and which reports each admin role can access, see [Use Teams administrator roles to manage Teams](#).

Go to the Microsoft Teams admin center, in the left navigation, select **Analytics & reports**, and then under **View Reports**, choose the report you want to run.

NOTE

The reports in the Microsoft Teams admin center are separate from the activity reports for Teams that are part of the Microsoft 365 reports in the Microsoft 365 admin center. For more information about the activity reports in the Microsoft 365 admin center, see [Teams activity reports in the Microsoft 365 admin center](#)

Teams reporting reference

Here's a list of the Teams reports available in the Microsoft Teams admin center and an overview of some of the information that's available in each report.

We're continually improving the Teams reporting experience and adding features and functionality. Over time, we'll be building additional capabilities into the reports and adding new reports in the Microsoft Teams admin center.

REPORT	WHAT'S MEASURED?
Teams usage report	Active users Active users in teams and channels Active channels Messages Privacy setting of teams Guests in a team
Teams user activity report	Messages a user posted in a team chat Messages a user posted in a private chat 1:1 calls a user participated in Number of meeting user organized number of meeting user participated in Meetings Audio, Video and Screen sharing time Last activity date of a user

REPORT	WHAT'S MEASURED?
Teams device usage report	Windows users Mac users iOS users Android phone users
Teams live event usage report	Total views Start time Event status Organizer Presenter Producer Recording setting Production type
Teams PSTN blocked users report	Display name Phone number Reason Action type Action date and time
Teams PSTN minute pools report	Country or region Capability (license) Total minutes Minutes used Minutes available
Teams PSTN usage report - Calling Plans	Time stamp User name Phone number Call type Called to To country or region Called from From country or region Charge Currency Duration Domestic/International Call ID Number type Country or region Conference ID Capability (license)

REPORT	WHAT'S MEASURED?
Teams PSTN usage report - Direct Routing	Time stamp Display name SIP address Phone number Call type Called to Start time Invite time Failure time End time Duration Number type Media bypass SBC FQDN Azure region Event type Final SIP code Final Microsoft subcode Final SIP phrase Correlation ID
Teams information protection license report	Whether users have valid licenses to push their messages via change notifications Total number of change notification events triggered by a user What apps are listening to org-wide change notification events

Definitions

The Teams reports show data for active users and active channels. For example, if a user in your organization isn't active in Teams during the date range that you specified for a report, data for that user isn't included in that report.

ITEM	DEFINITION
Active user	Measures the number of unique users who perform an action in Teams during the specified date range.
Active channel	Measures the number of channels of a team in which users perform an action during the specified date range.

Make the user specific data anonymous

To make the data in Teams user activity and Teams device usage report anonymous, you have to be a global administrator. This will hide identifiable information such as display name, email and AAD ID in reports and their exports.

1. In Microsoft 365 admin center, go to the **Settings > Org Settings**, and under **Services** tab, choose **Reports**.
2. Select **Reports**, and then choose to **Display anonymous identifiers**. This setting gets applied both to the usage reports in Microsoft 365 admin center as well as Teams admin center.

3. Select **Save changes**.

NOTE

Enabling this setting will de-identify information in [Teams user activity report](#) and [Teams device usage report](#) reports. It will not affect other usage reports available in Teams admin center.

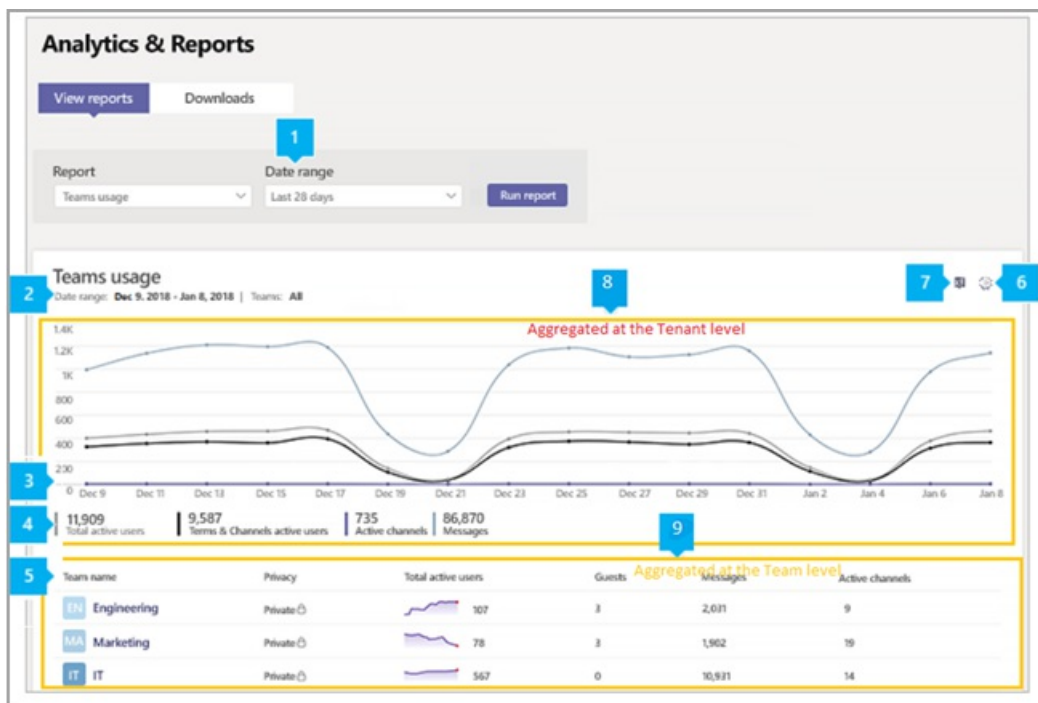

Microsoft Teams usage report

12/7/2021 • 3 minutes to read • [Edit Online](#)

The Teams usage report in the Microsoft Teams admin center gives you an overview of the usage activity in Teams, including the number of active users and channels, so you can quickly see how many users across your organization are using Teams to communicate and collaborate. You can view usage information for teams, including the number of active users and channels, guests, and messages in each team.

View the usage report

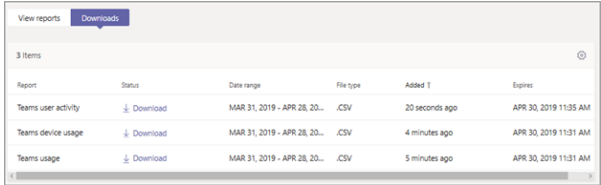

1. In the left navigation of the Microsoft Teams admin center, click **Analytics & reports** > **Usage reports**. On the **View reports** tab, under **Report**, select **Teams usage**.
2. Under **Date range**, select a range, and then click **Run report**.

Interpret the report

CALLOUT	DESCRIPTION
1	The Teams usage activity report can be viewed for trends over the last 7 days, 30 or 90 days.
2	Each report has a date for when this report was generated. The reports usually reflect a 24 to 48 hour latency from time of activity.

CALLOUT	DESCRIPTION
3	<ul style="list-style-type: none"> • The X axis on the chart is the selected date range for the report. • The Y axis is the count of active items or activity. <p>Hover over the dot representing an item or activity on a given date to see the number of instances of that item or activity on that given date.</p>

Microsoft Teams user activity report

12/7/2021 • 5 minutes to read • [Edit Online](#)

The Teams user activity report gives insight into the types of activities that users in your organization do in Teams. You can see how many users communicate on an unplanned basis through unscheduled meetings (1:1 and group calls). See how many meetings a Teams user has organized, and meetings a Teams user has participated in. See details about screen, video, and audio minutes, and chat communication statistics, such as how many users reply to and post channel messages, and how many users engage in 1:1 or group chat messages.

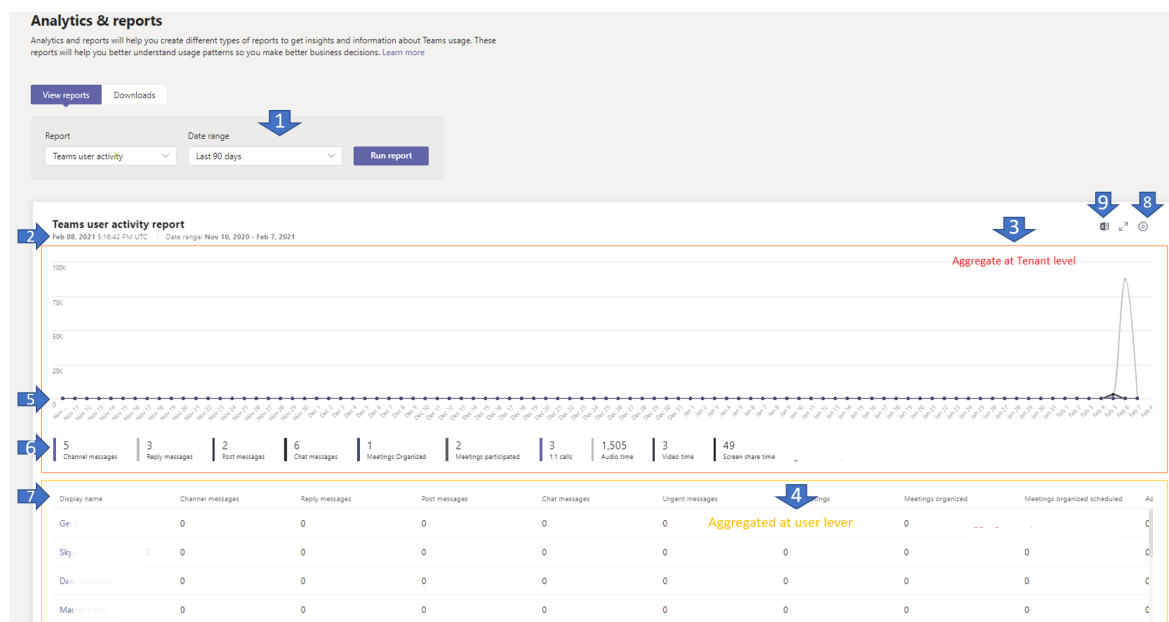

NOTE

The ability to schedule a user activity report isn't available at this time.

View the user activity report

You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

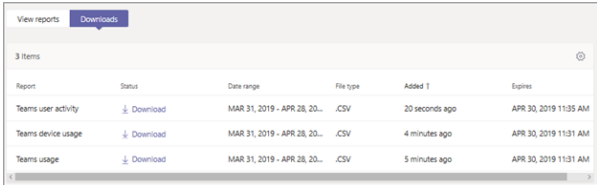

1. In the left navigation of the Microsoft Teams admin center, select **Analytics & reports > Usage reports**. On the **View reports** tab, under **Report**, select **Teams user activity**.
2. Under **Date range**, select a range, and then select **Run report**.

Interpret the report

CALLOUT	DESCRIPTION
1	The Teams user activity report can be viewed for trends over the last 7 days, 30 or 90 days.

CALLOUT	DESCRIPTION
2	Each report has a date for when this report was generated. The reports usually reflect a 24-hour latency from time of activity.
3	Time series data points in the graph show different usage metrics aggregated at tenant.
4	Tabular data represented different usage metrics aggregated per user.
5	<ul style="list-style-type: none"> • The X axis on the chart is the selected date range for the report. • The Y axis is the count of active items or activity. <p>Hover over the dot representing an item or activity on a given date to see the number of instances of that item or activity on that given date.</p>
6	Each of the metrics represented in graph at tenant level. Filter what you see on the chart by selecting an item in the legend. Select Channel messages , Reply messages , Chat messages , or Meetings Organized to see info related to each one. Changing this selection doesn't change the information in the table.
7	<p>The table gives you a breakdown of usage by user.</p> <ul style="list-style-type: none"> • Display name is the display name of the user. Select the display name to go to the user details page in the Microsoft Teams admin center. • Channel messages is the number of unique messages that the user posted in a team channel during the specified time period. • Reply messages is the number of unique reply messages that the user posted in a team channel during the specified time period. • Post messages is the number of unique post messages that the user posted in a team channel during the specified time period. • Chat messages is the number of unique messages that the user posted in a private chat during the specified time period. • Urgent messages is the number of urgent messages that the user posted in a chat during the specified time period. • Total Meetings organized is the sum of one time scheduled, Recurring, unplanned, and <i>unclassified</i> meetings a user organized during the specified time period. • Meetings organized scheduled onetime is the number of one time scheduled meetings a user organized during the specified time period. • Meetings organized scheduled recurring is the number of recurring meetings a user organized during the specified time period. • Meetings organized adhoc is the number of unplanned meetings a user organized during the specified time period. • Total Meetings participated is the sum of the one-time scheduled, recurring, unplanned, and

<p>CALLOUT</p>	<p><i>unclassified</i> meetings a user participated in during the specified time period.</p>
	<p>DESCRIPTION</p> <ul style="list-style-type: none"> • Meetings participated scheduled onetime is the number of the one time scheduled meetings a user participated in during the specified time period. • Meetings participated scheduled recurring is the number of the recurring meetings a user participated in during the specified time period. • Meetings participated adhoc is the number of unplanned meetings a user participated in during the specified time period. • 1:1 calls are the number of 1:1 calls that the user participated in during the specified time period. • Audio time is the total audio time (minutes) that the user participated in during the specified time period. • Video time is the total video time (minutes) that the user participated in during the specified time period. • Screen sharing time is the total screen share time (minutes) that the user participated in during the specified time period. • Last activity is the last date (UTC) that the user participated in a Teams activity. • Other activity tracks when the user is considered active but has a value of zero for chat messages, 1:1 calls, channel messages, total meetings, and meetings organized. Examples actions are when a user opens a channel message post but doesn't reply to it or when a user receives a private message and reads it but doesn't respond to it. • Unclassified meetings are those that can't be identified as scheduled, recurring, or unplanned. These are few in number and often can't be identified because of imperfect telemetry information. <p>Group calls has been replaced by Meetings organized adhoc and Meetings participated adhoc. The sum of these two values is equal to what was measured by Group calls.</p>
<p>8</p>	<p>Select Edit columns to add or remove columns in the table.</p>
<p>9</p>	<p>Export the report to a CSV file for offline analysis. Select Export to Excel, and then the Downloads tab, select Download to download the report when it's ready.</p>  <p>When you view the report in Excel, you'll also see an ID column, which represents the User ID. A User ID is typically an alphanumeric string.</p>

Definitions

The Teams reports show data for active users and active channels. For example, if a user in your organization isn't active in Teams during the date range that you specified for a report, data for that user isn't included in that report.

ITEM	DEFINITION
Active user	Measures the number of unique users who perform an action in Teams during the specified date range.
Active channel	Measures the number of channels of a team in which users perform an action during the specified date range.

Make the user-specific data anonymous

To make the data in Teams user activity report anonymous, you have to be a global administrator. This will hide identifiable information (using MD5 hashes) such as display name, email, and AAD ID in report and their export.

1. In Microsoft 365 admin center, go to the **Settings > Org Settings**, and under **Services** tab, choose **Reports**.
2. Select **Reports**, and then choose to **Display anonymous identifiers**. This setting gets applied both to the usage reports in Microsoft 365 admin center and Teams admin center.
3. Select **Save changes**.

Microsoft Teams app usage report

12/7/2021 • 2 minutes to read • [Edit Online](#)

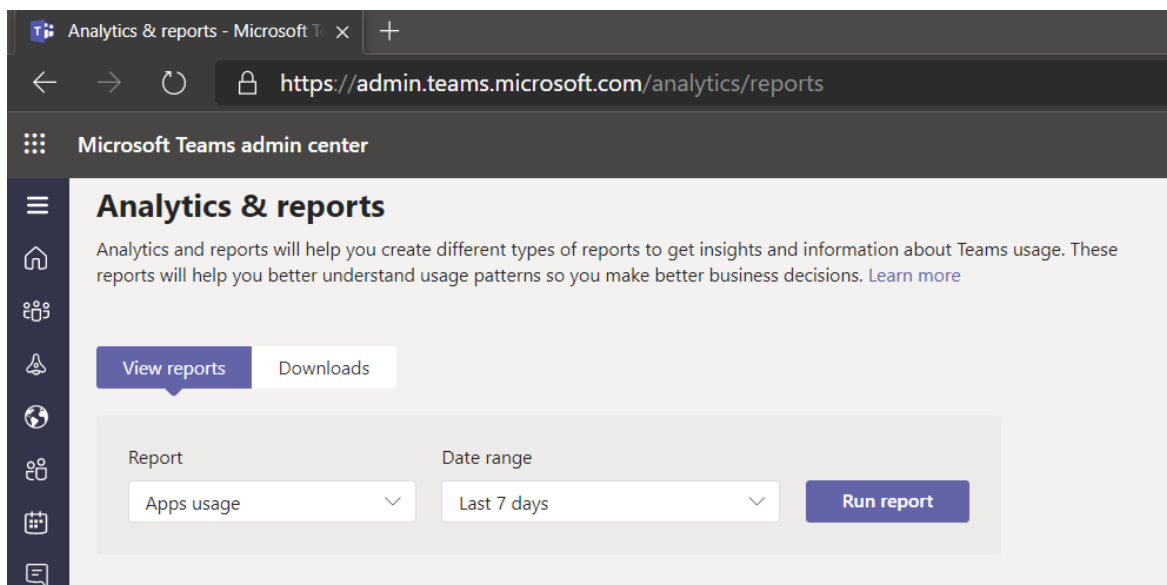

The Teams app usage report in the Microsoft Teams admin center provides you with information about which apps users are using in Teams.

View the App Usage report

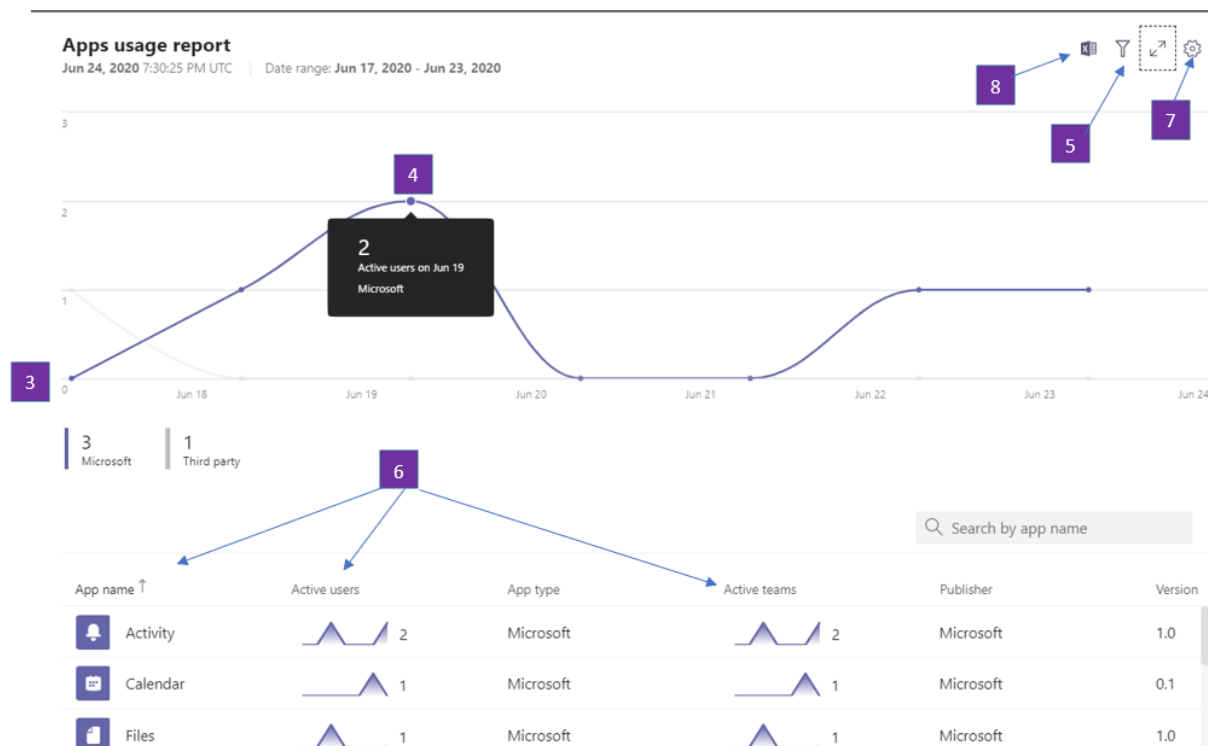

1. In the left navigation of the admin center at <https://admin.teams.microsoft.com>, click **Analytics & reports** > **Usage reports**.

2. On the **View reports** tab, under **Report**, select **Apps Usage**.
3. Under **Date range**, select a range, and then click **Run report**. The Teams Apps usage report can be viewed for trends over the last 7, 30 or 90 days.

Interpret the report

- Each report has a date at the upper left that shows when the report was created. Reports usually reflect a 24-hour latency from the time an app was opened.
- The Y axis on the chart is the number of users who for the date you selected by hovering over the chart are considered active users because they have opened an app at least once.
- The X axis on the chart is the date range that you selected for the report.
- Hover over the dot representing an app's usage on any date to see the total number of that app's active users on that date.
- To select other apps, at the upper right, click the **Filter** icon, select or type new criteria, and then click **Apply**.
- The table at the bottom of the report shows active users and teams by app name.
 - App name** is the display name of the app used in Teams.
 - Active users** is the number of users who opened the app at least once during the specified time period.
 - App type** is a static value of either "Microsoft" or "Third Party".
 - Active teams** is the number of teams who have opened the app by at least one member of the team and during the specified time periods.
 - Publisher** is the software publisher of the app.
 - Version** is the software version of the app, from the app publisher.

NOTE

Active users and Active teams are calculated for apps used in channels only.

- To add or remove columns in the table, at the upper right, click the **Edit columns** icon, on the **Edit columns** tab, select new criteria, and then click **Apply**.
- To export the report to a CSV file for offline analysis, at the upper right, select the **Export to Excel** icon, and then on the **Downloads** tab under **Status**, click **Download**.

Microsoft Teams device usage report

12/7/2021 • 2 minutes to read • [Edit Online](#)

The Teams device usage report in the Microsoft Teams admin center provides you with information about how users connect to Teams. You can use the report to see the devices that are used across your organization, including how many use Teams from their mobile devices when on-the-go.

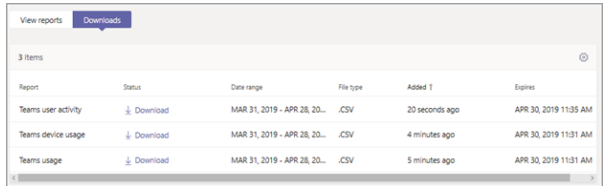

View the device usage report

1. In the left navigation of the Microsoft Teams admin center, click **Analytics & reports** > **Usage reports**. On the **View reports** tab, under **Report**, select **Teams device usage**.
2. Under **Date range**, select a range, and then click **Run report**.

Interpret the report

CALLOUT	DESCRIPTION
1	The Teams device usage report can be viewed for trends over the last 7 days or 30 days.
2	Each report has a date for when the report was generated. The reports usually reflect a 24 hour latency from time of activity.

CALLOUT	DESCRIPTION
3	<ul style="list-style-type: none"> The X axis on the chart represents the different devices (Windows, Mac, Linux, iOS, Android Phone, Web) used to connect to Teams. The Y axis is the number of users using the device over the selected time period. <p>Hover over the bar representing a device to see the number of users using the device to connect to Teams.</p>
4	<p>The table gives you a breakdown of device usage by user.</p> <ul style="list-style-type: none"> Username is the display name of the user. You can click the display name to go to the user's setting page in the Microsoft Teams admin center. Windows is selected if the user was active in the Teams desktop client on a Windows-based computer. Mac is selected if the user was active in the Teams desktop client on a macOS computer. Linux is selected if the user was active in the Teams desktop client on a Linux computer. iOS is selected if the user was active on the Teams mobile client for iOS. Android phone is selected if the user was active on the Teams mobile client for Android. Web is selected if the user was active on the Teams web client. Last activity is the last date (UTC) that the user participated in a Teams activity. <p>Note that if a user account no longer exists in Azure AD, the user name is displayed as "--" in the table.</p> <p>To see the information that you want in the table, make sure to add the columns to the table.</p>
5	Select Edit columns to add or remove columns in the table.

Microsoft Teams PSTN blocked users report

12/7/2021 • 2 minutes to read • [Edit Online](#)

The PSTN blocked users report in the Microsoft Teams admin center shows you the users in your organization who are blocked from making PSTN calls in Teams. You can view more information about each blocked user, including their assigned phone number and the reason they were blocked from making calls.

View the PSTN blocked users report

In the left navigation of the Microsoft Teams admin center, click **Analytics & reports** > **Usage reports**. On the **View reports** tab, under **Report**, select **PSTN blocked users**, and then click **Run report**.

Interpret the report

CALLOUT	DESCRIPTION
1	Each report has a date for when it was generated. The reports usually reflect a 24 to 48 hour latency from time of activity.
2	The X axis is the date. The Y axis is the number of users. Hover over the dot on a given date to see the number of users blocked on that date.

CALLOUT	DESCRIPTION
3	<p>The table gives a breakdown of all users who are blocked from making PSTN calls. It shows all users who have Phone System or Audio Conferencing assigned and gives you more information about each user.</p> <ul style="list-style-type: none"> • Display name is the display name of the user. You can click the display name to go to the user's setting page in the Microsoft Teams admin center. • Phone is the number that's assigned to the user. • Blocked reason is the reason the user is blocked from making calls. • Blocked action tells you whether the user is blocked or unblocked from making PSTN calls in Teams. • Blocked time is the date and time (UTC) that the user was blocked from making calls. <p>To see the information that you want in the table, make sure to add the columns to the table.</p>
4	Select Edit columns to add or remove columns in the table.
5	Select Full screen to view the report in full screen mode.

Microsoft Teams PSTN usage report

12/7/2021 • 15 minutes to read • [Edit Online](#)

The Teams PSTN (Public Switched Telephone Network) usage report in the Microsoft Teams admin center gives you an overview of calling and audio conferencing activity in your organization. You can view detailed calling activity for Calling Plans if you use Microsoft as your telephony carrier and for Direct Routing if you use your own telephony carrier.

The **Calling Plans** tab shows information including the number of minutes that users spent in inbound and outbound PSTN calls and the cost of these calls. The **Direct Routing** tab shows you information including the SIP address and call start and end times. Use the information in this report to gain insight into PSTN usage in your organization and help you to investigate, plan, and make business decisions.

NOTE

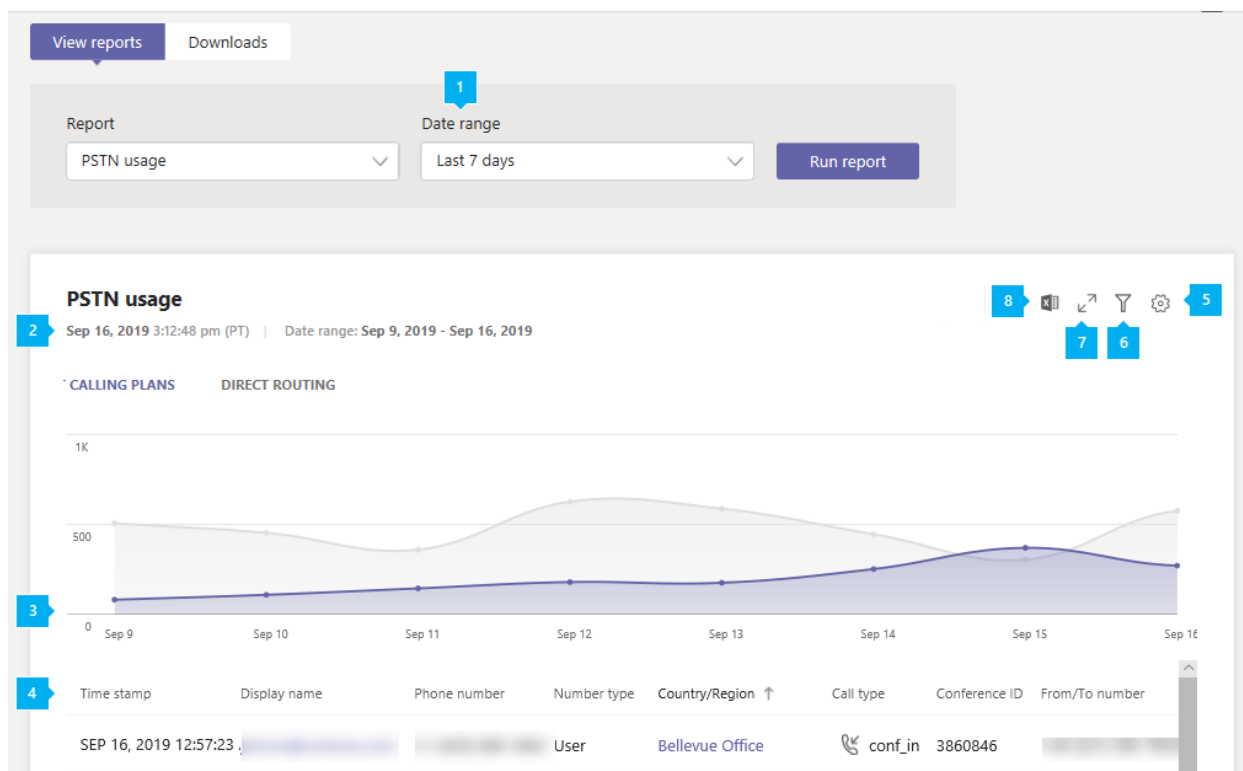

If you have a Telstra or Softbank calling plan, you will not see any call detail records in the PSTN usage report. Please contact Telstra or Softbank for your reporting needs.

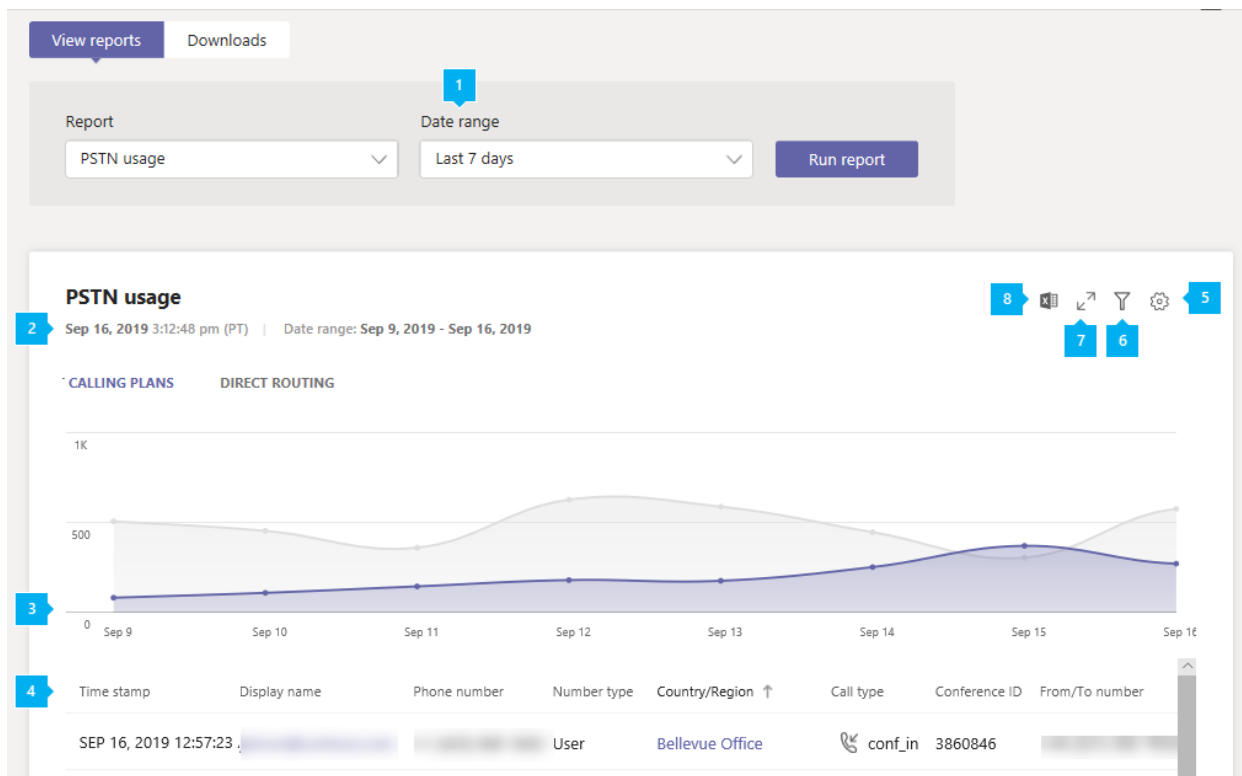

View the PSTN usage report

1. In the left navigation of the Microsoft Teams admin center, click **Analytics & reports > Usage reports**. On the **View reports** tab, under **Report**, select **PSTN usage report**.
2. Under **Date range**, select a predefined range of 7 or 28 days, or set a custom range, and then select **Run report**.

Interpret the report

Calling Plans

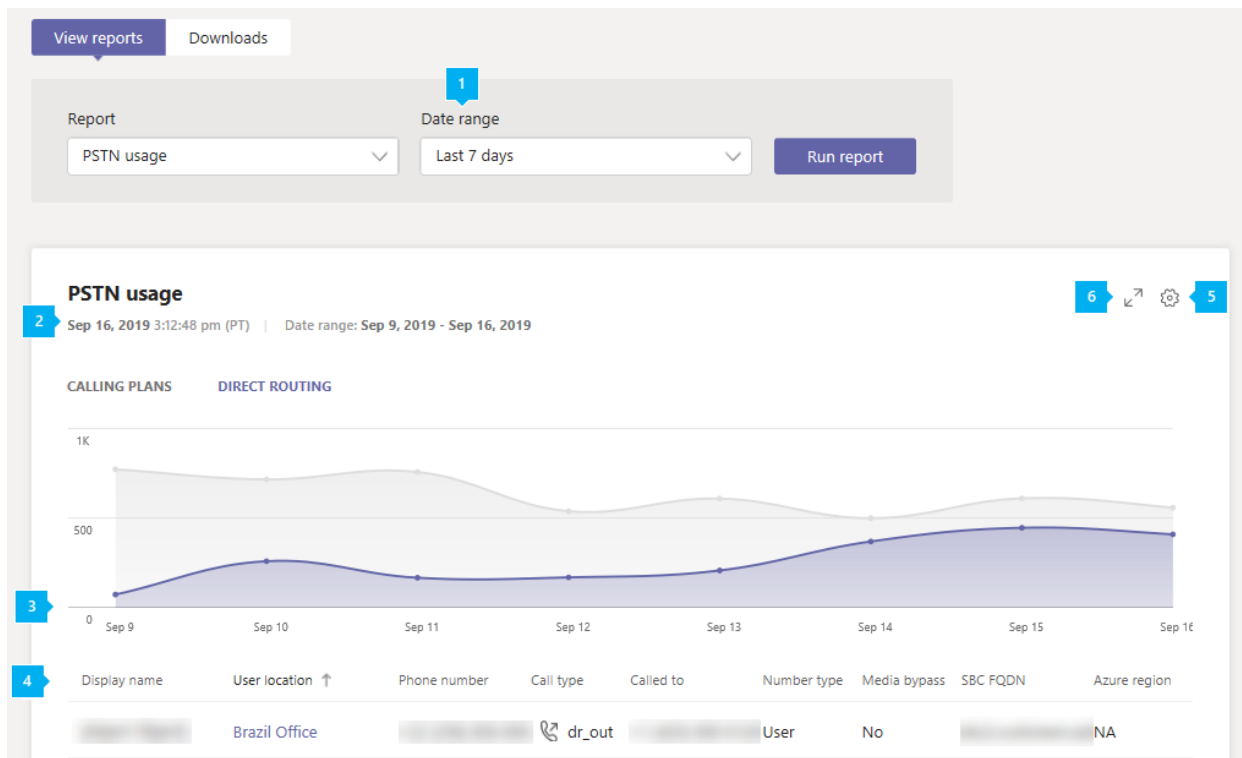

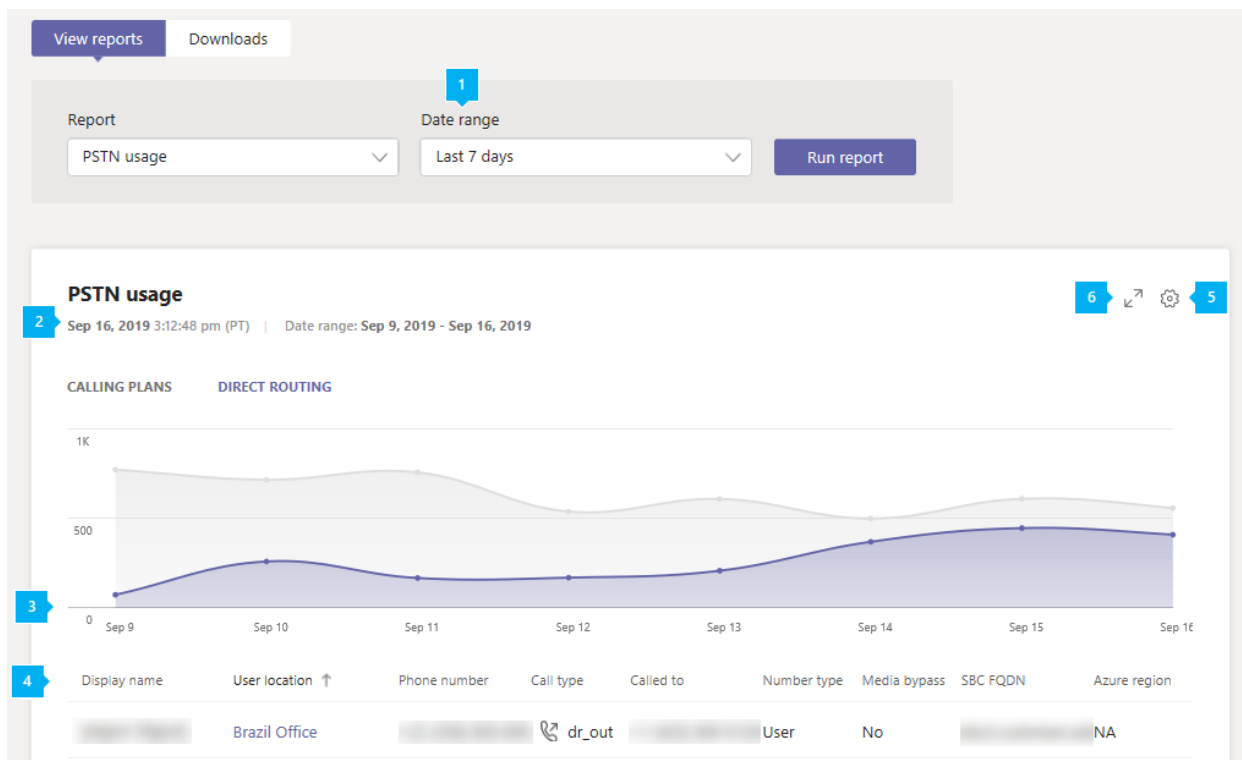

CALLOUT	DESCRIPTION
1	The report can be viewed for trends over the last 7 days, 28 days, or a custom date range that you set
2	Each report has a date for when it was generated. The reports usually reflect a 24 to 48 hour latency from time of activity.
3	<p>The X axis is the selected date range for the specific report. The Y axis is the total number of calls over the selected time period.</p> <p>Hover over the dot on a given date to see the total calls on that date.</p>
4	<p>The table gives you a breakdown of PSTN usage per call.</p> <ul style="list-style-type: none"> • Time stamp (UTC) is the time the call started. • Display name is the display name of the user. You can click the display name to go to the user's setting page in the Microsoft Teams admin center. • Username is the user's sign in name. • Phone number is the number that received the call for inbound calls or the number dialed for outbound calls. • Call type is whether the call was a PSTN outbound or inbound call and the type of call such as a call placed by a user or an audio conference. The calls types you may see include: <ul style="list-style-type: none"> Teams user call types <ul style="list-style-type: none"> ◦ user_in - the user received an inbound PSTN call. ◦ user_out - the user placed an outbound PSTN call ◦ user_out_conf - the user added two or more PSTN participants to the call such as a three-way conference call

CALLOUT	DESCRIPTION
	<ul style="list-style-type: none"> ◦ user_out_transfer - the user transferred the call to a PSTN number ◦ user_out_forwarding - the user forwarded the call to a PSTN number ◦ conf_in - an inbound call to the Audio Conferencing bridge ◦ conf_out - an outbound call from the Audio Conferencing bridge usually to add a PSTN number to the conference ◦ unassigned_in - an inbound PSTN call via Calling Plan to an unassigned number <p>Teams bots call types</p> <ul style="list-style-type: none"> ◦ ucap_in - an inbound PSTN call to Teams bot such as auto attendant or call queue ◦ ucap_out - an outbound PSTN call from a Teams bot such as auto attendant or call queue <ul style="list-style-type: none"> • Called to is the number dialed. • To country or region is the country or region dialed. • Called from is the number that placed the call. • From country or region is the country or region from where the call was placed. • Charge is the amount of money or cost of the call that's charged to your account. • Currency is the type of currency used to calculate the cost of the call. • Duration is how long the call was connected. • Domestic/International tells you whether the call was domestic (within a country or region) or international (outside a country or region) based on the user's location. • Call ID is the call ID for a call. It's an identifier for the call you can use when calling Microsoft Support. • Number type is the user's phone number type, such as a service of toll-free number. • Country or region is the usage location. • Conference ID is the conference ID of the audio conference. • Capability is the license used for the call. For failed calls only. Final SIP Code, Final Microsoft Subcode, and Final SIP Phrase provide the reasons why the call failed and can help with troubleshooting. • End time (UTC) is the time the call ended (for successful calls only). • Duration is how long the call was connected. • Number type is the user's phone number type, such as a service of toll-free number. • Media bypass indicates whether the trunk was enabled for media bypass. • SBC FQDN is the fully qualified domain name (FQDN) of the Session Border Controller (SBC). • Azure region for Media is the data center that was used as media path in a non-bypass call. • Azure region for Signaling is the data center that was used for signaling for both bypass and non-bypass calls. • Event type is the event type of the call. You'll see Success for successful calls and Attempt for failed calls. • Final SIP code is the code with which the call ended. • Final Microsoft subcode is a code that indicates specific actions that occurred. • Final SIP phrase is the description of the SIP code </div>

CALLOUT	DESCRIPTION
	<p>and Microsoft subcode.</p> <ul style="list-style-type: none"> • Correlation ID is a unique identifier for the call that you can use when calling Microsoft Support. • Shared Correlation ID is only visible in the downloadable CSV file and does not exist in the portal. The shared correlation ID exists in at least two calls which are related. Please see detailed description below. <p>To see the information that you want in the table, make sure to add the columns to the table.</p>
5	Select Edit columns to add or remove columns in the table.
6	Select Full screen to view the report in full screen mode.
7	Select Export to Excel to download the data in a comma separated file (CSV) for offline analysis or to use it as input for your billing system.

Caller/Callee fields considerations

Depending on the call direction, the Caller or Callee names can contain non-E164 numbers.

These fields can come from the customer SBC(s). There are three formats that the SBC can send to Direct Routing: E.164 numbers, non-E.164 numbers, and strings.

- E.164 phone number from a user who has an E.164 number to a user who also has an E.164 number.
- Call from a non-E.164 number. A user from a third-party PBX interconnected with Direct Routing makes a call to a Teams user. In this case, the caller number might be any non-E.164 number, for example +1001.
- A spammer calls and doesn't present a number, only a name, for example "Internal Revenue Service". This string will be shown in the reports.

About Shared Correlation ID

The Shared Correlation ID only exists in the exported Excel file that you download and indicates that two or more calls are related. The following explains the different scenarios, and when Shared Correlation ID is present.

1. PSTN User 1 on a PSTN endpoint called Teams User 1 on Teams client, call type Dr_In, correlation ID 57f28917-42k5-4c0c-9433-79734873f2ac, no shared correlation ID.
2. Teams User 1 on Teams client called PSTN User 1 on a PSTN endpoint, call type Dr_Out 2c12b8ca-62eb-4c48-b68d-e451f518ff4, no shared correlation ID.
3. PSTN User 1 on a PSTN endpoint called a Teams User 2 on Teams client, call type Dr_In f45e9a25-9f94-46e7-a457-84f5940efde9, shared correlation ID f45e9a25-9f94-46e7-a457-84f5940efde9.
4. Existing call 3 with correlation ID "f45e9a25-9f94-46e7-a457-84f5940efde9". PSTN User 1 in a call with Teams User 2. Teams User 2 transferred (blind or consultative) a call to Teams or PSTN User, call type Dr_Out_User_Transfer 45a1da7c-9e97-481a-8a05-3fe19a9a77e0, shared correlation ID f45e9a25-9f94-46e7-a457-84f5940efde9.

Exporting the reports

Click **Export to Excel**, and then on the **Downloads** tab, click **Download** to download the report when it's ready. Export process can take from a few seconds to several minutes to complete, depending on the quantity of the data.

This exports data of all users and enables you to do simple sorting and filtering for further analysis. Exported files contain additional fields that are not available in the online report. These can be used for troubleshooting and automated workflows.

You will receive a zip file named "Calls.Export.[identifier].zip", with the identifier being an unique ID for the export that can be used for troubleshooting.

If you have both Calling Plans and Direct Routing, the exported file may contain data for both products. PSTN usage report file will have filename "PSTN.calls.[UTC date].csv" and Direct Routing "DirectRouting.calls.[UTC date].csv".

In addition to PSTN and Direct Routing files, the archive contains file "parameters.json", with the selected export time range and capabilities.

Exported files are in Comma Separated Values (CSV) format, compliant with [RFC 4180](#) standard. The files can be opened in Excel or any other standards-compliant editor without requiring any transformations.

The first row of the CSV contains column names. All dates are UTC and in [ISO 8601](#) format.

Exported PSTN usage report

You can export data up to one year from the current date unless country-specific regulations prohibit retention of the data for 12 months.

#	NAME	DATA TYPE (SQL SERVER)	DESCRIPTION
0	UsageId	uniqueidentifier	Unique call identifier
1	Call ID	nvarchar(64)	Call identifier. Not guaranteed to be unique
2	Conference ID	nvarchar(64)	ID of the audio conference
3	User Location	nvarchar(2)	Country code of the user, ISO 3166-1 alpha-2
4	AAD ObjectId	uniqueidentifier	Calling user's ID in Azure Active Directory. This and other user info will be null/empty for bot call types (ucap_in, ucap_out)
5	UPN	nvarchar(128)	UserPrincipalName (sign in name) in Azure Active Directory. This is usually the same as user's SIP Address, and can be same as user's e-mail address
6	User Display Name	nvarchar(128)	Display name of the user
7	Caller ID	nvarchar(128)	Number that received the call for inbound calls or the number dialed for outbound calls. E.164 format
8	Call Type	nvarchar(32)	Whether the call was a PSTN outbound or inbound call and the type of call such as a call placed by a user or an audio conference

#	NAME	DATA TYPE (SQL SERVER)	DESCRIPTION
9	Number Type	nvarchar(16)	User's phone number type, such as a service of toll-free number
10	Domestic/International	nvarchar(16)	Whether the call was domestic (within a country or region) or international (outside a country or region) based on the user's location
11	Destination Dialed	nvarchar(64)	Country or region dialed
12	Destination Number	nvarchar(32)	Number dialed in E.164 format
13	Start Time	datetimeoffset	Call start time
14	End Time	datetimeoffset	Call end time
15	Duration Seconds	int	How long the call was connected
16	Connection Fee	numeric(16, 2)	Connection fee price
17	Charge	numeric(16, 2)	Amount of money or cost of the call that is charged to your account
18	Currency	nvarchar(3)	Type of currency used to calculate the cost of the call (ISO 4217)
19	Capability	nvarchar(32)	The license used for the call

Exported Direct Routing usage report

You can export data up to five months (150 days) from the current date unless country-specific regulations prohibit retention of the data for that period.

#	NAME	DATA TYPE (SQL SERVER)	DESCRIPTION
0	CorrelationId	uniqueidentifier	Unique call identifier

#	NAME	DATA TYPE (SQL SERVER)	DESCRIPTION
1	SIP Address	nvarchar(128)	The address of the user or bot that made or received the call. Note that this is actually UserPrincipalName (UPN, sign in name) in Azure Active Directory, which is usually the same as SIP Address
2	Display Name	nvarchar(128)	The name of a user or a calling bot (for example, Call Queue or Auto Attendant) as set in Microsoft 365 admin center
3	User country	nvarchar(2)	Country code of the user, ISO 3166-1 alpha-2
4	Invite time	datetimeoffset	When the initial Invite send on outbound from Teams user or bot call to the SBC, or received on inbound to Teams or bot call by the SIP Proxy component of Direct Routing from the SBC
5	Start time	datetimeoffset	Time when the SIP proxy received the final answer (SIP Message "200 OK") from the SBC on outbound (Teams/Bot to a PSTN User), or after the SIP Proxy send the Invite to the next hop within Teams backend on inbound call (PSTN User to a Teams/Bot). For failed and unanswered calls, this can be equal to invite or failure time
6	Failure time	datetimeoffset	Only exists for failed (not fully established) calls
7	End time	datetimeoffset	Only exists for successful (fully established) calls. Time when call ended
8	Duration (seconds)	int	Duration of the call
9	Success	nvarchar(3)	Yes/No. Success or attempt

#	NAME	DATA TYPE (SQL SERVER)	DESCRIPTION
10	Caller Number	nvarchar(32)	Number of the user or bot who made the call. On inbound to a Team user call it will be a PSTN User, on outbound from Teams user call it will be the Teams user number
12	Callee Number	nvarchar(32)	Number of the user or bot who received the call. On inbound to a Team user call it will be the Teams user, on outbound from Teams user call it will be the PSTN User
13	Call type	nvarchar(32)	Call type and direction
14	Azure region for Media	nvarchar(8)	The datacenter used for media path in non-bypass call
15	Azure region for Signaling	nvarchar(8)	The datacenter used for signaling for both bypass and non-bypass calls
16	Final SIP code	int	The code with which the call ended, RFC 3261
17	Final Microsoft subcode	int	In addition to the SIP codes, Microsoft has own subcodes that indicate the specific issue
18	Final SIP Phrase	nvarchar(256)	Description of the SIP code and Microsoft subcode
19	SBC FQDN	nvarchar(64)	Fully qualified domain name of the session border controller
20	Media bypass	nvarchar(3)	Yes/No. Indicates if the trunk was enabled for media bypass or not
21	Shared correlation ID	uniqueidentifier	Indicates that two or more calls are related

Microsoft Teams live event usage report

12/7/2021 • 2 minutes to read • [Edit Online](#)

The Teams live event usage report in the Microsoft Teams admin center shows you the activity overview for live events held in your organization. You can view usage information, including event status, start time, views, and production type for each event. You can gain insight into usage trends and see who in your organization schedules, presents, and produces live events.

View the live event usage report

1. In the left navigation of the Microsoft Teams admin center, click **Analytics & reports** > **Usage reports**. On the **View reports** tab, under **Report**, select **Teams live event usage**.
2. Under **Date range**, select a predefined range or set a custom range. You can set a range to show data up to a year, six months before and after the current date.
3. (Optional) Under **Organizer**, you can choose to show only live events organized by a specific user.
4. Click **Run report**.

Interpret the report

CALLOUT	DESCRIPTION
1	The Teams live event report can be viewed for trends over the last 7 days, 28 days, or a custom date range that you set.
2	Each report has a date for when it was generated. The report reflects near real time activity when the page is refreshed.

CALLOUT	DESCRIPTION
3	<ul style="list-style-type: none"> The X axis on the chart is the selected date range for the report. The Y axis is the total view count. <p>Hover over the dot on a given date to see the number of views across all live events on that date.</p>
4	<p>The table gives you a breakdown of each live event.</p> <ul style="list-style-type: none"> Event is the display name of the live event. Click the event name to get more details about the event. Start Time refers to the start date and time of the event. Event Status shows whether the event has taken place. Organizer is the name of the event organizer. Presenters are the names of the event presenters. Producers are the names of the event producers. Views is the number of unique views after the event is completed . Recording shows whether the recording setting is on or off. Production Type shows whether the event is produced in Teams or by an external application or device. <p>Note that if a user account no longer exists in Azure AD, the user name is displayed as "--" in the table.</p> <p>To see the information that you want in the table, make sure to add the columns to the table.</p>
5	Select Edit columns to add or remove columns in the table.

Notes

We show up to 100 live events that match the current report criteria. To see more live events, apply date filters to reduce the list size.

Anonymous presenters will not be included in the report.

Anybody who watches the recording of the event or the event on demand will not be included in the view count.

View event details

The live event details page gives you a summary of the details of a live event and lists all the files, including transcripts and recordings, associated with the event. Click a file name to view or download the file.

Microsoft Teams information protection license report

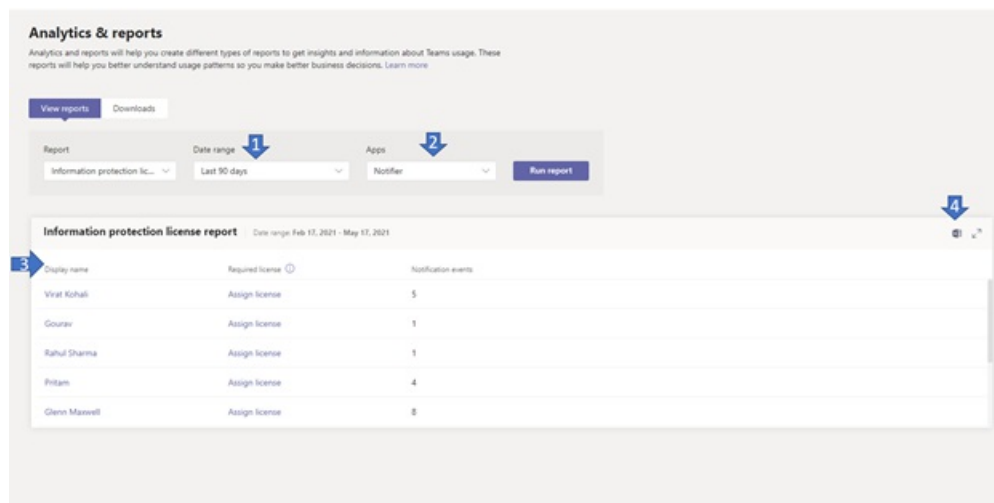

12/7/2021 • 2 minutes to read • [Edit Online](#)

The Teams information protection license report gives insight into apps that have [subscribed](#) to [change notification](#) events to listen to created, updated, or deleted messages at tenant level (that is, /teams/getAllMessage or /chats/getAllMessages). A change notification corresponding to the message is sent successfully only when the user has the [required license](#). You can see how many change notifications was triggered by a given user.

View the information protection license report

You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. In the left navigation of the Microsoft Teams admin center, select **Analytics & reports > Usage reports**. On the **View reports** tab, under **Report**, select **Information Protection License**.
2. Under **Date range**, select a range.
3. Under **Apps**, select an app and then select **Run report**.

Interpret the report

CALLOUT	DESCRIPTION
1	The information protection license report can be viewed for trends over the last 7 days, 30, or 90 days.
2	App name will display a list of all apps that have subscribed to change notification events of messages in the last n days as selected in the date range.

CALLOUT	DESCRIPTION
3	<p>The table gives you a breakdown of usage per user for the selected app.</p> <ul style="list-style-type: none"> • Display name is the display name of the user. Select the display name to go to the user's details page in the Microsoft Teams admin center. • Has Required License is yes if the user has one of the required licenses as defined (here) [https://docs.microsoft.com/en-us/graph/teams-licenses]. If the user does not have the required license, the <i>Assign license</i> link is displayed which navigated to the user's license detail page in the Microsoft admin center (Users > Active Users > select username). • License Protected Events is the number of unique change notification events sent to the app against a message which was created, updated or deleted by that user.
4	<p>Export the report to a CSV file for offline analysis. Select Export to Excel, and then the Downloads tab. Select Download to download the report when it's ready.</p>
5	<p>Export the report to a CSV file for offline analysis. Select Export to Excel, and then the Downloads tab. Select Download to download the report when it's ready. When you view the report in Excel, you'll also see an Id and email column, which represents the User ID and email address of the user.</p>

Make the user-specific data anonymous

To make the data in the Teams user activity report anonymous, you have to be a global administrator. This will hide identifiable information such as display name, email, and Azure AD ID in reports and their exports.

1. In the Microsoft 365 admin center, go to **Settings > Org Settings**, and under the **Services** tab, choose **Reports**.
2. Select **Reports**, and then choose to **Display anonymous identifiers**. This setting gets applied both to the usage reports in the Microsoft 365 admin center and the Teams admin center.
3. Select **Save changes**.

Use log files to monitor and troubleshoot Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

There are three types of log files automatically produced by the client, which can be leveraged to assist in monitoring and troubleshooting Teams:

- [Debug logs](#)
- [Media logs](#)
- [Desktop logs](#)

This article describes these logs and how they are used. For information about troubleshooting specific issues, see: [Teams Troubleshooting](#). For information about how to contact support, see [Get support](#). When creating a support request with Microsoft Support, the support engineer will require the debug logs. Having the debug logs on hand before creating the support request will allow Microsoft to quickly start troubleshooting the problem. **Media** or **Desktop** logs are only required if requested by Microsoft.

NOTE

In this article, the term **Debug logs** refers to the logs that are used for troubleshooting. However, the files that are generated for these logs will contain the term **diagnostic logs** in their names.

Collect and enable logging

It's important to collect logs as soon as an issue occurs. The logs can be collected together with just a couple of clicks.

- Windows: Right-click on the Teams icon in the system tray and choose **Collect support files**.
- Mac: Select the Help menu and choose **Collect support files**.

Debug, Desktop, and Media logs will be collected in one folder with the name *MSTeams Diagnostics Log <local date and time>*. This folder can be compressed and shared when you open a support request with Microsoft Support. The folder will contain folders for Desktop, Meeting (Media), and Debug (web). You can collect the files using the following keyboard shortcuts:

- Windows: **Ctrl + Alt + Shift + 1**
- Mac: **Option + Command + Shift + 1**

Media logging is turned off by default. To enable Media logging, users must turn on the option in the Teams client. Go to **Settings > General**, and select **Enable logging for meeting diagnostics (requires restarting Teams)**. The Teams client must be restarted for logging to begin.

If a problem occurs with a specific meeting or live event, it's helpful to have the URL associated with the meeting. This provides additional information to help pinpoint the exact meeting or live event in the logs. This information can be collected from any participant for a meeting or from presenter or producer for a live event. This URL can be captured by hovering over the join URL and choosing **Copy Hyperlink**.

NOTE

If Media logging is enabled, there will be additional files included in the Meeting folder which are necessary for investigating audio and video issues. If Media logging is not enabled, there will be a limited number of logs available.

NOTE

The debug logs were previously collecting using the keyboard shortcuts below. These still function and will complete the same log capture as the **Collect support files** option.

- Windows: Ctrl + Alt + Shift + 1
- Mac: Option + Command + Shift + 1

The following table outlines the various clients and their associated logs. Log files are stored in locations specific to the client and operating system.

CLIENT	DEBUG	DESKTOP	MEDIA
Web	X	-	-
Windows	X	X	X
Mac OSX	X	X	X
Linux	X	X	X
iOS	-	-	-
Android	-	-	-

For a complete list of supported operating systems and browsers, see [Get clients for Microsoft Teams](#).

Debug logs

See the *Collect and enable logging* section for Windows and Mac instructions. Debug logs are produced by the Windows and Mac desktop clients, as well as by browser-based clients. The logs are text-based and are read from the bottom-up. They can be read using any text-based editor, and new logs are created when logging into the client.

Debug logs show the following data flows:

- Login
- Connection requests to middle-tier services
- Call/conversation

To collect logs for Linux:

- Keyboard shortcut: Ctrl + Alt + Shift + 1
- The files will be available in `~/Downloads`

To collect logs for Browser and Windows:

- Keyboard shortcut: Ctrl + Alt + Shift + 1

- The files will be available in `%userprofile%\Downloads`

Media logs

See the *Collect and enable logging* section for Windows and Mac instructions. Media logs contain diagnostic data about audio, video, and screen sharing in Teams meetings. They are required for support cases that are linked to call-related issues.

Media logging is turned off by default. To log diagnostic data for Teams meetings, users must turn on the option in the Teams client. Go to **Settings > General**, select the **Enable logging for meeting diagnostics (requires restarting Teams)** check box, restart Teams, and reproduce the issue.

When you send the log files to Microsoft support, please verify the timestamp of the log files to ensure the logs cover the time frame when you reproduced the issue.

To collect logs for Linux:

- The files will be available in the following locations:
 - `~/.config/Microsoft/Microsoft Teams/media-stack/**.blog`
 - `~/.config/Microsoft/Microsoft Teams/skylib/**.blog`

To collect logs for Windows:

- The files will be available in the following locations:
 - `%userprofile%\Downloads\MSTeams Diagnostics Log\meeting\media-stack**.blog`
 - `%userprofile%\Downloads\MSTeams Diagnostics Log\meeting\skylib**.blog`

Here's a list of the log files that are generated and the information they contain.

LOG FILE NAME	DESCRIPTION
<code>Teams.msrtc-0-s1039525249.blog</code>	Contains information related to the media stack. This includes channel status such as resolution, decoders and encoders used, and the number of frames sent and received, and camera and video-based screen sharing (VBSS) session status.
<code>rtmcontrol.msrtc-0-2415069487.blog</code>	Records information related to remote control actions, such as the time stamp when control is given, and mouse pointer information.
<code>Teams_MediaStackETW-2-U-xr-U.etl</code>	Records media stack trace events.
<code>Debug-0-s2790420889.blog</code>	Contains information related to the media agent, including rendering quality.
<code>tscalling-0-2061129496.blog</code>	Records events in the ts-calling API.

Desktop logs

See the *Collect and enable logging* section for Windows and Mac instructions. Desktop logs, also known as bootstrapper logs, contain log data that occurs between the desktop client and the browser. Like media logs, these logs are only needed if requested by Microsoft. The logs are text-based and can be read using any text-based editor in a top-down format.

To collect logs for Linux:

- Click on the Microsoft Teams icon in your system tray, and select **Get Logs**.
- The files will be available in `~/.config/Microsoft/Microsoft Teams/logs.txt`.

To collect logs for Windows:

- Click the Microsoft Teams icon in your system tray, and select **Collect support files**.
- The `logs.txt` file will be opened in Notepad automatically.

When investigating problems signing into Teams, you might need to manually collect the desktop logs. These log files are located at %appdata%\Microsoft\Teams in Windows.

Browser trace

For some categories of errors, Microsoft Support might require you to collect a browser trace. This information can provide important details about the state of the Teams client when the error occurs.

Before you start the browser trace, make sure that you're signed in to Teams. It's important to do this before you start the trace so that the trace doesn't contain sensitive sign-in information.

After you're signed in, select one of the following links, as appropriate for your browser, and follow the provided steps.

- [Chrome & Edge \(Chromium\)](#)
- [Edge](#)
- [Safari](#)
- [Firefox](#)

NOTE

In the steps, replace all references to the Azure portal with the Teams client.

WebRTC logs in browsers

WebRTC logs can assist Microsoft Support by providing connection details for audio and video calls. Follow the steps to access the WebRTC logs in Edge (Chromium) or Chrome:

1. Open a new tab and go to one of the following URLs:
 - Edge (Chromium): `edge://webrtc-internals/`
 - Chrome: `chrome://webrtc-internals/`
2. Open the Teams Web application and reproduce the problem.
3. Go back to the tab that was accessed in step 1 and you will see at least two tabs:
 - GetUserMedia Requests
 - `https://teams.microsoft.com/url`
4. Choose the tab with the name of the Teams application and save the page content.

Verify service health for Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Service health for Microsoft Teams is displayed on the Microsoft 365 admin center. Before troubleshooting issues, it's a good practice to verify that the Teams service is healthy. Go to the [Teams Service Health](#) console to review the service health.

Also, keep in mind that, Microsoft Teams is built on top of other Microsoft 365 or Office 365 services, so when you look at Service Health, remember to also check the status of Exchange, SharePoint, and OneDrive for Business. Service Health issues for these other services doesn't automatically mean Teams is affected (for example, Address Book downloads in Exchange are unavailable), but you should review the advisories for those affected services to determine if there's an impact to Microsoft Teams.

Microsoft Teams

Service is healthy

How to look up your support PIN

12/7/2021 • 2 minutes to read • [Edit Online](#)

To look up your support PIN, which enables Microsoft Customer Support through the telephone, please follow these steps:

1. Log in to the [Office Admin Center](#).
2. Click on the gear icon.
3. Your support PIN will be displayed in the lower right pane. You may also choose to re-generate your PIN if needed.

Chat, teams, channels, & apps in Microsoft Teams

12/7/2021 • 10 minutes to read • [Edit Online](#)

Teams provides a great out-of-the-box collaboration experience for your organization, and most organizations find that the default settings work for them. This article helps you decide whether to change any of the default settings, based on your organization's profile and business requirements, then it walks you through each change. We've split the settings into two groups, starting with the core set of [changes you're more likely to make](#). The second group includes the [additional settings](#) you may want to configure, based on your organization's needs.

To get started, watch our short Teams chat, teams, and channels video (4:30 minutes):

You can use [Advisor for Teams](#) to help you roll out Microsoft Teams. Advisor for Teams walks you through your Teams rollout. It assesses your Microsoft 365 environment and identifies the most common configurations that you may need to update or modify before you can successfully roll out Teams.

TIP

We recommend that you include our featured apps -- such as Planner -- in your initial Teams rollout. Add other [apps](#), [bots](#), and [connectors](#) as you drive Teams adoption.

NOTE

For details about Teams features on different platforms, see [Teams features by platform](#).

Chat deployment prerequisites

Before you roll out Teams across your organization, take time to confirm that your environment is ready for Teams. Review [Prepare your organization's network for Teams](#) and make any required changes to your environment.

ASK YOURSELF	ACTION
Is my organization ready to roll out Teams?	To answer this question, see: <ul style="list-style-type: none">• Prepare your organization's network for Teams• URLs and IP address ranges• Plan for Microsoft 365 Groups when creating teams

Core deployment decisions

These are the chat, teams, and channels settings that most organizations want to change (if the default settings don't work for them).

Teams administrators

Teams provides a set of custom administrator roles that can be used to manage Teams for your organization.

The roles provide various capabilities to administrators.

ASK YOURSELF	ACTION
Who will be assigned the Teams Communications Administrator role?	To learn more about Teams administrator roles see Use Microsoft Teams admin roles to manage Teams .
Who will be assigned the Teams Communications Support Engineer role?	To assign admin roles, see Assign administrator and non-administrator roles to users with Active Directory .
Who will be assigned the Teams Communications Support Specialist role?	

Teams owners and members

In addition to administrator roles, Teams lets you assign owner and member user roles, and selectively give them moderator capabilities (if moderation has been set up) to control who can perform certain actions within a channel. Moderation allows you to control who can start new posts in a channel, add and remove team members as moderators, and control whether team members can reply to existing channel messages.

ASK YOURSELF	ACTION
Who should be assigned to each role?	To compare the capabilities of each role, see Assign team owners, moderators, and members in Microsoft Teams .
How do I assign a user role?	To assign or change a role, see Assign a user role .
Do I need to control who can post and reply in a channel?	To configure moderation, see Set up and manage channel moderation in Microsoft Teams .

Messaging policies

Messaging policies control which chat and channel messaging features are available to users in Teams. For example, who can edit and delete sent messages, who can use chat, who can use memes in conversations, and more. By default, users are assigned the global messaging policy and all features are **On**. You can use the default global policy or create one or more custom messaging policies for people in your organization.

ASK YOURSELF	ACTION
Will I customize the global messaging policy?	For information about using the Microsoft Teams admin center to change the global messaging policy or add a new policy, see Manage messaging policies in Teams .
Do I require multiple messaging policies?	To create and assign a messaging policy in PowerShell, see PowerShell script sample - Create and assign a messaging policy .
How will I determine which groups of users get which messaging policy?	To learn about the CsTeamsMessagingPolicy cmdlets, see Set-CsTeamsMessagingPolicy .

External access

External access (formerly known as federation) lets your Teams and Skype for Business users communicate with users who are outside of your organization. By turning this on and adding domains to the allowed list, your users can communicate with users in other domains and organizations. External access differs from guest access

in that an entire domain is given access permission, not an individual. External access is turned on by default.

ASK YOURSELF	ACTION
<ul style="list-style-type: none">• Will I turn on external access for my organization?• If enabled, will I limit which domains my organization can communicate with?	To turn on external access, see Plan for external access .

Guest access

Guest access in Teams lets individuals outside your organization access teams and channels. You can use the guest access settings to control which features guests can or can't use. Guest access is turned on by default. To learn more, see [Guest access in Teams](#).

NOTE

For more on External access and Guest access see here - [Communicate with users from other organizations in Microsoft Teams](#)

ASK YOURSELF	ACTION
Will I turn on guest access for my organization?	To turn on guest access, see Turn on or off guest access in Teams .
If enabled, will I customize the features available to guests in my organization?	To customize guest access feature availability, see Authorize guest access in Teams .

Teams settings

Teams settings let you set up your teams for features such as email integration, cloud storage options, organization tab, meeting room device setup, and search scope. When you make changes to these settings, they apply to all the teams in your organization. To learn more, see [Teams settings](#).

ASK YOURSELF	ACTION
Will I customize Teams settings for my organization?	To learn about Teams settings and how to customize them, see Teams settings .

Teams clients

Teams supports a number of clients from web to desktop to mobile, and the default configuration lets users choose whichever clients they want. To learn more, see [Get clients for Teams](#).

ASK YOURSELF	ACTION
Will I customize Teams client availability for my organization?	Check out Hardware requirements for the Teams app .
Will I customize Teams client settings for my organization?	Learn how to Install Teams using MSI .

Teams usage reporting

The Global Admin, Teams Service Admin, and Reports Readers roles can view Teams usage reports. To learn more, see the [Microsoft 365 usage analytics](#).

ASK YOURSELF	ACTION
Who needs to see the Teams usage reports, and do they have the correct role to view them?	<ul style="list-style-type: none">• If the user isn't an admin, assign the Reports reader role.• See Roles and permissions and View and assign roles to learn how to assign admin roles in Azure Active Directory.

Teams default apps

Teams provides a number of first-party (Microsoft provided) and third-party apps to engage users, support productivity, and integrate commonly used business services into Teams. Get apps from the Teams Store. Apps are turned on by default in Teams.

To learn more about rolling out and managing apps in Teams, see our in-depth [Apps, bots, & connectors](#) guidance.

Additional deployment decisions

You may want to change these settings, based on your organization's needs and configuration.

Teams licensing

Teams is provided as part of many Microsoft 365 or Office 365 licenses. To learn more about Teams licensing, see [Microsoft Teams service description](#).

ASK YOURSELF	ACTION
Do my users have the licenses they need in order to use all the Teams features I want to roll out?	To learn about licensing requirements, read Microsoft Teams service description .

Exchange and SharePoint interoperability

For the full Teams experience, every user should be enabled for Exchange Online, SharePoint Online, and Microsoft 365 Group creation. The following articles outline information related to Exchange mailboxes hosted in various environments, how Exchange and Teams interact, and similar considerations for SharePoint and OneDrive for Business.

ASK YOURSELF	ACTION
Will I be able to deploy the Teams features that I require with the current Exchange and SharePoint deployments?	<p>For more information about Exchange and SharePoint in Teams, see:</p> <ul style="list-style-type: none">• How Exchange and Teams interact• How SharePoint Online and OneDrive for Business interact with Teams

Teams limits and specifications

When planning an enterprise deployment of Teams, you should take into account any relevant limitations and specifications, such as the maximum number of members in a team, the maximum number of teams a user can create, and so on.

ASK YOURSELF	ACTION
What limits am I likely to hit with my Teams rollout?	To learn more, read Limits and specifications for Teams .

URLs and ports

Organizations that maintain fine-grained control of their internet traffic should read [URLs and IP address ranges](#) for an up-to-date list of the URLs, IP addresses, ports, and protocols that must be correctly configured for Teams. Microsoft is continuously improving the Microsoft 365 and Office 365 services and adding new functionality, which means the required ports, URLs, and IP addresses may change over time. We recommend that you subscribe via RSS to receive notifications when this information is updated or changed. At a minimum, make sure you've opened the ports listed above in [Chat deployment prerequisites](#).

ASK YOURSELF	ACTION
Do I require internet access rules to enable users to use Teams, or is it sufficient to open the minimum required ports?	To learn more, see URLs and IP address ranges .

Governance (naming conventions, who can create teams)

Your organization might require that you implement controls on how teams are named and classified, who can create teams, and team expiration, retention, and archiving. This is called governance. You can use Azure Active Directory (Azure AD) to configure each of these areas.

ASK YOURSELF	ACTION
Will I need to implement controls on who can create teams?	Read Plan for governance in Teams .
Will I need to implement controls on how teams are named?	Read Enforce a naming policy for Microsoft 365 Groups in Azure AD .

Teams application policy (side-rail control)

A pinned app shows up in the side rail in Teams. By creating Teams application policies, you can preconfigure sets of pinned Teams apps to personalize Teams for select groups of users. By default, the **Allow external apps in Microsoft Teams** setting is turned on.

ASK YOURSELF	ACTION
Should I create preconfigured sets of pinned Teams applications?	Read Admin settings for apps in Teams .
How will I decide which groups receive these app groupings?	Read Teams apps permissions and considerations .

Archiving and compliance

Your organization might require that you implement controls on how teams are archived and the types of data that are held in certain types of teams. Read [Overview of security and compliance in Teams](#) to learn which Teams settings are turned on by default.

ASK YOURSELF	ACTION
Will I need to configure team retention?	To set up retention policies, see Set up Teams retention policies .
Will I need to configure team archiving?	To archive or restore a team, see Archive or restore a team .
Will I need to configure additional compliance settings?	For more information about security and compliance, see Overview of security and compliance in Teams .

Conditional access

Teams relies heavily on Exchange Online, SharePoint Online, and Skype for Business Online for core productivity scenarios, including meetings, calendars, interop chats, and file sharing. Conditional access policies that are set for these cloud apps apply to Teams when a user signs in directly to Teams, on any client. Conditional access policies that are set for the Teams cloud app control aspects such as whether users can access Teams services from certain networks.

ASK YOURSELF	ACTION
Will I need to configure conditional access for Teams?	<ul style="list-style-type: none"> To understand how access policies work, see How do conditional access policies work for Teams? To set up multifactor authentication (MFA) for Teams, see: <ul style="list-style-type: none"> Quickstart: Require MFA for specific apps with Azure Active Directory conditional access Azure Active Directory conditional access settings reference

Education (EDU)

IT pros working in education can take advantage of Teams for Education, which comes with a number of capabilities that have been tailored to meet education-specific scenarios for students, faculty, and the wider business.

ASK YOURSELF	ACTION
Will I use EDU-specific Teams templates?	To learn more about Teams for Education, see Microsoft Education governance FAQ for admins .
Will I deploy scoped search?	To set up Teams for EDU, see Quickstart - Teams for Education admins .
Will I integrate Teams with the School Data Sync service to provision user accounts?	Teams resources for Education admins

Government - GCC considerations

The use of Office 365 for Government - GCC (Government Community Cloud) is appropriate to meet the requirements of IT pros who are driving deployments of Office 365 in US federal, state, local, tribal, or territorial government entities or other entities that handle data that's subject to government regulations and requirements.

ASK YOURSELF	ACTION
Will I need to deploy Teams in a Office 365 for Government – GCC environment?	For deployment considerations, see Plan for Office 365 Government - GCC deployments .

Next steps

- [Drive adoption](#) of chat, teams, channels, & apps.
- Include featured apps - such as Planner - in your initial Teams rollout. Add other [apps, bots, & connectors](#) as you drive Teams adoption.
- [Roll out meetings & conferencing](#)
- [Roll out cloud voice](#)

Use Advisor for Teams to help you roll out Microsoft Teams

12/7/2021 • 15 minutes to read • [Edit Online](#)

Advisor for Teams walks you through your Microsoft Teams rollout. It assesses your Microsoft 365 organization environment and identifies the most common configurations that you may need to update or modify before you can successfully roll out Teams. Then, Advisor for Teams creates a Deployment team (in Teams), with channels for each workload you want to roll out. Each workload in the Deployment team comes with a comprehensive Planner plan that includes all the rollout tasks for each workload. Using this Planner plan, you'll assign tasks to the people responsible for each phase of the rollout - including the project manager, Teams admins, support people, and your adoption and user readiness team. Each rollout task contains all the guidance and resources you need to successfully complete the task.

Advisor for Teams is part of the [Teams admin center](#). At a minimum, you'll need a Microsoft 365 Business Basic license so you can take advantage of the Advisor for Teams integration with Forms and Planner. To begin using Advisor for Teams, click the **Start** button in the **Deploying Teams workload** widget on the Dashboard. Or go to **Planning > Teams Advisor**.

IMPORTANT

Advisor for Teams isn't available for Microsoft 365 Government (GCC High or DoD) deployments.

For a guided overview of the Advisor for Teams experience, check out the [Deploy & Configure Microsoft Teams](#) Microsoft Mechanics video.

Using Advisor for Teams

Teams, Forms, and Planner licenses are required to use Advisor for Teams. However, you don't have to be a Teams admin to use Advisor for Teams - anybody in your organization can use it. We've set up special permissions so non-admin users can get to Advisor for Teams, even though it's in the Teams admin center. You DO have to be a Teams admin, Teams Administrator, or Global Administrator to open the tenant readiness assessments (this is because the special non-admin roles don't have access to the Microsoft Graph APIs underlying the assessments).

IMPORTANT

If **Teams Advisor** is missing under **Planning** in the Teams admin center, it means the user isn't licensed for Teams.

The first time you use Advisor for Teams, it will create a Deployment team for you in Teams. It adds a channel for each workload you select.

IMPORTANT

If a Deployment team has already been created and a different user tries to create it, they'll get an error telling them to contact their support team. This prevents Teams from unintentionally disclosing information about the existing team and its members. Ask the owner of the Deployment team to add you, or contact your support person for help.

Available Advisor for Teams plans

Advisor for Teams currently provides the following plans:

1. Chat, teams, channels, and apps
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
2. Meetings and conferencing
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
3. Skype for Business upgrade
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
 - Designed for customers who are currently using Skype for Business Online or Skype for Business on-premises environments, the Skype for Business upgrade plan will help you take the guesswork out of your upgrade journey. Leveraging a proven success framework for implementing change, the plan will guide you through the step-by-step process whether you're just getting started with Teams, already using Teams alongside Skype for Business, or ready to upgrade. The plan will also connect you to [online guidance and best practices](#), [downloadable assets](#), [live 1:many planning workshops](#), and additional resources to support your success.
4. Education (visible only to Educational organizations)
 - Tenant assessment
 - Planner plan, including adoption tasks
 - Forms user survey
 - Advisor for Teams bot
 - Designed for Educational organizations, the Education plan will help you deploy, adopt, and manage Teams in your educational institution.

For commercial organizations, we recommend that you start with the Chat, teams, channels, and apps plan. For educational organizations, we recommend that you start with Education plan. When you're done deploying that workload, go back to Advisor for Teams and select **Add channel** to start the next workload.

Tenant assessment

Each plan includes a tenant readiness assessment that you can use to quickly identify aspects of your environment that may need remediation before you roll out Teams. The assessments include prerequisites and best practices. Each assessment test will have a green check mark or an orange warning triangle.

-  A green check mark means your tenant passed the specific test.
-  An orange warning triangle means that we suggest you follow up to determine if any action is needed (for example, a Microsoft 365 Group expiration policy is recommended but not required).

IMPORTANT

Once a user with an Administrative role starts Advisor for Teams, all assessments run in the background. If you update or remediate something, it may not be reflected in your assessments for up to 24 hours.

The sections below describe each assessment, including whether something is a prerequisite or best practices, what each assessment checks is doing and why, and guidance for remediation as needed.

Assessment tests for all workloads

ASSESSMENT TEST	WHAT IT TELLS YOU
Vanity domain configured	Whether there's a non-@onmicrosoft.com domain configured for your tenant (for example, @contoso.onmicrosoft.com). You can use the @onmicrosoft.com domain, of course, or you can configure a vanity domain - your choice. For more information, read Add a domain to Microsoft 365 .
Teams licenses	This is a prerequisite - you must have Teams licenses in order to roll out Teams. Queries the Microsoft Graph to see whether you have Teams licenses (with at least one license available to assign). For more information, read Microsoft Teams service description .
Exchange Online licenses	Whether you have an active subscription with available Exchange Online licenses. While Exchange isn't required for basic Teams functionality, integration with Exchange provides an optimal Teams experience. Queries the Microsoft Graph to analyze the subscriptions associated with your tenant and validate whether you have subscriptions with an eligible Exchange Online license (with at least one license available to assign). For more information, read How Exchange and Teams interact .
SharePoint Online licenses	Whether you have an active subscription with available SharePoint Online licenses. We recommend per-user SharePoint Online licenses to provide OneDrive for Business for file storage in chats. Queries the Microsoft Graph to see whether you have SharePoint Online licenses (with at least one license available to assign). For more information, read How SharePoint Online and OneDrive for Business interact with Teams .
Guest access enabled	Whether guest access is turned on. Guest access lets you invite external users to your join your teams. See Collaborate with guests in a team to walk through turning on guest access in Teams; the checklist includes the required Azure AD configurations.
External access configured	Whether external access is turned on. By default, it's turned on, with open federation.

Assessments for chat, teams, channels, and apps

In addition to the [Assessment tests for all workloads](#), the following additional assessments are run for the chat, teams, channels, and apps workload:

ASSESSMENT TEST	WHAT IT TELLS YOU
Microsoft 365 Group naming policy configured	Whether naming standards have been configured for Microsoft 365 Groups. Microsoft 365 Groups naming policy enables your organization to apply a consistent naming strategy to user-created teams and also applies to other Groups workloads (including Outlook, SharePoint, Planner, and Yammer). This test queries Azure AD via the Microsoft Graph to check for the existence of naming policies that apply to Microsoft 365 Groups. For more information, read Groups naming policy .
Microsoft 365 Group Expiration Policy configured	Whether a Group Expiration Policy has been defined for Microsoft 365 Groups. This enables your organization to automatically remove inactive Teams. It's turned off by default. This test queries Azure AD via the Microsoft Graph and reports whether the value has been modified from the default. For more information, read Microsoft 365 group expiration policy .

Assessments for meetings and conferencing

In addition to the [Assessment tests for all workloads](#), the following additional assessments are run for the meetings and conferencing workload:

ASSESSMENT TEST	WHAT IT TELLS YOU
Audio Conferencing licenses	Whether you have an active subscription with Audio conferencing licenses. This is a prerequisite if you're deploying Audio conferencing bridges. Queries the Microsoft Graph to see whether you have Audio Conferencing licenses (with at least one license available to assign) For more information, read Teams add-on licensing .
Stream licenses	Whether you have an active subscription with Microsoft Stream licenses. This is a prerequisite if you want to turn on Meeting Recording. Queries the Microsoft Graph to see whether you have Microsoft Stream licenses (with at least one license available to assign). For more information on Stream and how to turn it on, read Teams cloud meeting recording .

Assessments for Skype for Business Upgrade

In addition to the [Assessment tests for all workloads](#), Skype for Business Upgrade also includes assessments used in the meetings and conferencing plan.

Advisor for Teams bot

Once Advisor for Teams creates your Deployment team, the Advisor bot delivers the following message in the General channel:

Welcome to your Deployment team for Microsoft Teams!

The purpose of this team is to walk you through your organization's Teams rollout by giving you all the resources you need and providing a collaboration space for the project team. Each channel created using Advisor for Teams includes a step-by-step Planner plan and other resources such as a Forms users survey that can be used throughout your rollout. At any point, you can go back and review the tenant readiness assessment or add additional workload plans using the Teams admin center.

Call to action

- If you're new to Teams or Planner, check out our [Teams walkthrough](#) and watch the [Planner quick-start videos](#).
- Head over to your Deployment team in Teams. Select your workload channel (for example, Chat, teams, channels, and apps), and select the **Planner** tab to get started.

To learn more about Advisor for Teams, read [Use Advisor for Teams to roll out Microsoft Teams](#).

IMPORTANT

The Advisor for Teams Bot is only used to send a welcome message to your Deployment team. No additional data is collected.

IMPORTANT

The Advisor for Teams bot is turned on by default. Don't turn it off if you use or plan on using Advisor for Teams.

Advisor for Teams and Microsoft 365 learning pathways

[Microsoft 365 learning pathways](#) is an on-demand learning solution that you can customize to train your users, and increase usage and adoption of Teams in your organization. Use learning pathways together with Advisor for Teams to get your users up and running quickly and drive adoption.

Learning pathways gives you a SharePoint Online site template and the ability to easily build a learning site for your users. You can customize the learning pathways training portal to include training and support content specific to your users' needs. Use the Teams playlists from the Microsoft online catalog and add your own.

You can build a learning site in learning pathways, and then add it as a tab to a channel in teams for quick and easy access by users.

For example, use Advisor for Teams together with learning pathways to train your help desk and Champions, and then let learning pathways support training your end users. Build a learning site to help onboard your help desk and Champions to Teams, and then add it as a tab to each workload channel that you're rolling out. Your help desk and Champions can then create a support page on the learning pathways training portal with links and custom playlists to support your users on Teams. This support page can be added to a channel in any team to help train your end users.

The following is an overview of how you can use Advisor for Teams together with learning pathways.

Get started in learning pathways

To get started with learning pathways, check out [Get started with learning pathways](#).

To set up a new learning pathways solution in your environment, see [Provision a new learning pathways solution](#).

Create a learning plan

Plan your learning content

Before you build your site in learning pathways, take some time to review and collect the learning resources and capabilities available to you. With learning pathways, you can use content from the Microsoft 365 training page and add content that you create to tailor the site to your unique needs.

To learn more, see [Plan your learning pathways content](#) and [Resources for supporting your remote workforce](#).

Explore Teams content in learning pathways

Learning pathways provides a SharePoint site with a web part that's connected to an online catalog. The

Microsoft 365 training page, which hosts the web part, shows all the training available in learning pathways. Have a look around to get familiar with what's available and how content is organized.

[Go to your learning pathways site](#), select **Microsoft 365 training**, and then select **Microsoft Teams** to see all the Teams training playlists in the online catalog. Select a playlist and then select the **Next** and **Previous** buttons to navigate through it. You can also click the down arrow to view the contents of the playlist and go to a specific topic.

Take an inventory of Teams learning resources in your organization

Review the Teams learning content that's already available in your organization. For example, you may have already developed custom onboarding, training, or support content for Teams. Your existing SharePoint assets can be mixed with Microsoft content in a playlist to build a targeted playlist for your organization.

Build your site in learning pathways

The [Admin Success Center](#) in learning pathways provides guidance and resources to help you plan and customize learning pathways in your organization. Learn how to [customize the site](#), show and hide content, build custom playlists, and more.

To access the Admin Success Center, on the learning pathways Home page, select **Admin Success Center**.

Add your site to Teams

When your site is ready, add it to a channel in any team for quick and easy access.

1. In Teams, go to the team, and then select a channel.
2. At the top of the channel page, select + (**Add a tab**).
3. Select **SharePoint Pages**, and then select **Add a page from any SharePoint site**.
4. Paste the URL of your learning pathways site, and then select **Save**.

To learn more, see [Add a SharePoint page or list to a channel in Teams](#).

Train your support team

Use the resources in your learning pathways site to onboard your help desk and Champions to Teams. Get them ready with the tools and information they need to support your users on Teams.

For guidance and resources on preparing your help desk and Champions for Teams, see [Train your org](#) and [Build Champions](#).

As the go-to contact for your users for "how to" questions, your help desk and Champions can use the learning pathways site to train users and as an alternative to creating support tickets. Encourage your help desk and Champions to [customize your learning pathways site](#) by building a training and support page, and then [add it as a tab to a channel](#) in a team for users to self-serve.

Drive adoption

After you have customized your site and put together your learning plans, consider how you'll drive awareness with your users to encourage them to use learning pathways for ongoing learning.

Use your communication channels to promote the site and generate awareness. For example, include a standard tagline such as "Check out our training and support site for how to get productive with Teams" in communications to your users.

Engage your users by highlighting the ways they can collaborate in Teams, and then direct them to the learning pathways site to learn how.

Check out these resources, which include guidance, adoption kits, best practices, and more, to help you implement a successful rollout and adoption plan.

- [Drive adoption of learning pathways](#)
- [Adopt Teams](#)

- [Adoption resources for Teams](#)

Frequently asked questions

What are the licensing requirements for Advisor for Teams

At a minimum, you'll need Microsoft 365 Business Basic so you can take advantage of the Advisor for Teams integration with Forms and Planner.

Can I delete the Deployment team

After Advisor for Teams has created your Deployment team, manage the team like any other team - including the ability to delete it. Be aware that, if you don't delete the team by using the Teams admin center, the Teams admin center will show that the team still exists.

Can I add or remove channels in the Deployment team

Yes, once the Deployment team has been created, you'll manage the channels the same way as any other team.

Can I add or remove project team members in the Deployment team

Yes, once the Deployment team has been created, you'll manage it the same way as any other team.

Can I modify the Planner plans

Yes, after Advisor for Teams has created your Deployment team, you should update the Planner plan so it best supports your Teams rollout. You can modify anything - buckets, tasks, task details - just like any other Planner plan.

Can I modify the Forms survey

Yes, after Advisor for Teams has created your Deployment team, you can modify the Forms survey as needed.

Are there any differences between Advisor for Teams in GCC

Yes, user survey Forms are created but are not pinned in plan channels as the Teams Forms app is not available in GCC presently.

What information is Advisor for Teams collecting about my organization

Advisor for Teams requests your agreement to collecting non-EUII (end user identifying information). The information that is collected is in the form of telemetry that provides feedback to Microsoft on how well Advisor for Teams is driving successful outcomes and where it may need to be improved. This same data is used to identify opportunities for Microsoft to proactively engage with your organization in an effort to assist with your deployment.

Can I use Advisor for Teams with FastTrack

Yes, FastTrack leverages Advisor for Teams for all customers looking to deploy Teams. They can assist with the initial setup of your Deployment team using Advisor for Teams (if required) and also provide as-needed support on specific topics during your Teams rollout.

Can I use Advisor for Teams with a partner

Yes, you can use Advisor for Teams while also using a deployment partner for your Teams deployment. If your partner is a CSP and manages your tenant on your behalf, they can use Advisor for Teams to create your Deployment team and assist you with executing the overall project. Additionally, you can work with any partner by adding those individuals as guests in your Deployment team, to allow them to participate as a member of the overall project team.

How do I use Planner

Check out [Microsoft Planner help](#) and the [Planner quick-start videos](#).

How do I use Forms

Go to the [Forms help center](#).

Overview of teams and channels in Microsoft Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

Let's get started by thinking about how Microsoft Teams allows individual teams to self-organize and collaborate across business scenarios:

- **Teams** are a collection of people, content, and tools surrounding different projects and outcomes within an organization.
 - Teams can be created to be private to only invited users.
 - Teams can also be created to be public and open and anyone within the organization can join (up to 10,000 members).

A team is designed to bring together a group of people who work closely to get things done. Teams can be dynamic for project-based work (for example, launching a product, creating a digital ship room), as well as ongoing, to reflect the internal structure of your organization (for example, departments and office locations). Conversations, files and notes across team channels are only visible to members of the team.

- **Channels** are dedicated sections within a team to keep conversations organized by specific topics, projects, disciplines—whatever works for your team! Files that you share in a channel (on the Files tab) are stored in SharePoint. To learn more, read [How SharePoint Online and OneDrive for Business interact with Teams](#).
 - Channels are places where conversations happen and where the work actually gets done. Channels can be open to all team members or, if you need a more select audience, they can be private. Standard channels are for conversations that everyone in a team can participate in and [private channels](#) limit communication to a subset of people in a team.
 - Channels are most valuable when extended with apps that include tabs, connectors, and bots that increase their value to the members of the team. To learn more, see [Apps, bots, & connectors in Teams](#).

For help using teams and channels, check out [Teams and channels](#).

View this short video to learn more about best practices for creating teams and channels:

- [TechTip: Guidance for Creating Teams & Channels including Private Channels in Microsoft Teams](#) (21:08 min)

Membership, roles, and settings

Team membership

When Teams is activated for your entire organization, team owners can invite anyone at your organization they work with to join their team. Teams makes it easy for team owners to add people in the organization based on their name. Depending on your organization's settings people from outside of your organization can be added to your teams as guests. See [Guest Access in Microsoft Teams](#) for more information.

Team owners can also create a team based on an existing Microsoft 365 group. Any changes made to the group membership will be synced with Teams automatically.

Team roles

There are two main roles in Teams:

- **Team owner** - The person who creates the team. Team owners can make any member of their team a co-

owner when they invite them to the team or at any point after they've joined the team. Having multiple team owners lets you share the responsibilities of managing settings and membership, including invitations.

- **Team members** - The people who the owners invite to join their team.

In addition, if moderation is set up, team owners and members can have moderator capabilities for a channel. Moderators can start new posts in the channel and control whether team members can reply to existing channel messages. Team owners can assign moderators within a channel. (Team owners have moderator capabilities by default.) Moderators within a channel can add or remove other moderators within that channel. For more information, see [Set up and manage channel moderation in Microsoft Teams](#).

NOTE

When you add a team owner, they are also added as a member, except when the team is created in the Teams admin center or when a team is added to a new or existing Microsoft 365 group.

Team settings

Team owners can manage team-wide settings directly in Teams. Settings include the ability to add a team picture, set permissions across team members for creating standard and [private channels](#), adding tabs and connectors, @mentioning the entire team or channel, and the usage of GIFs, stickers, and memes.

If you are a Teams administrator in Microsoft 365, you have access to system-wide settings in the Teams admin center. These settings can impact the options and defaults team owners see under team settings. For example, you can enable a default channel, "General", for team-wide announcements, discussions, and resources, which will appear across all teams.

By default, all users have permissions to create a team. To modify this, see [Assign roles and permissions in Teams](#).

One key early planning activity to engage users with Teams is to help people think and understand how Teams can enhance collaboration in their day to day lives. Talk with people and help them select business scenarios where they are currently collaborating in fragmented ways. Bring them together in a channel with the relevant tabs that will help them get their work done. One of the most powerful use cases of Teams is any cross-organizational process.

NOTE

When you create a new team or private channel in Microsoft Teams, a team site in SharePoint gets automatically created. To edit the site description or classification for this team site, go to the corresponding channel's [settings in Microsoft Teams](#).

Learn more about managing [Microsoft Teams connected teams sites](#).

Example Teams

Below are a few functional examples of how different types of users may approach setting up their teams, channels, and apps (tabs/connectors/bots). This may be useful to help kick off a conversation about Teams with your user community. As you think about how to implement Teams in your organization, remember that you can provide guidance on how to structure their teams; however, users have control of how they can self-organize. These are just examples to help get teams to start thinking through the possibilities.

Teams is great for breaking down organizational silos and promoting cross-functional teams, so encourage your users to think about functional teams rather than organizational boundaries.

TYPES OF TEAMS	POTENTIAL CHANNELS	APPS (TABS ) /CONNECTORS  /BOTS 
Sales	Annual Sales Meeting Quarterly Business Review Monthly Sales Pipeline Review Sales Playbook	Power BI Trello CRM Summarize Bot
Public Relations	Press Releases News and Updates Fact Checking	RSS Feed Twitter
Event Planning	Marketing Logistics and Scheduling Venue Budget	Twitter Facebook Planner PDF
Marketing/Go to Market	Market Research Messaging Pillars Communications Plan Marketing Bill of Materials	YouTube Microsoft Stream Twitter MailChimp
Technical Operations	Incident Management Sprint Planning Work Items Infrastructure and Operations	Team Services Jira AzureBot
Product Team	Strategy Marketing Sales Operations Insights Services & Support	Power BI Team Services
Finance	Current Fiscal FY Planning Forecasting Accounts Receivable Accounts Payable	Power BI Google Analytics
Logistics	Warehouse Operations Vehicle Maintenance Driver Rosters	Weather Service Travel / Road Disruptions Planner UPS Bot
HR	Talent Management Recruiting Performance Review Planning Morale	HR Tools External Job Posting Sites Growbot
Cross-organizational Virtual Team	Strategy Workforce Development Compete & Research	Power BI Microsoft Stream

It's possible to create Teams that align with the organizational structure. This is best used for leaders who want to drive morale, have team-specific reviews, clarify employee onboarding processes, discuss workforce plans, and increase visibility across a diverse workforce.

Org-wide teams

If your organization has no more than 10,000 users, you can create an org-wide team. Org-wide teams provide an automatic way for everyone in an organization to be a part of a single team for collaboration. For more information, including best practices for creating and managing an org-wide team, see [Create an org-wide team in Microsoft Teams](#).

Next steps

Read [Chat, teams, channels, & apps in Teams](#) to walk through a list of decisions important to your Teams rollout.

Private channels in Microsoft Teams

12/7/2021 • 7 minutes to read • [Edit Online](#)

Private channels in Microsoft Teams create focused spaces for collaboration within your teams. Only the users on the team who are owners or members of the private channel can access the channel. Anyone, including guests, can be added as a member of a private channel as long as they are already members of the team.

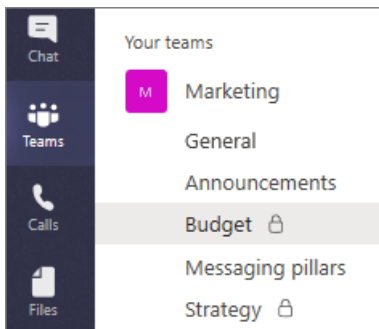

You might want to use a private channel if you want to limit collaboration to those who have a need to know or if you want to facilitate communication between a group of people assigned to a specific project, without having to create an additional team to manage.

For example, a private channel is useful in these scenarios:

- A group of people in a team want a focused space to collaborate without having to create a separate team.
- A subset of people in a team want a private channel to discuss sensitive information, such as budgets, resourcing, strategic positioning, and so on.

A lock icon indicates a private channel. Only members of private channels can see and participate in private channels that they are added to.

When a private channel is created, it's linked to the parent team and can't be moved to a different team. Additionally, private channels can't be converted to standard channels and vice versa.

Private channel creation

By default, any team owner or team member can create a private channel. Guests can't create them. The ability to create private channels can be managed at the team level and at the organization level. Use [policies](#) to control which users in your organization are allowed to create private channels. Once you've set the policies, team owners can turn off or turn on the ability for members to create private channels in the **Settings** tab for a team.

The person who creates a private channel is the private channel owner and only the private channel owner can directly add or remove people from it. A private channel owner can add any team member to a private channel they created, including guests. Members of a private channel have a secure conversation space, and when new members are added, they can see all conversations (even old conversations) in that private channel.

Team owners can see the names of all private channels in their team and can also delete any private channel in the team. (A deleted private channel can be restored within 30 days after it's deleted). Team owners can't see the files in a private channel or the conversations and member list of a private channel unless they are members of that private channel.

Team members can only see private channels that they've been added to.

Adding and removing owners and members

A private channel owner can't be removed through the Teams client if they are the last owner of one or more private channels.

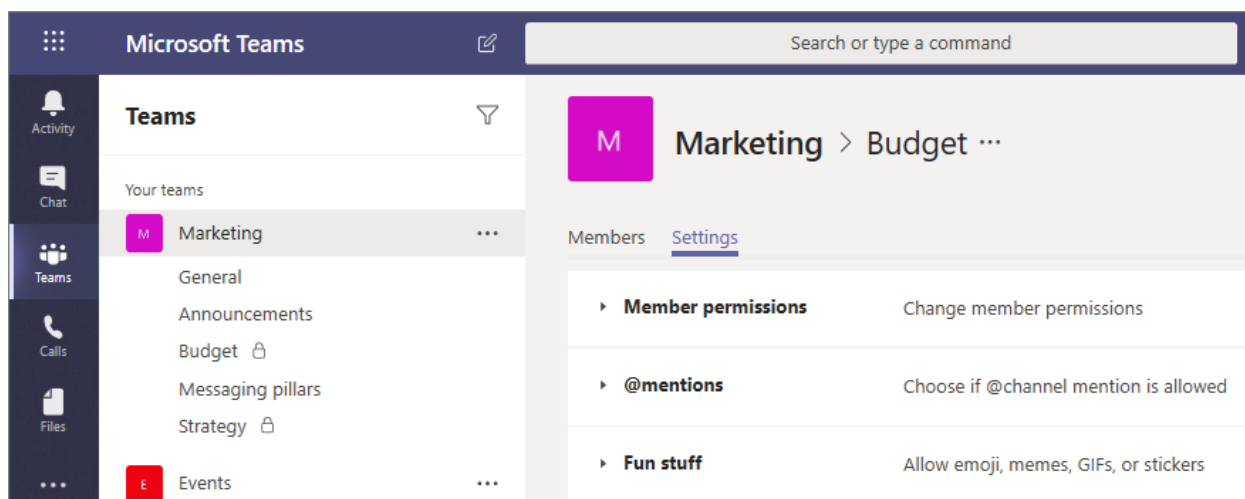

If a private channel owner leaves your organization or if they are removed from the Microsoft 365 Group associated with the team, a member of the private channel is automatically promoted to be the private channel owner.

If a team member leaves or is removed from a team, that user will also leave or be removed from all private channels in the team. If the user is added back to the team, they must be added back to the private channels in the team.

Channel owner settings

Each private channel has its own settings that the channel owner can manage, including the ability to add and remove members, add tabs, and @mentioning for the entire channel. These settings are independent of the parent team settings. When a private channel is created, it inherits settings from the parent team, after which its settings can be changed independently of the parent team settings.

The private channel owner can click **Manage channel**, and then use the **Members** and **Settings** tabs to add or remove members and edit settings.

Private channel owner and member actions

The following table outlines what actions owners, members, and guests can do in private channels.

ACTION	TEAM OWNER	TEAM MEMBER	TEAM GUEST	PRIVATE CHANNEL OWNER	PRIVATE CHANNEL MEMBER	PRIVATE CHANNEL GUEST
Create private channel	Admin controlled	Admin and team owner controlled	No	N/A	N/A	N/A
Delete private channel	Yes	No	No	Yes	No	No
Leave private channel	N/A	N/A	N/A	Yes unless they are the last owner	Yes	Yes

ACTION	TEAM OWNER	TEAM MEMBER	TEAM GUEST	PRIVATE CHANNEL OWNER	PRIVATE CHANNEL MEMBER	PRIVATE CHANNEL GUEST
Edit private channel	No	N/A	N/A	Yes	No	No
Restore deleted private channel	Yes	No	No	Yes	No	No
Add members	No	N/A	N/A	Yes	No	No
Edit settings	No	N/A	N/A	Yes	No	No
Manage tabs and apps	No	N/A	N/A	Yes, apps must be installed for the team	Channel owner controlled	No

Manage the lifecycle of private channels

See [Manage the lifecycle of private channels in Teams](#) for guidance on how to manage the lifecycle of private channels in your organization. This includes how to control whether users in your organization can create private channels, how to create a private channel on behalf of a team owner, how to get a list of all private channel messages for archiving and auditing purposes, and other management tasks.

Private channel SharePoint sites

Each private channel has its own SharePoint site. The separate site is to ensure access to private channel files is restricted to only members of the private channel. These sites are created with a document library by default, and can be easily enhanced to a full-featured site through the [site management interface](#). Each site is created in the same geographic region as the site for the parent team. These lightweight sites have a custom template ID, "TEAMCHANNEL#0", for easier management through PowerShell and Graph API.

NOTE

Only users with owner or member permissions granted in Microsoft Teams will have access to content in the private channel site. Private channel SharePoint sites created after June 28, 2021 will have the custom template ID TEAMCHANNEL#1.

A private channel site syncs data classification and inherits guest access permissions from the site of the parent team. Membership to the site owner and member groups are kept in sync with the membership of the private channel within Teams. Site permissions for a private channel site can't be managed independently through SharePoint.

Teams manages the lifecycle of the private channel site. If the site is deleted outside of Teams, a background job restores the site within four hours as long as the private channel is still active. If the site is permanently deleted, a new site is provisioned for the private channel.

If a private channel or a team containing a private channel is restored, the sites are restored with it. If a private channel site is restored and it's beyond the 30-day soft delete window for the private channel, the site operates as a standalone site.

NOTE

When you create a new team or private channel in Microsoft Teams, a team site in SharePoint gets automatically created. To edit the site description or classification for this team site, go to the corresponding channel's [settings in Microsoft Teams](#).

Learn more about managing [Microsoft Teams connected teams sites](#).

Private channel message compliance records

Records for messages sent in a private channel are delivered to the mailbox of all private channel members, rather than to a group mailbox. The titles of the records are formatted to indicate which private channel they were sent from.

For more information about performing an eDiscovery search for private channel messages, see [eDiscovery of private channels](#).

Considerations around file access in private channels

When a new OneNote notebook is created in a private channel, additional users can still get access to the notebook because the behavior is the same as sharing access to any other item in a private channel SharePoint site with a user.

If a user is granted access to a notebook in a private channel through SharePoint, removing the user from the team or private channel won't remove the user's access to the notebook.

If an existing notebook is added as a tab to a private channel, access to the private channel isn't changed and the notebook retains its existing permissions.

Private channel limitations

Currently, private channels support connectors and tabs (except Stream, Planner, and Forms). We're working on full apps support for private channels, including messaging extensions and bots.

Each team can have a maximum of 30 private channels and each private channel can have a maximum of 250 members. The 30 private channel limit is in addition to the 200 standard channel limit per team.

When you create a team from an existing team, any private channels in the existing team won't be copied over.

Notifications from private channels are not included in missed activity emails at this time.

Channel meetings can't be scheduled.

[Use the Microsoft Graph API to work with Teams](#)

Manage the life cycle of private channels in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Here you'll find the guidance you need to manage use the Graph API to manage [Teams private channels](#) in your organization.

Set whether team members can create private channels

As an admin, you can use Graph API to control whether members can create private channels in specific teams. Here's an example.

```
PATCH /teams/<team_id>
{
  "memberSettings": {
    "allowCreatePrivateChannels": false
  }
}
```

Create a private channel on behalf of a team owner

As an admin, you can use the Graph API to create a private channel on behalf of a team owner. For example, you may want to do this if your organization wants to centralize creation of private channels.

```
POST /teams/{id}/channels
{
  "membershipType": "Private",
  "displayName": "<Channel_Name>",
  "members": [{
    "@odata.type": "#microsoft.graph.aadUserConversationMember",
    "user@odata.bind": "https://graph.microsoft.com/beta/users('<user_id>')",
    "roles": ["owner"]
  }]
}
```

Get a list of all private channel messages

You may want to get a list of all messages and replies posted in a private channel for archiving and auditing purposes. Here's how to use Graph API to do this.

```
GET /teams/{id}/channels/{id}/messages
GET /teams/{id}/channels/{id}/messages/{id}/replies/{id}
```

Find SharePoint URLs for all private channels in a team

Whether you're looking to perform eDiscovery or legal hold on files in a private channel or looking to build a custom app that places files in specific private channels, you'll want a way to query the unique SharePoint site collections that are created for each private channel.

As an admin, you can use Graph APIs commands to query these URLs.

You can try these commands through [Graph Explorer](#).

1. Use the following to get the list of private channel IDs for a given team, where <group_id> is the group ID of the team. You'll need this in subsequent calls. (You can easily find the group ID in the link to the team).

Request

```
GET https://graph.microsoft.com/beta/teams/<group_id>/channels?$filter=membershipType eq 'private'
```

Response

```
HTTP/1.1 200 OK
Content-type: application/json
Content-length:

{
  "value": [
    {
      "description": "description-value",
      "displayName": "display-name-value",
      "id": "channel_id",
      "membershipType": "membership-type-value",
      "isFavoriteByDefault": false,
      "webUrl": "webUrl-value",
      "email": "email-value"
    }
  ]
}
```

2. For each private channel which you want to get the SharePoint URL, make the following request, where <channel_id> is the channel ID.

Request

```
GET https://graph.microsoft.com/beta/teams/<group_id>/channels/<channel_id>/filesFolder
```

Response

```
HTTP/1.1 200 OK
Content-type: application/json
Content-length:

{
  "value": [
    {
      "description": "description-value",
      "displayName": "display-name-value",
      "id": "channel_id",
      "membershipType": "membership-type-value",
      "isFavoriteByDefault": false,
      "webUrl": "webUrl-value",
      "email": "email-value"
    }
  ]
}
```

List and update roles of owners and members in a private channel

You may want to list out the owners and members of a private channel to decide whether you need to promote certain members of the private channel to an owner. This can happen when you have owners of private channels

who have left the organization and the private channel requires admin help to claim ownership of the channel.

As an admin, you can use the Graph API to perform these actions.

You can try these commands through [Graph Explorer](#).

1. Use the following, where <group_id> is the group ID of the team and <channel_id> is the channel ID.

Request

```
GET https://graph.microsoft.com/beta/teams/<group_id>/channels/<channel_id>/members
```

Response

```
HTTP/1.1 200 OK Content-type: application/json
Content-length:
{
  "@odata.context":
  "https://graph.microsoft.com/beta/$metadata#teams('{group_id}')/channels('{channel_id}')/members",
  "@odata.count": 2,
  "value": [
    {
      "@odata.type": "#microsoft.graph.aadUserConversationMember",
      "id": "id-value",
      "roles": [],
      "displayName": "display-name-value",
      "userId": "userId-value",
      "email": "email-value"
    },
    {
      "@odata.type": "#microsoft.graph.aadUserConversationMember",
      "id": "id-value",
      "roles": ["owner"],
      "displayName": "display-name-value",
      "userId": "userId-value",
      "email": "email-value"
    }
  ]
}
```

2. Use the following to promote the member to an owner, where <group_id>, <channel_id>, and <id> are returned from the previous call. Note that <id> and <userId> returned from the previous call aren't the same and aren't interchangeable. Make sure you use <id>.

Request

```
PATCH
https://graph.microsoft.com/beta/teams/<group_id>/channels/<channel_id>/members/<id>

{
  "@odata.type": "#microsoft.graph.aadUserConversationMember",
  "roles": ["owner"]
}
```

Response

```
HTTP/1.1 200 OK
Content-type: application/json

{
  "@odata.context":
  "https://graph.microsoft.com/beta/$metadata#teams('{group_id}')/channels('{channel_id}')/members/$entity",
  "@odata.type": "#microsoft.graph.aadUserConversationMember",
  "id": "id-value",
  "roles": ["owner"],
  "displayName": "display-name-value",
  "userId": "userId-value",
  "email": "email-value"
}
```

Assign team owners and members in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Within Microsoft Teams there are two user roles: **owner** and **member**. By default, a user who creates a new team is granted the owner status. In addition, owners and members can have moderator capabilities for a channel (provided that moderation has been set up). If a team is created from an existing Microsoft 365 Group, permissions are inherited.

The table below shows the difference in permissions between an owner and a member.

TASK	TEAM OWNER	TEAM MEMBER
Create team	Yes ¹	No
Leave team	Yes	Yes
Edit team name/description	Yes	No
Delete team	Yes	No
Add standard channel	Yes	Yes ²
Edit standard channel name/description	Yes	Yes ²
Delete standard channel	Yes	Yes ²
*Add private channel	Yes	Yes ²
*Edit private channel name/description	No	N/A
*Delete private channel	Yes	No
Add members	Yes ³	No ⁴
Request to add members	N/A	Yes ⁵
Add apps	Yes	Yes ²

¹ Team owners can create teams unless they've been restricted from doing so. [Permissions to create teams](#) below.

² An owner can turn off these items at the team level, in which case members would not have access to them.

³ After adding a member to a team, an owner can also promote a member to owner status. It is also possible for an owner to demote their own status to a member.

⁴ Team members can add other members to a public team.

⁵ While a team member can't directly add members to a private team, they can request someone to be added to a team they're already a member of. When a member requests someone to be added to a team, team owners

receive an alert that they have a pending request that they can accept or deny.

*To learn more about permissions for private channels, see [Private channels in Teams](#).

NOTE

Owners can make other members owners in the **View teams** option. A team can have up to 100 owners. We recommend that you have at least a few owners to help manage the team; this will also prevent orphaned groups if a sole owner leaves your organization. For more information about orphaned groups, see [Assign a new owner to an orphaned group](#).

Moderator capabilities

In addition to other capabilities, team owners and members can have moderator capabilities for a channel (provided that moderation is turned on for a team). Moderators can start new posts in a channel and control whether team members can reply to existing channel messages. They can also control whether bots and connectors can submit channel messages.

Moderator capabilities are assigned at the channel level. Team owners have moderator capabilities by default. Team members have moderator capabilities turned off by default, but a team owner can give moderator capabilities for a channel to a team member. Moderators within a channel can add and remove other moderators within that channel.

For more information about moderator capabilities, see [Set up and manage channel moderation in Microsoft Teams](#).

Assign a user role

To assign a user role, in Teams, select the team name and click **More options** > **Manage team**. On the **Members** tab, you can add members and choose owners and moderators (if you have sufficient permissions). For more information, see [Change team settings in Teams](#).

Permissions to create teams

By default, all users with a mailbox in Exchange Online have permissions to create Microsoft 365 groups and therefore a team within Microsoft Teams. You can have tighter control and restrict the creation of new teams and thus the creation of new Microsoft 365 groups by delegating group creation and management rights to a set of users. For instructions, see [Manage who can create Microsoft 365 Groups](#).

Overview of dynamic membership for teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams supports teams associated with Microsoft 365 groups by using *dynamic membership*. Dynamic membership enables the membership of a team to be defined by one or more rules that check for certain user attributes in Azure Active Directory (Azure AD). Users are automatically added or removed to the correct teams as user attributes change or users join and leave the tenant.

With dynamic membership you can set up teams for certain cohorts of users in your organization. Possible scenarios include:

- A hospital can create distinct teams for nurses, doctors, and surgeons to broadcast communications. This is especially important if the hospital relies on temp employees.
- A university can create a team for all faculty within a particular college, including an adjunct faculty that changes frequently.
- An airline wants to create a team for each flight (like a Tuesday afternoon non-stop from Chicago to Atlanta) and have a frequently changing flight crew automatically assigned or removed as needed.

Using this feature, a given team's members update automatically based on a specific set of criteria, instead of manually managing membership. Doing this requires Azure AD Premium P1 licenses and team membership can be [assigned by a tenant admin](#) to any user's Azure AD properties provided you have a tenant and an admin account.

Microsoft Teams may take anywhere from a few minutes to up to 2 hours to reflect dynamic membership changes once they take effect in the Microsoft 365 group for a team.

When using teams with dynamic groups:

- Rules can define who is a team member, but not who is a team owner.
- Owners will not be able to add or remove users as members of the team, since members are defined by dynamic group rules.
- Teams clients don't allow member management for the team. Options to add members, edit member roles, send and approve join requests, and leave the team are all hidden.

To create a team that uses dynamic membership, start by [creating a dynamic Microsoft 365 group](#) and then [create a team from that group](#).

You can change an existing team to have a dynamic membership. See [Change static group membership to dynamic in Azure Active Directory](#) for information.

Best practices for organizing teams in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Teams are collections of people who gather together around a common goal. This group of people may be within a department or across the organization. What brings them together is the outcome they are driving toward. Members of a team may work at a different pace or create assets differently, but in our experience they often collaborate quickly with each other, a process we call "high velocity teamwork."

Before creating a team, think about the goal, project, or work items and who in your organization can help deliver it collaboratively. Once you've identified them, add these people or groups to a team to start collaborating. Because membership can change over time, it's a good idea to designate multiple owners for each team. For more information, see [Managing teams](#).

Take a look at this short video to see some examples of how to structure cross-organizational or single purpose teams:

Add teams gradually

When you first roll out Teams, we recommend starting with a small number of teams and team members. Add new people or groups as you go. The great thing with Teams is that, when you add new people or groups, they can quickly get up to speed on what's already been discussed, as the conversations and files are available to users regardless of when they join. Avoid the temptation to create a bunch of different teams that have the same set of members; instead, create channels in a single team.

Create channels to focus discussions

Once you've created your team, it's a good idea to start to think about the different projects and types of conversations you need to support. Create initial channels so people know where to contribute and to find existing conversations. Use descriptive channel names, to make it easy for people to know where to go for each conversation. Add tools (such as OneNote, Power BI, or Planner) as tabs to a channel so members have everything they need, right in the channel. You can also add a commonly used web page as a tab to a channel.

Learn more about [working in teams](#) with these quick tips for end users.

Best practice: Create teams with a larger set of members and more channels. Minimize the number of teams that require a person's participation. Channels within a team should be thought of as topics or workstreams to aid the team in organizing their work to deliver on their joint objectives. There is no specific number of channels that should be created. Each team should craft channels based on their work, priorities, and style.

Use standard channels for conversations that everyone on the team can contribute to. Take advantage of [Private channels in Teams](#) when you need a focused collaboration space with a select group of members.

Larger organizations may want to create teams as "templates" to standardize the information they capture about specific types of work. This is useful for strategic customer management, classroom management, health care scenarios, claim management, incident management and other scenarios appropriate to a specific industry. To learn more, check out [Get started with Teams templates](#) and [Teams templates for small and medium businesses](#).

Use the General channel

By default, the **General channel** is created for you when you create the team. There are many useful purposes for this channel:

- Use it to share an overview of what the team wants to achieve such as a project charter or who's who in the team.
- Use it for new team member onboarding and other high-level information that a new team member would find useful.
- Use it for announcements, or configure the SharePoint News connector to post your modern status reports to this channel.
- For new or single purpose teams, it may be the only channel at the beginning as you decide how Teams can best support your goals.

You can't remove, rename, or unfavorite the General channel. Channels appear in alphabetical order (with the General channel at the top). In teams with many channels, use **Hide** or **Show** to display the channels you use the most.

To learn more, peruse the **Work in channels** tab on the [Teams and channels](#) page.

Consider setting up moderation in your channels

Team owners can turn on moderation for a channel to control who can start new posts and reply to posts in that channel. When you set up moderation, you can choose one or more team members to be moderators. (Team owners are moderators by default.) For more information, see [Set up and manage channel moderation in Microsoft Teams](#).

Manage large teams in Microsoft Teams - Best practices

12/7/2021 • 4 minutes to read • [Edit Online](#)

Microsoft Teams is equally effective at facilitating communications between small groups with dozens of members and large groups with thousands of members. Review [Limits and specifications for Teams](#) for updates on team sizes. Increase in team size leads to unique management and operational challenges. This article describes best practices for creating and managing large teams comprised of thousands of members.

Value of large teams

Large teams are very useful in enabling the following collaboration scenarios:

- **Department-wide collaboration:** If your organization has multiple departments such as Finance, Operations, R&D etc., then you can create a single team that includes all members in a specific department. Now all communications relevant to a department can be shared in this team, which facilitates instant reach and engagement from members.
- **Collaboration in employee resource groups:** Organizations often have large groups of people with mutual interests who belong to a different department or work group. As an example, there can be a group of people who share a passion for personal finance and investing. It's often hard to connect in a large organization. To develop communities for such groups, tenant admins can create a large team that serves as a public company-wide resource group that anyone can join and take advantage of. Eventually, these communities collect information that both new and existing members can enjoy.
- **Collaboration between internal and external members:** Popular products often develop a community of early adopters who are eager to try new product releases and provide feedback. Early adopters develop a relationship with product groups to help shape the product. In such scenarios, tenant admins can set up a large team which includes both internal product groups and external product evaluators to facilitate a rich product development process. These teams can also provide customer support to a select set of customers.

Create teams from existing groups

Use contact groups, security groups, or Office groups to jump start your team. You can import a group to make a team or create a team from an Office group.

Import a group to make a team: When you import a group with up to 3,500 members into Teams, Teams automatically calculates the total number of members in the group. This is a one-time import only and future changes in the group will not automatically be updated in Teams.

Create a team from a large Microsoft 365 group: When you create a team from a large Microsoft 365 group, members are automatically part of the Microsoft 365 group **and** the team. In the future, as team members join or leave the Microsoft 365 group, they're automatically added or removed from the team.

Bulk import/export/remove members in a team

The Azure portal allows users to bulk import/export/remove members in a Microsoft 365 Group. For more information, see [To bulk import group members](#).

Since every team is backed by a Microsoft 365 Group, you can use the Azure portal to perform these operations

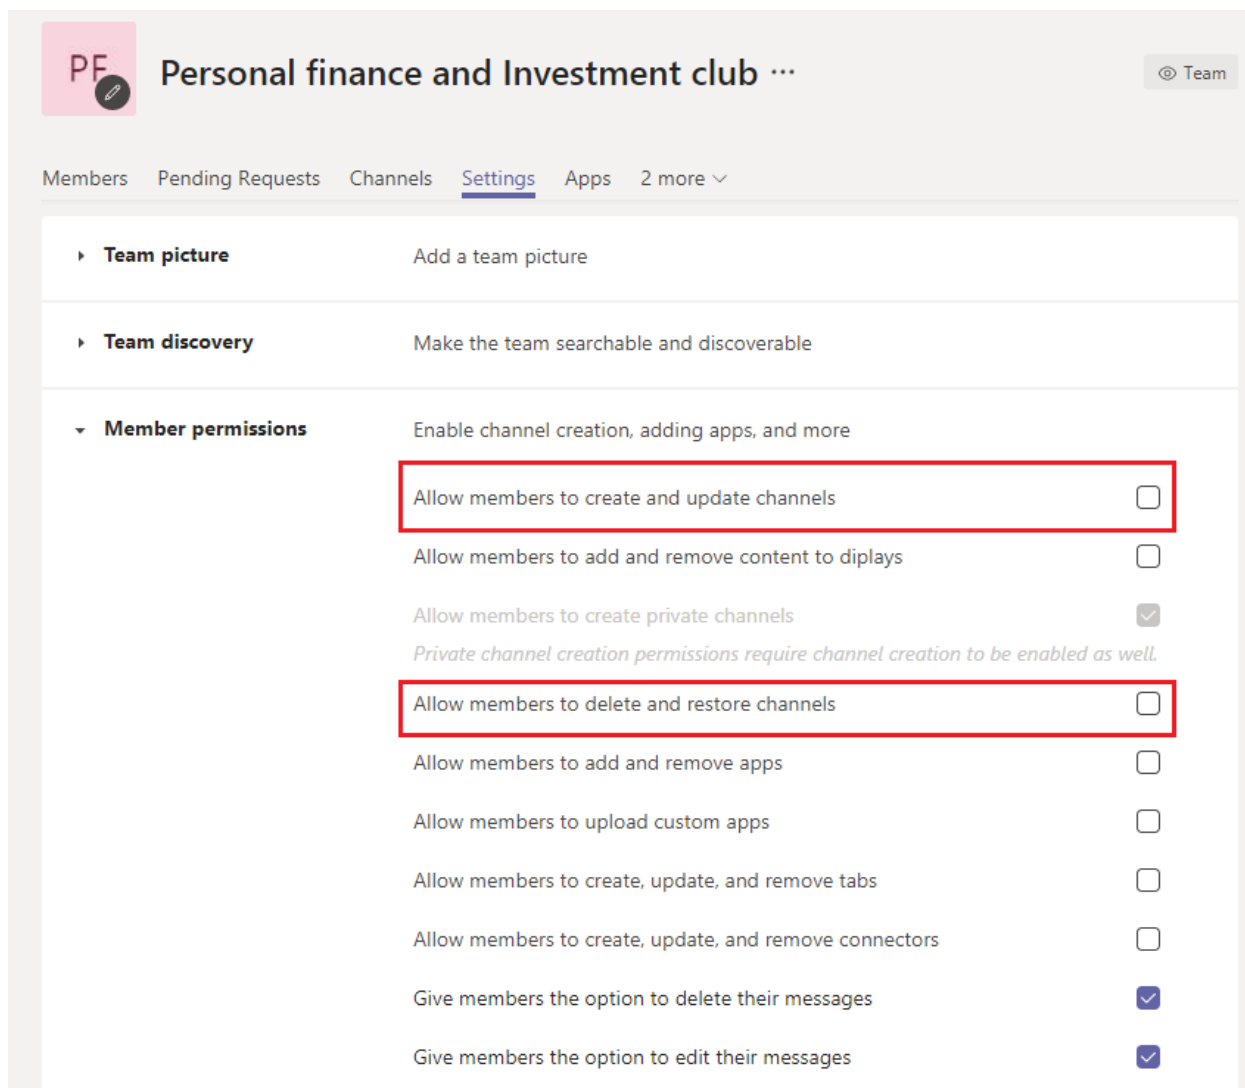

in the group corresponding to the team. The member operations will be reflected in the team within 24 hours.

Create channels to focus discussions

You can narrow the group discussions by creating focused channels. See [Best practices for organizing teams](#).

Restrict channel creation

If any team member is allowed to create channels, that team can have channel sprawl. Team owners should turn off channel create, update, delete, and restore for members in **Settings > Member permissions**. See [Overview of teams and channels](#).

Add favorite channels

In order to speed up new user engagement and content discovery, you can select favorite channels that are available to the user by default. In the **Channels** pane of the admin center, check the channels under the **Show for members** column.

Regulate team and channel mentions

Team and channel mentions can be used to draw the attention of the whole team to certain channel posts. Once a mention is used in a post, a notification is sent to thousands of team members. If the notifications are too frequent, then team members can become overloaded and might complain to team owners. To prevent team or channel mentions, turn off team and channel mentions for members by unchecking the boxes in the teams **Settings > @mentions** pane.

Related topics

- [Best practices for organizing Teams](#)
- [Create an org-wide team](#)

Create an organization-wide team in Microsoft Teams

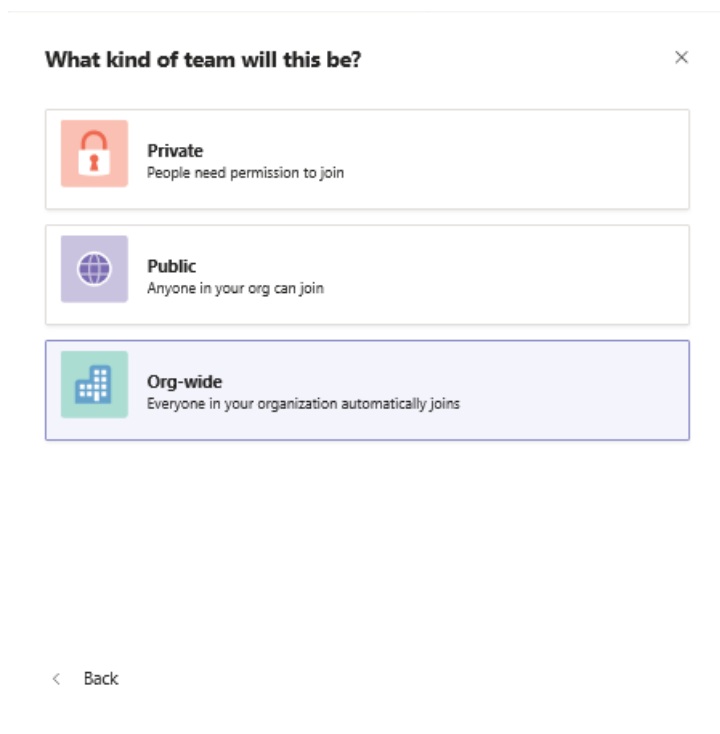

12/7/2021 • 4 minutes to read • [Edit Online](#)

Organization-wide teams provide an automatic way for everyone in a small-to-medium-sized organization to be part of a single and collaborative team.

With organization-wide teams, global admins can easily create a public team that has the following characteristics:

- Pulls in every user in the organization
- Keeps the membership up to date with Active Directory as users join and leave the organization.

Only global admins can create organization-wide teams. Currently, an organization-wide team is limited to organizations with no more than 10,000 users. There's also a limit of five organization-wide teams per tenant. When creating a team, if these requirements are met, global admins will see **Org-wide** as an option when they select **Build a team from scratch**.

When an organization-wide team is created, all global admins and Teams service administrators are added as team owners and all active users are added as team members. Unlicensed users are also added to the team. The first time an unlicensed user signs in to Teams, the user is assigned a Microsoft Teams Exploratory license. To learn more about the Exploratory license, check out [Manage the Microsoft Teams Exploratory license](#).

The following types of accounts won't be added to your organization-wide team:

- Accounts that are blocked from sign in
- Guest users
- Resource or service accounts (for example, accounts associated with auto attendants and call queues)
- Room or equipment accounts
- Accounts backed by a shared mailbox

As your organization's directory is updated to include new active users or to disable accounts of users who no longer work at your company, changes are automatically synced and the users are added or removed from the team. Team members can't leave an organization-wide team. As a team owner, you can manually add or remove users if needed.

NOTE

- If you don't see the **Org-wide** option when creating a team and you're a global admin, you might have reached the five organization-wide teams limit, or your organization might have more than the current size limit of 10,000 members. We're looking to increase this limit in the future. Org-wide teams aren't yet available for Teams for Education.
- Rooms that aren't a part of a room list, equipment, and resource accounts might be added or synced to the organization-wide team. Team owners can easily remove these accounts from the team.
- All actions by the system to add or remove members are posted in the General channel. The channel will also be marked as having new activity in the Teams client.
- We'll automatically create an organization-wide team for your organization if your organization is new to Teams and has no more than 5,000 users. The team name will reflect the tenant name and will have a General channel. Global admins can edit this team like any other team.

Best practices

To get the most out of your organization-wide team, we recommend that team owners do the following tasks:

Allow only team owners to post to the General channel

Reduce channel noise by having only team owners post to the General channel.

1. Go to the team, locate the General channel, and then select  **More options** > **Manage channel**.
2. On the **Channel settings** tab, click **Permissions**, and then select **Only owners can post messages**.

Turn off @team and @[team name] mentions

Reduce @mentions to keep them from overloading the entire organization.

1. Go to the team and click  **More options** > **Manage Team**.
2. On the **Settings** tab, click **@mentions** > turn off **Show members the option to @team or @[team name]**.

Automatically show important channels

Show important channels to ensure everyone in your organization engages in specific conversations. To learn more, see [Auto-favorite channels for the whole team](#).

Set up channel moderation

Consider setting up channel moderation and giving moderator capabilities to certain team members. (When moderation is set up, team owners are given moderator capabilities automatically.) Moderators can:

- Control who can start a new post in a channel
- Add and remove moderators
- Control whether team members can reply to existing channel messages
- Control whether bots and connectors can submit channel messages.

For more information, see [Set up and manage channel moderation in Microsoft Teams](#).

Remove accounts that might not belong

Even though members can't leave an organization-wide team, as a team owner, you can manage the team roster by removing accounts that don't belong. **Make sure you use Teams to remove users from your org-wide**

team. If you use another way to remove a user, such as the Microsoft 365 admin center or from a group in Outlook, the user might be added back to the organization-wide team.

FAQ

Is there a way to create an organization-wide team other than using the Teams client?

Only global admins can create an organization-wide team by using the Teams client. If your organization limits creating teams to using PowerShell, the recommended workaround is to add your global admins to the security group of users who can create a team.

For more information, see [Manage who can create groups](#).

If this workaround isn't an option, you can use PowerShell to create a public team and add a global admin as the team owner. Then, have the global admin click **More options** next to the team name, click **Edit team**, and then change the privacy to **Org-wide - Everyone in your organization will be automatically added**.

NOTE

Only team owners can access the **Edit team** option and only global admins can see the **Org-wide** option.

Is there a way to convert an existing team to an organization-wide team?

Global admins can convert an existing team to an organization-wide team by editing it in Teams client. Go to the team name, click **More options** > **Edit team**.

Can I create an organization-wide team using a team template?

Team templates can't be used to create an organization-wide team. Work for this feature is currently in progress.

Create people manager teams in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you roll out Microsoft Teams, rather than launching with a "blank slate" (no teams or channels), we strongly recommend that you set up a base framework of teams and channels. This helps to prevent "team sprawl," where users create numerous teams when they should be creating channels in existing teams. To help you get started with a well-designed teams and channels structure, we've created a PowerShell script that creates a team for each of your first and second line people managers, with each manager's direct reports as team members. This is a "point-in-time" script (it doesn't update your teams or channels automatically when people are added or removed from an organization). But it's a valuable tool you can use to impose some order on your Teams structure from the start. This script reads your Azure AD, gets a list of managers and their direct reports. It uses this list to create one team per people manager.

How to use the PowerShell script

Start by running the [Export managers and their directs script](#) (which assumes you've already run the [Connect-AzureAd](#) and [Connect-MicrosoftTeams](#) PowerShell modules). The *Export managers and their directs* script creates a tab-delimited file (ExportedManagerDirects.txt) that lists all managers with their direct reports.

Then, run the [Create new people manager teams script](#). This script reads in the ExportedManagerDirects.txt file and creates a team for each manager, with that manager's direct reports as members. If any manager or direct isn't enabled for Teams, the script skips them and doesn't create a team. (Review the report, then rerun the script after you've turned on Teams for anybody who needs it. The script won't create a second team for any manager it's already created a team for.)

For each team, the script creates a General and "Just for fun" channel.

Best practices

- Ask each people manager to add your organization's crisis communications website as a tab to the General channel for each team.
- Check out the new Crisis Communications app by reading this March 8, 2020 blog post: [Coordinate crisis communications using Microsoft Teams + Power Platform](#).

[Best practices for organizing teams](#)

[Create an org-wide team in Teams](#)

Manage channel policies in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

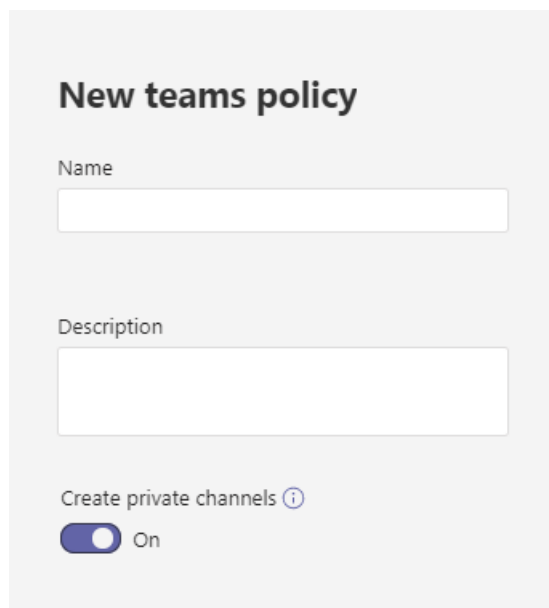

As an admin, you can use teams policies in Microsoft Teams to control what users in your organization can do in teams and channels. For example, you can set whether users are allowed to create private channels.

You manage teams policies by going to **Teams** > **Teams policies** in the Microsoft Teams admin center. You can use the global (Org-wide default) policy or create and assign custom policies. Users in your organization will automatically get the global policy unless you create and assign a custom policy.

You can edit the global policy or create and assign a custom policy. After you edit the global policy or assign a policy, it can take a few hours for changes to take effect.

Create a custom teams policy

1. In the left navigation of the Microsoft Teams admin center, go to **Teams** > **Teams policies**.
2. Click **Add**.
3. Enter a name and description for the policy.

New teams policy

Name

Description

Create private channels ⓘ

☒ On

4. Turn on or turn off **Create private channels**, depending on whether you want to allow users to create private channels.
5. Click **Save**.

Edit a teams policy

You can edit the global policy or any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Teams** > **Teams policies**.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. Turn on or turn off the settings that you want, and then click **Save**.

Assign a custom teams policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

Set up and manage channel moderation in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

In Microsoft Teams, team owners can turn on moderation for a standard channel to control who can start new posts and reply to posts in that channel.

Team owners can also add team members as moderators. A team owner might not have the subject matter expertise at the channel level to best support channel moderation. By allowing specific team members to moderate a channel, the responsibility of managing content and context within a channel is shared between team owners and channel moderators. For example, a team owner can add business owners or content owners as moderators, which lets them control information sharing in that channel.

NOTE

Channel moderation is available for standard channels. It's not available for the General channel or private channels.

What can a channel moderator do?

Channel moderators can:

- Start new posts in the channel. When moderation is turned on for a channel, only moderators can start new posts in that channel.
- Add and remove team members as moderators to a channel. Keep in mind that by default, team owners are channel moderators and can't be removed.
- Control whether team members can reply to existing channel messages and whether bots and connectors can submit channel messages.

Scenarios

Here's some examples of how your organization can use channel moderation in Teams.

Use a channel as an announcement channel

The Marketing team uses a specific channel to share key project announcements and deliverables. Sometimes team members post content to the channel that more appropriately belongs in other channels. The team owner wants to restrict information sharing in the channel to only announcements so that team members can use that channel to stay on top of what's important.

In this scenario, the team owner adds Marketing leads as moderators so they can post announcements in the channel and turns off the ability for team members to reply to messages in that channel.

Use a channel for class discussions in Teams for Education

In Teams for Education, a science teacher wants to use a channel to engage students in focused discussions on specific classroom topics.

In this scenario, the teacher allows their teaching assistants to moderate the channel. The teaching assistants can then create new posts to initiate and drive discussions with students.

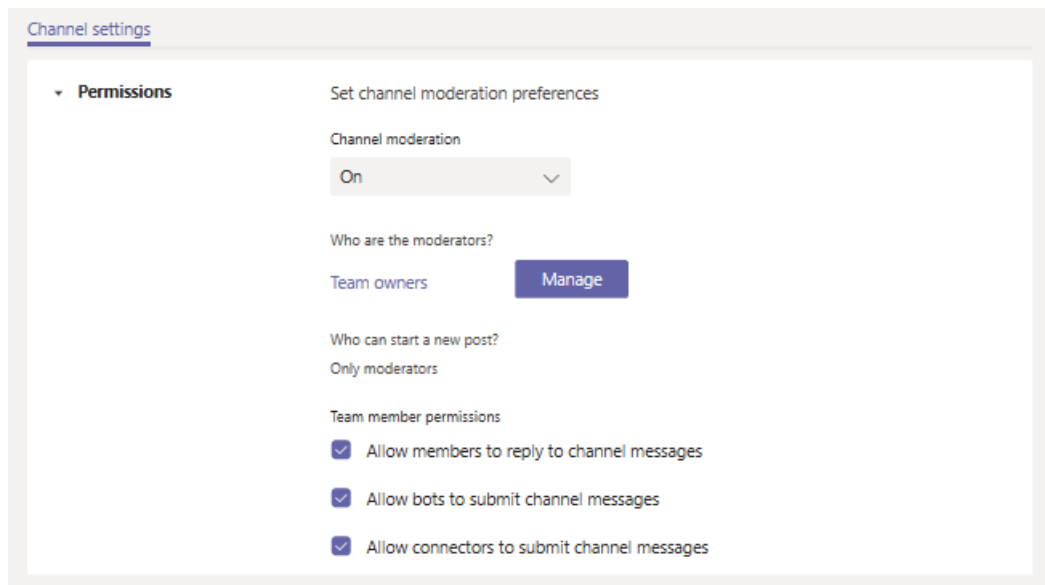

Manage channel moderation

In Teams, go to the channel, click **More options ...** > **Manage channel**. From here you can turn on and turn off moderation, add team members as moderators, and set preferences.

Channel moderation is a per-channel setting. There's no tenant-level setting for channel moderation. If you'd like us to add a tenant-level channel moderation setting, request it on [Teams UserVoice](#).

NOTE

Microsoft will be moving from UserVoice to our own customer feedback solution on a product-by-product basis during 2021. [Learn more](#).

Turn on or turn off moderation for a channel

By default, moderation is off, which means that the usual channel settings apply to team owners and team members. For example, you can restrict new posts to only team members or allow everyone, including guests, to start new posts.

To turn on moderation for a channel, under **Channel moderation**, click **On**. When channel moderation is on, only moderators can start new posts.

Add or remove channel moderators

Under **Who are the moderators?**, click **Manage**, and then add or remove team members as moderators. Team owners and moderators can add and remove other moderators.

Set team member permissions

Under **Team member permissions**, select the check boxes next to the activities you want to allow.

- [Overview of teams and channels in Teams](#)

Manage live components in Teams

12/7/2021 • 6 minutes to read • [Edit Online](#)

Live components in Teams chat offer a new way to ideate, create, and make decisions together. Send a component—like a table, task list, or paragraph—where everyone in your chat can edit inline and see changes as they're made. This means you can gather ideas and feedback from your team while holding fewer meetings and minimizing the need for long chat threads.

NOTE

Live components is the first feature of the [Microsoft Loop app](#) to become available in Teams. Please note that "Live components" will be renamed "Loop components" in early 2022.

Get tasks done faster together. Crowd-source an agenda, track a group's action items, or take notes collectively. These are just a few scenarios made easier with live components.

Share components. In this release, you can share live components into different Teams chats. Recipients can edit from wherever they are and see updates instantly no matter where the changes were made. In future releases, live components will be supported in Teams meeting notes and channels, Outlook, and eventually across all Microsoft 365 applications.

Start in chat, build from there. Every component you create from Teams chat is automatically saved to a file in OneDrive. So, you might begin collaborating in chat then later move to the file, where you have a larger visual space for editing and can add as many components as you like.

Clients and platforms

Available on Teams apps on Windows, Mac, Linux, iOS, and Android.

Settings management

Live components are built with Microsoft Fluid Framework supported across Microsoft 365 suite and controlled from SharePoint Online and not from the Teams admin center.

You'll need the latest version of [SharePoint Online PowerShell module](#) to enable or disable all Fluid Experiences across your Office 365 tenant. Microsoft Fluid Framework defaults to **ON** for all targeted release tenants.

Because live components are designed for collaboration, the components are always shared as editable by others, even if your tenant is set to default to view-only for other file types. See the **Learn more** link next to the setting for more details.

Checking if the Fluid Framework is enabled through the SharePoint Online PowerShell Cmdlet

1. [Connect to SharePoint Online PowerShell](#).
2. Check if Fluid Framework is enabled by running the Get-SPOTenant cmdlet without any arguments.
3. Verify the value of IsFluidEnabled is **true**.

Enabling the Fluid Framework through the SharePoint Online

PowerShell Cmdlet

1. [Connect to SharePoint Online PowerShell.](#)
2. Enable Fluid using the cmdlet Set-SPOTenant -IsFluidEnabled \$true

The change will take a short time to apply across your tenancy.

The feature will be available on Teams Windows Desktop, Mac, iOS, Android. When enabled, users will see a new option for inserting live components in the message compose experience for these clients.

Disabling Fluid Framework through SharePoint Online PowerShell Cmdlet

1. [Connect to SharePoint Online PowerShell.](#)
2. Disable Fluid using the Set-SPOTenant cmdlet Set-SPOTenant -IsFluidEnabled \$false.

The change will take a short time to apply across your tenancy.

If you need to re-enable this capability, you can use SharePoint Online PowerShell Cmdlets.

```
C:\WINDOWS\system32> Connect-SPOService  
cmdlet Connect-SPOService at command pipeline position 1  
  
Supply values for the following parameters:  
Url: <https://a830edad9050849822e21011208-admin.sharepoint.com/>  
PS C:\WINDOWS\system32> set-SPOTenant -isFluidEnabled $true  
PS C:\WINDOWS\system32>
```

Known issues

- Live components in chat cannot be edited via Office app when using Teams on Android.
- If tenant default file permissions are set to **Specific people (only the people the user specifies)**, and the sender removes some users from the Specific people list in the permissions dialog when creating a component, those users may still have access to the content. This issue is due to the access management limitation of the permission dialog and will be fixed in the future release.
- If the tenant's Conditional Access Policy settings prevent client network to connect to `https://pushchannel1.1drv.ms`, live components will not work as expected for saving real time changes to the service.

Known limitations

- Searching for live components in Teams search will return a link to the component in office.com, not the chat message itself.
- Live components are disabled in federated chats.
- B2B guests will not be able to collaborate on live component that is shared with them via Company Share Link unless tenant sets external access option to allow B2B guests have same access level as tenant members.
- Teams Web client full support of Live components will be available soon.
- Live components are not supported in Teams channels yet, but their inline editing in channels is planned for more experiences in the future.

- With tenant default file permissions set to **Specific people (only the people the user specifies)**, copying link to live component and pasting in another chat requires the sender to use permissions dialog and add the recipients in the Specific people option to grant access properly.
- With tenant default file permissions set to **Specific people (only the people the user specifies)**, creating a live component in group chat with more than 20 members will require the sender to manually select the permission options for the component.
- Live components in chat will not load only if file was moved to different library. If file is moved to different folder then it will continue to load in chat.

How to check your tenant's default file permissions

1. Go to the [Microsoft 365 admin center](#).
2. At the left, under **Admin centers**, select **SharePoint**.
3. Select **Policies** > **Sharing**, and under **File and folder links**, view your tenant's default file permissions.

Storage of `.fluid` files

How `.fluid` are stored?

Live components created in Teams are backed by a `.fluid` file stored in the creator's OneDrive for Business. Being a file in OneDrive for Business means that users can create, discover, and manage live components (`.fluid` files) as easily as any Office document.

Users can search for content in `.fluid` files from Office.com and OneDrive for Business. `.fluid` files work with data governance features like eDiscovery, auditing, reporting, and legal hold.

`.fluid` files will now appear on Office.com and OneDrive for Business, such as in the Recent and Recommended areas. `.fluid` files can be restored to previous versions from OneDrive for Business.

Chat participants must have a OneDrive account to create live components. Without a valid OneDrive account, chat participants might still be able to collaborate on a component created by other users who have a valid OneDrive account, but cannot create their own.

Moving a `.fluid` file from OneDrive to a SharePoint site will result in the live component failing to load in Teams chat.

What happens if the owner of the file leaves the company?

[OneDrive retention policies](#) apply to `.fluid` files just as they do to other content created by the user.

How are `.fluid` files shared?

Live components can be inserted in Teams chat or copied from one chat to another. (Live components aren't yet supported in channels.) They default to the tenant's existing permissions, but users can change permissions before sending to ensure everyone has access.

Opening components from Teams chat in Office.com offers share functionality at the top of the window, similar to the sharing options offered for other Office documents.

What if a `.fluid` file becomes corrupted or damaged?

Version History allows you to review and copy from previous versions of the file.

What apps can open and edit `.fluid` files?

`.fluid` files can only be opened as links in your browser, such as Office.com, and as live components in Teams chat. If downloaded, they can't be opened again without first uploading them back to OneDrive for Business or SharePoint Online.

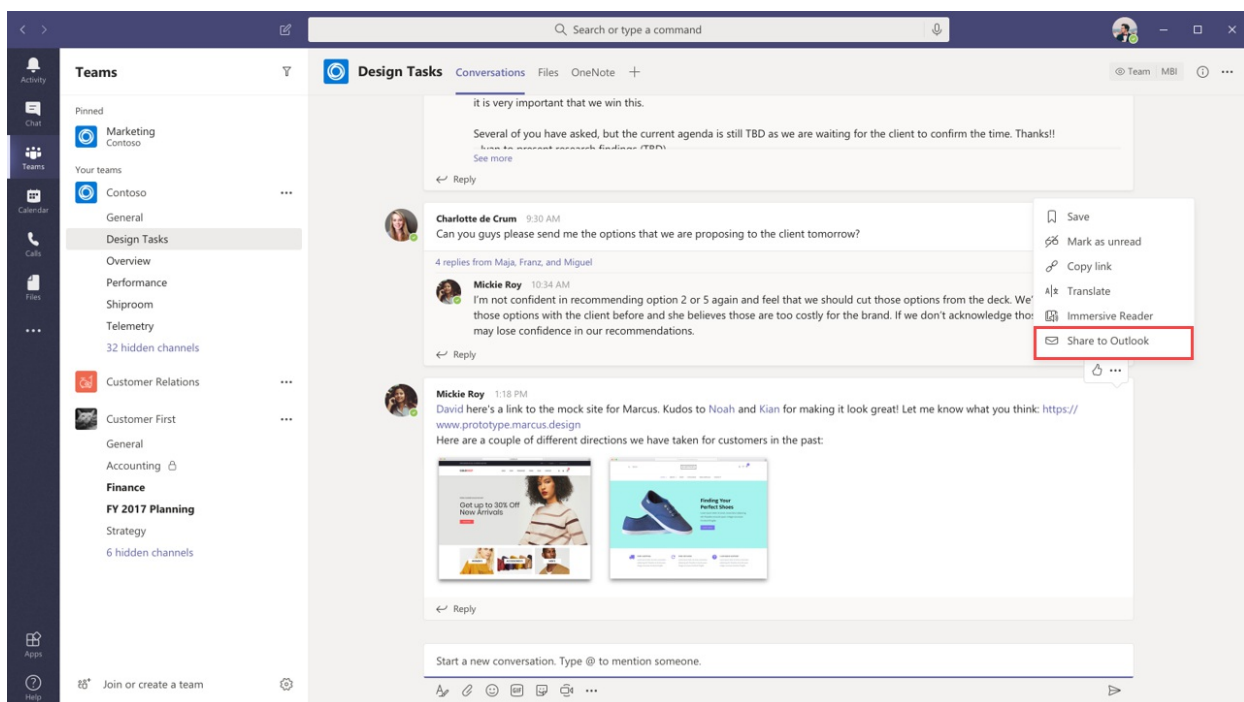

Teams and Outlook email integration

12/7/2021 • 2 minutes to read • [Edit Online](#)

Microsoft Teams includes features that make it easy for users in your organization to share information between email in Outlook and chat or channel conversations in Teams and to stay on top of missed conversations. This article gives you an overview of these features and the admin controls that apply.

Share to Outlook

Share to Outlook lets users share a copy of a Teams conversation to an email in Outlook, without having to leave Teams. This feature is handy if users need to share conversations or status updates with users outside their immediate team or even your organization. Go to the top of the conversation in Teams, select **More options**, and then select **Share to Outlook**. To learn more, see [Share to Outlook from Teams](#).

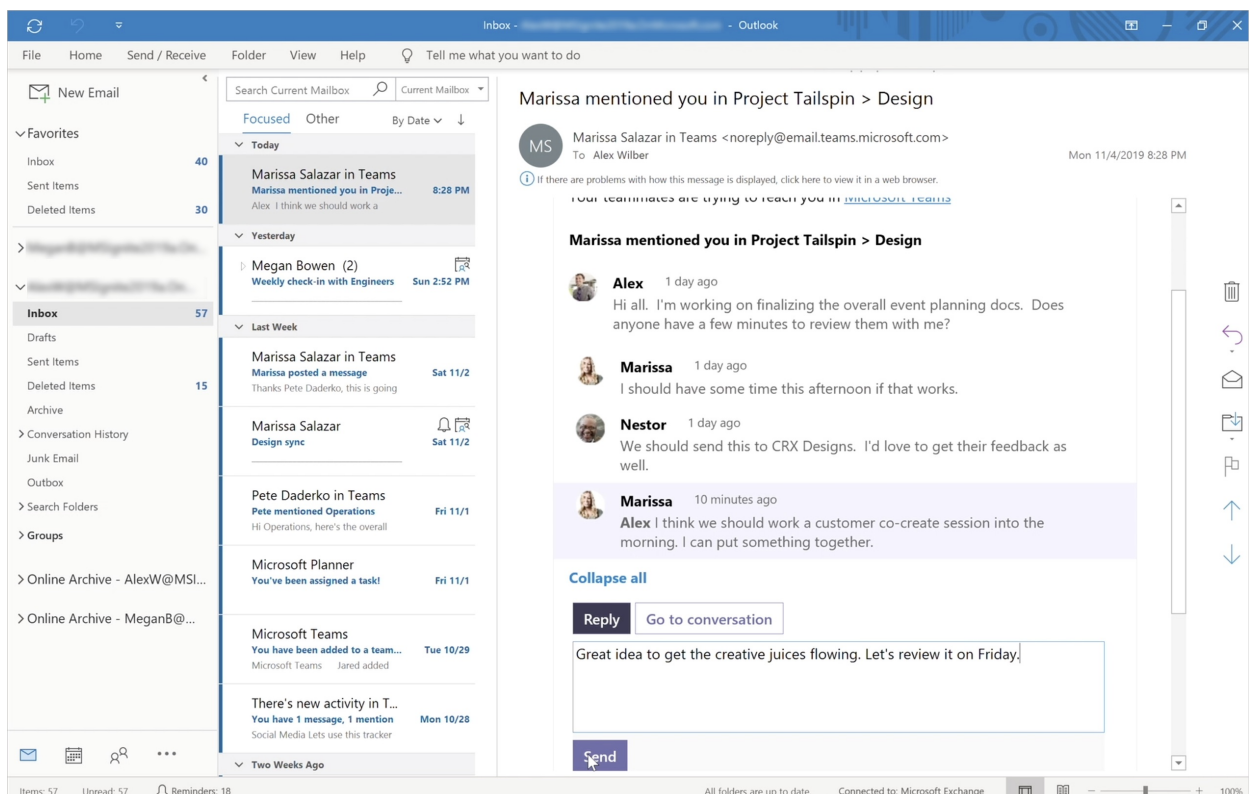

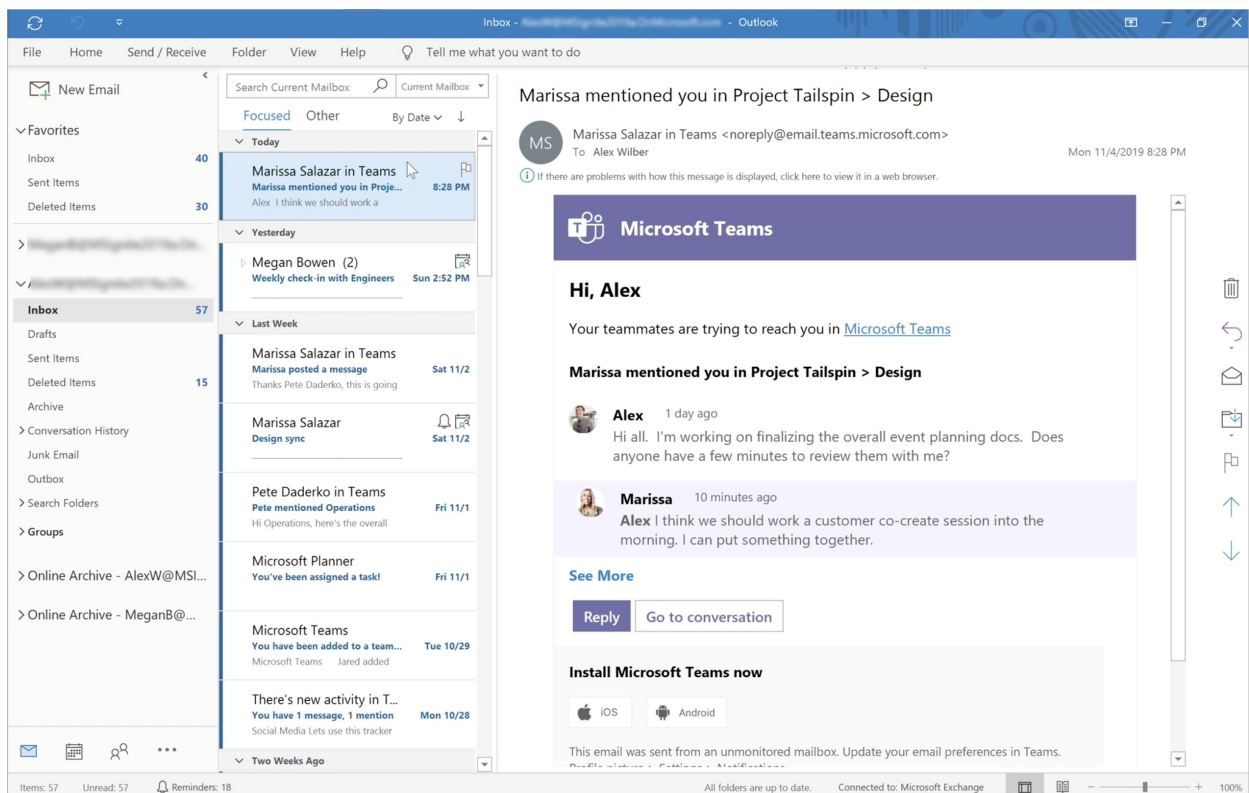

To use this feature, Outlook on the web must be turned on for the user. If Outlook on the web is turned off, the **Share to Outlook** option isn't displayed in Teams for the user. For steps on how to turn on and turn off Outlook on the web, see [Enable or disable Outlook on the web for a mailbox](#).

Actionable activity emails

Users automatically get actionable missed activity emails which help them to catch up on missed conversations in Teams. The missed activity emails show the latest replies from a conversation, including messages that were sent after the missed message, and users can click **Reply** to respond directly from within Outlook. To learn more, see [Reply to missed activity emails from Outlook](#).

NOTE

This feature isn't supported in Outlook for Mac or some older versions of Outlook for Windows. For more information, see [Actionable messages in Outlook and Office 365 Groups](#).

You can use the [Set-OrganizationConfig](#) cmdlet together with the `SmtplibActionableMessagesEnabled` parameter to turn off actionable emails. By default, the `SmtplibActionableMessagesEnabled` parameter is set to `true`. Setting the parameter to `false` turns off actionable email messages across Office 365. For Teams users, this means that the **Reply** option to respond directly in Outlook isn't available in missed activity emails. Instead, the missed activity emails include a **Reply in Teams** option for users to reply in Teams.

See also [Actionable messages in Outlook and Office 365 Groups](#).

Share to Teams from Outlook

12/7/2021 • 2 minutes to read • [Edit Online](#)

Share to Teams from Outlook (Share to Teams) enables users to share emails, including attachments, from Outlook to any chat or channel in Teams.

Outlook add-in for Share to Teams

The Share to Teams feature requires an add-in for Outlook. This add-in is installed automatically whenever a user logs on to either the Teams Web app or the Teams desktop client.

NOTE

Be sure to review [Add-ins for Outlook in Exchange Online](#) and [Client Access Rules in Exchange Online](#) to make sure your add-ins for Outlook function correctly. Also, disabling connected experiences can prevent add-ins for Outlook from working properly. See [Connected experiences in Office](#) for more information.

Share to Teams uses the same transport mechanism as when a user emails a channel. For sharing to chats, emails (including email attachments) are copied to the sender's OneDrive. For sharing to channels, emails and attachments are copied to the **Email messages** folder in SharePoint.

The Outlook add-in for Share to Teams uses requirement set 1.7, as detailed in [Outlook add-ins documentation](#), which includes details on Outlook add-ins, environment requirements for Outlook add-ins, and the specific Outlook clients that are supported with requirement set 1.7.

Enabling or disabling Share to Teams

The Outlook add-in for Share to Teams can be selectively disabled or enabled on a per-user basis using the following PowerShell cmdlets.

NOTE

Disabling the add-in is only possible after the add-in has been installed. If you would like to enforce disabling for all users in your tenant, run a script periodically.

To disable the add-in for Outlook used by Share to Teams, run the [cmdlet found here](#).

To enable the add-in for Outlook used by Share to Teams, run the [cmdlet found here](#).

Browsers and Single Sign-on

Share to Teams, in both Outlook on the web and Outlook desktop clients, relies on a browser WebView. See [Browsers used by Office Add-ins](#) for details on which clients use which specific browsers.

IMPORTANT

Share to Teams requires both third-party cookies and local storage access to be enabled for users' browsers.

Share to Teams uses Single Sign-on (SSO), which means users don't need to provide their credentials when using the add-in via Share to Teams. SSO for Outlook on the web supports

<https://outlook.office365.com/owa/extSSO.aspx> and <https://outlook.office.com/owa/extSSO.aspx> reply URLs by default. For vanity domains, administrators need to add the appropriate Azure Active Directory reply URL.

Manage messaging policies in Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

Messaging policies are used to control which chat and channel messaging features are available to [users \(owners and members\)](#) in Microsoft Teams. You can use the global (Org-wide default) policy that's created automatically or create and assign custom messaging policies.

Users in your organization will automatically get the global policy, unless you create and assign a custom policy. Edit the settings in the global policy or create and assign one or more custom policies to turn on or turn off the features that you want.

Create a custom messaging policy

1. In the left navigation of the Microsoft Teams admin center, go to **Messaging policies**.
2. Select **Add**.
3. Enter a name and description for the policy.
4. Choose the settings that you want.
5. Select **Save**.

For example, you want to make sure that sent messages aren't deleted or altered. Create a new custom policy named "Retain sent messages" and turn off the following settings:

- Owners can delete sent messages
- Users can delete sent messages
- Users can edit sent messages

Then assign the policy to users.

Edit a messaging policy

You can edit the global policy and any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Messaging policies**.
2. Select the policy by clicking to the left of the policy name, and then select **Edit**.
3. From here, make the changes that you want.
4. Select **Save**.

Assign a custom messaging policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

A user can only be assigned one messaging policy at a time.

NOTE

You can't delete a policy if users are assigned to it. You must first assign a different policy to all affected users, and then you can delete the original policy.

Messaging policy settings

Here are the messaging policy settings that you can configure.

- **Owners can delete sent messages** Use this setting to let owners delete messages that users sent in chat.
- **Delete sent messages** Use this setting to let users delete messages that they sent in chat.
- **Edit sent messages** Use this setting to let users edit the messages that they sent in chat.
- **Read receipts** Read receipts allow the sender of a chat message to be notified when their message was read by the recipient in 1:1 and group chats 20 people or fewer. Message read receipts remove uncertainty about whether a message was read, and improve team communication. Read receipts aren't captured in eDiscovery reporting.
 - **User controlled** This means that users get to decide if they want read receipts ON or OFF. Default setting within the app is ON. Users can then turn it OFF.
 - **Turned on for everyone** This means everyone in the tenant will have the feature ON with no option to turn it off. When using the **On for everyone** setting, the only way to set receipts for the whole tenant is either to have only one messaging policy for the whole tenant (the default policy named "Global (Org-wide Default)") or to have all messaging policies in the tenant use the same settings for receipts. The read receipts feature is most effective when the feature is enabled to **On for everyone**.
 - **Turned off for everyone** This means the feature is disabled and no one in the tenant has read receipts nor can they turn it on.
- **Chat** Turn this setting on if you want users in your organization to be able to use the Teams app to chat with other people.
- **Use Giphy in conversations*** If you turn on Giphys, users can include Giphys in chat conversations with other people. Giphy is an online database and search engine that allows users to search for and share animated GIF files. Each Giphy is assigned a content rating. In addition to turning on this setting, you need to enable [Optional Connected Experiences](#) to allow Giphys in conversations.
- **Giphy content rating**
 - **No restriction** This means that your users will be able to insert any Giphy in chats regardless of the content rating.
 - **Moderate** This means that your users will be able to insert Giphys in chats, but will be moderately restricted from adult content.
 - **Strict** This means that your users will be able to insert Giphys in chats, but will be strictly restricted from adult content.
- **Memes in conversations** If you turn Memes on, users can include Memes in chat conversations with other people.
- **Stickers in conversations** If you turn this on, users can include Stickers in chat conversations with other people.
- **URL previews** Use this setting to turn automatic URL previewing on or off in messages.
- **Translate messages** Turn this setting on to let users automatically translate Teams messages into the

language specified by their personal language settings for Microsoft 365 or Office 365.

- **Immersive reader for messages** Turn this setting on to let users view messages in Microsoft Immersive Reader. Immersive Reader is a learning tool that provides a full screen reading experience to increase readability of text.
- **Send urgent messages using priority notifications** If you turn this on, users can send messages using [priority notifications](#). Priority notifications notify users every 2 minutes for 20 minutes or until messages that are marked as *urgent* are picked up and read by the recipient. This feature increases the likelihood that the message is acted upon in a timely manner.
- **Create voice messages**

IMPORTANT

Audio messages are not captured in eDiscovery reporting.

- **Allowed in chats and channels** This means that users can leave audio messages in both chats and channels.
- **Allowed in chats only** This means that users can leave audio messages in chats, but not in channels.
- **Not enabled** This means that users cannot create audio messages in chats or channels.
- **On mobile devices, display favorite channels above recent chats** Enable this setting to move favorite channels to the top of the mobile device screen so that a user doesn't need to scroll to find them.
- **Remove users from group chats** Turn this setting on to let a user remove other users from a group chat. This feature lets you continue a chat with a smaller group of people without losing the chat history.
- **Text predictions** Turn on this setting to let a user get text predictions for chat messages.
- **Suggested replies** Turn this setting on to enable suggested replies for chat messages.
- **Chat permission role** Use this setting to define the supervised chat role of the user. Learn more about [supervised chat](#).

NOTE

Some of these settings, such as using Giphy, can also be configured at the team level by team owners and at the private channel level by private channel owners.

- [Assign team owners and members in Microsoft Teams](#)

User presence in Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Presence is part of a user's profile in Microsoft Teams (and throughout Microsoft 365 or Office 365). Presence indicates the user's current availability and status to other users. By default, anyone in your organization using Teams can see (in nearly real time) if other users are available online. Presence is updated in real time on the web and desktop versions when you refresh the page on mobile.

NOTE

For details about Teams user profiles on different platforms, see [Teams features by platform](#).

NOTE

Teams respects your privacy configuration so if you have enabled the privacy mode, your presence will not be visible to external users.

Presence states in Teams

USER CONFIGURED	APP CONFIGURED
 Available	 Available
	 Available, Out of Office. Note: Out of office is automatically set for the periods of time where the user sets "automatic replies". If the user is using the app during these periods of time, a dual presence might be shown, such as "Out of office, available".
 Busy	 Busy
	 In a call
	 In a meeting
	 On a call, out of office
 Do not disturb	
	 Presenting
	 Focusing. Focus happens when the users schedule focus time in MyAnalytics/Insights in their calendars.
 Away	 Away
	 Away Last Seen <i>time</i>

USER CONFIGURED	APP CONFIGURED
 Be right back	
 Appear offline	 Offline. When users aren't logged in on any of their devices for a few minutes, they appear offline.
	 Status unknown
	 Out of Office. Out of Office is used when an automatic reply is set.

NOTE

For users that have their mailbox hosted on-prem, presence delays of one hour (maximum) are expected.

App-configured presence states are based on user activity (Available, Away), Outlook calendar states (In a meeting), or Teams app states (In a call, Presenting). When you're in focus mode based on your calendar, **Focusing** will be the state people see in Teams. Focus mode will display as **Do not disturb** in other products.

Your current presence state changes to Away when you lock your computer or when your computer enters idle or sleep mode. On a mobile device, your presence status changes to Away whenever the Teams app is in the background.

Users receive all chat messages sent to them in Teams regardless of their presence state. If a user is offline when someone sends them a message, the chat message appears in Teams the next time the user is online. If a user state is set to Do not disturb, the user will still receive chat messages, but banner notifications aren't displayed.

Users receive calls in all presence states except for Do not disturb, in which incoming calls go to voicemail. If the recipient blocked the caller, the call won't be delivered and the caller sees the recipient's presence as Offline.

Users can add people to their priority access list by going to **Settings** > **Privacy** in Teams. People who have priority access can contact the user even when the user's status is set to Do not disturb.

Dual presence

The way presence works for most users is motivated by the events in the calendar or device events, such as a call. The user can override this status in the UI by manually setting states, which have some expiration time.

User configured states expiration

When a user selects a specific presence state, it takes precedence over any app activity update. For example, if a user sets herself as Do not disturb, her presence will remain as Do not disturb even if she attends a meeting or answers a call.

User configured states have default expiration settings in Teams, in order to prevent users from displaying a status that may not be relevant after a period of time.

USER CONFIGURED STATE	DEFAULT EXPIRATION
Busy	1 day
Do not disturb	1 day
Others	7 days

NOTE

A user can also configure manually a duration for her presence. For instance, a user can set herself as Appear offline until tomorrow morning.

Admin settings in Teams compared to Skype for Business

The following admin settings Skype for Business are different in Teams:

- In Teams, presence sharing is always enabled for users in the organization. Privacy (where you define who can see presence) configuration isn't available in Teams.
- Presence sharing with everyone (including Federated services) is always enabled for users in Teams. Their contact list (if they had one in Skype for Business) is visible under **Chat > Contacts** or under **Calls > Contacts**.
- Client Do Not Disturb and Breakthrough features are always enabled for users in Teams.
- Calendar (includes out of office and other calendar information) integration is always enabled for users when Teams is integrated with Outlook.
- The *Last seen* or *Away since* indicator is always enabled for users in Teams if the organization also uses Skype for Business.

NOTE

The ability of a Teams admin to customize these settings is not currently supported.

Admin settings in Teams compared to Microsoft Outlook

Teams presence in Outlook is supported on the Outlook 2013 desktop app and later for contacts in the same organization.

If the upgrade mode policy of the user account is set to TeamsOnly, Outlook talks to Teams to get presence. If the user account isn't set to TeamsOnly, then Outlook talks to Skype for Business.

Coexistence with Skype for Business

See [Coexistence with Skype for Business](#) for details on how Teams presence functions when your organization also uses Skype for Business.

Manage tags in Microsoft Teams

12/7/2021 • 5 minutes to read • [Edit Online](#)

Overview

Tags in Microsoft Teams let users quickly and easily connect with a subset of people on a team. You can create and assign custom tags to categorize people based on attributes, such as role, project, skill, or location. Or, tags can be automatically assigned to people based on their schedule and shift information in the [Shifts app](#). After a tag is added to one or multiple team members, it can be used in @mentions by anyone on the team in a channel post or to start a conversation with only those people who are assigned that tag.

As mentioned earlier, there are two kinds of tags in Teams.

- **Custom tags:** Team owners and team members (if the feature is enabled for them) can manually create and assign tags to people. For example, a "Designer" or "Radiologist" tag will reach those sets of people on a team without having to type their names.
- **Tagging by shift:** With this feature, people are automatically assigned tags that match their schedule and shift group name in the [Shifts app](#) in Teams. For example, the "EngineerOnCall" tag reaches all engineers who are scheduled in Shifts to work at the time the tag is used in a chat or channel post. With tagging by shift, Teams takes the guesswork out of knowing the name of on-shift staff when users need to quickly relay information. Tagging by shift can also be backed by major workforce management systems like JDA, Kronos, and AMiON by integrating them with Shifts in Teams. To learn more about how to set up this feature, see [Set up tagging by shift](#).

NOTE

Tags are not yet supported in private channels. Tags are not available in Department of Defense (DoD) organizations.

How tags work

A tag can be manually added or automatically assigned to a person on a specific team. It can then be used in @mentions on the **To** line in a chat or in a post on any standard channel of the team. Here's some examples of how tags can be used in Teams:

- A store manager posts an announcement to a channel to notify all cashiers.
- A hospital administrator sends a message to all radiologists in a channel.
- A marketing manager starts a group chat with all designers.
- A nurse sends a message to all on-call cardiologists. (coming soon)
- A system engineer posts an announcement to a channel to notify all on-shift field engineers. (coming soon)

When a tag is @mentioned in a channel conversation, team members associated with the tag will get notified, just like any other @mention.

Manage custom tags for your organization

As an admin, you can control how tags are used across your organization in the Microsoft Teams admin center. Currently, you can't use PowerShell to manage tags.

Tagging

Tags can be added to one or more team members and used to communicate with tagged with those members using @mentions of the tag in a channel post or starting a chat conversation. [Learn more](#)

The screenshot shows the 'Tagging' settings in the Microsoft Teams admin center. It includes a dropdown for 'Tags are managed by' set to 'Team owners and members', a toggle for 'Let team owners override who can manage tags' which is turned 'On', a section for 'Suggested tags' with three tags: 'contoso', 'design', and 'engineering', and a toggle for 'Let custom tags be created' which is turned 'Off'.

A team can have up to 100 tags, up to 100 team members can be assigned to a tag, and up to 25 tags can be assigned to a single user.

Set who can add custom tags

By default, team owners can add custom tags. You can change this setting to allow team owners and team members to create, edit, delete, and manage tags or you can turn off tags for your organization.

1. In the left navigation of the Microsoft Teams admin center, click **Org-wide settings** > **Teams settings**.
2. Under **Tagging**, next to **Tags are managed by**, select one of the following options:
 - **Team owners and members**: Allow team owners and members to manage tags.
 - **Team owners**: Allow team owners to manage tags.
 - **Disabled**: Turn off tags.

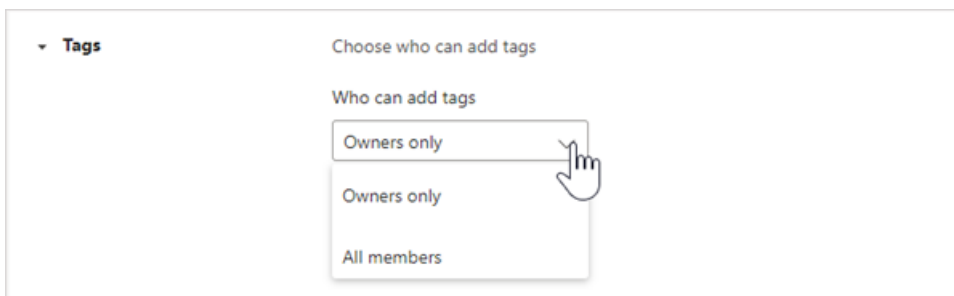

Configure custom tags settings

You can configure the following tags settings to control how custom tags are used across your organization.

1. In the left navigation of the Microsoft Teams admin center, click **Org-wide settings** > **Teams settings**.
2. Under **Tagging**, set the following, depending on the needs of your organization.
 - **Let team owners override who can manage tags**: When you turn on this setting, team owners can set whether team members can create and manage tags within a team and the value of the **Tags are managed by** setting is the default value for each team. If you turn off this setting, the **Tags are managed by** setting can't be changed per team.
 - **Suggested default tags**: Use this to add a set of default tags. You can add up to 25 tags, and each tag can contain a maximum of 25 characters. Team owners and members (if the feature is enabled for them) can use these suggestions, add to them, or create a new set of tags.
 - **Let custom tags be created**: Turn on this setting to let people add tags other than the suggested default tags that you set. If this is turned off, people can only use the suggested default tags. If you turn this off, make sure that you add one or more default tags.

Manage custom tags settings for a team

If you turned on the **Let team owners override who can manage tags** setting in the Microsoft Teams admin center, team owners can set whether members can add tags at the team level. To do this, on the **Settings** tab for a team, go to **Tags**, and then choose who can add tags.

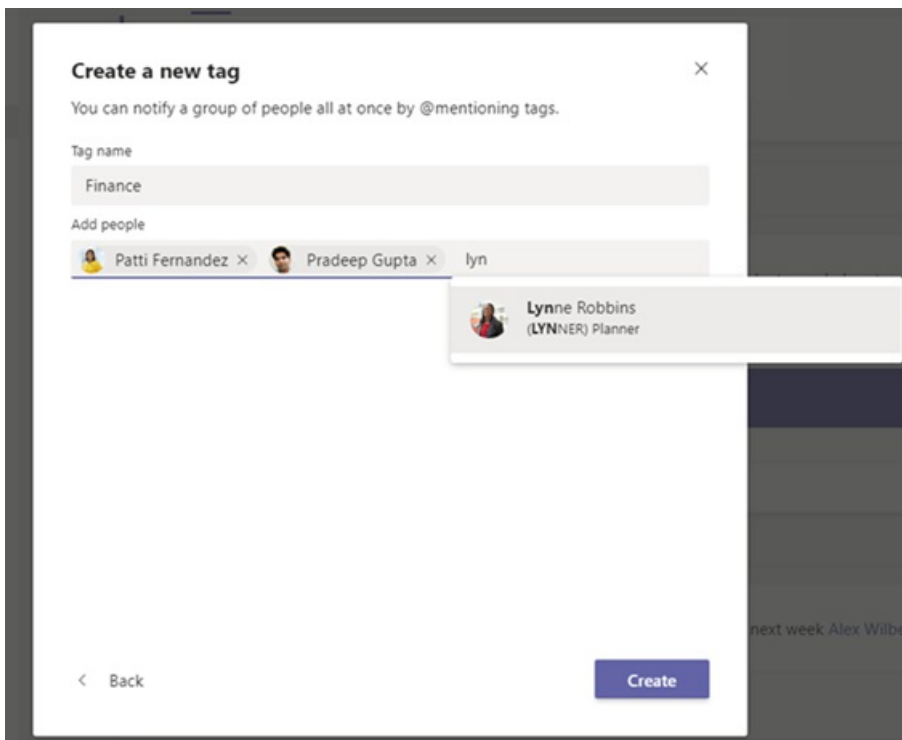

Use tags

Here's how to add custom tags and how to set up tagging by shift (if you're using the Shifts app in Teams). To learn more, check out [Using tags in Teams](#).

Create and assign custom tags

To create and assign custom tags, select **Teams** on the left side of the app, and then find your team in the list. Select **More options**, and then choose **Manage tags**. Here, you can create tags and assign them to people on your team.

To delete a tag, select **More options** next to the tag, and then select **Delete tag**.

Set up tagging by shift

Tagging by shift allows your users to reach the people on-shift in real-time. Teams automatically assigns users with tags matching their schedule and shift group name from the Shifts app, enabling dynamic role-based messaging. Notifications are sent only to those people who are on shift at the time a tag is used to start a chat or in a channel post.

1. In Teams, go to the [Shifts app](#).
2. Create [shift groups](#) and name them after an attribute such as a role. For example, EngineerOnCall. The shift group name will be the name of the tag.
3. [Fill out a schedule](#) by assigning shifts to members of your teams. When you're finished, in the upper-right corner of the Shifts app, select **Share with team**.
4. Wait 15 minutes for the scheduled shifts to populate the tagging service.
5. Use the tag anywhere you use tags in Teams.

View analytics in Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

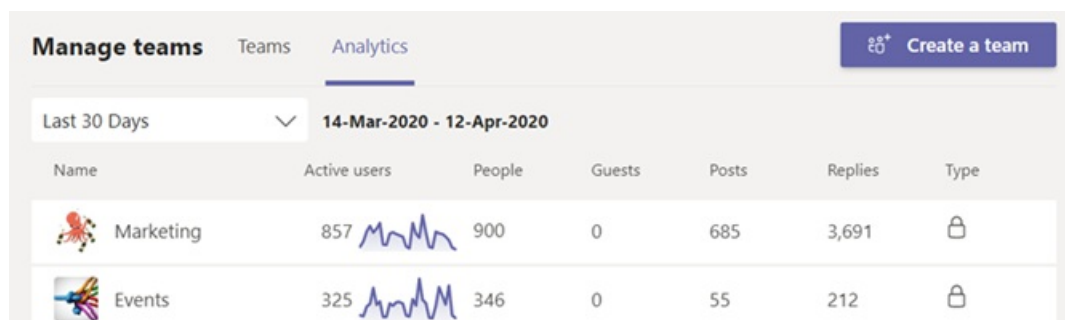

In Microsoft Teams, users can view analytics for teams and channels that they are part of. This information gives users insight into usage patterns and activity on their teams. Users can see data such as the number of active users, posts, replies, and more at three levels.

- **Cross-team analytics** gives users a broad overview of usage data for all teams that they are a member or owner of in a single list view.
- **Per-team analytics** gives users a more granular view, showing usage data for a specific team.
- **Per-channel analytics** gives users an even more granular view, showing usage data for a specific channel.

Users can filter any of these views to see data for a specified time period.

View cross-team analytics

1. In Teams, at the bottom of the teams list, next to **Join or create a team**, click **Manage teams**.
2. Click the **Analytics** tab.
3. Select a date range to show usage data for all teams that you're a member or owner of.

ITEM	DESCRIPTION
Name	Name of the team.
Active users	Number of active users on the team and trend line of team activity during the specified time period.
People	Total number of people on the team in the specified time period. This includes team owners, team members, and guests.
Guests	Number of guests on the team during the specified time period.
Posts	Number of new messages posted in team chat during the specified time period.
Replies	Number of replies in team chat during the specified time period.

ITEM	DESCRIPTION
Type	Whether the team is a private team or public team.

View per-team analytics

1. In Teams, go to the team that you want, click **More options (...)**, and then click **Manage team**.
2. Click the **Analytics** tab.
3. Select a date range to show usage data for the team.

Team expiration and renewal in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Organizations with a large number of teams often have teams that are never actually used. This can happen because of several reasons including product experimentation, short-term team collaboration, or team owners leaving the organization. Over time, such teams can accumulate and create a burden on tenant resources.

To curb the number of unused teams, as an admin, you can use [Microsoft 365 group expiration policy](#) to automatically clean up unused teams. Because teams are backed by groups, group expiration policies automatically apply to teams as well.

When you apply an expiration policy to a team, a team owner receives a notification for team renewal 30 days, 15 days and 1 day before the team's expiration date. When the team owner receives the notification, they can click **Renew now** in team settings to renew the team.

The screenshot shows the Microsoft Teams interface with the 'Settings' tab selected. The 'Team expiration' section is expanded, displaying the expiration date and a 'Renew now' button. The 'Renew now' button is highlighted with a red box.

Setting	Description
Team picture	Add a team picture
Team discovery	Make the team searchable and discoverable
Member permissions	Enable channel creation, adding apps, and more
Guest permissions	Enable channel creation
@mentions	Choose who can use @team and @channel mentions
Team code	Share this code so people can join the team directly - you won't get join requests
Fun stuff	Allow emoji, memes, GIFs, or stickers
Team expiration	See when your team will be expiring or up for renewal As per policy, your team will expire on 3/30/20. Contact your IT admin for more information on expiration policies. Renew now

If the team owner doesn't renew the team and there is no further activity on the team until the end of the expiration policy, the team is put in a "soft-deleted" state, which means it can be restored within the next 30 days.

Team auto-renewal

There can be times when a team owner is unable to renew the team perhaps because they forgot to renew or were away when renewal was due. In these scenarios, a team in active use can get deleted because of expiration policies that apply to the team.

To prevent accidental deletion, auto-renewal is automatically enabled for a team in the group expiration policy. When the group expiration policy is set up, any team that has at least one channel visit from any team member before its expiration date is automatically renewed without any manual intervention from the team owner.

Known issues

Expiration date of team and underlying group don't match

Before a team is renewed, the group that backs the team is renewed first. As part of renewal, a new expiry date is set on the group for a future date. This new date may not be immediately visible in Teams. It can take up to 24 hours to sync. If you see a discrepancy between the expiry date for a team and its underlying group, wait 24 hours before seeking further support.

Archive or delete a team in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Over time, a team created in Microsoft Teams might fall out of use or you might want to archive or delete a team at the end of a project. If you're a Microsoft Teams admin, follow the steps in this article to archive or delete a team that's no longer needed.

When you archive a team, all activity for that team ceases. Archiving a team also archives private channels in the team and their associated site collections. However, you can still add or remove members and update roles and you can still view all the team activity in standard and private channels, files, and chats.

When you delete a team, team activity in standard and private channels (and associated site collections), files, and chats is also deleted.

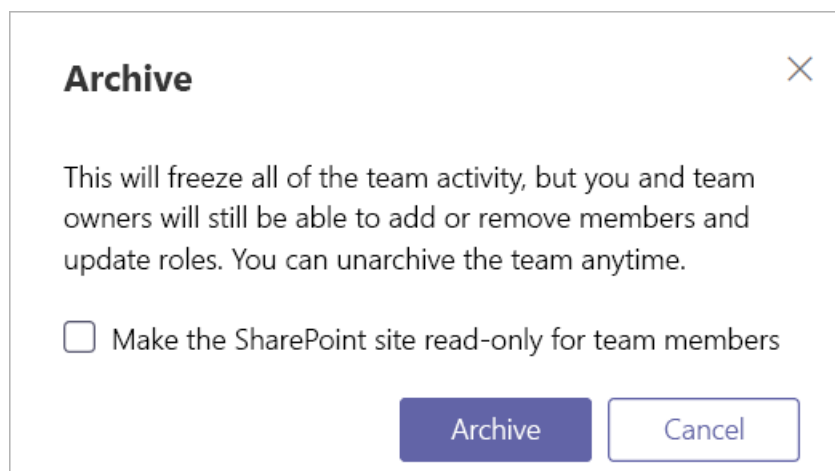

IMPORTANT

Archived teams can be reactivated, but you can't directly restore a team that has been deleted. Consider archiving the team first, and postpone the deletion until you're sure that you no longer need the team.

Archive a team

Follow these steps to archive a team. You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. In the admin center, select **Teams**.
2. Select a team by clicking the team name.
3. Select **Archive**. The following message will appear.

4. To prevent people from editing the content in the SharePoint site and Wiki tab associated with the team, select **Make the SharePoint site read-only for team members**. (Teams owners will still be able to edit this content.)
5. Select **Archive** to archive the team. The team's status will change to **Archived**.

Make an archived team active

Follow these steps to make an archived team active again.

1. In the admin center, select **Teams**.
2. Select a team by clicking the team name.
3. Select **Unarchive**. The team's status will change to **Active**.

Delete a team

If the team will not be required in the future, then you can delete it rather than archiving it. Follow these steps to delete a team.

1. In the admin center, select **Teams**.
2. Select a team by clicking the team name.
3. Select **Delete**. A confirmation message will appear.
4. Select **Delete** to permanently delete the team.

Restore a deleted team

Follow these steps to restore a deleted team by restoring the Microsoft 365 group that's associated with the team. Restoring the Microsoft 365 group for a team restores team content, including tabs, standard channels, and private channels and their associated site collections.

By default, a deleted Microsoft 365 group is retained for 30 days. This 30-day period is called "soft-delete" because you can restore the group. To learn more, see [Restore a deleted Group](#).

Install the AzureADPreview module

1. Open Windows PowerShell as an admin.
2. If you have an earlier version of the AzureADPreview module installed or the AzureAD module installed, uninstall it by running one of the following:

```
Uninstall-Module AzureADPreview
```

```
Uninstall-Module AzureAD
```

3. Install the latest version of the AzureADPreview module by running the following:

```
Install-Module AzureADPreview
```

Restore the deleted Microsoft 365 group

1. Connect to Azure AD by running the following:

```
Connect-AzureAD
```

When you're prompted, sign in using your admin account and password.

2. Run the following to display a list of all soft-deleted Microsoft 365 groups that are still within the 30-day retention period. Use the **-All \$True** parameter if you have a lot of groups.

```
Get-AzureADMSDeletedGroup
```

3. Find the group that you want to restore, and then make a note of the Id.

4. Run the following to restore the group, where [Id] is the group Id.

```
Restore-AzureADMSDeletedDirectoryObject -Id [Id]
```

5. Run the following to verify the group was successfully restored, where [Id] is the group Id.

```
Get-AzureADGroup -ObjectId [Id]
```

It can take up to 24 hours for the restore process to complete, after which the team and content associated with the team, including tabs and channels, is displayed in Teams.

Migrate from Slack to Microsoft Teams

12/7/2021 • 13 minutes to read • [Edit Online](#)

This article walks you through the journey of moving to Microsoft Teams from Slack.

When planning your organization's move to Teams from Slack, it's important to decide what you need to keep (if anything). We'll start off by describing what types of data can be migrated and then walk you through how to assess your needs, plan your move, and then make the move.

The diagram below shows the Slack architecture at a high level.

Plan your migration from Slack

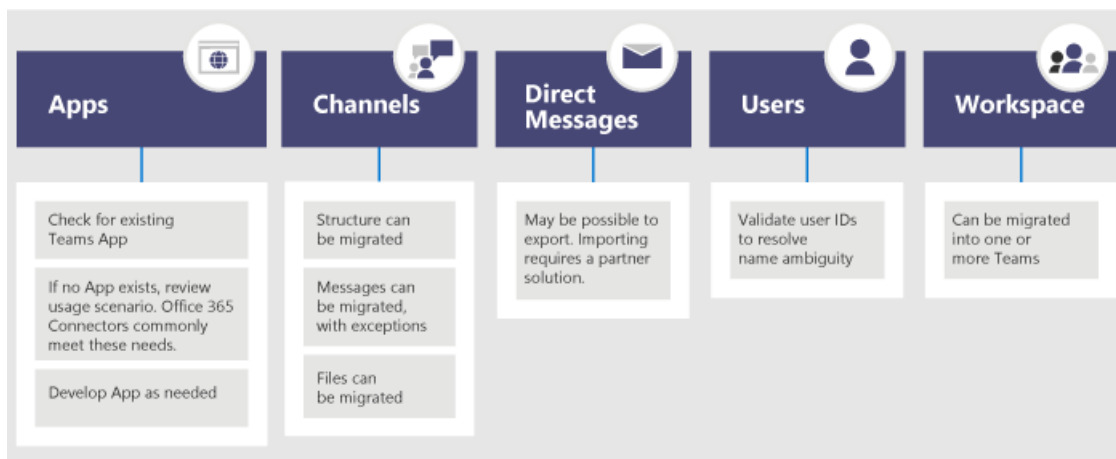

What you can and can't migrate

Your Slack service plan will determine what you can and can't migrate. For example, some Slack service plans only let you export public channels history and files, other require a DocuSign request to include Private Channels and Direct Messages.

To determine your Slack Workspace service level, log into Slack and note your plan type on the **About this Workspace** page.

To learn more about Slack export options, go to the Slack website: <https://get.slack.help/hc/articles/204897248-Guide-to-Slack-import-and-export-tools>

The diagram below gives you a high-level look at the Slack migration landscape that we'll cover in this article.

When you're done with this section, you should understand:

- The service level of your Slack Workspaces
- What can and can't be exported
- Common approaches to exporting

Assess your Slack workspaces

Before you can plan your organization's migration plan, you need to pull together some information about your Slack workspaces. Understanding how your Slack workspaces are being used helps you determine the scope of your migration. For example, how many workspaces are being moved? Are they used by a specific department, many, or in use by an entire organization?

If you're a member of the Slack Workspaces you want to migrate, you can analyze the usage yourself by going to `<your Slack workspace>.slack.com/stats`. Review the Channels and Members tabs to look for usage patterns. Decide which workspaces you want to migrate (and which ones you want to leave behind).

NOTE

If you don't have access to the stats page, you're not an admin or owner.

Export Channels

In Slack, users join a channel which is part of a Slack Workspace, whereas in Teams users join a team which is a collection of channels. We recommend that you use Slack analytics to see how much activity happens in each channel to help you decide which channels to move. You'll use the resulting list to figure out how to group your Slack channels into teams in Teams as well as who should be members of each team.

If you have a paid Slack service plan (anything other than Free), you can use Slack's analytics (`<your Slack workspace>.slack.com/admin/stats#channels`) to see how active a channel is, when it was last used, and how many people are members. This can help you decide whether to migrate the channel. By default, public channels content (messages and files) can be exported. Depending on your Slack service plan and whether you've requested Private Channels and Direct Messages from Slack, those can be exported.

To learn more about Slack export options, go to the Slack website: <https://get.slack.help/hc/articles/204897248-Guide-to-Slack-import-and-export-tools>

IMPORTANT

Check your organization's privacy and compliance requirements around channel data. Your organization may have compliance requirements around the handling, storage, and processing of this data, in addition to complying with the lifecycle of end-user identifiable content (EUII).

Export Direct Messages

Direct Messages are the same as chats in Teams, which are 1:1 or 1-to-many non-channel conversations. Exportability depends on your Slack service plan and if you've requested Direct Messages to be included in your Slack Export. Teams doesn't support importing Direct messages currently. Consult a Microsoft partner to learn about third-party solutions you can explore that bring Direct Messages content into Teams.

For exporting Direct Messages, check out tools, such as Export, in the Slack App Store.

Apps and custom integrations

Apps in Slack are like apps in Teams. Once you have a list of apps and their configurations in the Workspace, you can search in the Teams App store to see if they're available for Teams*.

Go to <your Slack workspace>.slack.com/apps/manage to get a list of Apps and Custom Integrations. This page also shows you the number of configurations where each app is in use. Custom Integrations vary in their "migrate-ability." If it's a Web Hook, you can usually send it to a Microsoft 365 or Office 365 Connector to shift the workflow into Teams. Assess bots and other apps on a case-by-case basis to plan for moving them to Teams.

* If your administrator has restricted apps usage, you may not be looking at the full list of available apps.

Users

The identity schemes you used in Slack might not map directly to Microsoft 365 or Office 365. For example, the email addresses of your Slack users may not map to Microsoft 365 or Office 365 work or school accounts. You should create a user-ID map before you start planning your Teams rollout.

If you're on a paid Slack service plan, you can go to <your Slack workspace>.slack.com/admin/stats#members to get member details such as email address and account type for each user (for example, single vs. multi-channel guest).

Here's a script you can use to compare email addresses from a Slack export against Azure AD to help solve for name ambiguity. It'll also report if the user is enabled for Teams. If you need help with PowerShell, read [Get started with Azure PowerShell](#).

```
Connect-AzureAD
Function Get-Timestamp {
    return "[{0:MM/dd/yy} {0:HH:mm:ss}]" -f (Get-Date)
}

class User {
    [ValidateNotNullOrEmpty()] $ID
    [ValidateNotNullOrEmpty()] $FullName
    [string] $Email
    [string] $UPN
    [ValidateNotNullOrEmpty()][bool] $ExistsAzureAD
    [ValidateNotNullOrEmpty()][bool] $TeamsEnabled
}

$output = New-Object -type System.Collections.ObjectModel.Collection["User"]

$users = Get-Content -Raw -Path .\slackHistory\users.json | ConvertFrom-Json

Write-Host -ForegroundColor Green "$(Get-Timestamp) User Count: " $users.Count

$i=1
Write-Host "$(Get-Timestamp) Attempting direct email match..`n"
foreach ($slackUser in $users) {
    $user = New-Object User
    $user.id = $slackUser.id
    $user.FullName = $slackUser.name
    try {
        if ($null -ne $slackUser.profile.email) {
            $user.email = $slackUser.profile.email
            $emailSplit = $slackUser.profile.email.Split('@')
```

```

$slackUser = $slackUser | For-Object -Member @{EmailSplit = $emailSplit}
$mailNickName = $emailSplit[0]
$result = Get-AzureADUser -Filter "MailNickName eq '$($mailNickName)' or UserPrincipalName eq '$($slackUser.profile.email)' or proxyAddresses/any(c:c eq 'smtp:$($slackUser.profile.email)')"
if ($null -ne $result) {
    $user.ExistsAzureAD = $true
    $user.UPN = $result.UserPrincipalName
    $assignedPlans = $result.assignedPlans
    foreach ($plan in $assignedPlans) {
        if ($plan.ServicePlanId -eq "57ff2da0-773e-42df-b2af-ffb7a2317929") {
            if ($plan.CapabilityStatus -eq "Enabled") {
                $user.TeamsEnabled = $true
            }
        }
        else {
            $user.TeamsEnabled = $false
        }
    }
}
Write-Host -ForegroundColor Green "$(Get-Timestamp) Current User $($i) - AzureAD object found:" $result.MailNickName
Write-Host -ForegroundColor Green "$(Get-Timestamp) Current User $($i) - Teams Enabled:" $user.TeamsEnabled
}
else {
    $user.ExistsAzureAD = $false
    Write-Host -ForegroundColor Yellow "$(Get-Timestamp) Current User $($i) - AzureAD object not found: " $slackUser.profile.email
}
}
$i++
}
catch
{
    $user.ExistsAzureAD = $false
    Write-Host -ForegroundColor Yellow "$(Get-Timestamp) Current User $($i) - AzureAD object not found: $($i)" $user.profile.email
    $i++
}
$output.Add($user)
}

$output | Export-Csv -Path .\SlackToAzureADIdentityMapping.csv -NoTypeInformation
Write-Host "`n $(Get-Timestamp) Generated SlackToAzureADIdentityMapping.csv. Exiting..."

```

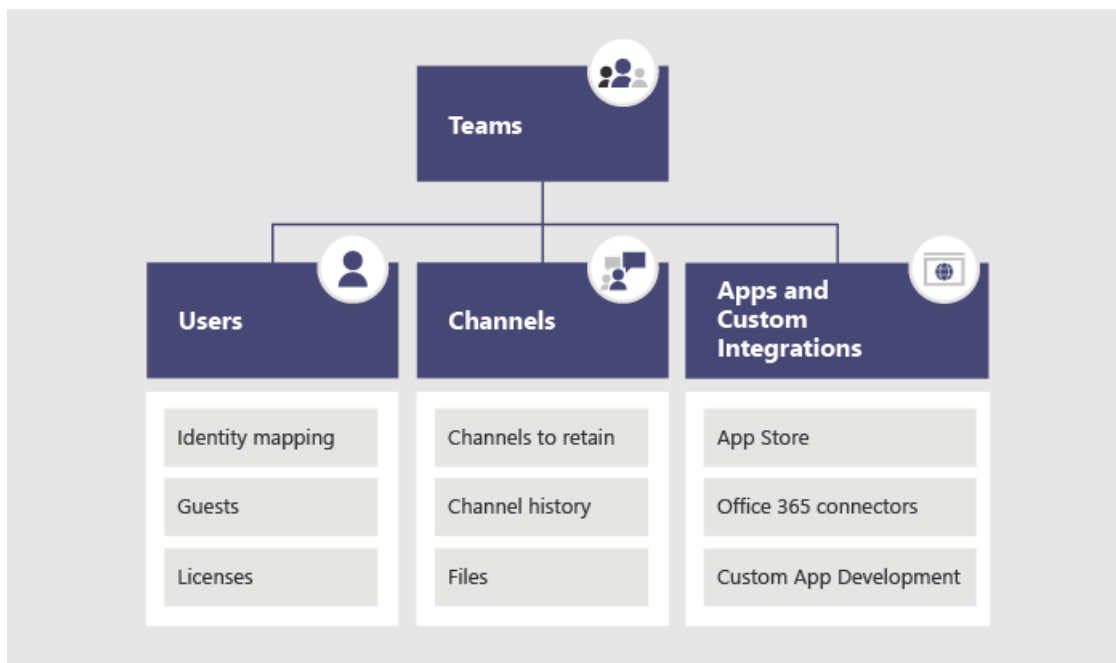

When you're done with this section, you should have:

- A list of Channels per Workspace with usage statistics.
- A list of Slack Apps with configurations per channel.
- Determined what type of Slack message history you want to export (if any).
- A list of users whose Slack accounts map to Microsoft work or school accounts and which Teams license they have.

Plan your Teams deployment

You've exported what you need from Slack (and left behind anything you don't need). Now it's time to plan how you'll roll out Teams and import your Slack data. This is a great opportunity to assess what's worked well for the team based on usage and include those elements in your Teams deployment plan. At the end of this section, you'll have a blueprint for your Teams users, channels, and apps.

The diagram below gives you a high-level outline of the things you'll address in your Teams deployment.

Team and channel structure

A Slack Workspace may represent a single team, multiple teams or an entire organization. It's important to understand the scope of the Workspaces as you determine the structure. The closest relationship to a Teams team in Slack is the Workspace, which contains a collection of channels. The diagram below demonstrates 3 different Slack-to-Teams mappings, and guidance for picking the right one for each Workspace.

SLACK-TO-TEAMS MAPPING	DESCRIPTION
1 Slack Workspace → 1 team	For smaller Slack workspaces that need fewer than 200 channels Include a buffer for growth and private channel planning
1 Slack Workspace → multiple teams	Use your Slack Workspace analytics data to create logical channel groupings, which become the basis of your teams
2+ Slack Workspaces → multiple teams	Use your Slack Workspace analytics data to create logical team and channel groupings, which become the basis of your teams

Third-party solutions have usage statistics to help you assess how active the channel is and how many posts there are. Typically, channels that are frequently used would be candidates to include in your team planning.

TIP

Retain only what is required in your approach to determine which channels to recreate in Teams. To learn more, read [Overview of teams and channels](#).

Team Planning

Using the Channel inventory you compiled in the Planning section above, work with your Slack owners and admins to figure out which channels should become teams and which ones should become channels in a team. Use either Excel or Power BI to help with this analysis - both can provide additional insights to help drive these discussions on which channels to retain.

TIP

Teams currently has a 200-channel limit per team. If your list of channels is getting close to that limit, you should figure out a way to split them into two separate teams.

Channel History

There are both free solutions on GitHub and paid solutions you can use, depending on your organization's requirements to retain Channel History of Public and Private channels. Additionally, this could be scripted into Teams.

Once you've set up your new team and channel structure in Teams, you can copy the exported files into the appropriate document libraries in your Teams channels.

To automate the importing of your content, there are several approaches you can consider. There are free solutions on GitHub ([ChannelSurf](#) or [Slack Export Viewer](#)) and partner solutions. Choose a solution based on your organization's needs.

Channel Files

Most solutions will export files. However, they're typically provided as links in the Channel History that require an API key to programmatically retrieve.

For files stored in Slack, once you've set up your teams and channels in Teams, you can programmatically copy them from Slack into the target Teams channel.

The following script retrieves files from Slack. It searches the specified Slack export on your computer, creates a folder in each target channel, and downloads all of the files to that location. Third-party solutions exist that can extract data. If you need help with PowerShell, read [Get started with Azure PowerShell](#).

```
$ExportPath = ".\slackHistory"
$ExportContents = Get-ChildItem -path $ExportPath -Recurse
Function Get-TimeStamp {
    return "[{0:MM/dd/yy} {0:HH:mm:ss}]" -f (Get-Date)
}

class File {
    [string] $Name
    [string] $Title
    [string] $Channel
    [string] $DownloadURL
    [string] $MimeType
    [double] $Size
    [string] $ParentPath
    [string] $Time
}

$channelList = Get-Content -Raw -Path .\slackHistory\channels.json | ConvertFrom-Json
$Files = New-Object -TypeName System.Collections.ObjectModel.Collection["File"]

Write-Host -ForegroundColor Green "$(Get-TimeStamp) Starting Step 1 (processing channel export for files) of 2. Total Channel Count: $($channelList.Count)"
#Iterate through each Channel listed in the Archive
foreach ($channel in $channelList) {
    #Iterate through Channel folders from the Export
    foreach ($folder in $ExportContents) {
        {
            #If Channel Name matches..
            if ($channel.name -eq $folder){
                $channelJsons = Get-ChildItem -Path $folder.FullName -File
                Write-Host -ForegroundColor White "$(Get-TimeStamp) Info: Starting to process $($channelJsons.Count) days of content for #{$channel.name}."
                #Start processing the daily JSON for files
            }
        }
    }
}
```

```

        foreach ($json in $channelJsons){
            $currentJson = Get-Content -Raw -Path $json.FullName | ConvertFrom-Json
            #Write-Host -ForegroundColor Yellow "$(Get-TimeStamp) Info: Processing $($json.Name) in
            #$( $channel.name).."
            #Iterate through every action
            foreach ($entry in $currentJson){
                #If the action contained file(s)..
                if($null -ne $entry.files){
                    #Iterate through each file and add it to the List of Files to download
                    foreach ($item in $entry.Files) {
                        $file = New-Object -TypeName File
                        if ($null -ne $item.url_private_download){
                            $file.Name = $item.name
                            $file.Title = $item.Title
                            $file.Channel = $channel.name
                            $file.DownloadURL = $item.url_private_download
                            $file.MimeType = $item.mimetype
                            $file.Size = $item.size
                            $file.ParentPath = $folder.FullName
                            $file.Time = $item.created
                            $files.Add($file)
                        }
                    }
                }
            }
        }
    }
}

    }
    catch [System.Net.WebException]{
        Write-Host -ForegroundColor Red "$(Get-TimeStamp) Error: Unable to download $($file.Name) to
        $($fullFilePath)"
    }
}
}
Write-Host -ForegroundColor Green "$(Get-TimeStamp) Step 2 of 2 complete. `n"
Write-Host -ForegroundColor Green "$(Get-TimeStamp) Exiting.."

```

Apps and Custom Integrations

Review your list of Slack apps and custom integrations (with configurations) and decide which ones you want to move to Teams. Check the Teams Marketplace to see if an app is available. If not, there are likely alternatives.

To figure out which apps to add to Teams, it's important to understand how the app is being used. By asking the question "what functionality is the app providing to this channel?", you'll learn about the outcome the app is delivering.

In many cases, apps primarily receive event-driven data from an external service (for example, monitoring system) and push a message into Slack. You can achieve the same outcome by using a Microsoft 365 Connector that can push messages into Teams based on events.

Below are examples of Slack solutions where a Microsoft 365 Connector was used in Teams for integration.

- Ansible
 - Alerts can be sent to Teams via [Ansible webhook](#)
- New Relic
 - Check out this user solution for [sending New Relic alerts to Teams](#)
- Nagios
 - Alerts can be integrated today via Connectors. <https://github.com/isaac-galvan/nagios-teams-notify>
- ZenDesk
 - App exists in Teams Store
- Jenkins
 - Alerts can be sent to Teams using [Jenkins's Office 365 Connector](#)

User readiness and adoption plan

The cornerstone of any successful software deployment hinges on how prepared users are for the change. Users in your organization using Slack will easily understand Teams concepts, but training is still needed to help them make a smooth transition. For a comprehensive set of Teams adoption resources, go to the [Teams adoption hub](#).

For example, both products feature channels, but they're used differently in each product. For example, often a Channel in Slack is used like a chat in Teams for short-term, transactional conversations. Other notable differences are around threaded/non-threaded conversations and tuning notification settings.

Check out our rich library of [End-user Teams video training](#).

Move to Teams

Now that your transition plan is defined, you can begin creating your teams and channels in Teams.

Once you've created your teams & channels, begin copying files from Slack channels into Teams and configuring your apps. If you're using a solution to retain history, that can be configured now as well. Then you're ready to start licensing users (if they aren't licensed already) and adding them to the appropriate teams.

To reduce the need for additional exports and file copies, consider removing Slack access at an agreed-upon date that coincides with each user's addition to the team. This avoids needing to re-export and import delta changes on files and history.

Follow the steps in the diagram below to roll out Teams in your organization. For more information, check out [How to roll out Teams](#).

Get started with team templates in the Teams admin center

12/7/2021 • 5 minutes to read • [Edit Online](#)

The ability to create custom templates is not yet supported for EDU customers.

NOTE

Private channels and sensitivity labels are currently not supported in team templates. Private channel creation is not included in template definitions. The sensitivity label option in **Create team from template** flow will not be applied to the team.

Overview

A team template in Microsoft Teams is a definition of a team's structure designed around a business need or project. As an admin, you can use templates to easily deploy consistent teams across your organization. With templates, your users can quickly create rich collaboration spaces with predefined settings, channels, and apps.

You can manage team templates in the Microsoft Teams admin center or by using PowerShell. You can use the pre-built templates that we provide and you can also [create your own custom templates](#). You can also [apply template policies](#) to control which templates are available to your users in Teams.

This article gives you an overview of working with team templates in the Teams admin center. You'll learn about the properties that are supported in templates, the pre-built templates that we provide, template size limits, how to create and manage templates, and more.

NOTE

Your users can [create teams from pre-built or custom team templates](#) in the Teams app. Developers can also programmatically create teams from pre-built team templates using Microsoft Graph. To learn more, see [Get started with team templates using Microsoft Graph](#).

Team template capabilities

Most properties in a team are included and supported by team templates. But there are a few properties and features that aren't currently supported. Here's a summary of what's included and what's not included in team templates.

TEAM PROPERTIES SUPPORTED BY TEAM TEMPLATES	TEAM PROPERTIES NOT YET SUPPORTED BY TEAM TEMPLATES
Template type	Team membership
Team name	Team picture
Team description	Channel settings
Team visibility (public or private)	Connectors

TEAM PROPERTIES SUPPORTED BY TEAM TEMPLATES	TEAM PROPERTIES NOT YET SUPPORTED BY TEAM TEMPLATES
Team settings (for example, member, guest, @ mentions)	Files and content
Autofavorite channel	
Installed app	
Pinned tabs	

NOTE

We'll be adding more template capabilities in future releases of Microsoft Teams, so check back for the most up-to-date information on supported properties.

Pre-built team templates in the Teams admin center

Here are the pre-built team templates that are available in the Teams admin center. Pre-built templates are templates that we created for specific industries. To view these templates, in the left navigation of the Teams admin center, go to **Teams > Team templates**.

You can duplicate pre-built templates but you can't edit them. If you want to change the properties in a pre-built template, you can create a new template from an existing one, and then add or remove the properties that you want. Keep in mind that certain properties in some templates can't be changed.

¹App added to the channel as a tab.

Team templates by category and industry

For more information about ways to use the pre-built templates in your industry, see:

- [Financial team templates](#)
- [General team templates](#)
- [Government team templates](#)
- [Healthcare team templates](#)
- [Manufacturing team templates](#)
- [Nonprofit team templates](#)
- [Retail team templates](#)

Team template size limits

Templates are limited to a specific number of channels, tabs, and apps.

NOTE

You can add more channels, tabs, and apps to the team after it's created from a template.

FEATURE	LIMIT
Channels per template	15
Tabs per channel in a template	20
Apps per template	50

For more information, see [Limits and specifications of Teams](#).

Manage team templates

Manage team templates in the Teams admin center

View team templates

To view team templates, in the left navigation of the Teams admin center, go to **Teams > Team templates**. Select a template to see more details, including the channels and apps it contains.

Create your own team templates

You can create your own custom templates from scratch, from an existing team, and from an existing template. To learn more, see:

- [Create a custom team template](#)
- [Create a template from an existing team](#)
- [Create a team template from an existing team template](#)

Apply team template policies

To control the templates that users see in Teams for [creating teams](#), you can set templates policies and assign them to users and groups in your organization. To learn more, see [Manage team templates in the Teams admin center](#).

Manage team templates using PowerShell

Use the following cmdlets to manage your templates in PowerShell.

- [Get-CsTeamTemplate](#)
- [Get-CsTeamTemplateList](#)
- [New-CsTeamTemplate](#)
- [Remove-CsTeamTemplate](#)
- [Update-CsTeamTemplate](#)

Get started with team templates using Microsoft Graph

12/7/2021 • 2 minutes to read • [Edit Online](#)

NOTE

Team templates currently don't support creating private channels. Private channel creation isn't included in template definitions.

A team template in Microsoft Teams is a definition of a team's structure designed around a business need or project. With team templates, you can quickly and easily create rich collaboration spaces with predefined settings, channels, and apps. Team templates can help you to deploy consistent teams across your organization.

With Microsoft Graph, you use the pre-built team templates that are included with Teams to create teams. In this article, you'll learn about the properties that can be defined in templates and the templates that are available only with Microsoft Graph.

This article is for you if you're:

- Responsible for planning, deploying, and managing multiple teams across your organization
- A developer wanting to programmatically create a team with predefined channels and apps

Team template capabilities

Most properties in a team are included and supported by templates. But there are a few properties and features that aren't currently supported. Here's a quick summary of what's included and what's not included in team templates.

TEAM PROPERTIES SUPPORTED BY TEAM TEMPLATES	TEAM PROPERTIES NOT YET SUPPORTED BY TEAM TEMPLATES
Template type	Team membership
Team name	Team picture
Team description	Channel settings
Team visibility (public or private)	Connectors
Team settings (for example, member, guest, @ mentions)	Files and content
Auto-favorite channel	
Installed app	
Pinned tabs	

NOTE

We'll be adding more template capabilities in future releases of Microsoft Teams, so check back for the most up-to-date information on supported properties.

Pre-built templates

Pre-built team templates are templates that we created for specific industries. Here's the pre-built templates that are available only with Microsoft Graph.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
Standard	<code>https://graph.microsoft.com/v1.0/teamsTemplates('standard')</code>	No additional apps and properties
Education - Class Team	<code>https://graph.microsoft.com/v1.0/teamsTemplates('educationClass')</code>	Apps: <ul style="list-style-type: none">OneNote Class Notebook (pinned to the General tab)Assignments app (pinned to the General tab) Team properties: <ul style="list-style-type: none">Team visibility set to HiddenMembership (cannot be overridden)
Education - Staff Team	<code>https://graph.microsoft.com/v1.0/teamsTemplates('educationStaff')</code>	Apps: <ul style="list-style-type: none">OneNote Staff Notebook (pinned to the General tab)
Education - PLC team	<code>https://graph.microsoft.com/v1.0/teamsTemplates('educationProfessionalLearningCommunity')</code>	Apps: <ul style="list-style-type: none">OneNote PLC Notebook (pinned to the General tab)

NOTE

Team templates built in Microsoft Graph for small and medium businesses

12/7/2021 • 4 minutes to read • [Edit Online](#)

Team templates in Microsoft Teams allow you to quickly and easily create teams by providing a predefined team structure of settings, channels, and pre-installed apps.

For small and medium businesses, templates can be especially powerful, as they help you to quickly deploy Teams across your organization. Templates also help users to get oriented with how to effectively use Teams. This article is for you if you're responsible for planning, deploying, and managing multiple teams across your organization.

We currently offer three pre-built templates for small and medium businesses that you can use for various situations. All templates create *private* teams. After you create the teams and are ready to roll out to your organization, you can set the privacy to *Org-Wide* or *Public*, as appropriate.

To learn more about team templates in general, see [Get started with team templates using Microsoft Graph](#).

Company-Wide template

The Company-Wide template is meant for communication and collaboration for the entire company. You can use the General channel for company-wide announcements, industry news or executive posts. The Human Resources channel is a great place to consolidate all HR-related activities like job posts, new employee onboarding, training, and development. The Fun Stuff channel provides a social platform for all random and fun posts.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
SMB - Company-wide	<code>https://graph.microsoft.com/beta/teamsTemplates('SmallBusinessOrgWide')</code>	<div>Channels</div> <ul style="list-style-type: none">• General*• Human Resources*• Fun Stuff* <div>Apps</div> <ul style="list-style-type: none">• Company Portal (Website pinned to the Human Resources channel) <div>Team properties</div> <ul style="list-style-type: none">• Team visibility set to Private

*Auto-favorited channels

To create the Company-Wide team by taking default settings from the pre-defined template, supply the JSON representation of the team object in the request body. To learn more about how to deploy team templates, see the Microsoft Graph [article on creating a Team](#).

Request

```
POST https://graph.microsoft.com/beta/teams
Content-Type: application/json
{
  "template@odata.bind": "https://graph.microsoft.com/beta/teamsTemplates('SmallBusinessOrgWide')",
  "displayName": "Org-wide",
  "description": "All posts that are relevant for entire company (e.g. Company-wide announcements, Exec posts, employee poll/feedback).",
  "visibility": "Private"
}
```

Executive Team template

The Executive Team template is ideal for creating a team for company executives to communicate and collaborate on company initiatives like annual priorities, fiscal budgets, strategic initiatives, and top clients. This template comes with a *private* channel to invite select users for specific topics.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
SMB - Executives Team	<code>https://graph.microsoft.com/beta/teamsTemplates('SmallBusinessExecutive')</code>	<p>Channels</p> <ul style="list-style-type: none"> General* Private * <p>Apps</p> <ul style="list-style-type: none"> OneNote (pinned to the Private channel) Planner (pinned to the Private channel) <p>Team properties</p> <ul style="list-style-type: none"> Team visibility set to Private

*Auto-favorited channels

To create the Executives team by taking default settings from the pre-defined template, supply the JSON representation of the team object in the request body. To learn more about how to deploy team templates, see the Microsoft Graph [article on creating a Team](#).

Request

```
POST https://graph.microsoft.com/beta/teams
Content-Type: application/json
{
  "template@odata.bind": "https://graph.microsoft.com/beta/teamsTemplates('SmallBusinessExecutive')",
  "displayName": "Executive",
  "description": "All posts, announcements and daily collaboration and communication for the company's leadership team.",
  "visibility": "Private"
}
```

Departmental Team template

The Departmental team template can be used for creating a team for individual departments or for projects. The Finance team template is ideal for all posts, announcements, and daily collaboration and communication within the Finance team members and executive team members as appropriate. The template comes with a *private* channel to invite select users for specific topics.

We also provide the script below for the Finance team that can be used to extend the template to additional departments or specific projects by adding, deleting from, or editing to your liking. For example, if you have a *Marketing* department, then the script can be adapted by renaming the team from *Finance* to *Marketing* to create a new Marketing team

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
SMB - Finance	<code>https://graph.microsoft.com/beta/teamsTemplates('SmallBusinessFinance')</code>	<p>Channels</p> <ul style="list-style-type: none"> General* Private * <p>Apps</p> <ul style="list-style-type: none"> OneNote (pinned to the Private channel) Planner (pinned to the Private channel) <p>Team properties</p> <ul style="list-style-type: none"> Team visibility set to Private

*Auto-favorited channels

To create the Finance team by taking default settings from the pre-defined template, supply the JSON representation of the team object in the request body. To learn more about how to deploy team templates, see the Microsoft Graph [article on creating a Team](#).

Request

```
POST https://graph.microsoft.com/beta/teams
Content-Type: application/json
{

Create a custom team template in Microsoft Teams

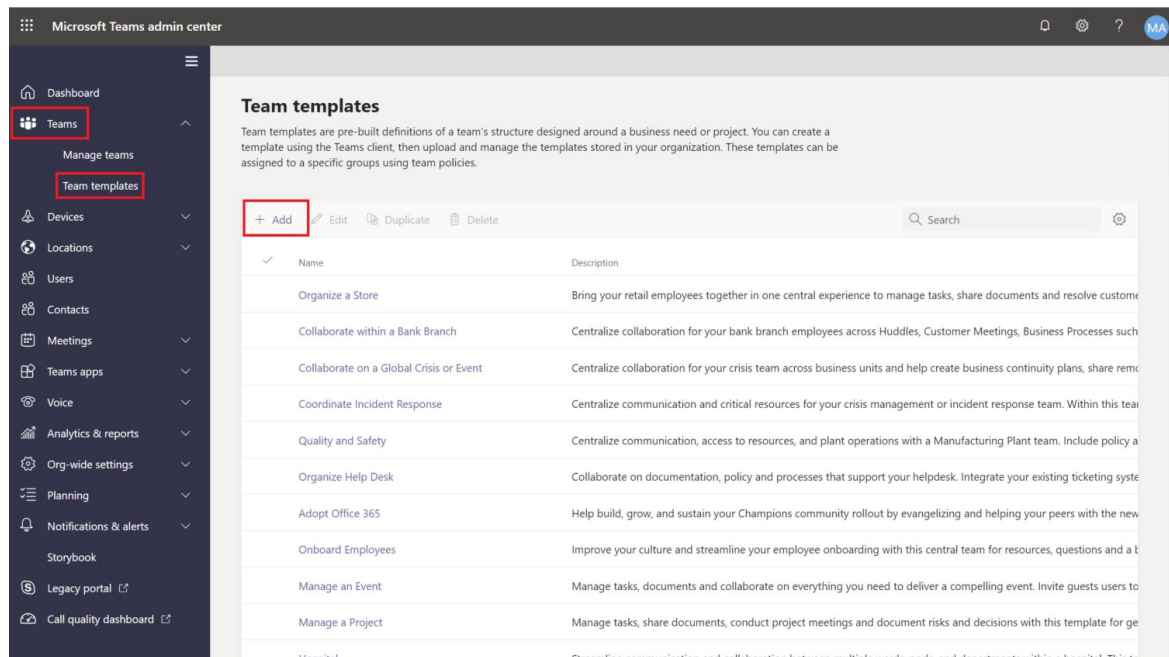

12/7/2021 • 2 minutes to read • [Edit Online](#)

Custom templates are not yet supported for EDU customers.

A custom team template is a predefined team structure with a set of channels, tabs, and apps. You can develop a template that helps you create the right collaboration space quickly. Your custom team template uses your preferred settings.

To get started:

1. Sign in to the Teams admin center.
2. In the left navigation, expand **Teams** > **Team templates**.
3. Select **Add**.

4. In the **Team templates** section, select **Create a brand new template**.
5. In the **Template settings** section, complete the following fields and then select **Next**:
 - Template name
 - Template short and long descriptions
 - Locale visibility

Add a name for your template

Template descriptions

Set a short and long description for this template. The short description is used in places like the new team creation dialog where not a lot of space is available since multiple templates are shown at the same time. The long description is shown in places like the template details screen where the entire dialog is dedicated to the template.

Short template description

Long template description

Locale visibility

Choose a locale for this template. Locale is used to track the language the template is authored in.

English (United States)

6. In the **channels, tabs, and apps** section, add any channels and apps that your team needs.

- In the **Channels** section, select **Add**.
- In the **Add** dialog, name the channel.
- Add a description.
- Decide if the channel should be shown by default.
- Search for an app name that you want to add to the channel.
- Select **Apply** when finished.

Channels

You can add, rename, and edit the settings for each of the channels to customize your team template.

+ Add  Edit  Delete

✓	Name	Tabs
	General	

Apps

Choose which apps will be installed for users when creating your team.

+ Add  Delete app

✓	Name

7. Select **Submit** when completed.

Your new template is displayed in the **Team templates** list. The template can be used to create a team in Teams.

NOTE

It can take up to 24 hours for teams users to see a custom template change in the gallery.

Customizing Website Tab apps

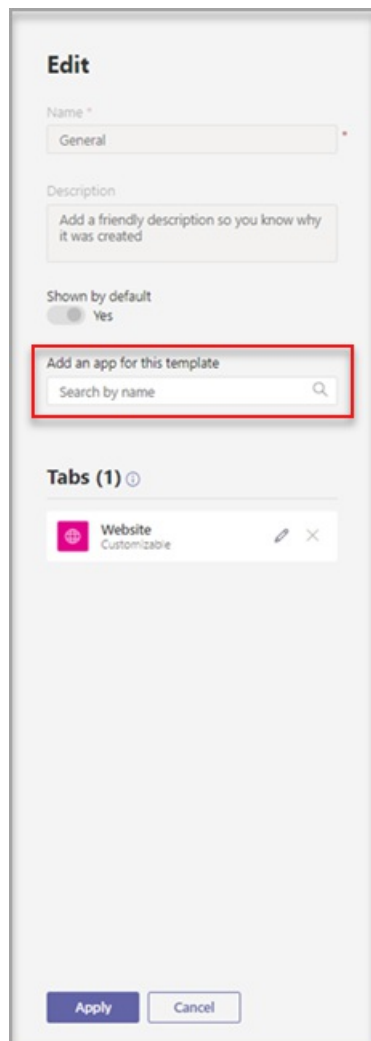

NOTE

This feature is in early preview

You might want to specify URLs for website tabs for channels in custom team templates. End users who create teams with templates will have website tabs that are preset to the specified site URL.

To get started:

1. Create a new team template or edit an existing team template.
2. In the Channels section, add a new channel or select an existing channel and select **Edit**.
3. In the **Add an app for this template** section, add a Website app.

5. Select **Save** for your tab app edits, and then select **Apply** to save your changes.

Known issues

Problem: If you've created a team from a custom template that contained additional custom tabs, you might see blank tabs in place of your custom tab apps. Your default tabs (such as **Posts**, **Files**, and **Wiki**) will appear as expected.

Solution: To fix this issue, remove the custom tab and add a new tab with the same app. If you don't have permissions to remove the custom tab and add a new tab, contact the team owner for assistance.

We're currently working on a fix for future teams created from custom templates.

Problem: When using Teams in the browser, some websites don't support being rendered within a Teams tab.

Solution: If you have trouble viewing the contents of the website tab, you'll be redirected to either open the tab in a separate webpage, or open Teams in the desktop app instead to view your website tab app.

Create a team template from an existing team in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

This is a preview or early release feature.

Custom templates are not yet supported for EDU customers.

Microsoft Teams lets you create a template from an existing team that can be saved and modified to meet your particular organizational needs.

1. Sign in to the Teams admin center.
2. In the left navigation, expand **Teams** > **Team templates**.
3. Select **Add**.
4. Select **Use an existing team as a template**, and select **Next**.

Select a starting point for your new template

You can start from scratch, use an existing team as a starting point, or use an existing template as a starting point.

- ☐ Create a brand new template
Start with a blank slate and create a template from scratch.
- ☒ Use an existing team as a template
Use one of your existing teams as a starting point. The template will start off looking exactly like the existing team you choose and you can customize it from there.
- ☐ Start with an existing template
Use an existing template as the starting point and then you can customize it.

5. Select a team to use as a starting point by selecting next to the team name, and then select **Next**.

Select the team to use as a starting point

The team you choose will be the starting point but then you can customize it. You might have to modify the template before submitting it if the team has a multiple channels, tabs, or apps.

<div>Search</div>				
✓	Name	Standard channels	Private channels	Team members
	 Test	1	0	1
	 M365 Core USBP	1	0	1
	 M365 Public Relations	1	0	1
	 Publix Team	1	0	1
	 Connector	1	0	1
	 TeamContactSyncDem	1	0	1
	 ContosoSalesTeam-tes	2	0	1
	 Organization	5	0	175

[Back](#)[Next](#)

6. In the **Template settings** section, complete the following fields and then select **Next**:
 - Template name
 - Template short and long descriptions
 - Locale visibility
7. In the **channels, tabs, and apps** section, add any channels and apps that your team needs.
 - a. In the **Channels** section, select **Add**.
 - b. In the **Add** dialog, name the channel.
 - c. Add a description.
 - d. Decide if the channel should be shown by default.
 - e. Search for an app name that you want to add to the channel.
 - f. Select **Apply** when finished.
8. Select **Submit** to save your changes.

Your new template is displayed in the **Team templates** list. The template can be used to create a team in Teams.

NOTE

It can take up to 24 hours for teams users to see a custom template in the gallery.

Create a new team template from an existing team template in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Custom templates are not yet supported for EDU customers.

Microsoft Teams provides pre-built templates that can be saved and modified to meet your particular organizational needs.

1. Sign in to the Teams admin center.
2. In the left navigation, expand **Teams** > **Team templates**.
3. In the **Team templates** section, select next to a team template that you want to duplicate to highlight it.
4. Select **Duplicate**.

Team templates

Team templates are pre-built definitions of a team's structure designed around a business need or project. You can create a template using the Teams client, then upload and manage the templates stored in your organization. These templates can be assigned to a specific groups using team policies.

+ Add

Edit

Duplicate

Delete

✓	Name	Description
	new template article	practice practice
	Onboard Employees custom	Improve your culture and streamline your employee onboarding w
	Manage a Project Custom	Manage tasks, share documents, conduct project meetings and do
	abcd	asdasdsaasd
✓	Onboard Employees Copy	testing template properties

(Alternatively, you can select **Add** > **Start with an existing template** to open **Select the template to use as a starting point**.)

Select a starting point for your new template

You can start from scratch, use an existing team as a starting point, or use an existing template as a starting point.

☐

Create a brand new template
Start with a blank slate and create a template from scratch.

☐

Use an existing team as a template
Use one of your existing teams as a starting point. The template will start off looking exactly like the existing team you choose and you can customize it from there.

☒

Start with an existing template
Use an existing template as the starting point and then you can customize it.

5. In the **Select the template to use as a starting point** screen, select **Next**.

The duplicated template opens, and the word **Copy** is appended to the name.

6. Complete the following fields and then select **Next**:

- Template name
- Template short and long descriptions
- Locale visibility

7. In the **channels, tabs, and apps** section, modify any existing channels and apps that your team needs.

- a. Select a channel to edit, and select **Edit**.
- b. **Apply** your changes when finished.

8. Add any channels or apps that your team needs.

- a. In the **Channels** section, select **Add**.
- b. In the **Add** dialog, name the channel.
- c. Add a description.
- d. Decide if the channel should be shown by default.
- e. Search for an app name that you want to add to the channel.
- f. Select **Apply** when finished.

9. Select **Submit** when you're finished adding channels and apps.

The new template is saved to the template library.

NOTE

It can take up to 24 hours for teams users to see a custom template in the gallery.

Use financial team templates

12/7/2021 • 2 minutes to read • [Edit Online](#)

Team templates in Microsoft Teams allow you to quickly and easily create teams by providing a predefined team structure of settings, channels, and pre-installed apps.

For financial services organizations, team templates can be especially powerful, as they help you to quickly deploy consistent teams across your organization. Templates also help staff to get oriented with how to effectively use Teams.

Teams includes templates designed for financial services organizations. Use these pre-built templates to quickly create teams for staff to communicate and collaborate. In this article, we introduce you to each of these templates and recommend how to use them.

How you manage and work with team templates depends on whether you're an admin or developer.

IF YOU'RE:	THEN, YOU:
An admin or IT pro	Manage team templates in the Teams admin center . View team templates and apply templates policies to control which templates your staff can use in Teams for creating teams.
A developer	Use Microsoft Graph to create teams from team templates.

Manage team templates in the Teams admin center

As an admin, you can manage team templates in the Microsoft Teams admin center. Here, you can view details about each template. You can also [create and assign templates policies](#) to your staff to control which templates they see in Teams for [creating teams](#).

To learn more about team templates in general, see [Get started with team templates in the Teams admin center](#).

We currently offer the following pre-built team templates for financial services organizations. To view them, in the left navigation of the Teams admin center, go to **Teams > Team templates**.

Collaborate within a bank branch

Centralize collaboration for your bank branch employees across huddles, customer meetings, business processes such as mortgage collaboration, and keep everyone in the loop with announcements and kudos.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
---------------	------------	---

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
Bank branch	CollaborateWithinABankBranch	<p>Channels:</p> <ul style="list-style-type: none"> • General • Announcements • Huddles • Customer meetings • Approvals request • Coaching • Skills development • Loan processing • Customer complaints • Kudos • Fun stuff • Compliance <p>Apps:</p> <ul style="list-style-type: none"> • Praise • Issue Reporter • Wiki • Calendar • Approvals • Bulletins • Ideas

Use team templates with Microsoft Graph

Developers can use Microsoft Graph to create teams from pre-built team templates. To learn more about using team templates with Microsoft Graph, see [Get started with team templates using Microsoft Graph](#), [Microsoft Teams API overview](#), and [teamsTemplate resource type](#).

Bank branch

Centralize collaboration for your bank branch employees across huddles, customer meetings, business processes such as mortgage collaboration, and keep everyone in the loop with announcements and kudos.

Use nonprofit team templates

12/7/2021 • 2 minutes to read • [Edit Online](#)

Team templates in Microsoft Teams allow you to quickly and easily create teams by providing a predefined team structure of settings, channels, and pre-installed apps.

For nonprofit organizations, team templates can be especially powerful, as they help you to quickly deploy consistent teams across your organization. Templates also help staff to get oriented with how to effectively use Teams.

Teams includes a Manage volunteers team template designed to streamline volunteer management activities. Use this pre-built template to quickly create teams for staff to communicate and collaborate on volunteer management tasks and activities.

In this article, you'll learn about the Manage volunteers team template and how to use it to create a team. This article also gives you an overview of how to manage team templates in the Teams admin center.

Manage volunteers team template

Bring your staff together to communicate and collaborate on volunteer management tasks and activities.

This template includes channels and apps designed to streamline volunteer management activities. Staff can organize and share onboarding materials and frequently used documents, view reporting, stay up to date on important team and event announcements, and more. The template also integrates with [Volunteer Management](#), an app that's part of [Microsoft Cloud for Nonprofit](#), enabling staff to manage volunteer engagement opportunities within Teams.

Here's the channels and apps that come with the Manage volunteers team template.

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
---------------	------------	---

TEMPLATE TYPE	TEMPLATEID	PROPERTIES THAT COME WITH THIS TEMPLATE
Manage volunteers	ManageVolunteers	<p>Channels:</p> <ul style="list-style-type: none"> • General <ul style="list-style-type: none"> ◦ Website¹ • Announcements • Reporting <ul style="list-style-type: none"> ◦ Power BI¹ • Volunteer Management <ul style="list-style-type: none"> ◦ Power Apps¹ • Engagement Opportunities <ul style="list-style-type: none"> ◦ Tasks¹ • Volunteer Onboarding <ul style="list-style-type: none"> ◦ SharePoint¹ ◦ OneNote¹ <p>Apps:</p> <ul style="list-style-type: none"> • Website • YouTube • Power BI • Power Apps • Tasks • SharePoint • OneNote

¹App added to the channel as a tab.

Create a team using the Manage volunteers team template

Create the team

It takes only a few quick steps to create a team from the Manage volunteers template.

1. In Teams, go to **Teams > Join or create a team > Create team**.
2. Choose the **Manage volunteers** team template.
3. Choose a privacy level:
 - **Private:** People need permission from the team owner to join the team.
 - **Public:** Anyone in your organization can join the team.
4. Give your team a name and add a description. You can also rename channels to customize the team.
5. Select **Create**.

To learn more, see [Create a team with a team template](#).

Add the Volunteer Management app to the Power Apps tab

To use the Volunteer Management app in Teams, add it to the Power Apps tab in the Volunteer Management channel.

1. In Teams, go to the team you created, choose the Volunteer Management channel, and then select the **Power Apps** tab.
2. In the drop-down list, select **Model-driven apps**, and then search for and select **Volunteer Management**.
3. Select **Save**.

To learn more, see [Embed a model-driven app as a tab app in Teams](#).

View and manage team templates in the Teams admin center

If you're an admin, you can view and manage team templates in the Microsoft Teams admin center. To view the Manage volunteers template, in the left navigation of the Teams admin center, go to **Teams** > **Team templates**.

You can also [create and assign templates policies](#) to your users to control which templates they see in Teams for creating teams.

To learn more about team templates in general, see [Get started with team templates in the Teams admin center](#).

Manage team templates in the admin center

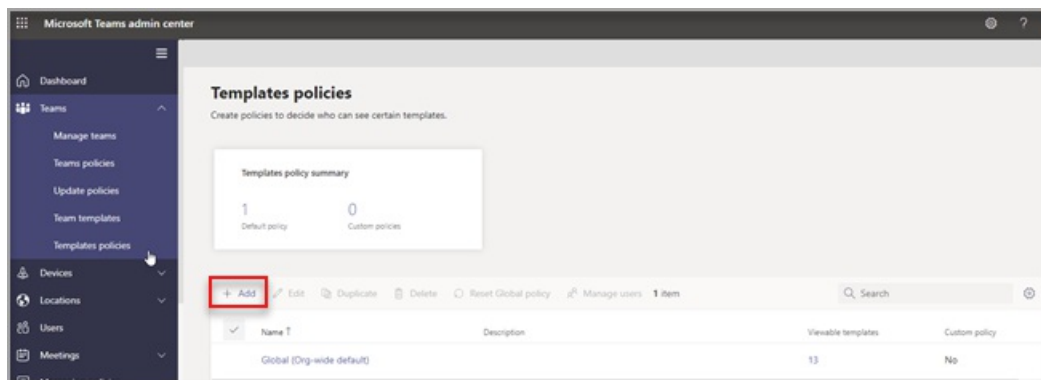

12/7/2021 • 2 minutes to read • [Edit Online](#)

Manage the team templates that your end users see by creating templates policies in the admin center. Within each template policy, you can designate which templates are shown or hidden. Assign different users to different template policies so that your users view only the subset of team templates specified.

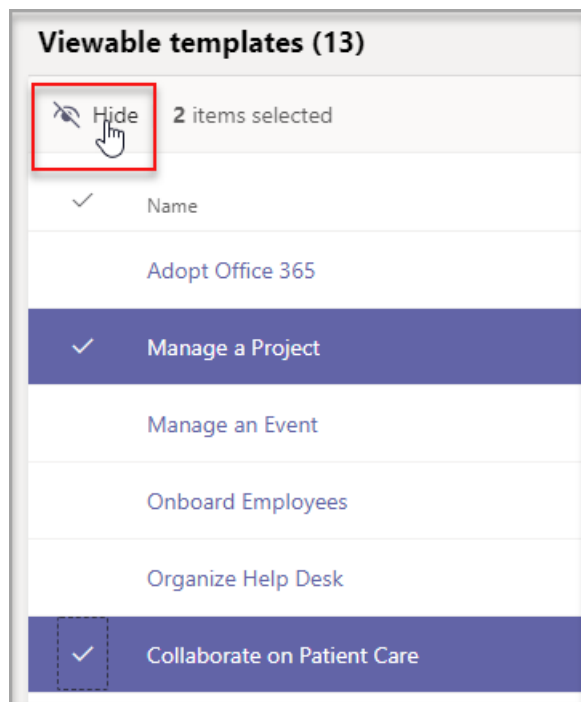

Watch this short video to learn how to manage template policies.

Create template policies and assign available templates

1. Sign in to the Teams admin center.
2. Expand **Teams** > **Templates policies**.
3. Select **Add**.

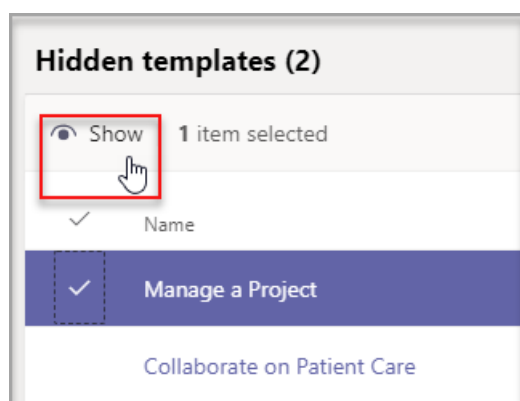

4. In the **Templates Policies Settings** section, complete the following fields:
 - Templates Policy name
 - Templates Policy short description
5. In the **Viewable Templates** table, select the templates you want to hide and select **Hide**.

You can see the templates you've selected to hide in the **Hidden Templates** table.

6. To unhide certain templates, scroll to the **Hidden templates** table.
7. Select the templates to unhide, and then select **Show**.

The selected templates will appear in your **Viewable templates** table.

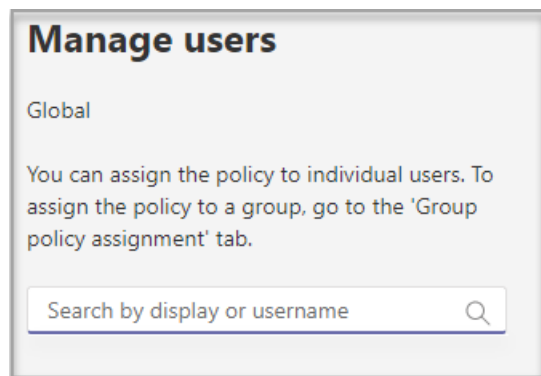

8. Select **Save**.

Your new template policy is displayed in the **Templates Policies** list.

Assign users to the template policies

Users assigned to a policy will only be able to view the viewable templates within that policy.

1. From **Templates Policies**, select a policy, and then select **Manage users**.
2. Type the users to assign to this policy.

3. Select **Apply**.

NOTE

It might take up to 24 hours for your new policy to take effect for end users.

Size limits for Template policies

You can hide a max of 100 templates per policy. The **Hide** button is disabled if the given policy already has 100 templates hidden.

Frequently asked questions

Q: Can I batch assign users to team templates policies?

A: Yes, we support batch assignment for template policy in PowerShell. The policy type for this action is TeamsTemplatePermissionPolicy. [Learn more](#)

Q: Can Groups be assigned to team templates policies?

A: Currently no. This functionality will be available in the future.

Q: If a new template is created, will the template be included in my policies?

A: Any new templates will be visible by default. You can choose to hide the template in the admin center in the Templates Policies section.

Q: What happens if a template is deleted?

A: Any deleted templates will no longer be present in any templates policies.

Q: Can I assign multiple users to a template policy in the Teams Admin Center?

A: Yes.

1. In the Admin center, go to **Users**.
2. In the Users list table, select the users you want to assign to a certain templates policy.
3. Select Edit settings, and change the Templates policies field.
4. Select apply. [Learn more](#).

Q: How do I view all users assigned to a specific policy?

A: In the Admin center:

1. Go to the **Users** section.
2. Select the filter in the Users list table and filter for the team template policy.
3. Select **Apply**.

Filter

☐ Match all of these conditions

☒ Match any one of these conditions

Templates policy  =  

Q: Can I manage templates policies via PowerShell?

A: No, managing templates in PowerShell isn't supported.

Q: Are templates policies applicable to EDU?

A: No, template policies for EDU isn't supported.

Use guest access and external access to collaborate with people outside your organization

12/7/2021 • 3 minutes to read • [Edit Online](#)

When you need to communicate and collaborate with people outside your organization, Microsoft Teams has two options:

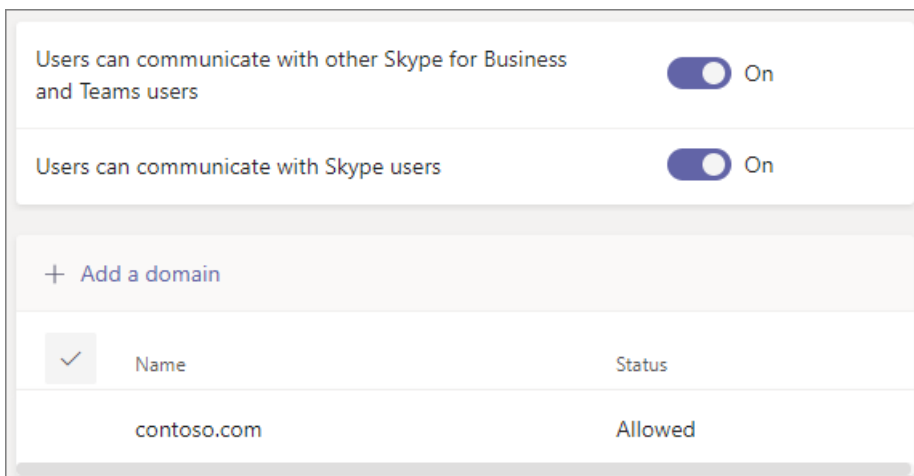

- **External access** - A type of federation that allows users to find, call, and chat with people in other organizations. These people cannot be added to teams unless they are invited as guests.
- **Guest access** - Guest access allows you to invite people from outside your organization to join a team. Invited people get a guest account in Azure Active Directory.

Note that Teams allows you to invite people outside your organization to meetings. This does not require external or guest access to be configured.

External access (federation)

Set up external access if you need to find, call, chat, and set up meetings with people outside your organization who use Teams, Skype for Business (online or on premises) or Skype.

By default, external access is enabled for all domains. You can restrict external access by allowing or blocking specific domains or by turning it off.

The screenshot shows the 'External access' settings in Microsoft Teams. At the top, there are two toggle switches, both set to 'On': 'Users can communicate with other Skype for Business and Teams users' and 'Users can communicate with Skype users'. Below these is a section titled '+ Add a domain' which contains a table. The table has two columns: 'Name' and 'Status'. One row is visible with 'contoso.com' in the 'Name' column and 'Allowed' in the 'Status' column.

Name	Status
contoso.com	Allowed

To configure external access, see [Manage external access](#).

NOTE

Microsoft Teams free licenses do not support external access.

Guest access

Use guest access to add a person from outside your organization to a team, where they can chat, call, meet, and collaborate on files. A guest can be given nearly all the same Teams capabilities as a native team member. For more information, see [Guest experience in Teams](#).

Guests are added to your organization's Azure Active Directory as B2B users and must sign in to Teams using their guest account. This means that they may have to sign out of their own organization to sign in to your

organization.

To configure guest access for Teams, see [Collaborate with guests in a team](#).

Compare external and guest access

The following tables show the differences between using external access (federation) and guests. In both cases, people outside your organization are identified to your users as being external.

Things your users can do

USERS CAN	EXTERNAL ACCESS USERS	GUESTS
Chat with someone in another organization	Yes	Yes
Call someone in another organization	Yes	Yes
See if someone from another organization is available for call or chat	Yes	Yes ¹
Search for people in other organizations	Yes ²	No
Share files	No	Yes
See the out-of-office message of someone in another organization	No	Yes
Block someone in another organization	No	Yes
Use @mentions	Yes ³	Yes

Things people outside your organization can do

PEOPLE OUTSIDE YOUR ORGANIZATION CAN	EXTERNAL ACCESS USERS	GUESTS
Access Teams resources	No	Yes
Be added to a group chat	Yes	Yes
Be invited to a meeting	Yes	Yes
Make private calls	Yes	Yes ⁵
View the phone number for dial-in meeting participants	No ⁴	Yes
Use IP video	Yes	Yes ⁵
Use screen sharing	Yes ³	Yes ⁵
Use meet now	No	Yes ⁵

PEOPLE OUTSIDE YOUR ORGANIZATION CAN	EXTERNAL ACCESS USERS	GUESTS
Edit sent messages	Yes ³	Yes ⁵
Delete sent messages	Yes ³	Yes ⁵
Use Giphy in conversation	Yes ³	Yes ⁵
Use memes in conversation	Yes ³	Yes ⁵
Use stickers in conversation	Yes ³	Yes ⁵
Presence is displayed	Yes	Yes
Use @mentions	Yes ³	Yes

¹ Provided that the user has been added as a guest and is signed in with the guest account.

² Only by email or Session Initiation Protocol (SIP) address.

³ Supported for 1:1 chat for Teams Only to Teams Only users from two different organizations.

⁴ By default, external participants can't see the phone numbers of dialed-in participants. If you want to maintain the privacy of these phone numbers, select **Tones** for **Entry/exit announcement type** (this prevents the numbers from being read out by Teams). To learn more, read [Turn on or off entry and exit announcements for meetings in Microsoft Teams](#).

⁵ Allowed by default, but can be turned off by the Teams admin

[External access in Teams](#)

[Guest access in Teams](#)

Manage external access in Microsoft Teams

12/7/2021 • 9 minutes to read • [Edit Online](#)

External access is a way for Teams users from outside your organization to find, call, chat, and set up meetings with you in Teams. You can also use external access to communicate with people from other organizations who are still using Skype for Business (online and on-premises) and Skype (in preview).

If you want people from other organizations to have access to your teams and channels, use guest access instead. For more information about the differences between external access and guest access, see [Compare external and guest access](#).

Use external access when:

- You have users in external domains who need to collaborate. For example, Rob@contoso.com and Ann@northwindtraders.com are working on a project together along with some others in the contoso.com and northwindtraders.com domains.
- You want the people in your organization to use Teams to contact people in specific businesses outside of your organization.
- You want anyone else in the world who uses Teams to be able to find and contact you, using your email address.

Plan for external access

By default, external access is turned on in Teams, which means that your organization can communicate with all external domains. If you add blocked domains, all other domains will be allowed; and if you add allowed domains, all other domains will be blocked. The exception to this rule is if anonymous participants are allowed in meetings. There are three scenarios for setting up external access in the Teams admin center (**Users > External access**):

NOTE

Teams users can add apps when they host meetings or chats with people from other organizations. They can also use apps shared by people in other organizations when they join meetings or chats hosted by those organizations. The data policies of the hosting user's organization, as well as the data sharing practices of any third-party apps shared by that user's organization, are applied.

NOTE

If you turn off external access in your organization, external users can still join meetings through anonymous join. To learn more, see [Manage meeting settings in Teams](#).

- **Allow all external domains:** This is the default setting in Teams, and it lets people in your organization find, call, chat, and set up meetings with people external to your organization in any domain.

In this scenario, your users can communicate with all external domains that are running Teams or Skype for Business or are allowing all external domains or have added your domain to their allow list.

- **Allow only specific external domains:** By adding domains to an **Allow** list, you limit external access to only the allowed domains. Once you set up a list of allowed domains, all other domains will be

blocked. To allow specific domains, click **Add a domain**, add the domain name, click **Action to take on this domain**, and then select **Allowed**.

- **Block specific domains** - By adding domains to a **Block** list, you can communicate with all external domains *except* the ones you've blocked. To block specific domains, click **Add a domain**, add the domain name, click **Action to take on this domain**, and then select **Blocked**. Once you set up a list of blocked domains, all other domains will be allowed.
- **Block all external domains** - Prevents people in your organization from finding, calling, chatting, and setting up meetings with people external to your organization in any domain.

NOTE

The allowed or blocked domains only apply to meetings if anonymous access to meetings is "off".

Allow or block domains

Using the Microsoft Teams admin center

To allow specific domains

1. In the Teams admin center, go to **Users > External access**.
2. Under **Choose which domains your users have access to**, choose **Allow only specific external domains**.
3. Select **Allow domains**.
4. In the **Domain** box, type the domain that you want to allow and then click **Done**.
5. If you want to allow another domain, click **Add a domain**.
6. Click **Save**.

To block specific domains

1. In the Teams admin center, go to **Users > External access**.
2. Under **Choose which domains your users have access to**, choose **Block only specific external domains**.
3. Select **Block domains**.
4. In the **Domain** box, type the domain that you want to allow and then click **Done**.
5. If you want to block another domain, click **Add a domain**.
6. Click **Save**.

Make sure the admin in the other Teams organization completes these same steps. For example, in their **allowed domains** list, their admin needs to enter the domain for your business if they limit the organizations that can communicate with their users.

Communicate with Skype users (preview)

Follow these steps to let Teams users in your organization chat with and call Skype users. Teams users can then search for and start a one-on-one text-only conversation or an audio/video call with Skype users and vice versa.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Users > External access**.
2. Turn on the **Allow users in my organization to communicate with Skype users** setting.

To learn more about the ways that Teams users and Skype users can communicate, including limitations that apply, see [Teams and Skype interoperability](#).

Block unsolicited contact with external unmanaged Teams users

Follow these steps to keep Teams users in your organization from unsolicited contact with external Teams users whose accounts are not managed by an organization.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Users > External access**.
2. Follow one of these steps:
 - To block Teams users in your organization from communicating with external Teams users whose accounts are not managed by an organization, turn off the **People in my organization can communicate with Teams users whose accounts aren't managed by an organization** setting and clear the **External users with Teams accounts not managed by an organization can contact users in my organization** checkbox.
 - To let Teams users in your organization communicate with external Teams users whose accounts are not managed by an organization if your Teams users have initiated the contact, turn on the **People in my organization can communicate with Teams users whose accounts aren't managed by an organization** setting and clear the **External users with Teams accounts not managed by an organization can contact users in my organization** checkbox.
 - To let Teams users in your organization communicate with external Teams users whose accounts are not managed by an organization and receive requests to communicate with those external Teams users, turn on the **People in my organization can communicate with Teams users whose accounts aren't managed by an organization** setting and select the **External users with Teams accounts not managed by an organization can contact users in my organization** checkbox.

Test access

To test your setup, you need a Teams user who's not behind your firewall.

1. After you and the admin from the organization have changed the **External access** settings, you should be good to go.
2. In the Teams app, search for the person by email address, and send a request to chat.
3. Ask your Teams contact to send you a request to chat. If you don't receive their request, the problem is your firewall settings (assuming they've already confirmed their firewall settings are correct).
4. Another way to test whether the problem is your firewall is to go to a WiFi location not behind your firewall. such as a coffee shop, and use Teams to send a request to your contact to chat. If the message goes through at the WiFi location, but does not when you're at work, then you know the problem is your firewall.

NOTE

If you and another user both turn on external access and allow one another's domains, this will work. If it doesn't work, the other user should make sure their configuration isn't blocking your domain.

Common external access scenarios

The following sections describe how to enable federation for common external access scenarios, and how the TeamsUpgradePolicy determines delivery of incoming chats and calls.

Enable federation

To enable users in your organization to communicate with users in another organization, both organizations must enable federation. The steps to enable federation for a given organization depend on whether the organization is purely online, hybrid, or purely on-premises.

IF YOUR ORGANIZATION IS	ENABLE FEDERATION AS FOLLOWS
Online with no Skype for Business on-premises. This includes organizations that have TeamsOnly users and/or Skype for Business Online users.	<p>If using Teams Admin Center:</p> <ul style="list-style-type: none">- Make sure the domains that you want to communicate with are allowed in External Access. <p>If using PowerShell:</p> <ul style="list-style-type: none">- Ensure the tenant is enabled for federation: <code>Get-CsTenantFederationConfiguration</code> must show <code>AllowFederatedUsers=true</code>.- Ensure the user's effective value of <code>CsExternalAccessPolicy</code> has <code>EnableFederationAccess=true</code>.- If you are not using open federation, ensure the target domain is listed in <code>AllowedDomains</code> of <code>CsTenantFederationConfiguration</code>.
Pure on-premises	<p>In on-premises tools:</p> <ul style="list-style-type: none">- Ensure federation is enabled in <code>CsAccessEdgeConfiguration</code>.- Ensure federation for the user is enabled through <code>ExternalAccessPolicy</code> (either through the global policy, site policy, or user assigned policy).- If you are not using open federation, ensure the target domain is listed in <code>AllowedDomains</code>.
Hybrid with some users online (in either Skype for Business or Teams) and some users on-premises.	Follow above steps for both online and on-premises organizations.

Delivery of incoming chats and calls

Incoming chats and calls from a federation organization will land in the user's Teams or Skype for Business client depending on the recipient user's mode in TeamsUpgradePolicy.

IF YOU WANT TO	DO THIS:
Ensure incoming federated chats and calls arrive in the user's Teams client:	Configure your users to be TeamsOnly.
Ensure incoming federated chats and calls arrive in the user's Skype for Business client	Configure your users to be in any mode other than TeamsOnly.

Enable federation between users in your organization and consumer users of Skype

To enable federation between users in your organization and consumer users of Skype:

IF YOUR ORGANIZATION IS	ENABLE CONSUMER FEDERATION AS FOLLOWS
Pure online with no Skype for Business on-premises. This includes organizations that have TeamsOnly users and/or Skype for Business Online users.	<p>If using Teams Admin Center:</p> <ul style="list-style-type: none">- Make sure Allow users in my organization to communicate with Skype users is enabled in External Access. <p>If using PowerShell:</p> <ul style="list-style-type: none">- Ensure the tenant is enabled for federation: <code>Get-CsTenantFederationConfiguration</code> must show <code>AllowPublicUsers=true</code>.- Ensure the user's effective value of <code>CsExternalAccessPolicy</code> has <code>EnablePublicCloudAccess=true</code>.
Pure on-premises	<p>In on-premises tools:</p> <ul style="list-style-type: none">- Ensure Skype is enabled as a federated partner.- Ensure <code>EnablePublicCloudAccess=true</code> for the user through <code>ExternalAccessPolicy</code> (either via global policy, site policy, or user assigned policy).
Hybrid with some users online (in either Skype for Business or Teams) and some users on-premises.	Follow above steps for both online and on-premises organizations.

IMPORTANT

You don't have to add any **Skype domains** as allowed domains in order to enable Teams or Skype for Business Online users to communicate with Skype users inside or outside your organization. All **Skype domains** are allowed.

Federation Diagnostic Tool

If you're an administrator, you can use the following diagnostic tool to validate a Teams user can communicate with a federated Teams user:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.
[Run Tests: Teams Federation](#)
2. In the Run diagnostic pane, enter the **Session Initiation Protocol (SIP) Address** and the **Federated tenant's domain name**, and then select **Run Tests**.
3. The tests will return the best next steps to address any tenant or policy configurations that are preventing communication with the federated user.

Related topics

- [Native chat experience for external \(federated\) users](#)

Native chat experience for external (federated) users in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When a Microsoft Teams user is chatting with an external (federated) user, the chat experience is limited to text. However, if both your Teams user and the person in another organization are in the TeamsOnly upgrade mode, you can have a "native-Teams chat experience," which includes rich formatting, @mentions, and other chat features.

The native chat experience for people in other organizations is turned on for all Teams tenants, but not all people are eligible. To be offered a native chat experience, both the sender and receiver need to be configured for TeamsOnly upgrade mode. To learn more about upgrade policies, read [Setting your coexistence and upgrade settings](#).

To see a list of capabilities for external access users in Teams, see [Compare external and guest access](#).

How do I know if I'm in a native chat?

If you can only exchange text in your chat with people in other organizations, then you're in a standard external-access (federated) chat. If you've got other chat functionality, including formatting, @mentions, emojis, etc., then you're in a native Teams chat.

Teams periodically checks the upgrade mode for people in other organizations and, when it finds an them running Teams in the TeamsOnly upgrade mode, it'll prompt you to switch to a native Teams chat and lock the original chat.

When you switch to a native Teams chat, Teams doesn't merge the two conversations. Instead, you'll see both of the chats in your chat feed. The new, native-Teams chat is active, but the old, text-only chat is locked.

What happens if a user isn't in Teams Only mode anymore?

If you were having a native Teams chat with people in other organizations and then one of you gets switched out of the TeamsOnly upgrade mode, Teams locks the native Teams chat and gives you a link for a limited, text-only chat. You won't be able to continue in the native Teams chat. You can still read the native Teams chat, but you can't continue the conversation there.

If Teams finds an old text-only chat with this person, it'll revive that chat. Otherwise, Teams creates a new text-only chat.

Teams and Skype interoperability

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article gives you an overview of the interoperability capabilities between Microsoft Teams and Skype (Consumer). Learn how Teams users and Skype users can communicate through chats and calls and the admin controls that apply.

Teams users in your organization can chat with and call Skype users by using their email address and vice versa.

- Teams users can search for and start a one-on-one text-only conversation or an audio/video call with a Skype user.
- Skype users can search for and start a one-on-one text-only conversation or an audio/video call with a Teams user.

These capabilities are available on the desktop, web, and mobile (Android and iOS) clients for both Teams and Skype. For an optimal experience, we recommend Skype version 8.58 and later.

NOTE

The Teams and Skype interop capabilities discussed in this article aren't available in GCC, GCC High, or DOD deployments, or in private cloud environments.

Chat and calling experience

Here's an overview of the chat and calling experience.

Teams user starts a chat or call with a Skype user

Teams users can search for a Skype user by typing their email address in a new chat or in the search bar. The Teams user can then select the Skype user in the search results to start a chat or call with them.

A Skype user may choose not to appear in search results. In this case, they won't show up in the search results in Teams and Teams users won't be able to find them.

Skype user starts a chat or call with a Teams user

Skype users can search for and start a chat with a Teams user by using their email address. The Teams user is notified that they have a new message from a Skype user, and has to first accept the message before they can reply to it.

- If the Teams user selects **Accept**, the conversation is accepted, and both users can chat and call each other.
- If the Teams user selects **Block**, the conversation is blocked, and subsequent messages and calls from that Skype user are blocked.
- If the Teams user selects **View messages**, the message is displayed in Teams, which helps the user decide whether to accept or block the conversation.

NOTE

If you upgraded from Skype for Business to Teams and your users are in Teams Only mode, chats and calls from Skype users to Teams users are delivered to Teams. If your users are in Islands mode, chats and calls from Skype users to Teams users are delivered to Skype for Business.

Teams user blocks or unblocks a Skype user

After a Teams user accepts or blocks the initial conversation request from a Skype user, they can choose to block or unblock that person at any time. They can do this either in the conversation or in their privacy settings in Teams. Skype users won't know that they've been blocked.

Blocked Skype users, along with other people and public switched telephone network (PSTN) phone numbers that a Teams user has blocked, are listed on the user's blocked contact list in Teams.

Limitations

- Conversations are text-only. This means that there's no rich formatting, @mentions, emojis, or other any of the other chat features that are available in a [native Teams chat experience](#).
- Conversations are one-on-one only. Group chats aren't supported.
- Teams users and Skype users can't see each other's presence.
- Searching for Skype users by using their Skype ID or phone number isn't supported.
- Skype users can't call Teams users who set up call forwarding to another user's number, a delegate's number, or a Public Switched Telephone Network (PSTN) number. Only voicemail is supported.
- Interop escalation, group calls, and meetings aren't supported.
- The ability for a delegate to call a Skype user on behalf of a Teams user isn't supported.
- Screen sharing with chat isn't supported.

Set whether Teams users can communicate with Skype users

As an admin, you use the Microsoft Teams admin center or PowerShell to set external access settings to control whether Teams users in your organization can communicate with Skype users. By default, this capability is turned on for new tenants. However, there's a prerequisite that the following DNS SRV record needs to be configured by the IT Admin if not already available for your domain, for example `_sipfederationtls.contoso.com`.

Service: sipfederationtls

Protocol: TCP

Priority: 100

Weight: 1

Port: 5061

Target: sipfed.online.lync.com

If you upgraded from Skype for Business to Teams, the external communications settings that you configured in the Skype for Business admin center are migrated to Teams.

In the Microsoft Teams admin center

In the Microsoft Teams admin center, go to **Org-wide settings > External access**, and then turn on **Users can communicate with Skype users**. For step-by-step guidance on how to configure this and other external access settings, see [Manage external access in Teams](#).

Using PowerShell

Do the following:

1. Use the [Set-CsExternalAccessPolicy](#) cmdlet together with the `EnablePublicCloudAccess` parameter to control whether Teams users can communicate with Skype users. Setting the parameter to `true` allows Teams users to communicate with Skype users. You can use the `EnablePublicCloudAudioVideoAccess` parameter to enable/disable audio/video calls.
2. Use the [Set-CsTenantPublicProvider](#) cmdlet together with the `Provider` parameter set to `"WindowsLive"` so that Teams users can communicate with Skype users.

Guest access in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

With guest access, you can provide access to teams, documents in channels, resources, chats, and applications to people outside your organization, while maintaining control over your corporate data. See [Set up secure collaboration with Microsoft 365 and Microsoft Teams](#). Guest access in Teams is an organization-wide setting and is turned on by default. You can control guest access to individual teams by using [sensitivity labels](#).

NOTE

If you just want to find, call, chat, and set up meetings with people in other organizations, use [external access](#).

A guest is someone who isn't an employee, student, or member of your organization. They don't have a school or work account with your organization. For example, guests may include partners, vendors, suppliers, or consultants. Anyone who is not part of your organization can be added as guest in Teams. This means that anyone with a business account (that is, an Azure Active Directory account) or consumer email account (with Outlook.com, Gmail.com or others) can participate as a guest in Teams, with access to teams and channel experiences.

Guests in Teams are covered by the same compliance and auditing protection as the rest of Microsoft 365, and can be managed within Azure AD. Guest access is subject to Azure AD and Microsoft 365 or Office 365 service limits.

The guest experience has limitations by design. For a full list of what a guest can and can't do in Teams, see [comparison of team member and guest capabilities](#).

IMPORTANT

Guests follow Teams Org-wide settings for the coexistence Upgrade mode. This can't be changed.

To set up guest access, see [Collaborate with guests in a team](#).

To compare external access (federation) with guest access (and decide which one you should use), read [Communicate with users from other organizations in Teams](#).

Set up guest access

Guest access in Teams requires configuring other settings in Microsoft 365, including settings in Azure AD, Microsoft 365 Groups, and SharePoint. If you're ready to start inviting guests to teams, read one of the following:

- To configure guest access for Teams for general use, see [Collaborate with guests in a team](#).
- To collaborate with a partner organization that uses Azure Active Directory and allow guests to self-enroll for team access, see [Create a B2B extranet with managed guests](#).

NOTE

If you're an administrator, and you're having trouble with Guest Access in Microsoft Teams, select **Run Tests** below, which will populate the Guest Access diagnostic in the Microsoft 365 Admin Center. These tests will check your configuration and quickly recommend next steps to enable Guest Access for your tenant.

[Run Tests: Guest Access](#)

Turning guest access off

If you turn guest access off in Teams, existing guests lose access to their team. However, they are not removed from the team. They are still visible to the team members and can be @mentioned. If you turn Teams guest access on again, they will regain access.

If you plan to leave guest access off, you may want to advise your team owners to manually remove the guest accounts from their teams. While these guests won't have access, having their accounts visible in the team could lead to confusion for other team members.

How a guest becomes a member of a team

1. A team owner or a Microsoft 365 admin [adds a guest to a team](#).
2. The guest receives a welcome email from the team owner, with information about the team and what to expect now that they're a member.
3. The guest accepts the invitation. Guests who have a work or school account in Azure Active Directory can accept the invitation and authenticate directly. Other users are sent a one-time pass code to validate their identity ([One-time passcode authentication](#) required).
4. After accepting the invitation, the guest can [participate in teams and channels](#), receive and respond to channel messages, [access files in channels](#), participate in chats, join meetings, collaborate on documents, and more.

In Teams, guests are clearly identified. A guest's name includes the label **(Guest)**, and a channel includes an icon to indicate that there are guests on the team. For more details, see [What the guest experience is like](#).

Guests can leave the team at any time from within Teams. For details, see [How do I leave a team?](#)

NOTE

Leaving the team doesn't remove the guest account from your organization's directory. This must be done by a Microsoft 365 global admin or an Azure AD admin.

Licensing for guest access

Guest access can be used with all Microsoft 365 Business Standard, Microsoft 365 Enterprise, and Microsoft 365 Education subscriptions. No additional Microsoft 365 license is necessary. The [billing model for Azure AD External Identities](#) applies to guests in Microsoft 365. Only people from outside your organization can be invited as guests.

Guest access reviews

You can use Azure AD to create an access review for group members or users assigned to an application. Creating recurring access reviews can save you time. If you need to routinely review users who have access to an application, a team, or are members of a group, you can define the frequency of those reviews.

You can perform a guest access review yourself, ask guests to review their own membership, or ask an

application owner or business decision maker to perform the access review. Use the Azure portal to perform guest access reviews. For more information, see [Manage guest access with Azure AD access reviews](#).

Guest experience in Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

When a guest is invited to join a team, they receive a welcome email message. This message includes some information about the team and what to expect now that they're a member. The guest must accept the invitation by selecting **Open Microsoft Teams** in the email message before they can access the team and its channels.

All team members see a message in the channel thread announcing that the team owner has added a guest and providing the guest's name. Everyone on the team can identify easily who is a guest. A tag in the upper-right corner of the channel thread indicates the number of guests on the team and a **(Guest)** label appears next to each guest's name.

Check out these videos about the guest experience in Teams:

- [Join a team as a guest](#)
- [Join a Teams meeting with guests](#)

Comparison of team member and guest capabilities

The following table compares the Teams functionality available for an organization's team members and its guests. Teams admins control the features available to guests.

CAPABILITY IN TEAMS	TEAMS USER IN THE ORGANIZATION	GUEST
Create a channel <i>Team owners control this setting.</i>	✓	✓
Participate in a private chat	✓	✓

CAPABILITY IN TEAMS	TEAMS USER IN THE ORGANIZATION	GUEST
Participate in a channel conversation	✓	✓
Post, delete, and edit messages	✓	✓
Share a channel file	✓	✓
Access SharePoint files	✓	✓
Attach files	✓	Channel posts only
Download private chat files	✓	✓
Search within files	✓	
Share a chat file	✓	
Add apps (tabs, bots, or connectors)	✓	
Create meetings or access schedules	✓	
Access OneDrive for Business storage	✓	
Create tenant-wide and teams/channels guest access policies	✓	
Invite a user outside the Microsoft 365 or Office 365 organization's domain <i>Team owners control this setting.</i>	✓	
Create a team	✓	
Discover and join a public team	✓	
View organization chart	✓	
Use inline translation	✓	
Become team owner	✓	

The following table shows the calling and meeting features available to guests, compared to other types of users.

CALLING FEATURE	GUEST	E1 AND E3 USER	E5 AND ENTERPRISE VOICE USER
VOIP calling	Yes	Yes	Yes
Group calling	Yes	Yes	Yes

CALLING FEATURE	GUEST	E1 AND E3 USER	E5 AND ENTERPRISE VOICE USER
Core call controls supported (hold, mute, video on/off, screen sharing)	Yes	Yes	Yes
Transfer target	Yes	Yes	Yes
Can transfer a call	Yes	Yes	Yes
Can consultative transfer	Yes	Yes	Yes
Can add other users to a call via VOIP	Yes	Yes	Yes
Can add users by phone number to a call	No	No	Yes
Forward target	No	Yes	Yes
Call group target	No	Yes	Yes
Unanswered target	No	Yes	Yes
Can be the target of a federated call	No	Yes	Yes
Can make a federated call	No	Yes	Yes
Can immediately forward their calls	No	No	Yes
Can simultaneously ring their calls	No	No	Yes
Can route their unanswered calls	No	No	Yes
Missed calls can go to voicemail	No	No ¹	Yes
Have a phone number that can receive calls	No	No	Yes
Can dial phone numbers	No	No	Yes
Can access call settings	No	No	Yes
Can change voicemail greeting	No	No ¹	Yes
Can change ringtones	No	No	Yes

CALLING FEATURE	GUEST	E1 AND E3 USER	E5 AND ENTERPRISE VOICE USER
Supports TTY	No	No	Yes
Can have delegates	No	No	Yes
Can be a delegate	No	No	Yes

¹ This feature will be available soon.

NOTE

The **Guest user access restrictions** policy in Azure Active Directory (Azure AD) determines permissions for guests in your directory. There are three policy options.

- The **Guest users have the same access as members (most inclusive)** setting means guests have the same access to directory data as regular users in your directory.
- The **Guest users have limited access to properties and membership of directory objects** settings means that guests don't have permissions for certain directory tasks, such as enumerating users, groups, or other directory resources using Microsoft Graph.
- The **Guest user access is restricted to properties and memberships of their own directory objects (most restrictive)** setting means guests can only access their own directory objects.

To learn more, see [What are the default user permissions in Azure Active Directory?](#)

[Use guest access and external access to collaborate with people outside your organization](#)

Turn on or turn off guest access to Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

NOTE

Until **February 2021**, guest access is turned off by default. You must turn on guest access for Teams before admins or team owners can add guests. After you turn on guest access, it might take a few hours for the changes to take effect. If users see the message **Contact your administrator** when they try to add a guest to their team, it's likely that either guest access hasn't been turned on or the settings aren't effective yet.

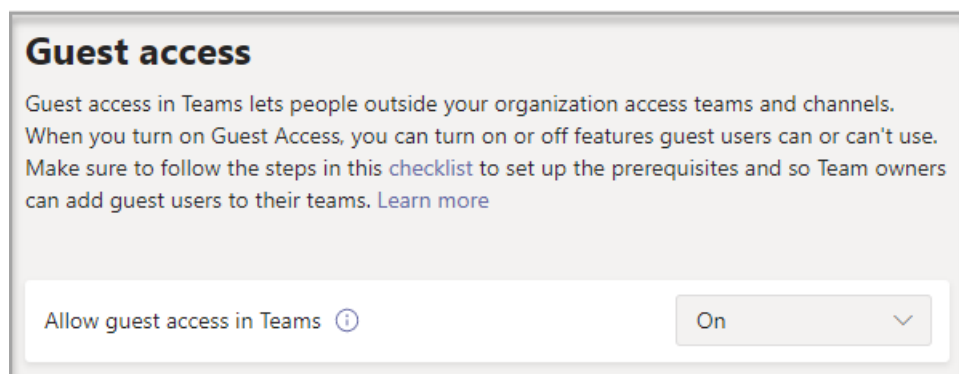

After **February 2021**, guest access in Microsoft Teams will be turned on by default for new customers & existing customers who haven't configured this setting. When this change is implemented, if you've not already configured guest access capability in Microsoft Teams, that capability will be enabled in your tenant. If you want guest access to remain disabled for your organization, you'll need to confirm that the guest access setting is set to **Off** instead of **Service default**.

IMPORTANT

Turning on guest access depends on settings in Azure Active Directory, Microsoft 365, SharePoint, and Teams. For more information, see [Collaborate with guests in a team](#).

Configure guest access in the Teams admin center

1. Sign in to the [Microsoft Teams admin center](#).
2. Select **Users > Guest access**.
3. Set **Allow guest access in Teams** to **On**.

4. Under **Calling, Meeting, and Messaging**, select **On** or **Off** for each capability, depending on what you want to allow for guests.
 - **Make private calls** – Turn this setting **On** to allow guests to make peer-to-peer calls.
 - **IP video** – Turn this setting **On** to allow guests to use video in their calls and meetings.
 - **Screen sharing mode** – This setting controls the availability of screen sharing for guests.
 - Turn this setting to **Disabled** to remove the ability for guests to share their screens in Teams.
 - Turn this setting to **Single application** to allow sharing of individual applications.
 - Turn this setting to **Entire screen** to allow complete screen sharing.
 - **Meet Now** – Turn this setting **On** to allow guests to use the Meet Now feature in Microsoft Teams.

- **Edit sent messages** - Turn this setting **On** to allow guests to edit messages they previously sent.
- **Delete sent messages** – Turn this setting **On** to allow guests to delete messages they previously sent.
- **Chat** – Turn this setting **On** to give guests the ability to use chat in Teams.
- **Giphy in conversations** – Turn this setting **On** to allow guests to use Giphys in conversations. Giphy is an online database and search engine that allows users to search for and share animated GIF files. Each Giphy is assigned a content rating.
- **Giphy content rating** – Select a rating from the drop-down list:
 - **Allow all content** - Guests will be able to insert all Giphys in chats, regardless of the content rating.
 - **Moderate** - Guests will be able to insert Giphys in chats, but will be moderately restricted from adult content.
 - **Strict** – Guests can insert Giphys in chats, but will be restricted from inserting adult content.
- **Memes in conversations** - Turn this setting **On** to allow guests to use Memes in conversations.
- **Stickers in conversations** – Turn this setting **On** to allow guests to use stickers in conversations.
- **Immersive reader for messages** - Turn this setting **On** to allow guests to use [immersive reader in Teams](#).

The screenshot shows the Microsoft Teams admin center interface. On the left is a dark blue navigation pane with a hamburger menu icon at the top. The menu items include: Home, Teams (with a dropdown arrow), Users (with an up arrow), Manage users, Guest access (highlighted in blue), External access, Teams devices (with a dropdown arrow), Teams apps (with a dropdown arrow), Meetings (with a dropdown arrow), Messaging policies, Voice (with a dropdown arrow), Locations (with a dropdown arrow), Policy packages, Planning (with a dropdown arrow), Analytics & reports (with a dropdown arrow), and Notifications & alerts (with a dropdown arrow). The main content area has a light gray background and is titled 'Meeting' at the top. Below the title is a subtitle 'Turn on or turn off settings for guests in meetings.' and a list of settings: 'IP video' (toggle On), 'Screen sharing mode' (dropdown menu showing 'Entire screen'), and 'Meet Now' (toggle On). Below this is a section titled 'Messaging' with the subtitle 'Turn on or turn off settings for guests in chats or channel conversations.' and a list of settings: 'Edit sent messages' (toggle On), 'Delete sent messages' (toggle On), 'Chat' (toggle On), 'Giphy in conversations' (toggle On), 'Giphy content rating' (dropdown menu showing 'Moderate'), 'Memes in conversations' (toggle On), 'Stickers in conversations' (toggle On), and 'Immersive reader for messages' (toggle On). At the bottom of the main content area are two buttons: 'Save' and 'Discard'.

5. Select **Save**.

External access (federation) vs. guest access

External access (federation) and guest access are different:

- External access gives access permission to an entire domain.
- Guest access gives access permission to an individual.

For a detailed comparison, see [Communicate with users from other organizations](#).

Add a guest to a team

12/7/2021 • 2 minutes to read • [Edit Online](#)

Anyone with a business or consumer email account, such as Outlook, Gmail, or others, can participate as a guest in Teams.

As an admin, you can add a new guest to the organization in a couple of ways:

- Global admins or Teams admins and team owners add a guest to a team in the Teams clients or in the Teams admin center. To learn more, read [Add guests to a team](#). If you haven't set up guest access yet, go through the steps in the [Collaborate with guests in a team](#).
- Add guests to your organization through Azure Active Directory (Azure AD) B2B collaboration. For details, check out [Quickstart: Add guests to your directory in the Azure portal](#).

Admins can also delegate permissions to add guests to others in their organization by assigning the Guest Inviter role. For more information, see [Enable B2B external collaboration and manage who can invite guests](#).

With Azure AD B2B collaboration, organizations can enforce conditional access and multi-factor authentication (MFA) policies for B2B users. These policies can be enforced at the tenant, app, or individual user level, the same way that they are enabled for full-time employees and members of the organization. Such policies are enforced at the resource organization. For more information, see [Conditional access for B2B collaboration users](#).

Individual guests can't be blocked.

Guests you have already added via Azure AD B2B, Microsoft 365 Groups, or SharePoint are ready to go. The Microsoft 365 admin or a team owner can add those guests to their respective teams. If you add a guest directly to the Microsoft 365 group associated with a team, the guest will get access to the team but the Microsoft 365 group doesn't generate an invitation email to the guest, so someone on the team should notify the guest.

NOTE

Guests are subject to [Microsoft 365 or Office 365](#) and [Azure Active Directory](#) service limits.

You can track guest additions in Azure AD or the Microsoft 365 security center. Adding a guest in Microsoft Teams is audited and logged as an Azure AD group administration activity "Added member to group". For more details, see [Auditing and reporting a B2B collaboration user](#) and [Search the audit log in the compliance Center](#).

View guests in a team

12/7/2021 • 2 minutes to read • [Edit Online](#)

Anyone in a team can see all members of a team, including guests, via **Manage team** in Microsoft Teams. Refer to [See who's on a team or in a channel](#) for more details.

To identify guests:

1. Sign in to the [Microsoft 365 admin center](#).
2. Select **Admin centers** > **Teams**.
3. In the Teams admin center, select **Users**. You will see **guest** appended to the display name of any guests.

You can also identify guests from within a team that you own.

Edit guest information

12/7/2021 • 2 minutes to read • [Edit Online](#)

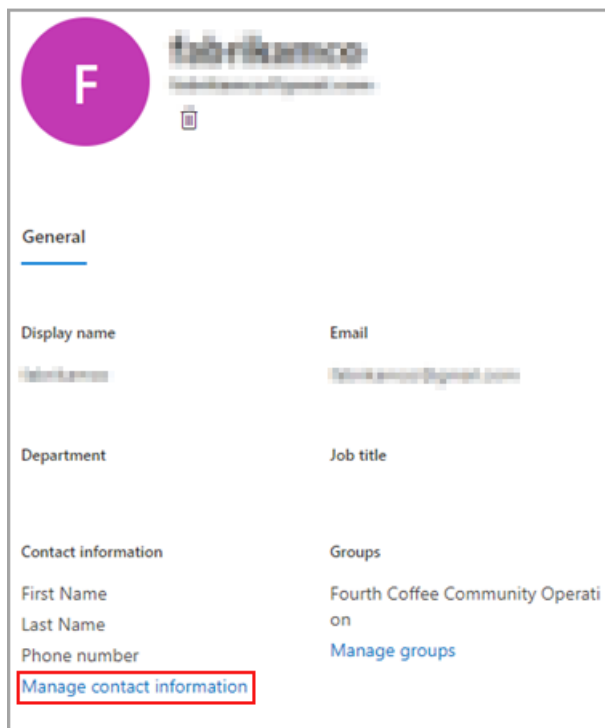

You can edit guest information from the Microsoft 365 admin center or the Azure Active Directory portal.

Guest users in the Microsoft 365 admin

1. To edit the guest information in the [Microsoft 365 admin center](#), select **Users** > **Guest Users**.

2. Select a user from **Guest users**.
3. In guest user information, select **Manage contact information**.

4. Edit any fields that you choose except for **Display name** in **Manage contact information**, and then select **Save changes**.

Cortana voice assistance in Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

NOTE

Cortana voice assistance is supported in Microsoft Teams mobile apps for iOS and Android and Microsoft Teams displays for users in the United States, United Kingdom, Canada, India, and Australia. Microsoft Teams Rooms on Windows is only supported for devices with locale set to en-us. Cortana voice assistance isn't currently available for GCC, GCC-High, DoD, and non-US EDU tenants. Cortana voice assistance in the Teams mobile app is now available for EDU customers in en-US. Expansion to additional languages and regions will happen as part of future releases.

Cortana voice assistance in the Teams mobile app, on Microsoft Teams Rooms on Windows, and on Microsoft Teams display devices enables Microsoft 365 Enterprise users to streamline communication, collaboration, and meeting-related tasks using spoken natural language. Users can speak to Cortana by selecting the microphone button located in the upper right of the Teams mobile app, or by saying "Cortana" in the Microsoft Teams Room or when using a Microsoft Teams display. To quickly connect with their team hands-free and while on the go, users can say queries such as "call Megan" or "send a message to my next meeting". Users can also join meetings by saying "join my next meeting" and use voice assistance to share files, check their calendar, and more. These voice assistance experiences are delivered using [Cortana enterprise-grade services](#) that fully comply with Office 365's privacy, security, and compliance promises as reflected in the [Online Services Terms \(OST\)](#).

Admin control and limitations

Cortana voice assistance in Teams is delivered using services that fully comply with the Office 365 enterprise-level privacy, security, and compliance promises as reflected in the Online Services Terms (OST). The feature will be enabled by default for tenants.

Tenant admins can control who in their tenant can use Cortana voice assistance in Teams using a policy (TeamsCortanaPolicy). This policy is set at either a user account level or tenant level. Admins can use the CortanaVoiceInvocationMode field within this policy control to determine whether Cortana is disabled, enabled with push-button invocation only, or with wake word invocation as well (applicable to devices that support it, like the Microsoft Teams display).

Admins can use the following PowerShell cmdlets to manage this policy (the policy is currently not available in Microsoft Teams admin center).

- [New-CsTeamsCortanaPolicy](#)
- [Get-CsTeamsCortanaPolicy](#)
- [Grant-CsTeamsCortanaPolicy](#)
- [Set-CsTeamsCortanaPolicy](#)
- [Remove-CsTeamsCortanaPolicy](#)

For example, the command below creates a new policy with name "EmployeeCortanaPolicy" where Cortana voice assistance in Microsoft Teams is disabled.

```
PS C:\> New-CsTeamsCortanaPolicy -Identity EmployeeCortanaPolicy -CortanaVoiceInvocationMode Disabled
```

This example shows updating an existing policy with name "EmployeeCortanaPolicy" and enabling Cortana voice assistance in Microsoft Teams with push-button invocation only. Users will be able to invoke Cortana by selecting the Cortana mic button in Teams. Wake word ("Hey Cortana" or "Cortana") invocation will be disabled.

```
PS C:\> Set-CsTeamsCortanaPolicy -Identity EmployeeCortanaPolicy -CortanaVoiceInvocationMode  
PushToTalkUserOverride
```

This example shows updating the policy and enabling Cortana voice assistance with both push button and wake word invocation.

```
PS C:\> Set-CsTeamsCortanaPolicy -Identity EmployeeCortanaPolicy -CortanaVoiceInvocationMode  
WakeWordPushToTalkUserOverride
```

At the time, of the initial release for Microsoft 365 Enterprise users in the US in English, the following are available functions:

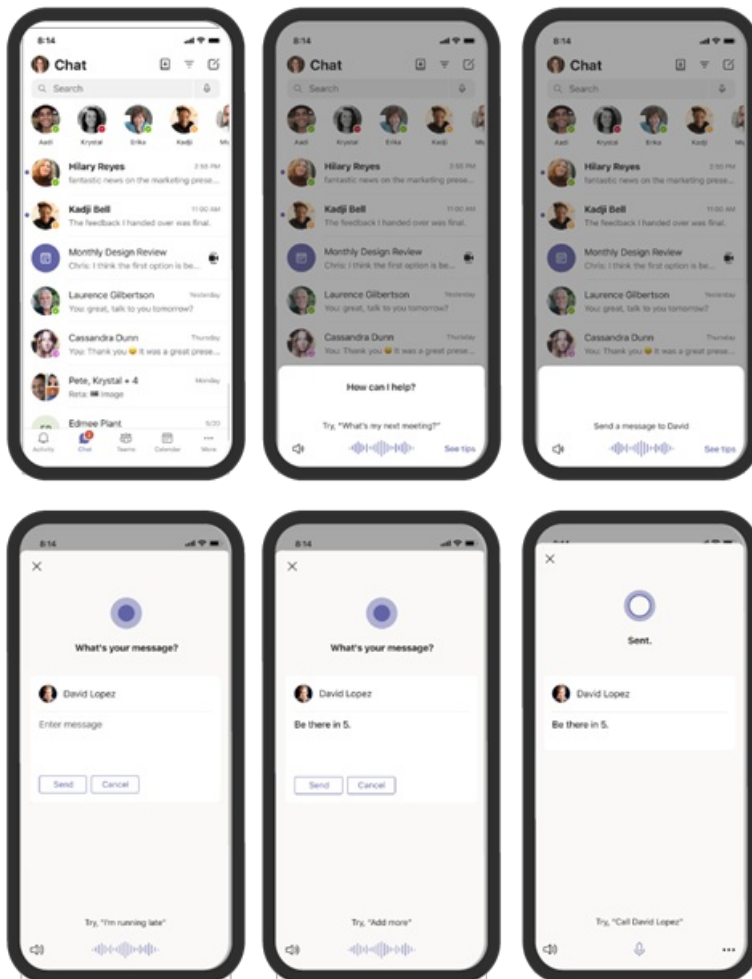

- The Teams mobile app won't support wake word activation, but it will be supported in the future.
- Microsoft Teams Rooms on Windows and Microsoft Teams display devices will support wake word activation.

User control

Individual users can try Cortana voice assistance in different devices:

- Select the microphone button in the Teams mobile app.
- Select the microphone button or say "Cortana" in Microsoft Teams Rooms.
- Say "Cortana" on Microsoft Teams displays devices.

You can control whether Cortana in Teams is enabled for your device by using a setting in the device.

Microsoft Teams Rooms on Windows

Making changes at the device level is available only if Cortana is enabled at the tenant level.

At the device level, you can configure Cortana to be used in two different ways. You can enable either option, or both at the same time:

- By tapping on a microphone, which is called *Cortana Push to talk*
- By saying "Hey, Cortana", which is called *Cortana Voice Activation*

Cortana Push to talk is enabled by default if your room is set up with any of the following languages: en-au (Australia), en-ca (Canada), en-gb (United Kingdom), en-in (India), en-us (United States). [Learn More](#). Cortana icon will displace the *Present* button under the *More...* menu in your Teams Room console. To disable Cortana *Push to talk* use PowerShell. [Learn More](#).

To enable Cortana *Voice Activation*, these conditions must be met:

- a Cortana certified device must be connected to your Teams Room. You can find a list of certified devices at the end of this article.
- the Teams Room must be set up with any of the following languages: en-au (Australia), en-ca (Canada), en-gb (United Kingdom), en-in (India), en-us (United States). More languages will be available at a later date.
- one of the following configuration changes must be made:
 - turn on the feature in Teams admin center [Learn More](#).
 - add the following XML attribute to the SkypeSettings XML file:

```
<SkypeSettings>  
  <CortanaWakewordEnabled>true</CortanaWakewordEnabled>  
</SkypeSettings>
```

At the meeting level, making changes is available only if Cortana *Voice Activation* is enabled at the device level. To enable Cortana *Voice Activation* during a meeting move the toggle **On**, or **Off** to disable. Once the meeting ends, Cortana returns to the device level settings set.

Making changes at the meeting level is available if Cortana is enabled at the device level.

To enable Cortana *voice activation* during a meeting, move the toggle **On** or **Off**. Once the meeting ends, Cortana returns to the device level settings set.

Cortana certified devices for Teams Rooms

Cortana *Voice Activation* can be enabled if you are using a Lenovo Hub 500 or if you have any of these devices connected to your room:

- Jabra Panacast 50
- Rally microphones
- Bose Video Bar VB1

Set up your team targeting hierarchy

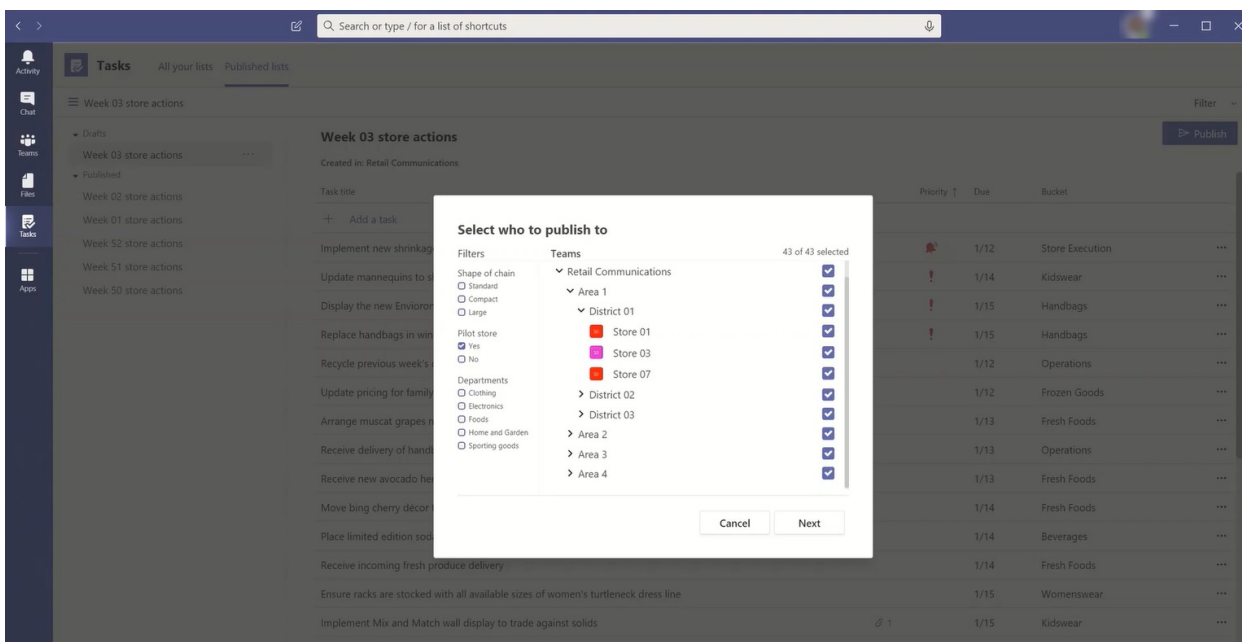

12/7/2021 • 15 minutes to read • [Edit Online](#)

Setting up a team targeting hierarchy will allow your organization to publish content to a large set of teams. The team targeting hierarchy defines how all the teams in your hierarchy are related to each other, which users can publish tasks, and which teams users have permissions to publish to. Publishing features are disabled for all users unless a team targeting hierarchy is set up for your organization. To set up a team targeting hierarchy, you'll need to create a file that defines the hierarchy and then upload it to Teams to apply it to your organization. After the schema is uploaded, apps within Teams can use it.

IMPORTANT

For the initial release, only the Tasks app supports hierarchical teams. Applying a team targeting hierarchy to your organization will enable [task publishing](#) in the Tasks app. You won't see a hierarchy of teams in other areas of Microsoft Teams.

Here's an example of how the hierarchy is represented in the Tasks app in Teams. After a task list is created, members of the publishing team can then select the recipient teams to send (publish) the task list to. When selecting teams, the publishing team can filter by hierarchy, by attributes, or a combination of both.

Terminology

The following terms will be important as you navigate hierarchies. Teams will be referred to as **nodes**.

- **Root nodes** are the topmost nodes in the hierarchy. In the example, Retail Communications is a root node.
- **Parent nodes** and **child nodes** are terms that represent a relationship between two connected nodes. In the example, District 01 is a child node of Area 1.
- Multiple levels of children are referred to as **descendants**. District 01, Store 01, Store 03, Store 07, District 02, and District 03 are all descendants of Area 1.
- A node with no children is called a **leaf node**. They are at the bottom of a hierarchy.
- **Recipient teams** are teams that have been selected to receive a specific set of content to be published. They must be leaf nodes.

Plan your hierarchy

Before you create the schema that defines your hierarchy, you need to do some planning and decide how you want to shape your organization. One of the first priorities is deciding which organizational groups need to publish tasks to other groups. Each node in the hierarchy represents a working group or group of groups.

Permissions to publish

Permission to publish depends on whether a user is a member of any teams in the hierarchy plus the relationship of that team or set of teams to other teams in the hierarchy.

NOTE

The owner of a team is also granted publishing permissions.

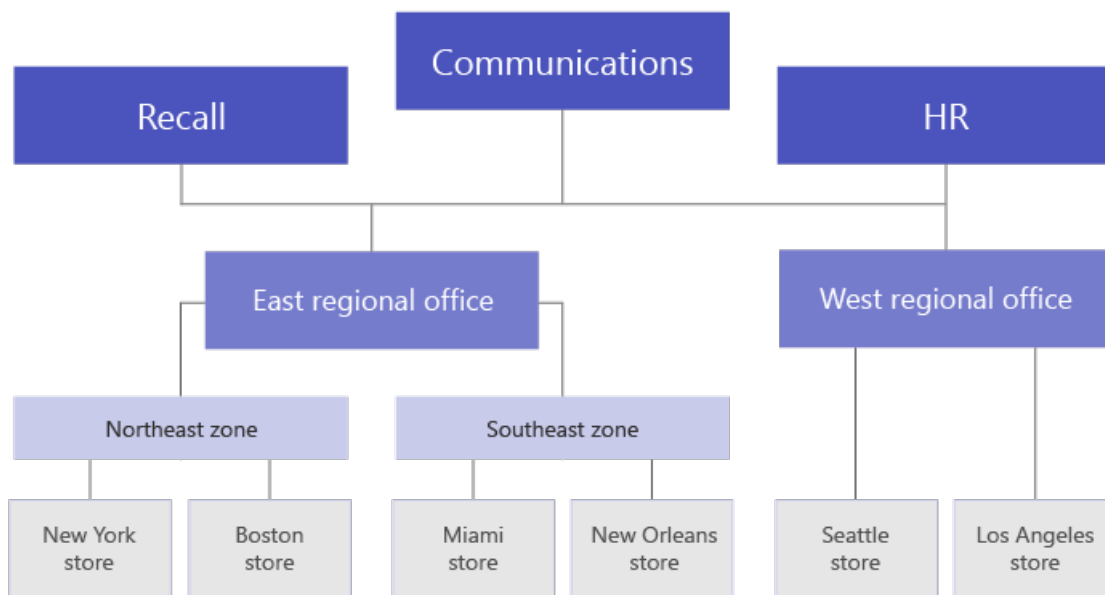

- If a user is a member of at least one team that has descendants in the hierarchy, that user can publish to those descendants without being a member of all teams they want to publish to.
- If a user is a member of a least one team in the hierarchy but isn't a member of any team with descendants in the hierarchy, that user can see and receive published content from their organization.
- If a user isn't a member of any team in the hierarchy, that user won't see any publishing-related functionality.

Guidelines

- There can only be one hierarchy file applied per organization. However, you can include different parts of your organization together as distinct hierarchies of nodes within one file. For example, Contoso Pharmaceuticals has a Pharmacy root node and a Retail root node. Both root nodes have multiple rows of descendants and there's no overlap between them.
- Only leaf nodes can be recipients of a publication. Other nodes in the hierarchy are helpful for selecting recipients of a publication.
- A team can only be represented one time in a hierarchy.
- A hierarchy can contain up to 15,000 nodes. We plan to work with customers to raise this limit for larger organizations.

Example hierarchy

For example, in the following hierarchy, Recall, Communications, and HR can publish tasks to every bottom node (team) in the hierarchy, but Northeast Zone can only publish tasks to the New York Store and Boston Store teams. The example hierarchy allows the Recall, Communications, and HR groups to publish tasks that apply to the entire company, such as benefits information or messages from the CEO. Northeast Zone can publish tasks like personnel scheduling, weather information, and so on, only to the New York Store and Boston Store teams.

Create your hierarchy

NOTE

The remainder of this article discusses setting up a team hierarchy in the context of publishing tasks to recipient teams. Refer to [Manage the Tasks app for your organization in Teams](#) for an overview of the Tasks app, where task publishing appears when enabled.

The schema that defines your hierarchy is based on a comma-separated values (CSV) file. The file must be in UTF-8 format. Each row in the CSV file corresponds to one node within the hierarchy of teams. Each row contains information that names the node within the hierarchy, optionally links it to a team, and includes attributes that can be used to filter teams in apps that support it.

You can also define **buckets**, which are categories that the publishing team can use to organize content sent to recipient teams to make it easier for them to view, sort, and focus on relevant content.

Add required columns

The CSV file must contain the following three columns, in the following order, starting at the first column. A node must be linked to a team for it to receive tasks.

COLUMN NAME	REQUIRED	DESCRIPTION
DisplayName	Yes	This field is the name of the node. The name can be up to 100 characters long and contain only the characters A-Z, a-z, and 0-9. Node names must be unique.

COLUMN NAME	REQUIRED	DESCRIPTION
ParentName	Yes	<p>This is the name of the parent node. The value you specify here must match the value in the DisplayName field of the parent node exactly. If you want to add more than one parent node, separate each parent node name with a semicolon (;). You can add up to 25 parent nodes, and each parent node name can be up to 2500 characters long. A node can have multiple parent nodes only if the parent nodes are root nodes.</p> <p>IMPORTANT Be careful not to create a loop where a parent higher up in the hierarchy references a child node lower in the hierarchy. This isn't supported.</p>
TeamId	Yes, if the team publishes tasks or receives tasks from a parent node	<p>This contains the ID of the team you want to link a node to. Each node must refer to a unique team, so each TeamId value may appear only once in the hierarchy file. To get the ID of a team you want to link a node to, run the following PowerShell command:</p> <pre>Get-Team Export-Csv TeamList.csv</pre> <p>. This command lists the teams in your organization and includes the name and ID for each team. Find the name of the team you want to link to, and then copy the ID into this field.</p>

NOTE

If a node isn't a root node or a leaf node and you don't need the team membership to grant the corresponding permissions for publishing and reporting, you can leave the TeamId blank. This method can be used to add more granularity when choosing recipient teams or for viewing completion reports without having a corresponding team.

Add attribute columns

After you add the three required columns, you can add optional attribute columns. These attributes can be used to filter nodes so that you can more easily select the ones you want to publish tasks to. There are two ways to define your attributes, depending on whether values for that attribute are mutually exclusive.

WAYS TO ADD ATTRIBUTES	DESCRIPTION	EXAMPLE
If the values for an attribute are mutually exclusive, the column name you specify becomes the name of the attribute.	Each row can contain one value for that attribute, and each attribute column can have up to 50 unique values. Each value can be up to 100 characters long. The set of attribute values you specify in the attribute column will be displayed as filter values for that attribute when selecting recipient teams using the team targeting hierarchy.	<p>You want users to be able to filter stores by layout. The values for this attribute are mutually exclusive because a store can have only one layout.</p> <p>To add an attribute to filter stores by layout, add a column named Store layout. In this example, values for the Store layout attribute are Compact, Standard, and Large.</p>

WAYS TO ADD ATTRIBUTES	DESCRIPTION	EXAMPLE
<p>If you need to indicate multiple values for an attribute and the values aren't mutually exclusive, use the AttributeName:UniqueValue format for the column names.</p> <p>IMPORTANT Make sure to use the English-only colon (:) as unicode isn't supported as an attribute column delimiter.</p>	<p>The text string before the colon (:) becomes the name of the attribute. All columns that contain the same text string before the colons (:) are grouped together into a section in the filtering menu. Each of the strings after the colon become the values for that section.</p> <p>Each row can have a value of 0 (zero) or 1 for that attribute. A value of 0 means that the attribute doesn't apply to the node and a value of 1 means that the attribute applies to that node.</p>	<p>You want users to be able to filter stores by department. A store can have multiple departments and so the values for this attribute aren't mutually exclusive.</p> <p>In this example, we add Departments:Clothing, Departments:Electronics, Departments:Foods, Departments:Home and Garden, Departments:Sporting goods as attribute columns. Departments becomes the attribute name and users can filter by the Clothing, Electronics, Foods, Home and Garden, and Sporting goods departments.</p>

When you add an attribute column, keep the following in mind:

- The column name you specify or the column name that you specify before the colon (:) becomes the name of the attribute. This value will be displayed in the Teams apps that use the hierarchy.
- You can have up to 50 attribute columns in your hierarchy.
- The column name can be up to 100 characters long and contain only the characters A-Z, a-z, and 0-9, and spaces. Column names must be unique.

Add bucket columns

You can add bucket columns to create buckets, which are groupings into which tasks can be organized. Each bucket gets its own column in the CSV file. The buckets you create are made available to the publishing team. The publishing team can then use these buckets to categorize tasks for the recipient teams. If a bucket doesn't already exist on a team, buckets are created on-demand when tasks are published.

By categorizing the work items one time centrally, the publishing team can pre-organize the task list for all the tens, hundreds, or thousands of recipient teams that receive the task list. The recipient teams can then sort and filter their tasks by bucket to focus on the area most relevant to their work.

When you add a bucket column, note the following:

- The column name becomes the name of the bucket. Each bucket you specify will appear in the Buckets list in the Teams apps that use the hierarchy.
- We recommend that you don't include sensitive information in bucket names. At this time, publishing teams can't remove a bucket through publishing after it's created.
- The column name must be preceded by a hashtag (#). It can be up to 100 characters long and contain only the characters A-Z, a-z, and 0-9. For example, #Operations and #Frozen Goods.
- A hierarchy may contain up to 25 bucket columns. We plan to work with customers to increase this limit for larger organizations.

Example

Here's an example of a schema CSV file that would be created to support the hierarchy shown in the previous image. This schema contains the following:

- Three required columns named `TargetName`, `ParentName`, and `TeamId`
- Three attribute columns named `Store layout`, `Departments:Clothing`, and `Departments:Foods`
- Three bucket columns named `Fresh Foods`, `Frozen Foods`, and `Women's Wear`

The `Store layout` attribute has values that include `Compact`, `Standard`, and `Large`. The `Departments` attribute columns can be set to a value of `0` (zero) or `1`. The `Store layout` and `Departments` attributes aren't shown in the image above. They're added here to help show how attributes can be added to node entries. The same is true for the three bucket columns.

```
TargetName,ParentName,TeamId,Store layout,Departments:Clothing,Departments:Foods,#Fresh Foods,#Frozen
Foods,#Women's Wear
Recall,,db23e6ba-04a6-412a-95e8-49e5b01943ba,,,,,
Communications,,145399ce-a761-4843-a110-3077249037fc,,,,,
HR,,125399ce-a761-4983-a125-3abc249037fc,,,,,
East Regional Office,HR;Communications;Recall,,,,,
West Regional Office,HR;Communications;Recall,,,,,
Northeast Zone,East Regional Office,,,,,
Southeast Zone,East Regional Office,,,,,
New York Store,Northeast Zone,e2ba65f6-25e7-488b-b8f0-b8562d5de60a,Large,1,1,,
Boston Store,Northeast Zone,0454f08a-0507-437c-969a-682eb2fae7fc,Standard,1,1,,
Miami Store,Southeast Zone,619d6e4e-5f68-4b36-8e1f-16c98d7396c1,Compact,0,1,,
New Orleans Store,Southeast Zone,6be960b8-72af-4561-a343-9ac4711874eb,Compact,0,1,,
Seattle Store,West Regional Zone,487c0d20-4e55-4dc2-8187-a24c826e0fee,Standard,1,1,,
Los Angeles Store,West Regional Zone,204a1287-2efb-4a8a-88e0-56fbaf5a2389,Large,1,1,,
```

Apply your hierarchy

NOTE

To perform this step, you must install and use the Teams PowerShell public preview module from the PowerShell Gallery. For steps on how to install the module, see [Install Teams PowerShell](#).

NOTE

Government Community Cloud (GCC) customers must use [cmdlet preview version 2.4.0-preview](#) or later to ensure data is routed to the GCC environment, rather than the public cloud environment.

After you've defined your hierarchy in the schema CSV file, you're ready to upload it to Teams. To do this, run the following command. You must be a global admin or Teams service admin to do this step.

```
Set-TeamTargetingHierarchy -FilePath "C:\ContosoTeamSchema.csv"
```

Update your hierarchy

You can upload a new hierarchy to replace the old one using the same PowerShell command as above. Each time you upload a new hierarchy, it replaces the previous hierarchy.

Check the status of your hierarchy

You can run the following command to check the status of your hierarchy upload.

```
Get-TeamTargetingHierarchyStatus
```

The command will return the following fields:

FIELD	DESCRIPTION
Id	The unique ID for the upload.

FIELD	DESCRIPTION
Status	Upload status. Values include Starting , Validating , Successful , and Failed
ErrorDetails	Details if there's an upload error. For more information about the error details, see the Troubleshooting section. If there's no error, this field is blank.
LastUpdatedAt	Timestamp and date of when the file was last updated.
LastModifiedBy	The ID of the last user who modified the file.
FileName	The file name of the CSV.

Remove your hierarchy

If you want to immediately disable the **Published lists** tab for all users in your organization, you can remove your hierarchy. Users won't have access to the **Published lists** tab or any of the functionalities on the tab. This includes the ability to create new task lists to publish, access draft lists, publish, unpublish, and duplicate lists, and view reporting. Removing the hierarchy doesn't unpublish tasks that were previously published. These tasks will remain available for recipient teams to complete.

To remove your hierarchy, run the following command. You must be an admin to perform this step.

```
Remove-TeamTargetingHierarchy
```

When confirming deletion, the status message will still display the previous schema is present, although attempting to delete again returns an error that the object is null.

Create a sample hierarchy

Install the Teams PowerShell module

IMPORTANT

To perform this step, you must install and use the Teams PowerShell public preview module from the [PowerShell Gallery](#). For steps on how to install the module, see [Install Teams PowerShell](#).

Sample script

The following script can be used to create the teams and upload a .csv file to your Microsoft Teams tenant. If you have an existing hierarchy, this script will replace it.

Create teams for a simple hierarchy

```
$tm1 = New-Team -DisplayName "HQ"
$tm2 = New-Team -DisplayName "North"
$tm3 = New-Team -DisplayName "Store 1"
$tm4 = New-Team -DisplayName "Store 2"
$tm5 = New-Team -DisplayName "South"
$tm6 = New-Team -DisplayName "Store 3"
$tm7 = New-Team -DisplayName "Store 4"
```

Use team data to create comma-separated output (DisplayName, ParentName, TeamId)

```

$csvOutput = "DisplayName" + "," + "ParentName" + "," + "TeamId" + "`n"
$csvOutput = $csvOutput + $tm1.DisplayName + "," + "," + $tm1.GroupID + "`n"
$csvOutput = $csvOutput + $tm2.DisplayName + "," + $tm1.DisplayName + "," + $tm2.GroupID + "`n"
$csvOutput = $csvOutput + $tm3.DisplayName + "," + $tm2.DisplayName + "," + $tm3.GroupID + "`n"
$csvOutput = $csvOutput + $tm4.DisplayName + "," + $tm2.DisplayName + "," + $tm4.GroupID + "`n"
$csvOutput = $csvOutput + $tm5.DisplayName + "," + $tm1.DisplayName + "," + $tm5.GroupID + "`n"
$csvOutput = $csvOutput + $tm6.DisplayName + "," + $tm5.DisplayName + "," + $tm6.GroupID + "`n"
$csvOutput = $csvOutput + $tm7.DisplayName + "," + $tm5.DisplayName + "," + $tm7.GroupID

```

Save output to a .csv file in the Downloads folder

```

$csvOutputPath = $env:USERPROFILE + "\downloads\testhierarchy-" + (Get-Date -Format "yyyy-MM-dd-hhmmss") +
".csv"
$csvOutput | Out-File $csvOutputPath

```

Upload the hierarchy

```

Set-TeamTargetingHierarchy -FilePath $csvOutputPath
Get-TeamTargetingHierarchyStatus

```

Troubleshooting

How to view error details

You can run the following command to understand what is causing an error and return the error details.

```
(Get-TeamTargetingHierarchyStatus).ErrorDetails.ErrorMessage
```

You receive an error message when you upload your schema CSV file

Take note of the error message as it should include troubleshooting information to indicate why the schema couldn't be uploaded. Review and edit your schema CSV file based on the information in the error message and then try again.

You receive an "Error: InvalidTeamId" error message when you upload your schema CSV file

When you try to upload your schema CSV file, you get the following error message:

```

Error: InvalidTeamId
Description: TeamID in row # doesn't match a valid Group ID. Please view our documentation to learn how to
get the proper GroupID for each team.

```

Check to make sure that you're using the correct TeamId for the team in your schema CSV file. The TeamId should be the same as the Group ID of the Microsoft 365 group that backs the team. You can look up the Group ID of the team in the Microsoft Teams admin center.

1. In the left navigation of the [Microsoft Teams admin center](#), go to **Teams > Manage teams**.
2. If the **Group ID** column isn't displayed in the table, select **Edit columns** in the upper-right corner of the table, and then turn on **Group ID**.
3. Find the team in the list, and then locate the Group ID.

Make sure that the TeamId in your schema CSV file matches the Group ID that's displayed in the Microsoft Teams admin center.

Supervised chats for non-educational tenants

12/7/2021 • 3 minutes to read • [Edit Online](#)

Supervised chat allows designated supervisors to initiate chats with anyone in their organization and blocks restricted users from starting new chats unless an appropriate supervisor is present. When chat supervision is enabled, supervisors aren't allowed to leave chats and other participants aren't allowed to remove them, ensuring that chats involving restricted users are properly supervised.

These limitations are only applied to new private chats that are created after supervised chat has been fully enabled. They don't apply to existing private chats, meetings chats, or channels.

Supervised chat is tailored for educational institution needs, but it is also available to non-educational tenants.

NOTE

Supervised chat protects new chats created after the feature is enforced. It doesn't protect existing chats.

Enable supervised chat

NOTE

Ensure that you set up chat permission roles and the role-based chat permission policies before enabling chat for your institution to avoid unwanted restricted user access to unsupervised chats.

Define chat permission roles for each user in your environment

For supervised chat to work as expected each user within your environment needs to be assigned the correct chat permission role. There are three roles that a user can have assigned:

- **Full permissions:** This role should be assigned to the chat supervisors in your environment. They can start chats with any user within your environment. Users with full permissions are expected to supervise the chats they participate in. They can't leave or be removed from chats that they start or chats that they're supervising in federated tenants.
- **Limited permissions:** This role is ideal for staff members who should only have supervised access to restricted users. They can start chats with any full or limited users but can't start chats with restricted users. If a user with full permissions begins a chat with a restricted user, limited users can be brought into the conversation. This access happens because a user with full permissions is present to supervise collaboration between limited and restricted users.
- **Restricted permissions:** This role is ideal for users who need to be supervised. They can only start chats with users who have full permissions. They can participate in any conversation that a user with full permissions invites them to. In federated chat cases, restricted users can only be added to chats by a user with full permissions who is from the restricted user's tenant.

To set your users' chat permission role, use the **Chat permissions role** policy found within your Messaging policy options in the Teams admin portal. You can use PowerShell to define roles using the ChatPermissionRole policy with the values Full, Limited, or Restricted. This policy is under [CsTeamsMessagingPolicy](#).

Roles can't be assigned to guests in your tenant. Guests are assigned the limited role.

Allow supervised chat

Supervised chat is disabled by default for your tenant. After you've set chat permission roles for your users, you can enable supervised chat within your tenant by going to **Org-wide settings** > **Teams Settings** and setting **Role-based chat permissions** policy to **On**. You can also use PowerShell to enable Supervised Chat by setting AllowRoleBasedChatPermissions to True. This cmdlet is under [CsTeamsClientConfiguration](#).

Supervised chat must be enabled for all users in the tenant and cannot be enabled for only a portion of your users.

Enable chat

Enable chat for all your users using the existing Chat policy available in Teams admin center.

Maintain supervised chats

After supervised chat is initially enabled, you'll need to do a few things to ensure that the chats in your environment remain supervised:

- Assign appropriate roles to any new users that join your tenant. By default, users will be assigned a restricted role.
- If a user with full permissions leaves or is removed from a tenant, the chats they were supervising will be left unattended. Before you remove the original user, ensure that another user with full permissions is added to these conversations so that the chat can remain supervised. Once the original supervisor is removed, new participants can't be added to the conversation, but current participants can continue to communicate.

Meetings and conferencing in Microsoft Teams

12/7/2021 • 9 minutes to read • [Edit Online](#)

NOTE

- For an overview of making the transition to remote learning and resources to help you get started, see our [remote learning home page](#).
- Resources to assist educators and students with remote learning are available in [Remote teaching and learning in Office 365 Education](#).

You've completed [Get started](#). You've rolled out Teams with [chat](#), [teams](#), [channels](#), & [apps](#) across your organization. Now you're ready to add the meetings workload, including [audio conferencing](#), video, and sharing. This article walks you through the rollout of meetings and audio conferencing. Start by watching our Teams meetings, conferencing, and devices video (3:28 minutes):

To learn more about the meetings experience for your users, see [Meetings and calls](#).

New in April 2020: Meeting organizers can end a meeting for all meeting participants in Teams by clicking **End meeting** in the meeting controls within the meeting.

New in November 2019: You can now [use Advisor for Teams \(preview\) to help you roll out Microsoft Teams](#). Advisor for Teams (preview) walks you through your Teams rollout, including meetings and conferencing. It assesses your Office 365 environment and identifies the most common configurations that you may need to update or modify before you can successfully roll out meetings and conferencing in Teams.

NOTE

For details about Teams meetings and conferencing on different platforms, see [Teams features by platform](#).

Meetings and conferencing deployment decisions

Teams provides a great out-of-the-box experience for your organization, and most organizations find that the default settings work for them. This article helps you decide whether to change any of the default settings, based on your organization's profile and business requirements, then it walks you through each change. We've split the settings into two groups, starting with the core set of [changes you're more likely to make](#). The second group includes the [additional settings](#) you may want to configure, based on your organization's needs.

TIP

Watch the following session to learn more about Meetings: [Introduction to Meetings in Microsoft Teams for IT Pros](#)

Meetings and conferencing prerequisites

Before scaling your meetings deployment across your organization, take time to review and confirm that your environment is ready to provide users with the best possible experience. Review the following information and make any required changes to your environment as needed.

To get the best experience on Teams, your organization must have deployed Exchange Online and SharePoint

Online, and you must have a verified domain for O365 such as *contoso.com*.

To scale meetings across your organization you should ensure that all user locations have internet access to connect to the Office 365 Services. At a minimum you should make sure that the following common ports are open to the internet from your user's locations:-

- TCP ports 80 and 443 outgoing from clients that will use Teams
- UDP ports 3478 through 3481 outgoing from clients that will use Teams

ASK YOURSELF	ACTION
Is my network ready for Teams meetings deployment?	To verify that your network is ready, see: <ul style="list-style-type: none">• Prepare your organization's network for Microsoft Teams• URLs and IP address ranges

Core deployment decisions

These are the settings that most organizations want to change (if the Teams default settings don't work for the organization).

Teams administrators

Teams provides a set of custom administrator roles that can be used to manage Teams for your organization. The roles provide various capabilities to administrators.

ASK YOURSELF	ACTION
Who will be assigned the Teams Communications Administrator role?	To learn more about Teams administrator roles see Use Microsoft Teams admin roles to manage Teams .
Who will be assigned the Teams Communications Support Engineer role?	To assign admin roles, see Assign administrator and non-administrator roles to users with Active Directory .
Who will be assigned the Teams Communications Support Specialist role?	

Meetings settings

Meetings settings are used to control whether anonymous users can join Teams meetings, set up meeting invitations, and if you want to turn on Quality of Service (QoS), set the ports for real-time traffic. These settings will be used for all of the Teams meetings that users schedule in your organization.

ASK YOURSELF	ACTION
Will I customize the initial meeting settings?	See the Meetings in Teams tutorial to learn more about meetings settings.
Will I implement QoS?	See Quality of Service in Microsoft Teams for information about QoS concepts, scenarios, and implementation.

Meeting policies

Meeting policies are used to control what features are available to users when they join Teams meetings. You can use the default policy or create one or more custom meeting policies for people that host meetings in your organization. To learn more, see the [Meetings in Microsoft Teams tutorial](#).

ASK YOURSELF	ACTION
<ul style="list-style-type: none">• Will I customize the initial meeting policies?• Do I require multiple meeting policies?• How will I determine which groups of users get which meetings policy applied?	Read Manage meeting policies in Teams .

Audio Conferencing

Audio Conferencing provides organizations with additional entry points to any meeting (ad hoc or scheduled) by allowing meeting participants to join via public switched telephone network (PSTN) by dialing in using a traditional land line, private branch exchange (PBX), or mobile phone.

When you're ready to roll out Audio Conferencing, see the in-depth [Audio Conferencing rollout](#) guidance.

Meeting room and personal devices

For an optimal meeting experience in Teams, consider using Teams devices such as room systems, phones, headsets, and cameras. To learn more, see [Teams devices for intelligent communications](#).

ASK YOURSELF	ACTION
Will I purchase personal devices for my users?	Read Manage your devices in Teams .
Will I purchase and deploy room system devices for my conference rooms?	Read Meeting room devices and solutions .

Reporting

Use activity reports to see how users in your organization are using Teams. For example, if some don't use Teams yet, they might not know how to get started or understand how they can use Teams to be more productive and collaborative. Your organization can use the activity reports to decide where to prioritize training and communication efforts.

ASK YOURSELF	ACTION
Who will be responsible for reporting?	Read Use activity reports for Teams .
Who will be responsible for monitoring usage?	Read Monitor usage and feedback in Teams .

Additional deployment decisions

You may want to change these settings, based on your organization's needs and configuration.

Bandwidth planning

Bandwidth planning lets organizations estimate the bandwidth that will be required to support meetings across their wide area networks and internet links so they can confirm that the network is correctly provisioned to support a scaled out meeting service.

IMPORTANT

Teams won't let users schedule meetings or live events when they're offline or running with limited bandwidth.

ASK YOURSELF	ACTION
Do I need to do bandwidth planning prior to and during my Meetings rollout?	See Network Readiness for more information and links to tools to simplify your planning process.

Meeting recording and archiving

Users can record their meetings and group calls to capture audio, video, and screen sharing activity. There is also an option for recordings to have automatic transcription, so that users can play back meeting recordings with closed captions and search for important discussion items in the transcript. The recording happens in the cloud and is saved in Microsoft Stream, so users can share it securely across their organization. To find the recording for a meeting, go to the meeting conversation.

NOTE

The change from using Microsoft Stream to [OneDrive for Business and SharePoint for meeting recordings](#) will be a phased approach. At launch you'll be able to opt-in to this experience, in November you'll have to opt-out if you want to continue using Stream, and some time in early 2021 we'll require all customers to use OneDrive for Business and SharePoint for new meeting recordings.

To learn more, see [Teams cloud meeting recording](#).

ASK YOURSELF	ACTION
Will I turn on the meeting transcription service?	See Turn on or turn off recording transcription

Live events policies

Teams live events policies are used to manage event settings for groups of users. You can use the default policy or create additional policies that can be assigned to users who hold live events within your organization.

ASK YOURSELF	ACTION
Will my organization use Teams live events?	See the live events articles for more information about planning for, setting up, and configuring Teams live events.

Conference room systems rollout

Organizations with many conference rooms may want to consider a structured approach to inventorying their rooms, identifying the appropriate devices, and then rolling them out.

ASK YOURSELF	ACTION
What do I need to do to roll out conference room systems?	Check out the Plan Microsoft Teams Rooms articles.

Cloud video interop

Cloud video interop makes it possible for third-party meeting room devices to join Teams meetings.

Video teleconferencing with content collaboration helps you make the most out of meetings. However, meeting room systems and devices are expensive to upgrade. Cloud video interop for Teams works with third-party systems and delivers a native meeting experience for all participants – in meeting rooms or inside Teams clients.

ASK YOURSELF	ACTION
Will I use a cloud video interop solution as part of my room systems deployment?	Read Cloud Video Interop for Teams .

Personal device rollout

When planning a larger rollout of personal devices to support meetings or voice deployments, consider using a repeatable site-by-site rollout process that delivers repeatable quality.

ASK YOURSELF	ACTION
Will I use a site-by-site approach to roll out Meetings?	The Site enablement playbook for Teams provides a good foundation that you can use for your own deployments. The guide is focused on voice, but the general principles of device delivery, account readiness, adoption, and training apply to a large meeting deployment.

Troubleshoot meeting and call quality

Teams gives you two ways to monitor and troubleshoot call quality problems: [Call Analytics and Call Quality Dashboard](#). Call Analytics shows detailed information about the devices, networks, and connectivity related to the specific calls and meetings for each user. Call Analytics is designed to help admins and helpdesk agents troubleshoot call quality problems with specific calls, whereas the Call Quality Dashboard is designed to help admins and network engineers optimize a network. Call Quality Dashboard shifts focus from specific users and instead looks at aggregate information for an entire Teams organization.

ASK YOURSELF	ACTION
Who will be responsible for monitoring and troubleshooting call quality issues?	Read Use Call Analytics to troubleshoot poor call quality for information about permission levels required to troubleshoot call quality issues.

Operate your meetings service

It's important that you understand the overall health of the Teams service so that you can proactively alert others in your organization of any event that affects the service. The [Operate my service](#) articles provide in-depth guidance for service operations.

ASK YOURSELF	ACTION
Who in my organization will be responsible for managing the meetings service?	Make sure this person has the Teams admin permissions they need in order to manage your meetings service. To learn more about Teams administrator roles see Use Microsoft Teams admin roles to manage Teams .

Next steps

- [Drive adoption](#) of meetings & conferencing throughout your organization.
- [Add audio conferencing](#)
- [Roll out cloud voice](#)
- Include featured apps - such as Planner - in your initial Teams rollout. Add other [apps, bots, & connectors](#) as you drive Teams adoption.

Quick start - Meetings, webinars, and live events

12/7/2021 • 6 minutes to read • [Edit Online](#)

There are multiple ways to meet in Microsoft Teams: meetings, webinars, and live events.

This article, intended for administrators and IT Pros, briefly describes the differences between meetings, webinars, and live events. It then provides links to the information you need to quickly roll out this functionality for your users.

NOTE

For details about quickly configuring Teams meetings and events on different platforms, see [Teams features by platform](#).

Meetings, webinars, and live events

[Meetings](#), [webinars](#), and [live events](#) are all types of meetings, but webinars and live events provide additional control for the organizer over the conversation and participants. Webinars provide two-way interaction while live events provide a managed Q&A experience.

The different types of meetings also have different participant limits and participant capabilities.

The following table briefly summarizes the three types of meetings, the number of recommended participants, and how participants can interact in the meeting. More information about each type of meeting follow the table.

TYPE OF MEETING	NUMBER OF PARTICIPANTS	INTERACTION	REGISTRATION SUPPORTED
Meetings	Up to 20,000*	<ul style="list-style-type: none">-Participants up to 1,000 have fully interactive equal meeting capabilities.-Participants over 1,000 up to 20,000 have View-only capabilities.	No
Webinars	<ul style="list-style-type: none">-Up to 1,000-Increased limits with View-only capabilities coming soon.	<ul style="list-style-type: none">-Participants up to 1,000 have fully interactive capabilities.-Audience interaction configurable.-Can specify presenters.	Yes
Live events	Up to 20,000**	<ul style="list-style-type: none">-Broadcast to large audiences.-Moderated Q&A for audience interaction.-Can specify producers and presenters, including external presenters.-Supports more advanced production capabilities.	No

*The usual 10,000 is increased to 20,000 through June 30, 2022.

**The usual 10,000 is increased to 20,000 through June 30, 2022. You can schedule even greater numbers with live events in Yammer and/or Microsoft Stream. For more information, see [Live events across Microsoft 365](#). Note that events over 20,000 attendees require the [Live Events Assistance Program](#).

Considerations for large meetings, webinars, and live events - When hosting large meetings, consider the following:

- For the best experience in large meetings, webinars, and live events, Microsoft recommends using the latest version of the Teams desktop client or Teams mobile clients.
- Presenters in large meetings, webinars, and live events should use the Teams desktop client.
- For more tips on hosting large meetings, see [Best practices for a large Teams meeting](#).

For information about the view-only meeting experience, see [Teams view-only meeting experience](#).

Note that NDI is fully supported in meetings, webinars, and live events, allowing you to produce the broadcast by using tools such as OBS and Wirecast. For more information, see [Use NDI® technology in Microsoft Teams](#).

Meetings

Meetings in Teams include audio, video, and screen sharing for up to 1,000 people and [view-only capabilities](#) for participants over 1,000. Participants don't need to be a member of an organization (or have a Teams account) to join a Teams meeting. They can join directly from the calendar invitation via the Join meeting link or call in via audio if available.

As the administrator, you'll configure meeting settings and control which meeting features are enabled for your organization by specifying meeting policies.

In addition to regularly scheduled meetings, your users can create channel meetings. With channel meetings, everybody in a team can see there is a meeting, join the meeting, and use the meeting chat. Channel meetings are a way to quickly invite everyone in a team to a meeting. For more information about how end users schedule meetings, see [Schedule a meeting](#).

Articles for administrators

The following table highlights key articles that you'll want to review:

ARTICLE	DESCRIPTION
Meeting settings	Describes how to configure meetings settings for anonymous users, meeting invitations, and media traffic.
Meeting policies	Describes how to create and manage the policies that determine which features are available to meeting participants.
Manage Teams cloud meeting recording	Describes how to manage meeting recordings.
Manage your organization's devices	Describes how to manage your organization's devices, such as phones and Teams Rooms.

Key training for end users

The following table lists training available to the end users in your organization:

TRAINING	DESCRIPTION
----------	-------------

TRAINING	DESCRIPTION
Manage meetings	A quick training video for users who are new to Teams meetings.
Schedule a meeting	Article that describes how to schedule different types of meetings.
Run effective meetings with Teams	A free instructor-led class about how to make meetings more engaging, productive, and meaningful.
Change participant settings for a Teams meeting	Article about managing meeting options.

Webinars

Webinars are structured meetings where presenters and participants have clear roles. A key difference between webinars and Teams meetings is that webinars support registration and provide attendee engagement data. To enable webinars in your organization, see [Set up webinars in Teams](#).

Key training for end users

The following table lists training available to the end users in your organization:

TRAINING	DESCRIPTION
Get started with Teams webinars	A quick training video for users who are new to Teams webinars.
Visual quick start guide	A downloadable visual guide that describes how to start scheduling webinars.

Live events

Live events are structured meetings that enable your organization to schedule and produce events that stream to large online audiences—up to 20,000 people. With live events, the audience interaction is a managed Q&A experience.

Articles for administrators

The following table highlights key articles that you'll want to review:

ARTICLE	DESCRIPTION
What are Teams live events?	A quick introduction to live events.
Plan for Teams live events	What you need to know before configuring live events.
Set up for Teams live events	Describes prerequisites such as network planning.
Configure live events	Steps for configuring live events.

Key training for end users

The following table lists training available to the end users in your organization:

TRAINING	DESCRIPTION
Get started with live events	An introduction to live events and how to get started.
Teams Live Events video training	Video that describes how to plan and schedule a live event.

To produce larger scale virtual events, review the [Virtual Event Guide](#), which has guidance for event organizers, technical producers, IT professionals, and content creators.

Apps for meetings

Microsoft enables you to enhance meeting experiences by integrating and using meeting apps. For example, whiteboard integration in Teams meetings is powered by the Whiteboard web app, which lets Teams meeting participants draw, sketch, and write together on a shared digital canvas.

You can add meetings apps to your Teams deployment by using the apps provided with Teams, using certified third-party apps and templates, and creating your own custom apps.

The following table lists articles for more information:

ARTICLE	DESCRIPTION
Apps, bots, & connectors	Introduction to apps and how to deploy apps for your organization.
[Apps for Teams meetings](/microsoftteams/platform/apps-in-teams-meetings/teams-apps-in-meetings)	Overview of meeting app extensibility, API references, and how to enable and configure apps for meetings.
Manage the Whiteboard in Teams	Describes Whiteboard functionality and how to enable and disable for your organization.

License requirements for meetings, webinars, and live events

Anyone can attend a Teams meeting, webinar, or live event for free—no license is required.

For the people who organize, schedule, and host meetings, webinars, or live events, they'll need one of the Microsoft 365 licenses listed in the [Microsoft Teams service description](#). If you're already using Teams, you probably have the license you need for organizing and hosting meetings, webinars, and live events.

To allow people to dial in to a meeting by phone, you'll need to set up audio conferencing. For more information about audio conferencing, see [Audio conferencing in Teams](#).

Manage meeting policies in Microsoft Teams

12/7/2021 • 3 minutes to read • [Edit Online](#)

Meeting policies are used to control the features that are available to meeting participants for meetings that are scheduled by users in your organization. You can use the global (Org-wide default) policy that's automatically created or create and assign custom policies. You manage meeting policies in the Microsoft Teams admin center or by using [PowerShell](#).

NOTE

For information about using roles to manage the permissions of meeting presenters and attendees, see [Roles in a Teams meeting](#).

You can implement policies in the following ways, which affect the meeting experience for users before a meeting starts, during a meeting, or after a meeting.

IMPLEMENTATION TYPE	DESCRIPTION
Per-organizer	When you implement a per-organizer policy, all meeting participants inherit the policy of the organizer. For example, Automatically admit people is a per-organizer policy and controls whether users join the meeting directly or wait in the lobby for meetings scheduled by the user who is assigned the policy.
Per-user	When you implement a per-user policy, only the per-user policy applies to restrict certain features for the organizer and/or meeting participants. For example, Meet now in channels is a per-user policy.
Per-organizer and per-user	When you implement a combination of a per-organizer and per-user policy, certain features are restricted for meeting participants based on their policy and the organizer's policy. For example, Cloud recording is a per-organizer and per-user policy. Turn on this setting to allow the meeting organizer and participants to start and stop a recording.

You can edit the settings in the global policy or create and assign one or more custom policies. Users will get the global policy unless you create and assign a custom policy.

NOTE

Meeting details button will be available if a user has the audio conference licenses enabled or the user is allow for audio conferencing, if not, the meeting details will not be available.

Create a custom meeting policy

1. In the left navigation of the Microsoft Teams admin center, go to **Meetings > Meeting policies**.
2. Click **Add**.

3. Enter a name and description for the policy. The name can't contain special characters or be longer than 64 characters.
4. Choose the settings that you want.
5. Click **Save**.

For example, say you have a bunch of users and you want to limit the amount of bandwidth that their meeting would require. You would create a new custom policy named "Limited bandwidth" and disable the following settings:

Under **Audio & video**:

- Turn off Cloud recording.
- Turn off IP video.

Under **Content sharing**:

- Disable screen sharing mode.
- Turn off Whiteboard.
- Turn off Shared notes.

Then assign the policy to the users.

Edit a meeting policy

You can edit the global policy and any custom policies that you create.

1. In the left navigation of the Microsoft Teams admin center, go to **Meetings > Meeting policies**.
2. Select the policy by clicking to the left of the policy name, and then click **Edit**.
3. From here, make the changes that you want.
4. Click **Save**.

NOTE

A user can be assigned only one meeting policy at a time.

Assign a meeting policy to users

You can assign a policy directly to users, either individually or at scale through a batch assignment (if supported for the policy type), or to a group that the users are members of (if supported for the policy type).

To learn about the different ways that you can assign policies to users, see [Assign policies to your users in Teams](#).

NOTE

You can't delete a policy if users are assigned to it. You must first assign a different policy to all affected users, and then you can delete the original policy.

Meeting policy settings

When you select an existing policy on the **Meeting policies** page or select **Add** to add a new policy, you can configure settings for the following.

- [General](#)

- [Audio & video](#)
- [Recording & transcription](#)
- [Content sharing](#)
- [Participants & guests](#)

Related topics

- [Teams PowerShell overview](#)

Meeting policy settings - General

12/7/2021 • 7 minutes to read • [Edit Online](#)

This article describes the following general policy settings for Teams meetings:

- [Meet now in channels](#)
- [Outlook add-in](#)
- [Channel meeting scheduling](#)
- [Private meeting scheduling](#)
- [Meet now in private meetings](#)
- [Designated presenter role mode](#)
- [Engagement report](#)
- [Meeting registration](#)
- [Who can register](#)
- [Meeting provider for Islands mode](#)

Meet now in channels

This is a per-user policy and applies before a meeting starts. This setting controls whether a user can start an ad hoc meeting in a Teams channel. If you turn this on, users can click the **Meet** button to start an ad hoc meeting or schedule a meeting in the channel. The default value is True.

Outlook add-in

This is a per-user policy and applies before a meeting starts. This setting controls whether Teams meetings can be scheduled from within Outlook (Windows, Mac, web, and mobile).

If you turn this off, users are unable to schedule Teams meetings when they create a new meeting in Outlook. For example, in Outlook on Windows, the **New Teams Meeting** option won't show up in the ribbon.

Channel meeting scheduling

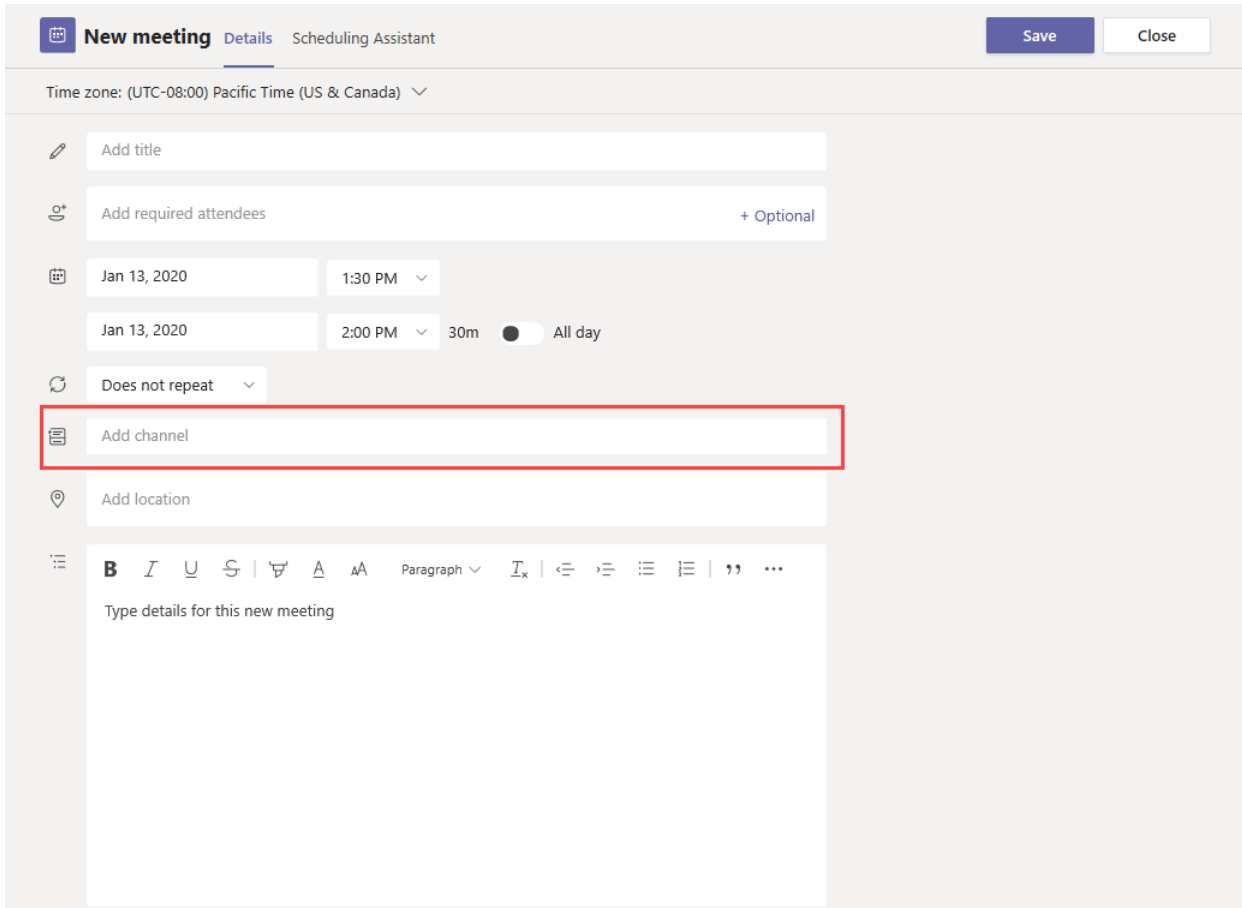

Use the existing AllowChannelMeetingScheduling policy to control the types of events that can be created on the team channel calendars. This is a per-user policy and applies before a meeting starts. This setting controls whether users can schedule a meeting in a Teams channel. By default, this setting is turned on.

If this policy is turned off, users will not be able to create new channel meetings. However, existing channel meetings can be edited by the organizer of the event.

Schedule a meeting will be disabled.

Channel selection is disabled.

In the channel posts page, the following will be disabled:

- **Schedule a meeting** button on the channel reply compose box.

- **Schedule a meeting** button on the channel header.

In the channel calendar:

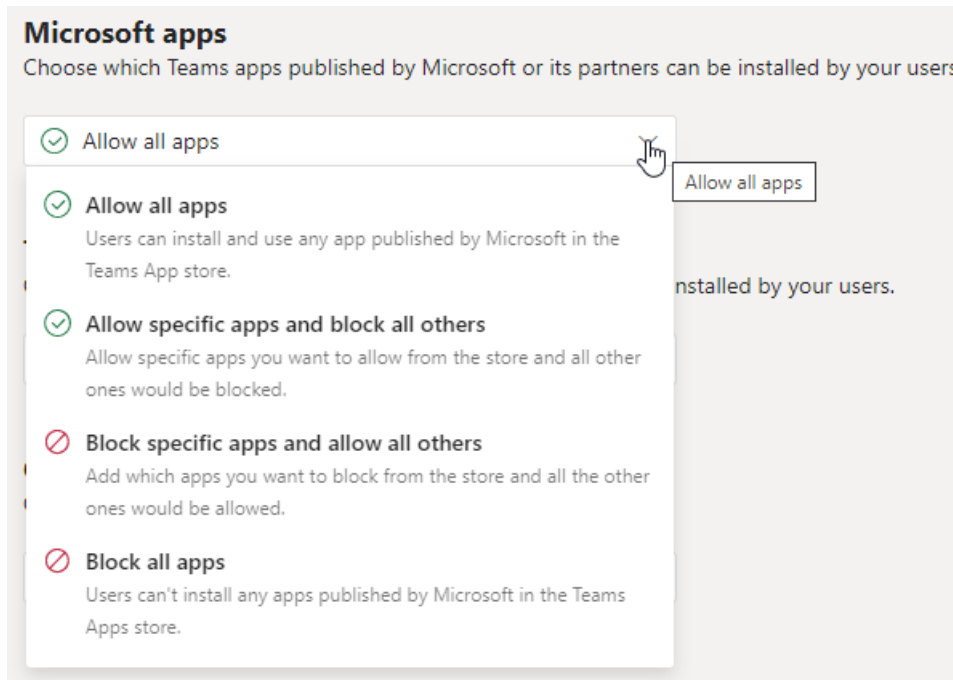

- **Add new event** button on channel calendar header will be disabled.

- Users will not be able to drag and select a time block on the channel calendar to create a channel meeting.
- Users cannot use Keyboard shortcuts to create a meeting on the channel calendar.

In the admin center:

The channel calendar app will show up in the **Microsoft apps** section on the app permission policies page.

Private meeting scheduling

This is a per-user policy and applies before a meeting starts. This setting controls whether users can schedule private meetings in Teams. A meeting is private when it's not published to a channel in a team.

Note that if you turn off **Allow scheduling private meetings** and **Allow channel meeting scheduling**, the **Add required attendees** and **Add channel** options are disabled for users in Teams. By default, this setting is turned on.

Meet now in private meetings

This is a per-user policy and applies before a meeting starts. This setting controls whether a user can start an ad hoc private meeting. By default, this setting is turned on.

Designated presenter role mode

This is a per-user policy. This setting lets you change the default value of the **Who can present?** setting in **Meeting options** in the Teams client. This policy setting affects all meetings, including Meet Now meetings.

The **Who can present?** setting lets meeting organizers choose who can be presenters in a meeting. To learn more, see [Change participant settings for a Teams meeting](#) and [Roles in a Teams meeting](#).

Currently, you can only use PowerShell to configure this policy setting. You can edit an existing Teams meeting policy by using the [Set-CsTeamsMeetingPolicy](#) cmdlet. Or, create a new Teams meeting policy by using the [New-CsTeamsMeetingPolicy](#) cmdlet and assign it to users.

To specify the default value of the **Who can present?** setting in Teams, set the **DesignatedPresenterRoleMode** parameter to one of the following:

- **EveryoneUserOverride:** All meeting participants can be presenters. This is the default value. This parameter corresponds to the **Everyone** setting in Teams.
- **EveryoneInCompanyUserOverride:** Authenticated users in the organization, including guest users, can be presenters. This parameter corresponds to the **People in my organization** setting in Teams.
- **OrganizerOnlyUserOverride:** Only the meeting organizer can be a presenter and all meeting participants are designated as attendees. This parameter corresponds to the **Only me** setting in Teams.

Keep in mind that after you set the default value, meeting organizers can still change this setting in Teams and choose who can present in the meetings that they schedule.

Engagement report

This is a per-user policy. This setting controls whether meeting organizers can download the [meeting attendance report](#).

This policy is off by default and allows your organizers to see who registered and attended the meetings and webinars they set up. To turn this on in the Teams admin center, go to **Meetings > Meeting policies**, and set the policy to **Enabled**.

You can edit an existing Teams meeting policy by using the [Set-CsTeamsMeetingPolicy](#) cmdlet. Or, create a new Teams meeting policy by using the [New-CsTeamsMeetingPolicy](#) cmdlet and assign it to users.

To enable a meeting organizer to download the meeting attendance report, set the **AllowEngagementReport** parameter to **Enabled**. When enabled, the option to download the report is displayed in the **Participants** pane. By default, this setting is not enabled.

To prevent a meeting organizer from downloading the report, set the parameter to **Disabled**.

Meeting registration

This is a per-user policy. If you turn this on, users in your organization can set up webinars. This policy is enabled by default.

To edit this policy in the Teams admin center, go to **Meetings > Meeting policies**. To turn off meeting registration, set the policy to **Off**.

You can edit an existing Teams meeting policy by using the [Set-CsTeamsMeetingPolicy](#) cmdlet. Or, create a new Teams meeting policy by using the [New-CsTeamsMeetingPolicy](#) cmdlet and assign it to users.

To turn on meeting registration, set the **MeetingRegistration** parameter to **True**. This is set to **True** by default.

To turn off meeting registration and prevent users from scheduling webinars, set the parameter to **False**.

Who can register

This policy controls which users can register and attend webinars. This policy has two options, which are only available if **Meeting registration** is turned on.

- Set **Who can register** to **Everyone** if you want to allow everyone, including anonymous users, to register and attend webinars that users in your organization set up.
- Set **Who can register** to **Everyone in the organization** if you want to allow only the users in your organization to register and attend webinars.

By default, **Who can register** is set to **Everyone**. To edit this policy in the Teams admin center, go to **Meetings > Meeting policies**.

You can edit an existing Teams meeting policy by using the [Set-CsTeamsMeetingPolicy](#) cmdlet. Or, create a new

Teams meeting policy by using the [New-CsTeamsMeetingPolicy](#) cmdlet and assign it to users.

To allow everyone, including anonymous users, to register and attend webinars, set the **WhoCanRegister** parameter to **Everyone**. This is set to **Everyone** by default.

To allow only users in your organization to register and attend webinars, set the parameter to **EveryoneInCompany**.

Meeting provider for Islands mode

This is a per-user policy. This setting controls which Outlook meeting add-in is used for *users who are in Islands mode*. You can specify whether users can only use the Teams Meeting add-in or both the Teams Meeting and Skype for Business Meeting add-ins to schedule meetings in Outlook.

You can only apply this policy to users who are in Islands mode and have the **AllowOutlookAddIn** parameter set to **True** in their Teams meeting policy.

Currently, you can only use PowerShell to set this policy. You can edit an existing Teams meeting policy by using the [Set-CsTeamsMeetingPolicy](#) cmdlet. Or, create a new Teams meeting policy by using the [New-CsTeamsMeetingPolicy](#) cmdlet and assign it to users.

To specify which meeting add-in you want to be available to users, set the **PreferredMeetingProviderForIslandsMode** parameter as follows:

- Set the parameter to **TeamsAndSfB** to enable both the Teams Meeting add-in and Skype for Business add-in in Outlook. This is the default value.
- Set the parameter to **Teams** to enable only the Teams Meeting add-in in Outlook. This policy setting ensures that all future meetings have a Teams meeting join link. It doesn't migrate existing Skype for Business meeting join links to Teams. This policy setting doesn't affect presence, chat, PSTN calling, or any other capabilities in Skype for Business, which means that users will continue to use Skype for Business for these capabilities.

If you set the parameter to **Teams**, and then switch back to **TeamsAndSfB**, both meeting add-ins are enabled. However, note that existing Teams meeting join links won't be migrated to Skype for Business. Only Skype for Business meetings scheduled after the change will have a Skype for Business meeting join link.

Meeting reactions

The **AllowMeetingReactions** setting can only be applied using PowerShell. There is no option to toggle **AllowMeetingReactions** on or off from the Teams admin center.

Meeting reactions are Off by default. Turning off reactions for a user doesn't mean that a user can't use reactions in meetings they schedule. The meeting organizer can still turn on reactions from the meeting option page, regardless of the default setting.

Meeting policy settings for audio & video

12/7/2021 • 9 minutes to read • [Edit Online](#)

This article describes the meeting policy settings specific to audio and video. These include the following:

- [Mode for IP audio](#)
- [Mode for IP video](#)
- [IP video](#)
- [Media bit rate \(Kbs\)](#)
- [Video filters mode](#)
- [Allow custom background settings](#)

Mode for IP audio

This is a per-user policy. This setting controls whether audio can be turned on in meetings and group calls. Here are the values for this setting.

SETTING VALUE	BEHAVIOR
Outgoing and incoming audio enabled	Outgoing and incoming audio is allowed in the meeting. This is the default setting.
Disabled	Outgoing and incoming audio is turned off in the meeting.

If set to **Disabled** for a user, that user can still schedule and organize meetings but they can't use audio. To join a meeting, they have to dial in through the Public Switched Telephone Network (PSTN) or have the meeting call and join them by phone. Meeting participants who don't have any policies assigned (for example, anonymous participants) have this set to **Outgoing and incoming audio enabled** by default. On Teams mobile clients, if this setting is disabled, the user has to dial in to the meeting through the PSTN.

This setting doesn't apply to 1:1 calls. To restrict 1:1 calls, configure a Teams [calling policy](#) and turn off the **Make private calls** setting. This setting also doesn't apply to conference room devices such as Surface Hub and Microsoft Teams Rooms devices.

This setting isn't yet available for Microsoft 365 Government Community Cloud (GCC), GCC High, or Department of Defense (DoD) environments.

To learn more, see [Manage audio/video for meeting participants](#).

Mode for IP video

This is a per-user policy. This setting controls whether video can be turned on in meetings and group calls. Here are the values for this setting.

SETTING VALUE	BEHAVIOR
Outgoing and incoming video enabled	Outgoing and incoming video is allowed in the meeting. This is the default setting.

SETTING VALUE	BEHAVIOR
Disabled	<p>Outgoing and incoming video is turned off in the meeting. On Teams mobile clients, users can't share videos or photos in the meeting.</p> <p>Note that if Mode for IP audio is disabled, then Mode for IP video will also remain disabled.</p>

If set to **Disabled** for a user, that user can't turn on video or view videos shared by other meeting participants. Meeting participants who don't have any policies assigned (for example, anonymous participants) have this set to **Outgoing and incoming video enabled** by default.

This setting doesn't apply to conference room devices such as Surface Hub and Microsoft Teams Rooms devices.

This setting isn't yet available for Microsoft 365 Government Community Cloud (GCC), GCC High, or Department of Defense (DoD) environments.

NOTE

Keep in mind that this setting controls both outgoing and incoming video whereas the **IP video** setting controls outgoing video. To learn more, see [Which IP video policy setting takes precedence?](#) and [Manage audio/video for meeting participants](#).

To learn more, see [Manage audio/video for meeting participants](#).

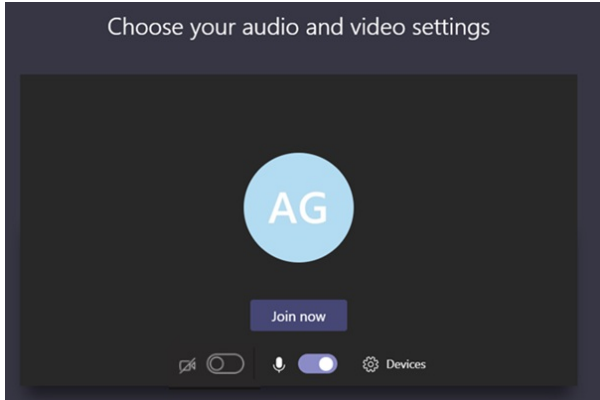

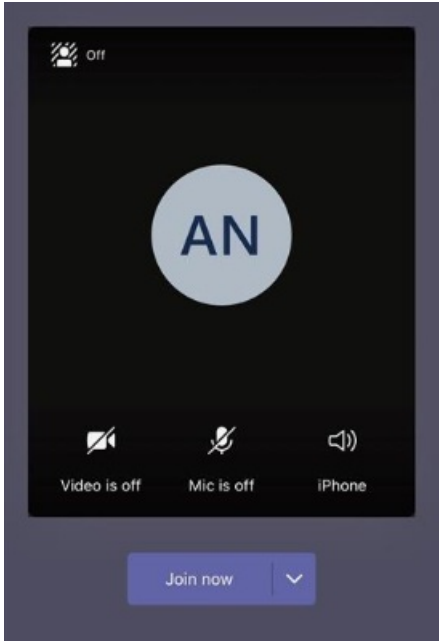

IP video

This is a combination of a per-organizer and per-user policy. Video is a key component to meetings. In some organizations, admins might want more control over which users' meetings have video. This setting controls whether video can be turned on in meetings hosted by a user and in 1:1 and group calls started by a user. On Teams mobile clients, this setting controls whether users can share photos and videos in a meeting.

Meetings organized by a user who has this policy setting enabled, allow video sharing in the meeting by the meeting participants, if the participants also have the policy setting enabled. Meeting participants who don't have any policies assigned (for example, anonymous and federated participants) inherit the policy of the meeting organizer.

NOTE

Keep in mind that this setting controls outgoing video whereas the **Mode for IP video** setting controls both outgoing and incoming video. To learn more, see [Which IP video policy setting takes precedence?](#) and [Manage audio/video for meeting participants](#).

TEAMS DESKTOP AND WEB CLIENT	TEAMS MOBILE CLIENT
	

Let's look at the following example.

USER	MEETING POLICY	IP VIDEO
Daniela	Global	On
Amanda	Location1MeetingPolicy	Off

Meetings hosted by Daniela allow video to be turned on. Daniela can join the meeting and turn on video. Amanda can't turn on video in Daniela's meeting because Amanda's policy is set to not allow video. Amanda can see videos shared by other participants in the meeting.

In meetings hosted by Amanda, no one can turn on video, regardless of the video policy assigned to them. This means Daniela can't turn on video in Amanda's meetings.

If Daniela calls Amanda with video on, Amanda can answer the call with audio only. When the call is connected, Amanda can see Daniela's video, but can't turn on video. If Amanda calls Daniela, Daniela can answer the call with video and audio. When the call is connected, Daniela can turn on or turn off her video, as needed.

To learn more, see [Manage audio/video for meeting participants](#).

Which IP video policy setting takes precedence?

For a user, the most restrictive policy setting for video takes precedence. Here's some examples.

IP VIDEO	MODE FOR IP VIDEO	MEETING EXPERIENCE
Organizer: On Participant: On	Participant: Disabled	The Mode for IP video setting takes precedence. The participant who is assigned this policy can't turn on or view videos shared by others.
Organizer: On Participant: On	Participant: Outgoing and incoming video enabled	The participant who is assigned this policy can turn on or view videos shared by others.

IP VIDEO	MODE FOR IP VIDEO	MEETING EXPERIENCE
Organizer: On Participant: Off	Participant: Outgoing and incoming video enabled	The IP video setting takes precedence. Participants can only see incoming video and can't send outgoing video.
Organizer: On Participant: Off	Participant: Disabled	The Mode for IP video setting takes precedence. The participant can't see incoming or outgoing video.
Organizer: Off		The IP video setting takes precedence because it's turned off for the organizer. No one can turn on video in meetings organized by the user who is assigned this policy.

Manage audio/video for meeting participants

IF YOU WANT TO...	SET THE FOLLOWING POLICY SETTINGS
Disable audio and video for participants in meetings	Mode for IP audio: Disabled Mode for IP video: Disabled IP video: N/A
Enable only incoming video and audio for participants in meetings	Mode for IP audio: Outgoing and incoming audio enabled Mode for IP video: Outgoing and incoming video enabled IP video: Off
Disable video for participants in meetings (participants have audio only)	Mode for IP audio: Enable outgoing and incoming audio Mode for IP video: Disabled IP video: N/A
Enable audio and video for participants in meetings	Mode for IP audio: Outgoing and incoming audio enabled (default) Mode for IP video: Outgoing and incoming video enabled (default) IP video: On (default)

The most restrictive policy between the meeting organizer's policy and the user's policy applies. For example, if an organizer has a policy that restricts video and a user's policy doesn't restrict video, meeting participants inherit the policy of the meeting organizer and don't have access to video in meetings. This means that they can join the meeting with audio only.

NOTE

When a user starts a group call to join by phone, the **Use phone for audio** screen doesn't appear. This is a known issue that we're working to resolve. To work around this issue, select **Phone audio** under **Other join options**.

Teams mobile clients

For users on Teams mobile clients, the ability to share photos and videos during a meeting is also determined by the **IP video** or **IP video mode** setting. Depending on which policy setting takes precedence, the ability to share videos and photos won't be available. This doesn't affect screen sharing, which you configure using a separate [Screen sharing mode](#) setting. Additionally, you can set a [Teams mobility policy](#) to prevent mobile users

from using IP video over a cellular connection, which means they must use a WiFi connection.

Media bit rate (Kbs)

This is a per-user policy. This setting determines the media bit rate for audio, video, and video-based app sharing transmissions in calls and meetings for the user. It's applied to both the uplink and downlink media traversal for users in the call or meeting. This setting gives you granular control over managing bandwidth in your organization. Depending on the meetings scenarios required by users, we recommend having enough bandwidth in place for a good quality experience. The minimum value is 30 Kbps and the maximum value depends on the meeting scenario. To learn more about the minimum recommended bandwidth for good quality meetings, calls, and live events in Teams, see [Bandwidth requirements](#).

If there isn't enough bandwidth for a meeting, participants see a message that indicates poor network quality.

For meetings that need the highest-quality video experience, such as CEO board meetings and Teams live events, we recommend you set the bandwidth to 10 Mbps. Even when the maximum experience is set, the Teams media stack adapts to low-bandwidth conditions when certain network conditions are detected, depending on the scenario.

Video filters mode

This is a per-user policy. This setting controls whether users can customize their video background in a meeting.

You can use both Teams admin center and PowerShell to set this policy. You can edit an existing Teams meeting policy by using the [Set-CsTeamsMeetingPolicy](#) cmdlet. Or, create a new Teams meeting policy by using the [New-CsTeamsMeetingPolicy](#) cmdlet, and then assign the policy to users.

To specify whether users can customize their video background in a meeting, set the **VideoFiltersMode** parameter (**Select video filters** setting in Teams admin center) as follows:

SETTING VALUE IN POWERSHELL	SETTING VALUE IN TEAMS ADMIN CENTER	BEHAVIOR
NoFilters	No filter	User can't customize their video background.
BlurOnly	Background blur only	User has the option to blur their video background.
BlurandDefaultBackgrounds	Background blur and default images	User has the option to blur their video background or choose from the default set of images to use as their background.
AllFilters	All filters	User has the option to blur their video background, choose from the default set of images, or upload custom images to use as their background.

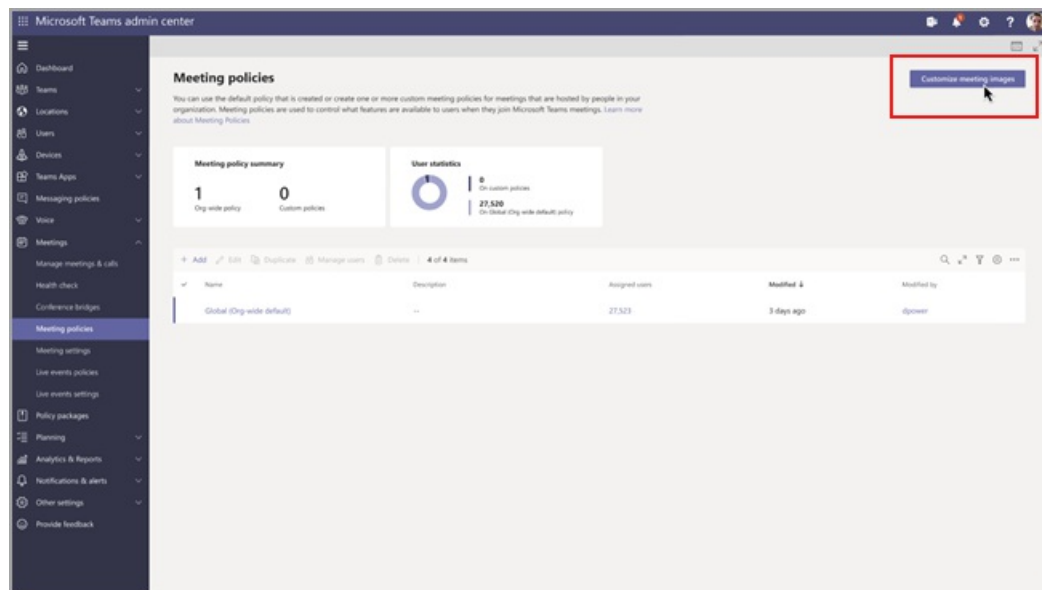

NOTE

Images uploaded by users aren't screened by Teams. When you use the **AllFilters** setting, you should have internal organization policies to prevent users from uploading offensive or inappropriate images, or images your organization don't have rights to use for Teams meeting backgrounds.

Allow custom background settings

You can add custom background images to be used per tenant. This feature allows companies to apply corporate branding to Teams meetings.

1. Sign in to the Teams admin center.
2. Select **Meetings > Meeting Policies > Customize meeting images**.

3. Select **On** from **Org wide background images**.
4. Select **+ Add images**.
5. In the Managing backgrounds panel, select **Add image**.
6. Ensure that the images meet these requirements:
 - Minimum size 360 px
 - Maximum size 2048 px
 - File type of PNG, JPG, or BMP
 - Maximum 50 images can be uploaded
7. Preview the images that you've selected, and then select **Close**.
8. Review the images and add more as needed.
9. Select **Save**.

The meeting attendees will see a selection of background images that they can use when they attend a meeting.

NOTE

It could take up to 24 hours for the changes to take effect.

Meeting policy settings for recording & transcription

12/7/2021 • 2 minutes to read • [Edit Online](#)

This article describes the meeting policy settings specific to recording and transcription including the following:

- [Allow transcription](#)
- [Allow cloud recording](#)
- [Store recordings outside of your country or region](#)

Allow transcription

This is a combination of a per-organizer and per-user policy. This setting controls whether captions and transcription features are available during playback of meeting recordings. If you turn off this setting, the **Search** and **CC** options won't be available during playback of a meeting recording. The person who started the recording needs this setting turned on so that the recording also includes transcription.

Transcription for recorded meetings is currently only supported for users who set their language to or speak English in Teams meetings.

Allow cloud recording

This setting is a combination of a per-organizer and per-user policy and controls whether the meetings can be recorded. The recording can be started by the meeting organizer or by another meeting participant if the policy setting is turned on for the participant and if they're an authenticated user from the same organization.

People outside your organization, such as federated and anonymous users, can't start the recording. Guest users can't start or stop the recording.

Let's look at the following example.

USER	MEETING POLICY	ALLOW CLOUD RECORDING
Daniela	Global	Off
Amanda	Location1MeetingPolicy	On
John (external user)	Not applicable	Not applicable

- Meetings organized by Daniela can't be recorded.
- Amanda can't record meetings organized by Daniela.
- Meetings organized by Amanda can be recorded.
- Daniela can't record meetings organized by Amanda.
- John can't record meetings organized by Amanda.

To learn more about cloud meeting recording, see [Teams cloud meeting recording](#).

Store recordings outside of your country or region

This policy controls whether meeting records can be permanently stored in another country or region. If it's enabled, the recordings can't be migrated. For more information on cloud meetings and where recordings are stored, see [Teams cloud meeting recording](#).

Meeting policy settings - Content sharing

12/7/2021 • 4 minutes to read • [Edit Online](#)

This article describes the following meeting policy settings related to content sharing:

- [Screen sharing mode](#)
- [Allow a participant to give or request control](#)
- [Allow an external participant to give or request control](#)
- [PowerPoint sharing](#)
- [Whiteboard](#)
- [Shared notes](#)

Screen sharing mode

This setting is a combination of a per-organizer and per-user policies. This setting controls whether desktop and window sharing is allowed in the user's meeting. Meeting participants who don't have any policies assigned (for example, anonymous, guest, B2B, and federated participants) inherit the policy of the meeting organizer.

SETTING VALUE	BEHAVIOR
Entire screen	Full desktop sharing and application sharing are allowed in the meeting
Single application	Application sharing is allowed in the meeting
Disabled	Screen sharing and application sharing turned off in the meeting.

Let's look at the following example.

USER	MEETING POLICY	SCREEN SHARING MODE
Daniela	Global	Entire screen
Amanda	Location1MeetingPolicy	Disabled

Meetings hosted by Daniela allow meeting participants to share their entire screen or a specific application. If Amanda joins Daniela's meeting, Amanda can't share her screen or a specific application as her policy setting is disabled. In meetings hosted by Amanda, no one is allowed to share their screen or a single application, regardless of the screen sharing mode policy assigned to them. Consequently, Daniela can't share her screen or a single application in Amanda's meetings.

Currently, users can't play video or share their screen in a Teams meeting if they're using Google Chrome.

Allow a participant to give or request control

This setting is a per-user policy. This setting controls whether the user can give control of the shared desktop or window to other meeting participants. To give control, hover over the top of the screen.

If this setting is turned on for the user, the **Give Control** option is displayed in the top bar in a sharing session.

If the setting is turned off for the user, the **Give Control** option isn't available.

Let's look at the following example.

USER	MEETING POLICY	ALLOW PARTICIPANT TO GIVE OR REQUEST CONTROL
Daniela	Global	On
Babek	Location1MeetingPolicy	Off

Daniela can give control of the shared desktop or window to other participants in a meeting organized by Babek. However, Babek can't give control to other participants.

To use PowerShell to control who can give control or accept requests for control, use the `AllowParticipantGiveRequestControl` cmdlet.

NOTE

To give and take control of shared content during sharing, both parties must be using the Teams desktop client. Control isn't supported when either party is running Teams in a browser. This is due to a technical limitation that we're planning to fix.

Allow an external participant to give or request control

This setting is a per-user policy. Whether an organization has set this policy for a user doesn't control what external participants can do, regardless of what the meeting organizer has set. This parameter controls whether external participants can be given control or request control of the sharer's screen, depending on what the sharer has set within their organization's meeting policies. External participants in Teams meetings can be categorized as follows:

- Anonymous user
- Guest users
- B2B user
- Federated user

Whether federated users can give control to external users while sharing is controlled by the **Allow an external participant to give or request control** setting in their organization.

To use PowerShell to control whether external participants can give control or accept requests for control, use the `AllowExternalParticipantGiveRequestControl` cmdlet.

PowerPoint sharing

This is a per-user policy. This setting controls whether the user can share PowerPoint slide decks in a meeting. External users, including anonymous, guest, and federated users, inherit the policy of the meeting organizer.

Let's look at the following example.

USER	MEETING POLICY	POWERPOINT SHARING
Daniela	Global	On
Amanda	Location1MeetingPolicy	Off

Amanda can't share PowerPoint slide decks in meetings even if she's the meeting organizer. Daniela can share PowerPoint slide decks even if the meeting is organized by Amanda. Amanda can view the PowerPoint slide decks shared by others in the meeting, even though she can't share PowerPoint slide decks.

Whiteboard

This setting is a per-user policy. This setting controls whether a user can share the whiteboard in a meeting. External users, including anonymous, B2B, and federated users, inherit the policy of the meeting organizer.

Let's look at the following example.

USER	MEETING POLICY	WHITEBOARD
Daniela	Global	On
Amanda	Location1MeetingPolicy	Off

Amanda can't share the whiteboard in a meeting even if she's the meeting organizer. Daniela can share the whiteboard even if a meeting is organized by Amanda.

Shared notes

This setting is a per-user policy. This setting controls whether a user can create and share notes in a meeting. External users, including anonymous, B2B, and federated users, inherit the policy of the meeting organizer. The **Meeting Notes** tab is currently only supported in meetings that have fewer than 20 participants.

Let's look at the following example.

USER	MEETING POLICY	SHARED NOTES
Daniela	Global	On
Amanda	Location1MeetingPolicy	Off

Daniela can take notes in Amanda's meetings and Amanda can't take notes in any meetings.

- [Remove the RestrictedAnonymousAccess Teams meeting policy from users](#)

Configure desktop sharing in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

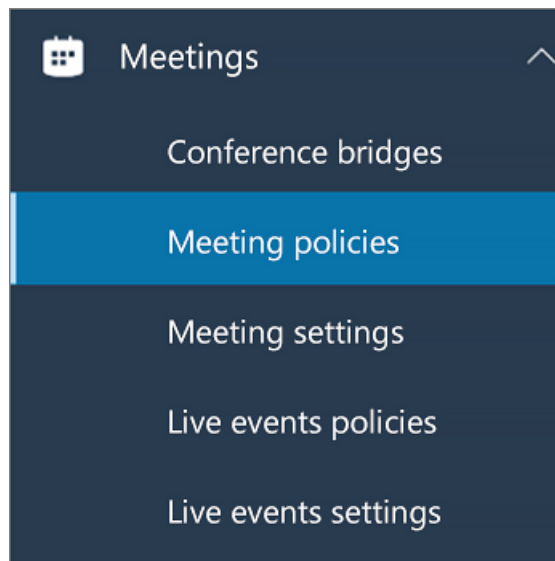

Desktop sharing lets users present a screen or app during a meeting or chat. Admins can configure screen sharing in Microsoft Teams to let users share an entire screen, an app, or a file. You can let users give or request control, allow PowerPoint sharing, add a whiteboard, and allow shared notes. You can also configure whether anonymous or external users can request control of the shared screen. External participants in Teams meetings can be categorized as follows:

- Anonymous user
- Guest users
- B2B user
- Federated user

To configure screen sharing, you create a new meetings policy and then assign it to the users you want to manage.

In the [Microsoft Teams admin center](#)

1. Select **Meetings > Meeting policies**.

2. On the **Meeting policies** page, select **Add**.

Meeting policies

Meeting policies are used to control what features are available to users when they join Microsoft Teams meetings. You can use the Global (Org-wide default) policy and customize it or create one or more custom meeting policies for people that host meetings in your organization. [Learn more](#)

3. Give your policy a unique title and enter a brief description.
4. Under **Content sharing**, choose a **Screen sharing mode** from the drop-down list:
 - **Entire screen** – lets users share their entire desktop.
 - **Single application** – lets users limit screen sharing to a single active application.
 - **Disabled** – Turns off screen sharing.

The 'Content sharing' settings form includes a description, a dropdown for 'Screen sharing mode' (currently set to 'Entire screen'), and several toggle switches for permissions. The dropdown menu is open, showing 'Entire screen', 'Single application', and 'Disabled' options.

Setting	Value
Screen sharing mode	Entire screen
Allow a participant to give or request control	Entire screen
Allow an external participant to give or request control	Single application
Allow PowerPoint sharing	On
Allow whiteboard	On
Allow shared notes	On

NOTE

You don't have to enable the calling policy in order for users to use screen share from chat. However, their audio is turned off until they unmute themselves. In addition, the user sharing the screen can click **Add Audio** to enable audio. If the calling policy is disabled, users won't be able to add audio to the screen share from a chat session.

5. Turn the following settings on or off:
 - **Allow a participant to give or request control** – lets members of the team give or request control of the presenter's desktop or application.
 - **Allow an external participant to give or request control** – This is a per-user policy. Whether an organization has this set for a user doesn't control what external participants can do, regardless of what the meeting organizer has set. This parameter controls whether external participants can be given control or request control of the sharer's screen, depending on what the sharer has set within their organization's meeting policies.
 - **Allow PowerPoint sharing** – lets users create meetings that allow PowerPoint presentations to be uploaded and shared.
 - **Allow whiteboard** – lets users share a whiteboard.

- **Allow shared notes** – lets users take shared notes.

6. Click **Save**.

Use PowerShell to configure shared desktop

You can also use the [Set-CsTeamsMeetingPolicy](#) cmdlet to control desktop sharing. Set the following parameters:

- Description
- ScreenSharingMode
- AllowPrivateCalling
- AllowParticipantGiveRequestControl
- AllowExternalParticipantGiveRequestControl
- AllowPowerPointSharing
- AllowWhiteboard
- AllowSharedNotes

[Learn more about using the csTeamsMeetingPolicy cmdlet.](#)

Meeting policy settings - Participants & guests

12/7/2021 • 4 minutes to read • [Edit Online](#)

These settings control which meeting participants wait in the lobby before they are admitted to the meeting and the level of participation they are allowed in a meeting.

- [Let anonymous people start a meeting](#)
- [Automatically admit people](#)
- [Allow dial-in users to bypass the lobby](#)
- [Live captions](#)
- [Chat in meetings](#)

NOTE

Options to join a meeting will vary, depending on the settings for each Teams group, and the connection method. If your group has audio conferencing, and uses it to connect, see [Audio Conferencing](#). If your Teams group doesn't have audio conferencing, refer to [Join a meeting in Teams](#).

Let anonymous people start a meeting

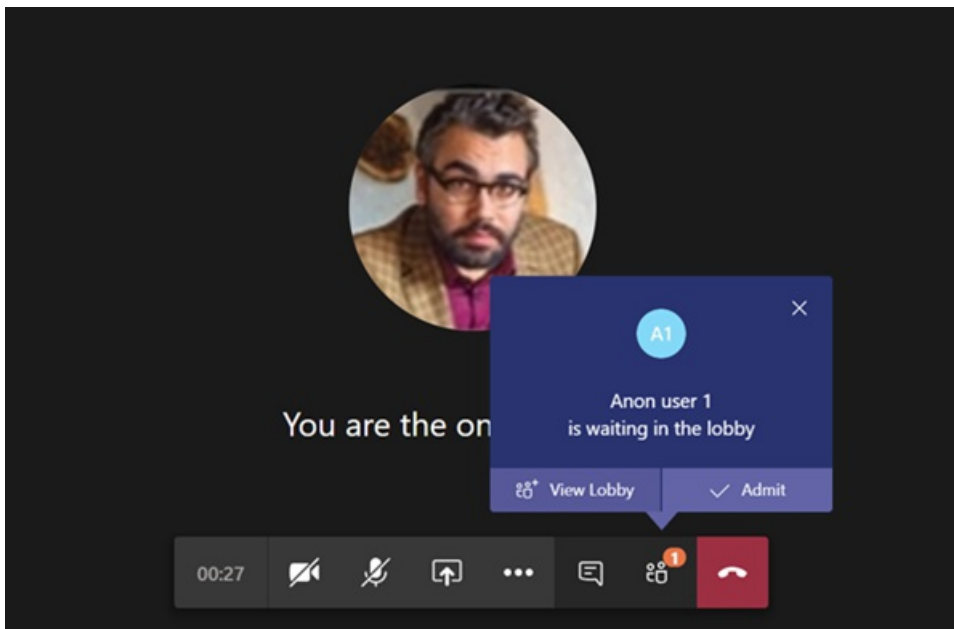

This setting is a per-organizer policy that allows for leaderless dial-in conferencing meetings. This setting controls whether dial-in users can join the meeting without an authenticated user from the organization in attendance. By default, this setting is turned off, which means dial-in users will wait in the lobby until an authenticated user from the organization joins the meeting.

NOTE

If this setting is turned off and a dial-in user joins the meeting first and is placed in the lobby, an organization user must join the meeting with a Teams client to admit the user from the lobby. There are no lobby controls available for dialed in users.

Automatically admit people

This is a per-organizer policy. This setting controls whether people join a meeting directly or wait in the lobby until they are admitted by an authenticated user. This setting does not apply to dial-in users.

Meeting organizers can click **Meeting Options** in the meeting invitation to change this setting for each meeting they schedule.

NOTE

In the meeting options the setting is labeled "Who can bypass the lobby". If you change the default setting for any user, it will apply to all new meetings organized by that user and any prior meetings where the user didn't modify Meeting options.

SETTING VALUE	JOIN BEHAVIOR
Everyone	All meeting participants join the meeting directly without waiting in the lobby. This includes authenticated users, external users from trusted organizations (federated), guests, and anonymous users.
People in my organization and guests	Authenticated users within the organization, including guest users, join the meeting directly without waiting in the lobby. Users from trusted organizations, and anonymous users wait in the lobby. This is the default setting.
People in my organization, trusted organizations, and guests	Authenticated users within the organization, including guest users and the users from trusted organizations, join the meeting directly without waiting in the lobby. Anonymous users wait in the lobby.
People in my organization	Authenticated users from within the organization join the meeting directly without waiting in the lobby. Users from trusted organizations, guest users, and anonymous users wait in the lobby.
Organizer only	Only meeting organizers can join the meeting directly without waiting in the lobby. Everyone else, including authenticated users within the organization, guest users, users from trusted organizations, and anonymous users must wait in the lobby. On the Teams client meeting options page, it appears as "Only me".

SETTING VALUE	JOIN BEHAVIOR
Invited users only	Only invited users and meeting organizers can join the meeting directly without waiting in the lobby. Everyone else, including authenticated users within the organization, guest users, users from trusted organizations, and anonymous users must wait in the lobby. On the Teams client meeting options page, it appears as "People I invite". Users added as a part of a distribution group will have to go through the lobby.

NOTE

Trusted organizations are domains that you allow federated communications with in Teams. If you enable **Allow all external domains** for external access in the Teams admin center, any authenticated user within any Teams organization will be trusted. If you choose to specify external domains that are allowed and block all others, the allowed domains become trusted organizations. Any blocked domain is considered to not be a trusted organization.

Allow dial-in users to bypass the lobby

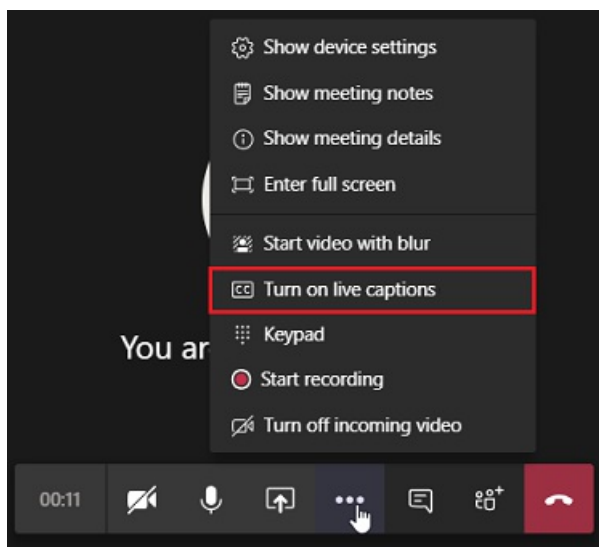

This is a per-organizer policy. This setting controls whether people who dial in by phone join the meeting directly or wait in the lobby regardless of the **Automatically admit people** setting. By default, this setting is turned off. When this setting is turned off, dial-in users will wait in the lobby until an organization user joins the meeting with a Teams client and admits them. When this setting is turned on, dial-in users will automatically join the meeting when an organization user joins the meeting.

NOTE

If a dial-in user joins a meeting before an organization user joins the meeting, they will be placed in the lobby until an organization user joins the meeting using a Teams client and admits them. If you change the default setting for any user, it will apply to all new meetings organized by that user and any prior meetings where the user didn't modify Meeting options.

Live captions

This setting is a per-user policy and applies during a meeting. This setting controls whether the **Turn on live captions** option is available for the user to turn on and turn off live captions in meetings that the user attends.

SETTING VALUE	BEHAVIOR
Disabled but the user can override	Live captions aren't automatically turned on for the user during a meeting. The user sees the Turn on live captions option in the overflow (...) menu to turn them on. This is the default setting.
Disabled	Live captions are disabled for the user during a meeting. The user doesn't have the option to turn them on.

Chat in meetings

This setting is a per-participant setting. This setting controls whether meeting chat is allowed in the user's meeting.

- [Remove the RestrictedAnonymousAccess Teams meeting policy from users](#)

Remove the RestrictedAnonymousAccess Teams meeting policy from users

12/7/2021 • 2 minutes to read • [Edit Online](#)

[Meeting policies](#) in Microsoft Teams are used to control the features that are available to meeting participants for meetings that are scheduled by users in your organization.

Teams includes a built-in policy named `RestrictedAnonymousAccess`, which contains pre-defined settings that include restricting anonymous users from starting a meeting. (Anonymous users are users who haven't been authenticated.) The predefined settings in the meeting policy can't be edited or changed by admins.

This article shows you how to use PowerShell to remove the `RestrictedAnonymousAccess` meeting policy from users who are assigned this policy. To learn more about how to manage Teams using PowerShell, see [Teams PowerShell overview](#).

Before you start

Install and connect to the [Skype for Business PowerShell module](#). For step-by-step guidance, see [Install Microsoft Teams PowerShell](#).

Get the Teams meeting policy assignments for your organization

Run the following to get the Teams meeting policy assignments for your organization.

```
Get-CsOnlineUser | Select-Object objectid, TeamsMeetingPolicy | Group-Object TeamsMeetingPolicy
```

In this example, the following output is returned, which shows that two users are assigned the `RestrictedAnonymousAccess` meeting policy.

Count	Name	Group
-----	-----	-----
233	Education_HigherEducationStudent	{@{ObjectId=755e0d21-0737-4219-b68a-23423497f61f; TeamsMeetingPolicy=Education_HigherEducationStudent...
20		{@{ObjectId=e27fdfb5-bb38-4032-bb33-8e8bdf086eff; TeamsMeetingPolicy=}, @{ObjectId=91c330...
2	RestrictedAnonymousAccess	{@{ObjectId=38b35ebf-cc8b-4b61-a2db-f6e67c3f614b; TeamsMeetingPolicy=RestrictedAnonymousAccess...

Unassign the RestrictedAnonymous meeting policy from users

To remove the `RestrictedAnonymous` meeting policy from users, you can use the [Grant-CsTeamsMeetingPolicy](#) cmdlet if you have a small number of users (for example, less than 100 users). If you have a large number of users (for example, more than 100 users), it's more efficient to use the [New-CsBatchPolicyAssignmentOperation](#) cmdlet to submit a batch operation.

Use the Grant-CsTeamsMeetingPolicy cmdlet

Run the following to remove the `RestrictedAnonymous` meeting policy from users.

```
Get-CsOnlineUser |? TeamsMeetingPolicy -eq "RestrictedAnonymousAccess" | Select-Object objectid | foreach
{Grant-CsTeamsMeetingPolicy -Identity $_.ObjectId -PolicyName $null}
```

Use the New-CsBatchPolicyAssignmentOperation cmdlet

With [batch policy assignment](#), the maximum number of users for which you can remove or update policies is 5,000 at a time. For example, if you have more than 5,000 users, you'll need to submit multiple batches. For best results, do not submit multiple batches at a time. Allow batches to complete processing before submitting more batches.

NOTE

The [New-CsBatchPolicyAssignmentOperation](#) cmdlet is in the Teams PowerShell module. Before you follow these steps, install and connect to the [Teams PowerShell module](#). For step-by-step guidance, see [Install Microsoft Teams PowerShell](#).

Run the following commands to remove the RestrictedAnonymousAccess meeting policy from a batch of users.

```
$restrictedAnonymousUsers = @(Get-CsOnlineUser |? TeamsMeetingPolicy -eq "RestrictedAnonymousAccess" | %{
$_.ObjectId })
```

```
New-CsBatchPolicyAssignmentOperation -PolicyType TeamsMeetingPolicy -PolicyName $null -Identity
$restrictedAnonymousUsers -OperationName "Batch unassign meeting policy"
```

Get the status of the batch assignment

Each batch assignment returns an operation ID, which you can use to track the progress and status of the assignments and identify any failures that might occur. For example, run the following:

```
Get-CsBatchPolicyAssignmentOperation -OperationId 62557b78-e734-42d6-952f-41a454ed6115
```

Make sure the **ErrorCount** is 0 (zero) and **OverallStatus** is **Completed**.

Meeting policies and meeting expiration in Microsoft Teams

12/7/2021 • 9 minutes to read • [Edit Online](#)

Meeting policies in Microsoft Teams are used to control whether users in your organization can start and schedule meetings and the features that are available to meeting participants for meetings that are scheduled by users. You can use the global (Org-wide default) policy or create and assign custom policies. You manage meeting policies in the Microsoft Teams admin center or by using [Get](#), [New](#), [Set](#), [Remove](#), [Grant](#) - CsTeamsMeetingPolicy PowerShell cmdlets.

The meeting policy settings that control whether users can start and schedule meetings and also control expiration of meetings scheduled by users. When a meeting join link and conference ID for a meeting expires, no one can join the meeting. The following meeting policy settings determine whether users can start and schedule meetings in Teams. We discuss the meeting settings in this article.

- **Meet now in channels**: Controls whether a user can start an impromptu meeting in a channel.
- **Channel meeting scheduling**: Controls whether a user can schedule a meeting in a channel.
- **Private meeting scheduling**: Controls whether a user can schedule a private meeting in Teams. A meeting is private when it's not published to a channel in a team.
- **Outlook add in**: Controls whether a user can schedule a private meeting from Outlook. A meeting is private when it's not published to a channel in a team.
- **Meet now in private meetings**: Controls whether a user can start an impromptu private meeting.

By default, these settings are on. When any of these settings are turned off, any user who is assigned the policy can't start or schedule new meetings of that type. At the same time, the meeting join links and conference IDs of all existing meetings of that type that the user previously started or scheduled expire.

For example, if a user is assigned a meeting policy in which these meeting policy settings are set to **On**, and then you turn off the **Allow Meet now in channels** setting, that user can no longer start impromptu meetings in channels, and the channel Meet now join links that the user previously created are expired. The user can still start and schedule other meeting types and join meetings organized by other people.

What happens when the meeting join link and conference ID expire?

When the meeting join link and conference ID for a meeting expires, no one can join the meeting. When a user tries to join the meeting through the link or by phone, they'll get a message that says the meeting is no longer available. Conversations, files, whiteboards, recordings, transcripts, and other content related to the meeting are retained and users can still access them.

What happens when you turn on and turn off a meeting policy setting?

Switch a meeting policy setting from on to off

When a meeting policy setting is set to **On**, users who are assigned the policy can start or schedule meetings of that type and everyone can join. When you switch the meeting policy setting to **Off**, users who are assigned the policy can't start or schedule new meetings of that type, and the meeting join links and conference IDs of existing meetings that the user previously scheduled are expired.

Keep in mind that the user can still join meetings organized by other people.

Switch a meeting policy setting from off to on

When you switch a meeting policy setting from **Off** to **On**, users who are assigned the policy can start or schedule meetings of that type. If a meeting policy setting is turned off and then turned on again for a user, all previously scheduled (and expired) meetings organized by the user become active and people can join them using the meeting join link or by phone.

Meeting expiration scenarios

Here's a summary of how meeting expiration works for each of the meeting policy settings discussed in this article.

IF YOU WANT TO...	DO THIS	MEETING JOIN BEHAVIOR
Expire private Meet now meetings started by a user	Turn off Meet now in private meetings .	No one can join private Meet now meetings started by the user.
Expire private meetings scheduled by a user	Turn off Private meeting scheduling <i>and</i> turn off Outlook add-in .	<p>No one can join private meetings scheduled by the user. This prevents people from joining the following meetings:</p> <ul style="list-style-type: none">• Private meetings that occurred in the past.• Private meetings that are scheduled for the future and have not yet occurred.• Future instances of recurring private meetings. <p>Both Private meeting scheduling and Outlook add-in must be off to expire private meetings scheduled by a user. If one setting is off and the other is on, meeting join links and conference IDs of existing meetings remain active and won't be expired.</p>
Expire channel Meet now meetings started by a user	Turn off Meet now in channels <i>and</i> turn off Channel meeting scheduling .	No one can join channel Meet now meetings started by the user.
Expire channel meetings scheduled by a user	Turn off Channel meeting scheduling .	<p>No one can join channel meetings scheduled by the user. This prevents people from joining the following meetings:</p> <ul style="list-style-type: none">• Channel meetings that occurred in the past.• Channel meetings that are scheduled for the future and haven't yet occurred.• Future instances of recurring channel meetings.

If you want people to access meetings that were previously scheduled or started by a particular user, you can:

- Turn on the meeting policy setting for that user.
- Turn off the meeting policy setting for that user and have another user who has the policy setting enabled create a new meeting to replace the expired meeting.

NOTE

If the meeting was sent by a delegate, who was given permissions to send meeting invitations on behalf of another person, such as a manager, the meeting policy setting is applied to the person who granted permission (the manager).

Changes to meeting expiration

All newly created Teams meeting recordings (TMRs) will have a default expiration of 60 days. This is on by default for all tenants. This means that by default, all TMRs created *after this feature was turned on* will be deleted 60 days after their creation date. Admins can also set meetings to **never auto-expire**. The OneDrive and SharePoint system will monitor the expiration date set on all TMRs and will automatically move TMRs to the recycle bin on their expiration date.

Automatic meeting expiration is a lightweight housekeeping mechanism to reduce storage clutter created by older TMRs. On average, across all customers, 99% of TMRs aren't watched after 60 days. We believe nearly all customers will benefit from the reduced storage load on their tenant by removing recordings that likely won't be watched again after 60 days. It's our goal to provide as clean an experience as possible for all customers by default.

Use meeting expiration to limit the OneDrive or SharePoint for cloud storage consumption driven by Teams meeting records. A typical meeting recording consumes around 400 MB per hour of recording.

NOTE

The maximum default expiration date for A1 users is 30 days.

Expiration date

- The expiration date is calculated as the **day it's created** plus the **default number of days set in the Teams policy by the admin**.
- Playback doesn't impact the expiration date.

Change the default expiration date

Admins can edit the default expiration setting in PowerShell or the Teams admin center. Any changes will only effect *newly created* TMRs from that point forward. It won't impact any recordings created before that date. Admins can't change the expiration date on existing TMRs. This is done to protect the decision of the user that owns the TMR. Both meetings and calls can be controlled by this setting.

The expiration date value can be set as follows:

- Minimum value: **1 day**
- Maximum value: **99,999 days**
- You can also set the expiration date to **-1** so the recordings never expire.

Example PowerShell command:

```
Set-CsTeamsMeetingPolicy -Identity Global -NewMeetingRecordingExpirationDays 50
```

You can set the expiration date in the Teams admin center under **Meeting policies**. After you turn on **Meetings automatically expire**, you'll get the option to set a recording expiration.

Recording & transcription

Recording and transcription settings let you control how these features are used in a Teams meeting. [Learn more.](#)

Transcription ⓘ	<input type="checkbox"/> Off
Cloud recording	<input checked="" type="checkbox"/> On
Meetings automatically expire ⓘ	<input checked="" type="checkbox"/> On
Default expiration time	<input type="text" value="45"/>
Store recordings outside of your country or region ⓘ	<input type="checkbox"/> Off

Security and compliance

Should I rely on this feature for strict security and compliance adherence?

No, you shouldn't rely on this for legal protection since end users can modify the expiration date of any recordings they control.

Will a retention and/or deletion policy I've set in the Security & Compliance center override the Teams meeting recording expiration setting?

Yes, any policies you have set in the compliance center will take full precedence.

For example:

- If you have a policy that says all files in a site must be retained for 100 days, and the expiration setting for a Teams meeting recording is 30 days, then the recording will be retained for the full 100 days.
- If you have a deletion policy that says all Teams meeting recordings will be deleted after five days and you have an expiration setting for a Teams meeting recording of 30 days, then the recording will be deleted after five days.

Will this feature enforce file retention?

No, files won't be retained due to this feature or its settings. If a user with delete permissions attempts to delete a TMR that has an expiration setting, that user's delete action will be executed.

What SKUs are required for this feature?

- All SKUs will have this feature by default.
- A1 users will be defaulted to a maximum 30-day expiration period, but they can change the expiration date as needed.

What if I want the admin to have full control over the lifecycle of meeting recordings and don't want to give end users the ability to override the expiration date?

We recommend using the Security and Compliance retain and/or delete policies. That offering is targeted to solve complex policy and SLA-driven administrative legal concerns.

The auto-expiration feature is solely meant as a lightweight housekeeping mechanism to reduce storage clutter created from old Teams meeting recordings.

Will future TMRs migrated from Classic Stream after this feature is released have auto-expiration applied to them too?

No, migrated TMRs will not come with an expiration set on them. Instead, we encourage admins to only migrate TMRs that they want to retain. More details will be provided in the migration documentation.

How is this feature different from the expiration message I see when a TMR upload to OneDrive and SharePoint fails?

When a recording fails to upload to OneDrive or SharePoint, the Teams application displays a message in the chat that users have up to 21 days to download the TMR before it's permanently deleted from the Teams server. This existing expiration experience due to failed TMR uploads is not related to the OneDrive and SharePoint auto-expiration feature being discussed in the help document.

[Teams PowerShell overview](#)

Manage meeting settings in Microsoft Teams

12/7/2021 • 7 minutes to read • [Edit Online](#)

As an admin, you use Teams meetings settings to control whether anonymous users can join Teams meetings, customize meeting invitations, and if you want to enable Quality of Service (QoS), set port ranges for real-time traffic. These settings apply to all Teams meetings that users schedule in your organization. You manage these settings from **Meetings > Meeting settings** in the Microsoft Teams admin center.

Through a per-organizer policy setting, admins now can control whether specific users or groups of users can let anonymous users join the meetings they organize. The per-organizer and organization-wide policy settings both control anonymous join, and the more restrictive takes effect.

IMPORTANT

-**DisableAnonymousJoin** is the organization-wide policy setting. It will be deprecated in the future, and then the per-organizer policy will be the only way to control anonymous join.

Allow anonymous users to join meetings

With anonymous join, anyone can join the meeting as an anonymous user by clicking the link in the meeting invitation. To learn more, see [Join a meeting without a Teams account](#). You can control anonymous users' ability to join meetings either at your organization level, or per meeting organizer by using two different policy settings.

Using the Microsoft Teams admin center to configure organization-wide policy

You must be a Teams admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. Go to the [Teams admin center](#).
2. In the left navigation, go to **Meetings > Meeting settings**.
3. Under **Participants**, turn on **Anonymous users can join a meeting**.

Participants

Anonymous users can join a meeting

Caution

If you don't want anonymous users to join meetings scheduled by users in your organization, turn off this setting.

Using PowerShell to configure per-organizer policy

Admins can now control whether specific users or groups of users can let anonymous users join the meetings they organize. This new per-organizer policy is controlled by using the -

AllowAnonymousUsersToJoinMeeting parameter in [Set-CsTeamsMeetingPolicy](#). This comes with Teams PowerShell version 2.6.0 and later.

You can use either policy, organization-wide or per-organizer, to manage anonymous join. We recommend that you implement the per-organizer policy. The organization-wide policy setting will be deprecated in the future and the per-organizer policy will be the only way to control anonymous join.

Since both the organization-wide and per-organizer policies control anonymous join, the more restrictive setting will be effective. For example, if you don't allow anonymous join at the organization level, that will be your effective policy regardless of what you configure for the per-organizer policy. Therefore, in order to allow anonymous users to join meetings, you must configure both policies to allow anonymous join by setting the following values:

- `-DisableAnonymousJoin` set to `$false`
- `-AllowAnonymousUsersToJoinMeeting` set to `$true`

Any other combination of values will prevent anonymous users from joining meetings.

NOTE

To use the per-organizer policy for organizations with anonymous join turned off per organization, admins need to create a policy and then assign it to users. To learn how to do that, see [Manage meeting policies in Microsoft Teams](#).

Allow anonymous users to interact with apps in meetings

Anonymous users will now inherit the user-level global default permission policy. This control will then allow anonymous users to interact with apps in Teams meetings as long as the user-level permission policy has enabled the app. Note that anonymous users can only interact with apps that are already available in a meeting and cannot acquire and/or manage these apps.

IMPORTANT

By default, the setting to allow anonymous users to interact with apps in meetings is enabled.

Using the Microsoft Teams admin center

You must be a Teams service admin to access this setting. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. Go to the admin center.
2. In the left navigation, go to **Meetings > Meeting settings**.
3. Under **Participants**, the setting for **Anonymous users can interact with apps in meetings** can be changed.

Caution

If you don't want anonymous users to interact with apps in meetings scheduled by users in your organization, turn off this setting.

Customize meeting invitations

You can customize Teams meeting invitations to meet your organization's needs. You can add your organization's logo and include helpful information, such as links to your support website and legal disclaimer, and a text-only footer.

Tips for creating a logo for meeting invitations

1. Create an image that's no more than 188 pixels wide by 30 pixels tall (it's quite small).
2. Save the image in JPG or PNG format.
3. Store the image in a location that everyone receiving the invitation can access, such as a public website.

Now you can add it to your meeting invitations. See the next steps.

Customize your meeting invitations

Using the Microsoft Teams admin center

1. Go to the admin center.
2. In the left navigation, go to **Meetings > Meeting settings**.
3. Under **Email invitation**, do the following:

Email invitation

Customize meeting invitations sent to people that can include your organization's logo, specific URLs and custom footers that can include statements for privacy or security and phone numbers for technical support. ⓘ

Logo URL	<input type="text" value="https://contoso.com/images/contosologo.png"/>
Legal URL	<input type="text" value="https://contoso.com/legal.html"/>
Help URL	<input type="text" value="https://contoso.com/joiningmeetinghelp.html"/>
Footer	<input type="text" value="Footer"/>

[Preview invite](#)

- **Logo URL** Enter the URL where your logo is stored.
 - **Legal URL** If your organization has a legal website that you want people to go to for any legal concerns, enter the URL here.
 - **Help URL** If your organization has a support website that you want people to go to if they run into issues, enter the URL here.
 - **Footer** Enter text that you want to include as a footer.
4. Click **Preview invite** to see a preview of your meeting invitation.
 5. When you're done, click **Save**.
 6. Wait an hour or so for the changes to propagate. Then schedule a Teams meeting to see what the meeting invitation looks like.

Set how you want to handle real-time media traffic for Teams meetings

If you're using Quality of Service (QoS) to prioritize network traffic, you can enable QoS markers and set port ranges for each type of media traffic. Setting port ranges for different traffic types is only one step in handling real-time media; see [Quality of Service \(QoS\) in Teams](#) for much more detail.

IMPORTANT

Apple-based systems: The only instance that we know of where Apple-based devices actually set the DSCP value is if all the following conditions are met:

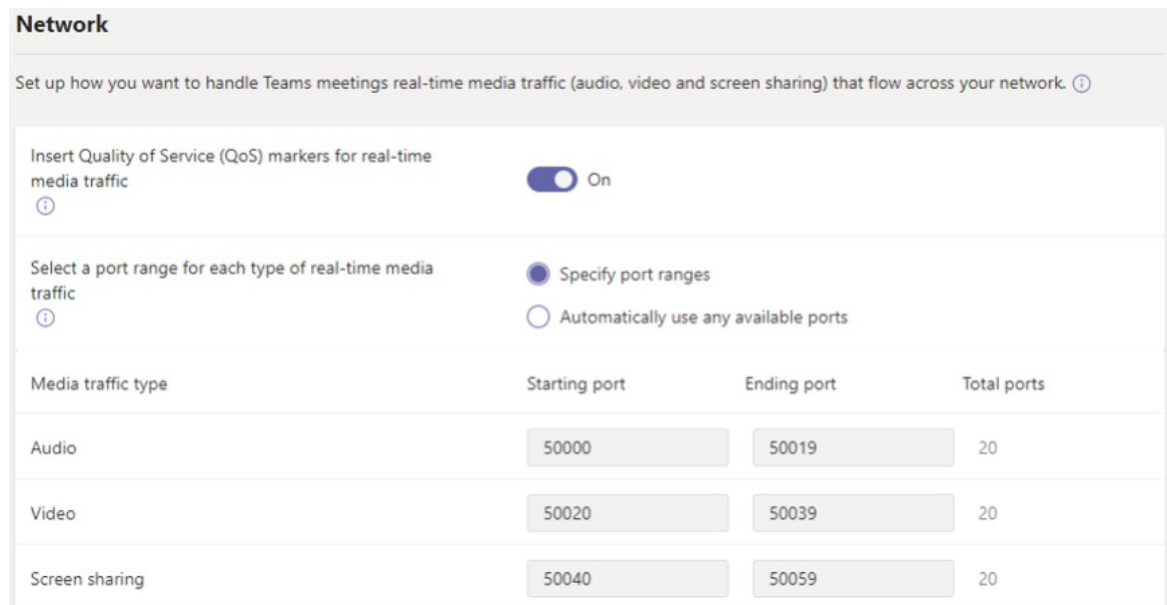

- iOS.
- WiFi network.
- Cisco switches.
- The network administrator has added the app to the approved list.

Android-based systems: There are no known limitations.

If you enable QoS or change settings in the Microsoft Teams admin center for the Teams service, you'll also need to [apply matching settings to all user devices](#) and all internal network devices to fully implement the changes to QoS in Teams.

Using the Microsoft Teams admin center

1. Go to the admin center.
2. In the left navigation, go to **Meetings > Meeting settings**.
3. Under **Network**, do the following:

Media traffic type	Starting port	Ending port	Total ports
Audio	50000	50019	20
Video	50020	50039	20
Screen sharing	50040	50059	20

- To allow DSCP markings to be used for QoS, turn on **Quality of Service (QoS) markers for real-time media traffic**. You only have the option of using markers or not; you can't set custom markers for each traffic type. See [Select a QoS implementation method](#) for more on DSCP markers.

IMPORTANT

Note that enabling QoS is only performed on the endpoints for tagging packets leaving the client. We still recommend applying matching QoS rules on all internal network devices for incoming traffic.

NOTE

DSCP tagging is typically done via Source Ports and UDP traffic will route to Transport Relay with destination port of 3478 by default. If your company requires tagging on destination ports, please contact support to enable communication to the Transport Relay with UDP ports 3479 (Audio), 3480 (Video), and 3481 (Sharing).

- To specify port ranges, next to **Select a port range for each type of real-time media traffic**, select **Specify port ranges**, and then enter the starting and ending ports for audio, video, and screen sharing. Selecting this option is required to implement QoS.

NOTE

If **Quality of Service (QoS) markers for real-time media traffic** is on, then you have to manage your port settings. They aren't managed automatically.

IMPORTANT

If you select **Automatically use any available ports**, available ports between 1024 and 65535 are used. Use this option only when not implementing QoS.

Selecting a port range that is too narrow will lead to dropped calls and poor call quality. The recommendations below should be a bare minimum.

If you're unsure what port ranges to use in your environment, the following settings are a good starting point. To learn more, read [Implement Quality of Service \(QoS\) in Microsoft Teams](#). These are the required DSCP markings and the suggested corresponding media port ranges used by both Teams and ExpressRoute.

Port ranges and DSCP markings

MEDIA TRAFFIC TYPE	CLIENT SOURCE PORT RANGE *	PROTOCOL	DSCP VALUE	DSCP CLASS
Audio	50,000–50,019	TCP/UDP	46	Expedited Forwarding (EF)
Video	50,020–50,039	TCP/UDP	34	Assured Forwarding (AF41)
Application/Screen Sharing	50,040–50,059	TCP/UDP	18	Assured Forwarding (AF21)

* The port ranges you assign can't overlap and should be adjacent to each other.

After QoS has been in use for a while, you'll have usage information on the demand for each of these three workloads, and you can choose what changes to make based on your specific needs. [Call Quality Dashboard](#) will be helpful with that.

Emails sent to users when their settings change in Microsoft Teams

12/7/2021 • 4 minutes to read • [Edit Online](#)

Emails will be automatically sent to users who are [enabled for Audio Conferencing](#) using Microsoft as the audio conferencing provider.

By default, there are four types of email that will be sent to your users who are enabled for Audio Conferencing. However, if you want to limit the number of emails sent to users, you can turn it off. Audio Conferencing in Microsoft 365 or Office 365 will send email to your users' email when:

- **An Audio Conferencing license is assigned to them or when you are changing the audio conferencing provider to Microsoft.**

This email includes the conference ID, the default conference phone number for the meetings, the audio conferencing PIN for the user, and the instructions and link to use the Skype for Business Online Meeting Update Tool that is used to update existing meetings for the user. See [Assign Microsoft Teams add-on licenses](#) or [Assign Microsoft as the audio conferencing provider](#).

NOTE

If your organization has been enabled for dynamic conference IDs, all of a user's meetings that they schedule will have unique conference IDs. You can set up [Audio Conferencing dynamic IDs in your organization](#).

Here is an example of this email:

You now have Office 365 Audio Conferencing

Office 365 Audio Conferencing has been turned on for your account. With Audio Conferencing, you and your meeting participants can join by phone.

Name:

Account:

Your Audio Conferencing Information

Here are the credentials that you and your meeting participants can use to join by phone. This information will be added to any Skype for Business or Microsoft Teams meetings you create. To join a meeting by phone, dial the conference phone number and enter the conference ID.

Conference phone number:

1(800) 555-1234

Note: You can get additional phone numbers by clicking the "Find a local number" link in your meeting invites.

Your Audio Conferencing PIN

As the meeting organizer, you'll need to enter your PIN to start your meeting when you're the first person to join and you join by phone. As with any PIN, keep it confidential. You can reset your PIN via the reset PIN link that is included in your meeting invites or by contacting your Office 365 admin.

Audio Conferencing PIN:

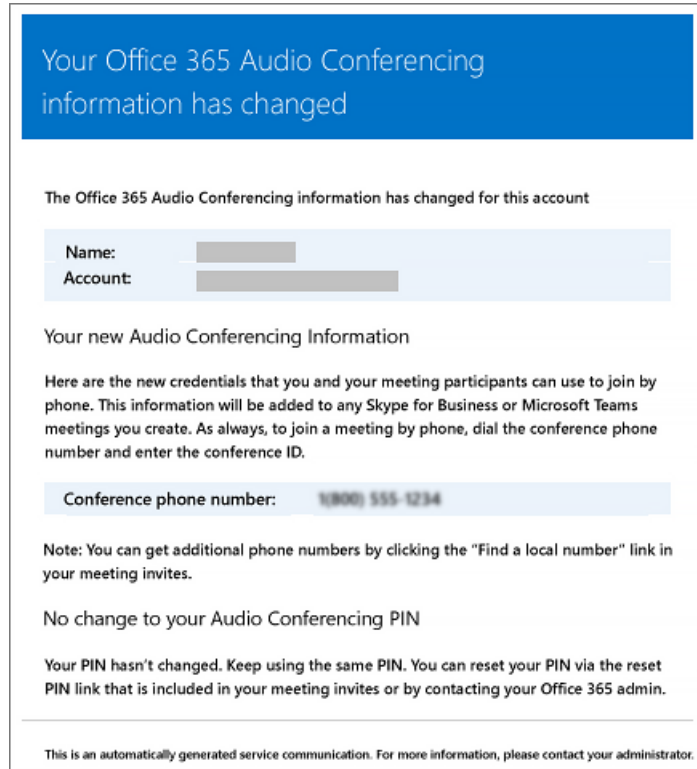

This is an automatically generated service communication. For more information, please contact your administrator.

To find out more about licensing, see [Microsoft Teams add-on licensing](#).

- **The conference ID or default conference phone number of a user changes.**

This email contains the conference ID, default conference phone number, and the instructions and link to use the Skype for Business Online Meeting Update Tool that is used to update existing meetings for the user. But this email doesn't include the user's audio conferencing PIN. See [Reset a conference ID for a user](#).

Here is an example of this email:

- **The audio conferencing PIN of a user is reset.**

This email contains the organizer's audio conferencing PIN, the existing conference ID, and default conference phone number for the user. See [Reset the Audio Conferencing PIN](#).

Here is an example of this email:

Your Office 365 Audio Conferencing PIN
has changed

Effective immediately, you've got a new Office 365 Audio Conferencing PIN.

Name:

Account:

New Audio Conferencing PIN

Audio Conferencing PIN:

As the meeting organizer, you'll need to enter your PIN to start your meeting when you're the first person to join and you join by phone. As with any PIN, keep it confidential. You can reset your PIN via the reset PIN link that is included in your meeting invites or by contacting your Office 365 admin.

No change to Audio Conferencing phone number or ID

Keep using the same Audio Conferencing phone number and ID - these credentials haven't changed. As always, this information will be added to any Skype for Business or Microsoft Teams meetings you create. To join a meeting by phone, dial the conference phone number and enter the conference ID. Here are your existing Audio Conferencing credentials:

Conference phone number:

1(800) 555-1234

Note: You can get additional phone numbers by clicking the "Find a local number" link in your meeting invites.

This is an automatically generated service communication. For more information, please contact your administrator.

- A user's license is removed or when audio conferencing provider changes from Microsoft to other provider or None.

This happens when the **Audio Conferencing** license is removed from a user or when setting the audio conferencing provider to **None**.

See [Assign or remove licenses for Microsoft 365 for business](#).

Here is an example of this email:

Office 365 Audio Conferencing has been
turned off

Office 365 Audio Conferencing has been turned off for your account. This means your meeting participants can no longer join by phone. Please contact your Office 365 admin if you have questions.

Name:

Account:

This is an automatically generated service communication. For more information, please contact your administrator.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Make changes to the email messages that are sent to them

You can make changes to the email that is automatically sent to users. By default, the sender of the emails will be from Microsoft 365 or Office 365, but you can change the display name using Windows PowerShell. See the

[Microsoft Teams PowerShell reference](#) for more information.

What if you don't want email to be sent to them?

When you disable sending emails to users, email won't be sent even when a user gets assigned a license. In this case, the conference ID, default conferencing phone number, and, more importantly, their audio conferencing PIN won't be sent to the user. When this happens, you must tell the user by sending them a separate email or by calling them.

By default, emails will be sent to your users, but if you want to prevent them from receiving email for audio conferencing, you can use Microsoft Teams or Windows PowerShell.

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings > Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. In the **Bridge settings** pane, enable or disable **Automatically send emails to users if their dial-in settings change**.
4. Click **Save**.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Using Windows PowerShell

You can also use the Microsoft Teams PowerShell module and run:

```
Set-CsOnlineDialInConferencingTenantSettings -AutomaticallySendEmailsToUsers $true|$false
```

You can use the [Set-CsOnlineDialInConferencingTenantSettings](#) to manage other settings for your organization, including email.

See the [Microsoft Teams PowerShell reference](#) for more information.

Want to know more about Windows PowerShell?

By default, the sender of the emails will be from Microsoft 365 or Office 365, but you can change the email address and display name using Windows PowerShell.

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 or Office 365 using a single point of administration that can simplify your daily work when you have multiple tasks to do. To get started with Windows PowerShell, see these topics:

- [Why you need to use Office 365 PowerShell](#)
- [Best ways to manage Office 365 with Windows PowerShell](#)

For more information about Windows PowerShell, see the [Microsoft Teams PowerShell reference](#) for more information.

Enable or disable sending emails when Audio Conferencing settings change

Send an email to a user with their Audio Conferencing information

Enable users to record their name when they join a meeting in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you are setting up Audio Conferencing in Microsoft 365 or Office 365, you will receive phone numbers and what is called an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers that can be a dedicated or shared phone number.

The conferencing bridge answers a call for a user who is dialing in to a meeting using a phone. The conferencing bridge answers the caller with voice prompts from an auto attendant, and then, depending on their settings, can play notifications, ask callers to record their name, and set up the PIN security for meeting organizers. PINs are given to meeting organizers to allow them to start a meeting. However, you can set it up so a PIN isn't required to start a meeting.

Set whether callers should record their name

Using the Microsoft Teams admin center

1. In the left navigation, go to **Meetings** > **Conference Bridges**.
2. At the top of the **Conference Bridges** page, click **Bridge settings**.
3. Enable or disable **Meeting entry and exit notifications**.
4. If enabling notifications, choose **Names or phone numbers** under **Entry/exit announcement type**, and then turn on **Ask callers to record their name before joining a meeting**.
5. Click **Save**.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Want to know more about Windows PowerShell?

Windows PowerShell is all about managing users and what users are allowed or not allowed to do. With Windows PowerShell, you can manage Microsoft 365 or Office 365 using a single point of administration that can simplify your daily work when you have multiple tasks to do. To get started with Windows PowerShell, see these topics:

Related topics

[Try or purchase Audio Conferencing](#)

Turn on or off entry and exit announcements for meetings in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

When you are setting up Audio Conferencing in Microsoft 365 or Office 365, you will get an audio conferencing bridge. A conferencing bridge can contain one or more phone numbers that people will use to call in to a Microsoft Teams meeting.

The conferencing bridge answers a call for a user who is dialing in to a meeting using a phone. The conferencing bridge answers the caller with voice prompts from a conferencing auto attendant, and then, depending on your settings, can play notifications, ask callers to record their name, and set up the PIN security. A PIN is given to a Microsoft Teams meeting organizer, and it allows them to start a meeting if they can't start the meeting using the Microsoft Teams app. You can, however, set it so that a PIN isn't required to start a meeting.

NOTE

We are frequently updating how you can manage features, so the steps here might be a little different from what you see.

Setting meeting join options

Using the Microsoft Teams admin center

You must be a Teams service admin to make these changes. See [Use Teams administrator roles to manage Teams](#) to read about getting admin roles and permissions.

1. Log in to the admin center.
2. In the left navigation, go to **Meetings > Conference Bridges**.
3. At the top of the **Conference Bridges** page, click **Bridge Settings**.
4. In the **Bridge settings** pane, enable or disable **Meeting entry and exit notifications**. This is selected by default. If you clear it, users who have already joined the meeting won't be notified when someone enters or leaves the meeting.
5. Under **Entry/exit announcement type**, select **Names or phone numbers** or **Tones**.

NOTE

By default, external participants can't see the phone numbers of dialed-in participants. If you want to maintain the privacy of these phone numbers, select **Tones** for **Entry/exit announcement type** (this prevents the numbers from being read out by Teams).

6. If you chose **Names or phone numbers**, enable or disable **Ask callers to record their name before joining the meeting**.
7. Click **Save**.

Broadcast meeting content

12/7/2021 • 2 minutes to read • [Edit Online](#)

Teams provides two options for broadcasting Teams meeting content: Network Device Interface (NewTek NDI®) and Serial Digital Interface (SDI):

- NewTek NDI® technology is a modern solution for connecting media devices (such as a studio camera and mixer). Instead of using physical connections, NDI® technology enables connectivity over a local intranet, including on a local machine.

NDI® technology has become a standard industry solution for producing live content for streams and has gained significant awareness and adoption in the professional broadcast world.

- SDI has been used in broadcast productions since 1989 and is supported on most legacy studio hardware devices. Hardware devices from AJA Video Systems and Blackmagic Design provide connectivity to legacy broadcast devices that use SDI.

NOTE

The Video Hardware Out feature that supports SDI is currently in Preview release.

NDI® and SDI technology is supported in all locales.

Access to using NDI and SDI is determined by the meeting policy for the user attempting to activate the feature. For the most secure solution, do not turn on the local streaming parameter as a global setting.

Enable broadcast features

To enable NDI® and SDI broadcast features for a user:

1. The tenant admin must enable the end user to have local streaming turned on for their meeting policy.
2. The end user must turn on local streaming for their specific client.

To enable the end user, you can use the Teams Admin center or Teams PowerShell as follows.

In the Teams admin center, go to **Meeting policies > Audio & video** and select **Allow NDI Streaming**.

To use PowerShell, use the Set-CsTeamsMeetingPolicy cmdlet as follows:

```
Set-CsTeamsMeetingPolicy -Identity MEETING_POLICY -AllowNDIStreaming $true
```

After this change has populated, the end user must turn on local streaming for their specific client from **Settings > Permissions**. For more information, see [Broadcasting audio and video from Teams](#).

Microsoft Teams meetings on unsupported browsers

12/7/2021 • 2 minutes to read • [Edit Online](#)

Some browsers, such as Internet Explorer 11, Safari, and Firefox, support the Microsoft Teams web app but don't support some of the Teams calling and meeting features. To work around this limitation, the Teams web app lets users receive audio through a PSTN connection and lets them view presented content (screen share) at a reduced display rate.

NOTE

Microsoft 365 apps and services will not support Internet Explorer 11 starting August 17, 2021 (Microsoft Teams will not support Internet Explorer 11 earlier, starting November 30, 2020). [Learn more](#). Please note that Internet Explorer 11 will remain a supported browser. Internet Explorer 11 is a component of the Windows operating system and [follows the Lifecycle Policy](#) for the product on which it is installed.

When Teams detects an unsupported browser, it automatically displays a message explaining the issue and the session limitations. The message provides further instructions for accessing the meeting audio, such as advising the user to leave a call back number so that Teams can call the user, or instructing the user to call the conference number included in the meeting invitation. The message also encourages the user to download and use the [Teams desktop client](#) for the full Teams experience.

If PSTN is unavailable, the user won't see the instructions for accessing the meeting and won't be able to join the meeting.

Browser limitations

People who use the Teams web app on unsupported browsers will experience the following limitations:

- Audio is available through a PSTN connection only. Users can't use their microphone.
- Users can't share their camera or see other participants' videos but can view presented content through image-based screen sharing.
- Users can't share their screen, although they can see a screen that another meeting participant shares.
- Users can't take control during a screen sharing session.
- Users won't receive incoming call notifications.
- If the call is interrupted, the meeting won't automatically reconnect.
- Users can't start meetings.

For more information about browser support in Teams, see [Limits and specifications for Teams](#).

Configure desktop sharing in Microsoft Teams

12/7/2021 • 2 minutes to read • [Edit Online](#)

Desktop sharing lets users present a screen or app during a meeting or chat. Admins can configure screen sharing in Microsoft Teams to let users share an entire screen, an app, or a file. You can let users give or request control, allow PowerPoint sharing, add a whiteboard, and allow shared notes. You can also configure whether anonymous or external users can request control of the shared screen. External participants in Teams meetings can be categorized as follows:

- Anonymous user
- Guest users
- B2B user
- Federated user

To configure screen sharing, you create a new meetings policy and then assign it to the users you want to manage.

In the [Microsoft Teams admin center](#)

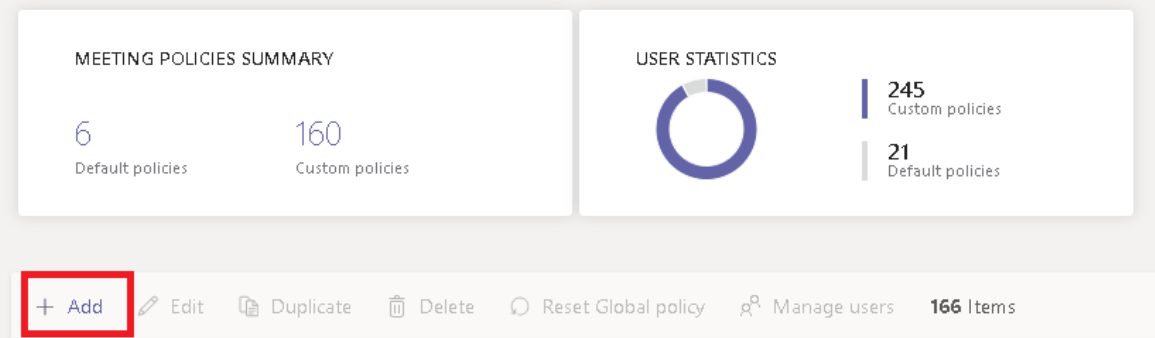

1. Select **Meetings > Meeting policies**.

2. On the **Meeting policies** page, select **Add**.

Meeting policies

Meeting policies are used to control what features are available to users when they join Microsoft Teams meetings. You can use the Global (Org-wide default) policy and customize it or create one or more custom meeting policies for people that host meetings in your organization. [Learn more](#)

3. Give your policy a unique title and enter a brief description.
4. Under **Content sharing**, choose a **Screen sharing mode** from the drop-down list:
 - **Entire screen** – lets users share their entire desktop.
 - **Single application** – lets users limit screen sharing to a single active application.
 - **Disabled** – Turns off screen sharing.

The 'Content sharing' settings form includes a description, a dropdown for 'Screen sharing mode' (currently set to 'Entire screen'), and several toggle switches for permissions. The dropdown menu is open, showing 'Entire screen', 'Single application', and 'Disabled' options.

Setting	Value
Screen sharing mode	Entire screen
Allow a participant to give or request control	Entire screen
Allow an external participant to give or request control	Single application
Allow PowerPoint sharing	On
Allow whiteboard	On
Allow shared notes	On

NOTE

You don't have to enable the calling policy in order for users to use screen share from chat. However, their audio is turned off until they unmute themselves. In addition, the user sharing the screen can click **Add Audio** to enable audio. If the calling policy is disabled, users won't be able to add audio to the screen share from a chat session.

5. Turn the following settings on or off:
 - **Allow a participant to give or request control** – lets members of the team give or request control of the presenter's desktop or application.
 - **Allow an external participant to give or request control** – This is a per-user policy. Whether an organization has this set for a user doesn't control what external participants can do, regardless of what the meeting organizer has set. This parameter controls whether external participants can be given control or request control of the sharer's screen, depending on what the sharer has set within their organization's meeting policies.
 - **Allow PowerPoint sharing** – lets users create meetings that allow PowerPoint presentations to be uploaded and shared.
 - **Allow whiteboard** – lets users share a whiteboard.

- **Allow shared notes** – lets users take shared notes.

6. Click **Save**.

Use PowerShell to configure shared desktop

You can also use the [Set-CsTeamsMeetingPolicy](#) cmdlet to control desktop sharing. Set the following parameters:

- Description
- ScreenSharingMode
- AllowPrivateCalling
- AllowParticipantGiveRequestControl
- AllowExternalParticipantGiveRequestControl
- AllowPowerPointSharing
- AllowWhiteboard
- AllowSharedNotes

[Learn more about using the csTeamsMeetingPolicy cmdlet.](#)

Teams cloud meeting recording

12/7/2021 • 25 minutes to read • [Edit Online](#)

In Microsoft Teams, users can record their Teams meetings and group calls to capture audio, video, and screen sharing activity. There is also an option for recordings to have automatic transcription, so that users can play back meeting recordings with closed captions and review important discussion items in the transcript. The recording happens in the cloud and is saved to Microsoft OneDrive for Business and Microsoft SharePoint Online, so users can share it securely across their organization.

When a meeting is recorded, it's automatically:

- Uploaded to OneDrive for Business or SharePoint Online
- Permissioned to the people invited to the meeting
- Linked in the chat for the meeting
- Displayed in the Recordings and Transcripts tab for the meeting in Teams calendar
- Added to various file lists across Microsoft 365: Shared with me, office.com, Recommended, Recent, etc.
- Indexed for Microsoft 365 Search

Related: [Teams meeting recording end user documentation](#)

NOTE

The change from using Microsoft Stream (classic) to OneDrive for Business and SharePoint Online for meeting recordings will automatically happen in August 2021. For detailed information, see [Use OneDrive for Business and SharePoint Online or Stream for meeting recordings](#).

NOTE

For information about using roles in Teams meetings, and how to change users' roles, see [Roles in a Teams meeting](#). For live events recording options, see [Live event recording policies in Teams](#).

Prerequisites for Teams cloud meeting recording

For a Teams user's meetings to be recorded, OneDrive for Business and SharePoint Online must be enabled for the tenant. In addition, the following prerequisites are required for both the meeting organizer and the person who is initiating the recording:

- User has sufficient storage in OneDrive for Business for non-channel meeting recordings to be saved.
- The Teams' channel has sufficient storage in SharePoint Online for channel meeting recordings to be saved.
- User has `CsTeamsMeetingPolicy -AllowCloudRecording` setting set to true in order to record meetings and group calls.
- User has `CsTeamsCallingPolicy -AllowCloudRecordingForCalls` setting set to true in order to record 1:1 calls.
- User is not an anonymous, Guest, or federated user in the meeting.
- To enable transcription for a user's meeting, the Teams meeting policy they are assigned to must have the

`-AllowTranscription` setting set to true.

- To enable channel meeting recordings to be saved so channel members can't edit or download the recordings the `CSTeamsMeetingPolicy -ChannelRecordingDownload` setting must be set to Block.

IMPORTANT

Users won't need OneDrive for Business or SharePoint Online enabled if you want users to only record and download the recordings. This will mean that the recordings aren't stored in OneDrive for Business or SharePoint Online, but are instead stored in temporary Teams storage with a 21-day limit before it's deleted. It's not something that an admin can control, manage, or delete at this time.

For more [information on how temporary meeting recording storage works](#), see [below](#).

Set up Teams cloud meeting recording for users in your organization

This section explains how you can set up and plan for recording Teams meetings via [Teams meeting policies](#).

Turn on or turn off cloud recording

You can use the Microsoft Teams admin center or PowerShell to set a Teams meeting policy to control whether user's meetings can be recorded.

In the Microsoft Teams admin center, turn on or turn off the **Cloud recording** setting in the meeting policy. To learn more, see [Meeting policy settings for audio and video](#).

Using PowerShell, you configure the `AllowCloudRecording` setting in `TeamsMeetingPolicy`. To learn more, see [New-CsTeamsMeetingPolicy](#) and [Set-CsTeamsMeetingPolicy](#).

Both the meeting organizer and the recording initiator need to have the recording permissions to record the meeting. Unless you have assigned a custom policy to the users, users get the Global policy, which has `AllowCloudRecording` enabled by default.

NOTE

For more information about using Teams roles to configure who has permission to record a meeting, see [Roles in a Teams meeting](#).

For a user to fall back to the Global policy, use the following cmdlet to remove a specific policy assignment for a user:

```
Grant-CsTeamsMeetingPolicy -Identity {user} -PolicyName $null -Verbose
```

To change value of `AllowCloudRecording` in the Global policy, use the following cmdlet:

```
Set-CsTeamsMeetingPolicy -Identity Global -AllowCloudRecording $true
```

SCENARIO	STEPS
I want all users in my company to be able to record their meetings.	<ol style="list-style-type: none">1. Confirm Global <code>CsTeamsMeetingPolicy</code> has <code>AllowCloudRecording = True</code>.2. All users have the Global <code>CsTeamsMeetingPolicy</code> OR one of the <code>CsTeamsMeetingPolicy</code> policies with <code>AllowCloudRecording = True</code>.

SCENARIO	STEPS
I want most of my users to be able to record their meetings but selectively disable specific users who are not allowed to record.	<ol style="list-style-type: none"> 1. Confirm GlobalCsTeamsMeetingPolicy has AllowCloudRecording = True. 2. Most of the users have the Global CsTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = True. 3. All other users have been granted one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = False.
I want recording to be 100% disabled.	<ol style="list-style-type: none"> 1. Confirm Global CsTeamsMeetingPolicy has AllowCloudRecording = False. 2. All users have been granted the Global CsTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = False.
I want recording to be turned off for the majority of the users but selectively enable specific users who are allowed to record.	<ol style="list-style-type: none"> 1. Confirm Global CsTeamsMeetingPolicy has AllowCloudRecording = False. 2. Most of the users have been granted the Global CsTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = False. 3. All other users have been granted one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = True.

Block or allow download of channel meeting recordings

This setting controls if channel meetings are saved to a "Recordings" folder or a "Recordings\View only" folder in the channel. The setting applies to the policy of the user who selects record for the channel meeting.

The two values for this setting are:

- **Allow** (default)—Saves channel meeting recordings to a "Recordings" folder in the channel. The permissions on the recording files will be based off the Channel SharePoint Online permissions. This is the same as any other file uploaded for the channel.
- **Block**—Saves channel meeting recordings to a "Recordings\View only" folder in the channel. Channel owners will have full rights on the recordings in this folder, but channel members will have read access without ability to download.

Using PowerShell, you configure the ChannelRecordingDownload setting in TeamsMeetingPolicy. To learn more, see [New-CsTeamsMeetingPolicy](#) and [Set-CsTeamsMeetingPolicy](#).

Unless you have assigned a custom policy to the users, users get the Global policy, which has ChannelRecordingDownload set to Allow by default.

For a user to fall back to Global policy, use the following cmdlet to remove a specific policy assignment for a user:

```
Grant-CsTeamsMeetingPolicy -Identity {user} -PolicyName $null -Verbose
```

To change value of ChannelRecordingDownload in the Global policy, use the following cmdlet:

```
Set-CsTeamsMeetingPolicy -Identity Global -ChannelRecordingDownload Block
```

NOTE

The ChannelRecordingDownload setting is only available in the Teams PowerShell module version 2.4.1-preview or higher. To download the latest preview version of the module use this command:

```
Install-Module -Name MicrosoftTeams -Force -AllowClobber -AllowPrerelease
```

Turn on or turn off recording transcription

This setting controls whether captions and transcription features are available during playback of meeting recordings. If you turn this off, the **Search** and **CC** options won't be available during playback of a meeting recording. The person who started the recording needs this setting turned on so that the recording also includes transcription.

NOTE

That transcription for recorded meetings is currently only supported for English (US), English (Canada), English (India), English (United Kingdom), English (Australia), English (New Zealand), German (Germany), Portuguese (Brazil), Dutch (Netherlands), Dutch (Belgium), French (France), Spanish (Spain), Japanese (Japan), French (Canada), Chinese (Cantonese, Traditional), Chinese (Mandarin, Simplified), Hindi (India), Italian (Italy), Korean (Korea), Spanish (Mexico), Swedish (Sweden), Polish (Poland), Arabic (United Arab Emirates), Arabic (Saudi Arabia), Danish (Denmark), Finnish (Finland), Norwegian (Norway), and Russian (Russia). They are stored together with the meeting recordings in OneDrive for Business and SharePoint Online cloud storage.

You can use the Microsoft Teams admin center or PowerShell to set a Teams meeting policy to control whether the recording initiator gets a choice to transcribe the meeting recording.

In the Microsoft Teams admin center, turn on or turn off the **Allow transcription** setting in the meeting policy. To learn more, see [Meeting policy settings for audio and video](#).

Using PowerShell, you configure the AllowTranscription setting in TeamsMeetingPolicy. To learn more, see [New-CsTeamsMeetingPolicy](#) and [Set-CsTeamsMeetingPolicy](#).

Unless you have assigned a custom policy to the users, users get the Global policy, which has AllowTranscription disabled by default.

For a user to fall back to Global policy, use the following cmdlet to remove a specific policy assignment for a user:

```
Grant-CsTeamsMeetingPolicy -Identity {user} -PolicyName $null -Verbose
```

To change value of AllowCloudRecording in the Global policy, use the following cmdlet:

```
Set-CsTeamsMeetingPolicy -Identity Global -AllowTranscription $false
```

SCENARIO	STEPS
I want all users in my company to be able to transcribe when initiating recording of a meeting.	<ol style="list-style-type: none"> 1. Confirm Global CsTeamsMeetingPolicy has AllowTranscription = True. 2. All users have the Global csTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowTranscription = True.
I want most of my users to be able to transcribe the meeting recordings, but selectively disable specific users who are not allowed to transcribe.	<ol style="list-style-type: none"> 1. Confirm Global CsTeamsMeetingPolicy has AllowTranscription = True. 2. Majority of the users have the Global CsTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowTranscription = True. 3. All other users have been granted one of the CsTeamsMeetingPolicy policies with AllowTranscription = False.
I want transcription of the recording to be 100% disabled.	<ol style="list-style-type: none"> 1. Confirm Global CsTeamsMeetingPolicy has AllowTranscription = False. 2. All users have been granted the Global CsTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowTranscription = False.
I want transcription to be disabled for the majority of the users but selectively enable specific users who are allowed to transcribe.	<ol style="list-style-type: none"> 1. Confirm Global CsTeamsMeetingPolicy has AllowCloudRecording = False. 2. Majority of the users have been granted the Global CsTeamsMeetingPolicy OR one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = False. 3. All other users have been granted one of the CsTeamsMeetingPolicy policies with AllowCloudRecording = True.

Terms of use acceptance

If your organization has a meeting recording policy that you would like your users to accept before recording a meeting, use the [Azure Active Directory terms of use](#) feature. This feature allows your users to accept your organization's terms of user policy before getting access to Microsoft Teams. This feature is not specific to clicking the record button, but is related to using Teams or other Microsoft 365 apps overall. Our suggestion is to add your meeting recording information to your overall terms of use for using Teams or Microsoft 365.

Permissions and storage

Meeting recordings are stored in OneDrive for Business and SharePoint Online cloud storage. The location and permissions depend on the type of meeting and the role of the user in the meeting. The default permissions applied to the recording are listed below, users that have full edit rights on the video recording file can change the permissions and share it later with others as needed.

Non-Channel meetings

- The recording is stored in a folder named **Recordings** in the OneDrive for Business of the user who clicked record.

Example: *recorder's OneDrive for Business/Recordings*

- People invited to the meeting, except external users, will automatically be granted permission to the recording file with view access without ability to download.
- The meeting owner and the person who clicked record will get full edit access with ability to change permissions and share with other people.

Channel meetings

If `Set-CsTeamsMeetingPolicy -ChannelRecordingDownload` is set to Allow (default):

- The recording is stored in the Teams site documentation library in a folder named **Recordings**.

Example: *Teams name - Channel name/Documents/Recordings*

- The member who clicked record has edit rights to the recording.
- Every other member's permissions are based on the Channel SharePoint Online permissions.

If `Set-CsTeamsMeetingPolicy -ChannelRecordingDownload` is set to Block:

- The recording is stored in the Teams site documentation library in a folder named **Recordings/View only**.

Example: *Teams name - Channel name/Documents/Recordings/View only*

- Channel owners will have full edit and download rights on the recordings in this folder.
- Channel members will have view only access without ability to download.

For more info on specific meeting types, see the following table:

MEETING TYPE	WHO CLICKED ON RECORD?	WHERE DOES THE RECORDING LAND?	WHO HAS ACCESS? R/W, R, OR SHARING
1:1 call with internal parties	Caller	Caller's OneDrive for Business account	<p>Caller is owner and has full rights.</p> <p>Callee (if in the same tenant) has read-only access. No sharing access.</p> <p>Callee (if in different tenant) has no access. Caller must share it to the Callee.</p>
1:1 call with internal parties	Callee	Callee's OneDrive for Business account	<p>Callee is owner and has full rights.</p> <p>Caller (if in the same tenant) has read-only access. No sharing access.</p> <p>Caller (if in different tenant) has no access. Callee must share it to the Caller.</p>
1:1 call with an external call	Caller	Caller's OneDrive for Business account	<p>Caller is owner and has full rights.</p> <p>Callee has no access. Caller must share it to the Callee.</p>

MEETING TYPE	WHO CLICKED ON RECORD?	WHERE DOES THE RECORDING LAND?	WHO HAS ACCESS? R/W, R, OR SHARING
1:1 call with an external call	Callee	Callee's OneDrive for Business account	<p>Callee is owner and has full rights.</p> <p>Caller has no access. Callee must share it to the Caller.</p>
Group call	Any member of the call	Group member who clicked on Record's OneDrive for Business account	<p>Member who clicked on Record has full rights.</p> <p>Other members from the same tenant have Read rights.</p> <p>Other group members from different tenants have no rights to it.</p>
Adhoc/Scheduled meeting	Organizer	Organizer's OneDrive for Business account	<p>Organizer has full rights to the recording.</p> <p>All other members of the meeting have read access without ability to download.</p>
Adhoc/Scheduled meeting	Other meeting member	Meeting member who clicked on Record	<p>Member who clicked on Record has full rights to the recording.</p> <p>Organizer has edit rights and can share.</p> <p>All other meeting members have read access without ability to download.</p>
Adhoc/Scheduled meeting with external users	Organizer	Organizer's OneDrive for Business account	<p>Organizer has full rights to the recording.</p> <p>All other members of the meeting from the same tenant as the organizer have read access without ability to download.</p> <p>All other external members have no access, and the Organizer must share it to them.</p>

MEETING TYPE	WHO CLICKED ON RECORD?	WHERE DOES THE RECORDING LAND?	WHO HAS ACCESS? R/W, R, OR SHARING
Adhoc/Scheduled meeting with external users	Other meeting member	Member who clicked on Record	<p>Member who clicked on Record has full rights to the recording. Organizer has edit rights and can share.</p> <p>All other members of the meeting from the same tenant as the organizer have read access without ability to download.</p> <p>All other external members have no access, and the Organizer must share it to them.</p>
Channel meeting	Channel Member	Teams' SharePoint Online location for that channel	<p>If Set- CsTeamsMeetingPolicy - ChannelRecordingDownload is set to Allow (default) the member who clicked on Record has edit rights to the recording. Every other member's permissions are based on the Channel SharePoint Online permissions.</p> <p>If Set- CsTeamsMeetingPolicy - ChannelRecordingDownload is set to Block channel owners will have full rights on the recording, but channel members will have read access without ability to download.</p>

Temporary storage when unable to upload to OneDrive for Business and SharePoint Online

If a meeting recording isn't able to be uploaded to OneDrive for Business and SharePoint Online, it will temporarily be available for download from Teams for 21 days before it is deleted. This is not something at this point that an admin can control or manage to include the ability to delete it.

Meeting recordings may end up in this temporary storage for the following reasons:

- For non-channel meetings if the user recording doesn't have a OneDrive for Business set up or the OneDrive for Business has reached its storage quota
- For a channel meeting if the SharePoint Online site has reached its storage quota or the site wasn't provisioned yet
- If specific OneDrive for Business and SharePoint Online policies are enabled restricting users from uploading files when not on specific IP ranges, etc.

The recording retention for this is temporary storage is affected by the chat message itself. As such, any deletion of the original chat message for the recording will prevent users from being able to access the recording. There are two scenarios that can affect this:

- **User manually deletes the chat message**—In this scenario, as the original message is gone, users

will no longer be able to access the recording and no further downloads will be possible. However, the recording itself may still be retained within Microsoft's internal systems for a time (not exceeding the original 21-day period).

- **Recording chat message is deleted by chat retention policy**—Temporary storage recordings are directly tied to the chat retention policy. As such, although recordings on Teams temporary storage will by default be retained for 21 days before being deleted, if the chat message is deleted before the 21-day time period, due to chat message retention policies, the recording will also be deleted. There is no way to recover the recording after this.

Planning for storage

The size of a 1-hour recording is 400 MB. Make sure you understand the capacity required for recorded files and have sufficient storage available in OneDrive for Business and SharePoint Online. Read [Set the default storage space for OneDrive for Business](#) and [Manage SharePoint Online site storage limits](#) to understand the base storage included in the subscription and how to purchase additional storage.

Auto-expiration of Teams meeting recordings:

IMPORTANT

The auto-expiration feature discussed in this article is not yet launched. Please refer to [the roadmap \(Feature ID: 84580\)](#) for more information on its delivery date.

We're providing information about how this feature will work in the future, so that you're able to plan for this change and modify the Teams policy settings in advance.

The command to preemptively change the default expiration setting in Teams is currently in deployment, but you may be able to see the attribute in PowerShell. The setting is not currently available in the Teams admin centers. These settings will be available and communicated in a message center post at least 30 days before we launch the feature.

See the frequently asked questions for admins and end users to gather insights into how auto-expiration of Teams meeting recordings will work, what actions you can take now, and what actions you can take after the feature launches.

Frequently asked questions

What is the change?

We're introducing a default 60-day expiration setting for all newly created Teams meeting recordings (TMRs). This means that by default, all TMRs created after we enable this feature will be deleted 60 days after their creation date. If admins want meeting recordings to expire sooner or later than the default, they can modify the expiration setting. The OneDrive and SharePoint systems will monitor the expiration date set on all meeting recordings and will automatically move them to the recycle bin on their expiration date.

Who does this impact?

Anyone storing a Teams meeting recording (non-channel, channel, or ad-hoc meeting) in OneDrive or SharePoint.

Why should I use this feature?

You should use this feature to limit OneDrive or SharePoint storage consumed by Teams meeting recordings (note: they typically use around 400 MB per hour of recording).

Why are we introducing this change?

Customers have provided overwhelming feedback that they want more controls to reduce storage clutter

created from Teams meeting recordings, 99% of which, on average, are never rewatched after 60 days.

Why is this being turned on by default?

We believe nearly all customers will benefit from the reduced storage load on their tenant by removing recordings that will likely never be rewatched after 60 days. It is our goal to provide as clean an experience as possible for all customers by default.

Will it be automatically deleted even if the data is accessed or downloaded?

Accessing the file does not change the expiration date.

Is the expiry date visible as a column in the list?

Users with view access to the recording will see a red icon next to the file in the OneDrive or SharePoint folder 14 days before the file expires. There is currently no way to add a column to a list with expire date.

How is the expiration date calculated?

The expiration date is calculated as the day the meeting recording is created plus the default number of days set in the Teams setting by the admin.

Can the expiration date be changed for each TMR, such as data A expiration date is 30 days and data B expiration date is 60 days?

Yes, the expiration date is set per file. Users can modify the expiration date in the details pane of a selected file in OneDrive or SharePoint.

How can an admin change the expiration date?

Admins can change the default expiration setting in PowerShell or the Teams admin center before the feature is released. Changing expiration settings will only impact newly created TMRs from that point forward. It won't impact any recordings made prior to that date. New recordings will not auto-expire until the feature is released, even though you can set the policy attribute before it's released.

The expiration days value can be set as follows:

- Value can be from 1 to 9,999.
- Value can also be -1 to set TMR to never expire.

Admins can't change the expiration date on existing TMRs already uploaded to OneDrive or SharePoint before this feature was released. This protects the intent of the user that owns the TMR.

To change the default auto-expiration behavior for your tenant, modify the following attribute in PowerShell. In this example, the default is changed to 50 days.

```
Set-CsTeamsMeetingPolicy -Identity Global -NewMeetingRecordingExpirationDays 50
```

The ability to change the default setting in the Teams admin center will be deployed at a later time, at least 30 days before we turn on the auto-expiration feature by default.

Can an admin set TMR's to never expire?

Yes, administrators can set TMR's to never expire.

Does playing the recording change the expiration date?

No, playback does not impact the expiration date.

What happens to the expiration date if the TMR is downloaded and re-uploaded?

The expiration date will be cleared upon re-upload, regardless of the user's SKU.

What happens if I copy or move the TMR to a different location or site?

The date is only retained for a moved TMR file. A copied file will not have the expiration date, just like a re-uploaded TMR.

What is the scope of control for the admin policy?

Both meetings and calls will be controlled by the same `CsTeamsMeetingPolicy` setting, `MeetingRecordingExpirationDays`.

How can end users modify the expiration date on a specific TMR file?

Anyone who has edit and delete permissions on a TMR can modify the expiration date in the file's details pane in OneDrive or SharePoint.

The user can defer the expiration 14, 30, or 60 days, or they can choose a specific date in the future, or they can select that the file never be expired.

Should admins rely on this feature for strict security and compliance adherence?

No, admins should not rely on this feature for legal protection since end users can modify the expiration date of any recordings they control.

Will this feature enforce file retention?

No, files will not be retained due to this feature or its settings. If a user with delete permissions attempts to delete a TMR that has an expiration setting, that user's delete action will be executed.

Will a retention and/or deletion policy I have set in the security & compliance (S+C) center override the TMR expiration setting?

Yes, any policies you have set in the S+C center will take full precedence. For example:

- If you have a policy that says all files in a site must be retained for 100 days, and the expiration setting for a TMR is 30 days, then the recording file will be retained for the full 100 days.
- If you have a deletion policy that says all TMRs will be deleted after 5 days and you have an expiration setting on a recording file of 30 days, then that file will be deleted after five days.

What happens when a TMR "expires"?

On the expiration date, the TMR is moved into the OneDrive or SharePoint recycle bin and the expiration date field is cleared. This action by the system is exactly the same as if a user deleted the file. The recycle bin lifecycle will subsequently follow the normal path. If the user recovers the TMR from the recycle bin, the TMR will not be deleted by this feature again since the expiration date has been cleared, unless the end user sets a new expiration date on the file.

How will I be notified about a file's expiration?

Everyone with view access will see a notification about the expiration date in the recording chiclet in the Teams chat window.

Everyone with view access will see a red icon next to the file in your OneDrive or SharePoint folder 14 days before the file expires.

The file owner will receive an email notification when the TMR expires and will be directed to the recycle bin to recover the TMR if they desire to do so.

What SKUs are required for this feature?

All SKUs will have this feature by default. A1 users will be defaulted to a 30-day expiration period.

Is the file expiration an audited event and will I be able to see it in my audit logs?

Yes, file expirations will show up as system deletion events in the audit log.

What if I want the admin to have full control over the lifecycle of TMRs and don't want to give end users the ability to override the expiration date?

We recommend using the S+C retain and/or delete policies available as part of the E5 compliance SKU. That offering is targeted to solve complex policy and SLA-driven administrative legal concerns.

This feature is solely meant as a lightweight housekeeping mechanism to reduce storage clutter created from cold TMRs.

When will the file be deleted?

The file will be deleted within 5 days of the expiration date, though this is not a strict guarantee.

Will future TMRs migrated from Classic Stream after this feature is released have auto-expiration applied to them too?

No, migrated TMRs will not come with an expiration set on them. Instead, we encourage admins to only migrate TMRs that they want to retain. More details will be provided in the migration documentation.

Manage meeting recordings

Meeting recordings are stored as video files in OneDrive for Business and SharePoint Online and follow management and governance options available in those platforms. Read [SharePoint Online governance overview](#), [OneDrive for Business guide for enterprises](#), or [OneDrive for Business guide for small businesses](#) for more information.

For non-channel meetings, the recordings are stored in the recorder's OneDrive for Business, thus handling ownership and retention after an employee leaves will follow the normal [OneDrive for Business and SharePoint Online process](#).

Closed captions for recordings

Closed captions for Teams meeting recordings will be available during playback only if the user had transcription turned on at the time of recording. Admins must [turn on recording transcription via policy](#) to ensure their users have the option to record meetings with transcription.

Captions help create inclusive content for viewers of all abilities. As an owner, you can hide captions on the meeting recording, although the meeting transcript will still be available on Teams unless you delete it there.

Today closed captions for the recording video file are linked to the Teams meeting transcript. This link will remain for the lifetime of the file in most cases, but can be broken if the video file is copied within the same OneDrive for Business or SharePoint Online site, which would result in captions not being available on the copied video file.

Any future changes to the link between the transcript in Teams and the recording will be clarified here and in message center notifications. If we make any changes in the future, we will ensure recording files less than 60 days old display the transcript from the meeting as captions.

NOTE

Meeting transcription is not yet available in GCC.

eDiscovery and Compliance for meeting recordings

eDiscovery

The meeting recordings are stored in OneDrive for Business and SharePoint Online, which is Microsoft 365 and Office 365 Tier-D compliant. To support e-Discovery requests for compliance admins who are interested in meeting or call recordings, the recording completed message is available in the compliance content search functionality for Microsoft Teams. Compliance admins can look for the keyword "recording" in the subject line of the item in compliance content search preview and discover meeting and call recordings in the organization.

In addition, the meeting recording video file can be found via eDiscovery searches for files on SharePoint Online and OneDrive for Business.

To learn more about eDiscovery see the article [eDiscovery solutions for Microsoft 365](#)

Retention policies

You can apply automatic retention labels to target just Teams meeting recording video files via the ProglD property. For more information, see [How to auto-apply a retention label for Teams meeting recordings](#).

Data Loss Prevention (DLP) policies

You can apply DLP policies to meeting recording files also by the ProglD property. In the DLP rule for files in SharePoint Online and OneDrive for Business set the conditions to be:

- Document property = *ProglD*
- Value = *Media.Meeting*

To learn more about DLP see the article [Learn about data loss prevention](#)

Meeting Recording Diagnostic Tools

User cannot record meetings

If you're an administrator, you can use the following diagnostic tool to validate that the user is properly configured to record a meeting in Teams:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.

[Run Tests: Meeting Recording](#)

2. In the Run diagnostic pane, enter the email of the user who cannot record meetings in the **Username or Email** field, and then select **Run Tests**.
3. The tests will return the best next steps to address any tenant or policy configurations to validate that the user is properly configured to record a meeting in Teams.

Meeting record is missing

If you're an administrator, you can use the following diagnostic tool to validate that the meeting recording completed successfully and it was uploaded to Stream or OneDrive, based on the meeting ID and recording start time:

1. Select **Run Tests** below, which will populate the diagnostic in the Microsoft 365 Admin Center.

[Run Tests: Missing Meeting Recording](#)

2. In the Run diagnostic pane, enter the URL of the meeting in the **URL of the meeting that was recorded** field (usually found in the meeting invitation) as well as the date of the meeting in the ****When was the meeting recorded? **** field and then select **Run Tests**.
3. The tests will validate that the meeting recording completed successfully and it was uploaded to Stream or OneDrive.

Use OneDrive for Business and SharePoint or Stream for meeting recordings

12/7/2021 • 10 minutes to read • [Edit Online](#)

NOTE

The change of storing Teams meeting recordings from Classic Stream to OneDrive and SharePoint (ODSP) has been completed as of August 30th, 2021. All recordings are now stored in ODSP. This change overrides the RecordingStorageMode policy, and modifying the setting in PowerShell no longer has any impact.

DATE	EVENT
October 5, 2020 (Complete)	You enable the Teams Meeting policy to have meeting recordings saved to OneDrive for Business and SharePoint instead of Microsoft Stream (Classic)
Rolling out starting January 7, 2021 (Complete)	All new Teams meeting recordings will be saved to OneDrive for Business and SharePoint unless you delay this change by modifying your organization's Teams Meeting policies and explicitly setting them to Stream . Seeing the policy reporting as Stream isn't enough. You need to explicitly set the policy value to Stream .
Rolling out starting January 11, 2021 (Complete)	GCC only While GCC customers can opt out starting October 5, you're unable to opt in. This feature will be rolled out to all GCC customers starting January 11, 2021, unless you've opted-out. Starting on January 11, 2021, all new Teams meeting recordings for GCC customers will be saved to OneDrive for Business and SharePoint unless you delay this change by modifying your organization's Teams Meeting policies and explicitly setting them to Stream . If you've opted-out but are ready to turn on this feature, you may do so by setting your Teams Meeting Policy explicitly to OneDrive for Business .
Rolling out starting March 1, 2021 (Complete)	GCC-High and DoD only Customers can now enable cloud meeting recordings in their Microsoft Teams for the first time. These recordings will be stored and played on OneDrive and SharePoint by default.

DATE	EVENT
Rolling out incrementally starting August 16, 2021 (Complete)	<p>All customers (Enterprise, Education, and GCC)</p> <p>No new meeting recordings can be saved to Microsoft Stream (Classic); all customers will automatically have meeting recordings saved to OneDrive for Business and SharePoint even if they've changed their Teams meeting policies to Stream.</p> <p>We recommend that customers, to better control the change in your organization, opt in whenever you're comfortable with the change rather than wait for it to happen.</p>

Microsoft Teams has a new method for saving meeting recordings. As the first phase of a transition from classic Microsoft Stream to the [new Stream](#), this method stores recordings on Microsoft OneDrive for Business and SharePoint in Microsoft 365 and offers many benefits.

NOTE

If a Teams meeting recording fails to successfully upload to OneDrive/SharePoint, a "The recording ended unexpectedly" error message will appear and the recording will instead be temporarily saved to Azure Media Services (AMS). Once stored in AMS, no retry attempts are made to automatically upload the recording to OneDrive/SharePoint or Stream.

Meeting recordings stored in AMS are available for 21 days before being automatically deleted. Users can download the video from AMS if they need to keep a copy.

The benefits of using OneDrive for Business and SharePoint for storing recordings include:

- Retention policies for Teams meeting recording (TMR) (S+C E5 autoretention labels)
- Benefit from OneDrive for Business and SharePoint information governance
- Easy to set permissions and sharing
- Share recordings with guests (external users) with explicit share only
- Request access flow
- Provide OneDrive for Business and SharePoint shared links
- Meeting recordings are available faster
- **Go local** tenant support
- Multi-geo support – recordings are stored in a region specific to that user
- Bring your own key (BYOK) support

See the full list of [features available today and what to expect over time](#).

Watch "What's New for Microsoft Teams Meeting Recordings" for more information.

Set up the meeting recording option for OneDrive for Business and SharePoint

The meeting recording option is a setting at the Teams policy level. The following example shows how to set the Global policy. Make sure that you set the meeting recording option for the policy or policies that you've assigned to your users.

NOTE

Teams meeting policy changes take a while to propagate. Check back after a few hours of setting it, then sign out and sign in to the Teams Desktop app again or simply restart your computer.

1. Install Teams PowerShell PowerShell.

NOTE

Skype for Business Online Connector is currently part of the latest Teams PowerShell module. If you're using the latest Teams PowerShell public release, you don't need to install the Skype for Business Online Connector. See [Manage Skype for Business Online with PowerShell](#).

2. Launch PowerShell as an admin.
3. Install [Teams PowerShell module](#).
4. Import the MicrosoftTeams module and sign in as a Teams admin.

```
# When using Teams PowerShell Module

Import-Module MicrosoftTeams
$credential = Get-Credential
Connect-MicrosoftTeams -Credential $credential
```

5. Use [Set-CsTeamsMeetingPolicy](#) to set a Teams Meeting Policy to transition from the Stream storage to OneDrive for Business and SharePoint.

```
Set-CsTeamsMeetingPolicy -Identity Global -RecordingStorageMode "OneDriveForBusiness"
```

NOTE

If some of your users have assigned a per-organizer or per-user policy, you must set this setting on this policy if you want them to also store the meeting recordings in OneDrive for Business and SharePoint. For more information, see [Manage meeting policies in Teams](#).

Opt out of OneDrive for Business and SharePoint to continue using Stream

Even if a policy says it's set to **Stream**, it might not be set. Typically, if the policy isn't set, then the default setting is **Stream**. However, with this new change, if you want to opt-out of using SharePoint or OneDrive for Business, then you must reset the policy to **Stream** to ensure that **Stream** is the default.

```
Set-CsTeamsMeetingPolicy -Identity Global -RecordingStorageMode "Stream"
```

Permissions or role-based access

NOTE

We recommend that the recipient is required to be a logged-in user when sharing Teams Meeting Recordings. Select the **People in (Your Organization)** option when you share the file as documented in [Share SharePoint files or folders](#). External sharing isn't designed for the distribution of large files or a large number of files. In order to prevent fraud and abuse scenarios, you might experience issues when sharing a large amount of data to external users.

MEETING TYPE	WHO CLICKED ON RECORD?	WHERE DOES THE RECORDING LAND?	WHO HAS ACCESS? R/W, R, OR SHARING
1:1 call with internal parties	Caller	Caller's OneDrive for Business account	Caller is owner and has full rights. Callee (if in the same tenant) has read-only access. No sharing access. Callee (if in different tenant) has no access. Caller must share it to the Callee.
1:1 call with internal parties	Callee	Callee's OneDrive for Business account	Callee is owner and has full rights. Caller (if in the same tenant) has read-only access. No sharing access. Caller (if in different tenant) has no access. Callee must share it to the Caller.
